Les représentants des laboratoires Servier, ont présenté lors de la réunion deux propositions d'études à réaliser :

i) une étude anatomopathologique sur un modèle exposé/non-exposé (ce modèle d'étude a été récusé par la commission),
ii) une étude cas-témoin ayant pour objectif de quantifier un éventuel sur-risque de valvulopathie associé au MEDIATOR® chez des patients atteints de valvulopathie idiopathique comparativement à des patients indemnes de valvulopathie. Cette étude se ferait sur une population de patients diabétiques ayant une échographie cardiaque.

Le protocole serait disponible début Septembre et permettrait dans le meilleur des cas d'avoir des résultats dans un an.

Par ailleurs, l'étude, REGULATE, (MEDIATOR® + sulfonylurée versus pioglitazone + sulfonylurée) est actuellement en cours d'analyse. Cette étude incluant 840 patients dont 420 dans chaque bras, comporte une échographie cardiaque à T0 et à la 52ème semaine de traitement. Le laboratoire a informé la Commission que les résultats de cette étude seraient disponibles début 2010.

7- Conclusions de la Commission Nationale de Pharmacovigilance :

Le responsable du CRPV de Brest, présent à la réunion de la CNPV, a informé les membres que les résultats de l'étude brestoise cas-témoin seront disponibles fin Juillet 2009.

Les membres de la CNPV ont également discuté de l'importance des utilisations hors AMM de ce produit, notamment dans la perte de poids, malgré la restriction d'indication.

La commission s'est prononcée en faveur (16 voix pour, 2 voix contre et 2 abstentions) de l'attente des résultats de l'ensemble des études en cours ou planifiées (laboratoires Servier et CRPV de Brest) avant de proposer d'éventuelles mesures.
Elle a toutefois souhaité qu'une communication soit effectuée auprès des professionnels de santé pour leur rappeler le bon usage du Benfluorex dans le cadre de l'AMM.

Les résultats de l'étude Brestoise seront examinés par le groupe «PGR et études pharmaco-épidémiologiques» de l'Afssaps. Ces résultats ainsi que les conclusions du groupe PGR-épi seront ensuite présentés à la Commission Nationale de Pharmacovigilance lors de sa réunion du 29 septembre 2009.

Identification des valvulopathies

1. 4 cas signalés spontanément par des collègues brestois (dont le1er cas publié dans l'ERJ)

2. Interrogation du PMSI (données à partir de 2003)
   - Codages "valvulopathies" et "diabète" : 240 dossiers, 3 cas compatibles
   - Codage "valvulopathies" et terme "Médiator®" : 23 dossiers, 11 compatibles

3. Vigilance prospective : 2 nouveaux cas compatibles

Caractéristiques des 15 patients identifiés "compatibles" depuis 2003 au CHU de Brest

(compatibles = la prise de Médiator^{R} précède les symptômes et le diagnostic de valvulopathie fuyante + valvulopathie inexpliquée)

-**12 femmes**, 3 hommes

-Âge moyen au diagnostic = **58 ans** [49-78] (série" fen-phen" du NEJM : 44)

-BMI moyen = **33** [24-52] (38)

-Diabète : **6 / 12**

-Durée exposition moyenne = **53 mois** [12-144] (11)

-Délai entre la première prise et le diagnostic = **97 mois** [13-384]

-Echographie cardiaque antérieure (ex.cardio 1 fois) "normale" : **5 / 7**

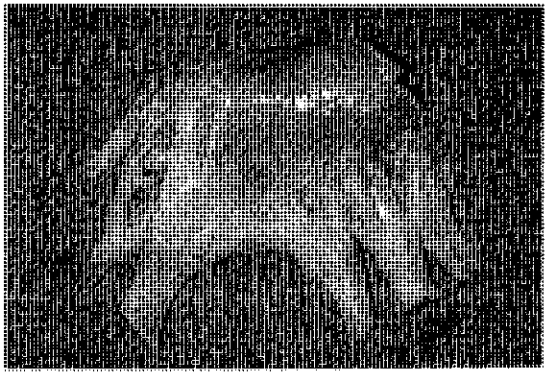
-Exposition à d'autres anorexigènes : **5 / 12**

-Exposition à un ISRS : **8 / 10**

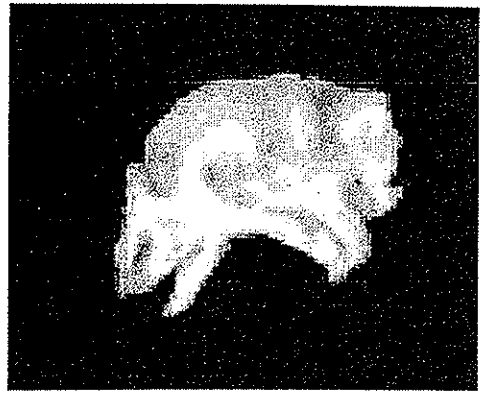
-Valves atteintes : **mitrale 100 %, aortique 100%,** tricuspide 7/15, pulmonaire 1/15

-Chirurgie de remplacement valvulaire : **8 / 15**

Etude macroscopique (3 cas) : comparaison aux photos publiées



Cas brestois : valve mitrale



Valvular Heart Disease Associated with Benfluorex; Riberaa et al, Rev Esp Cardiol 2003

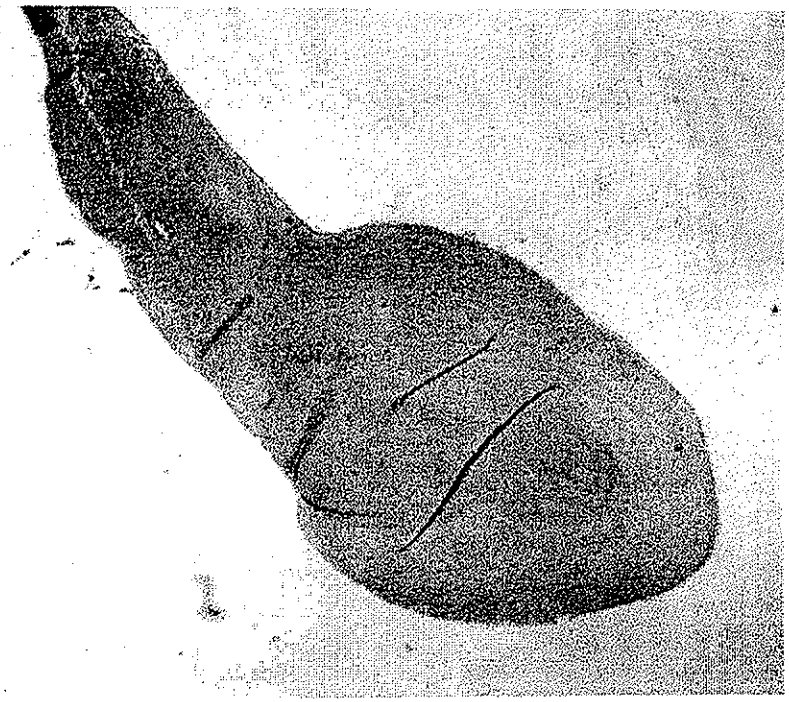
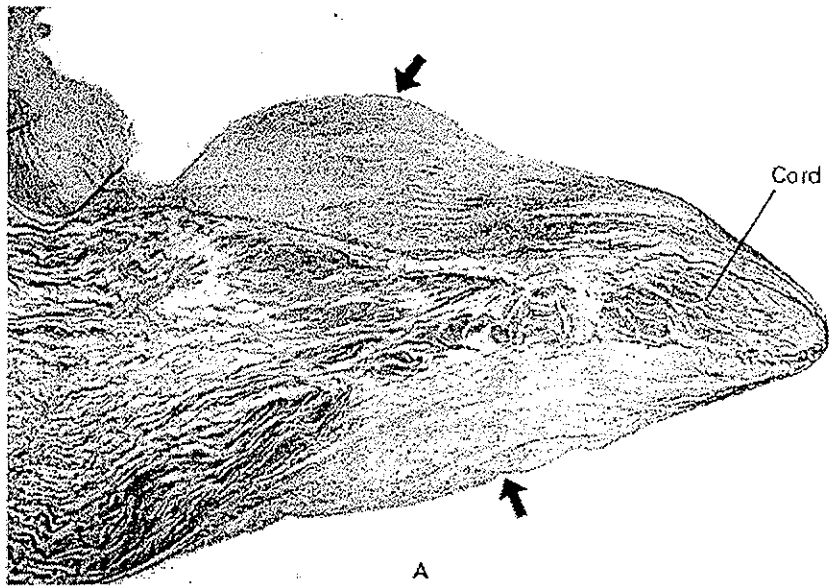
Etude microscopique (3 cas) : Comparaison aux études publiées





In Panel A, a low-power view (elastic–van Gieson stain, ×36) shows intact valve architecture with "stuck-on" plaques (arrows). In Panel B, a high-power view (hematoxylin and eosin, ×360) shows pro-

Cas brestois : dépôts myxoides diffus modérés le long de la face atriale de la sigmoide aortique, se majorant au niveau de son bord libre

Valvular Heart Disease associated with fenfluramine-phentermine; Connoly et al, NEJM 1997

Annexe 3-78

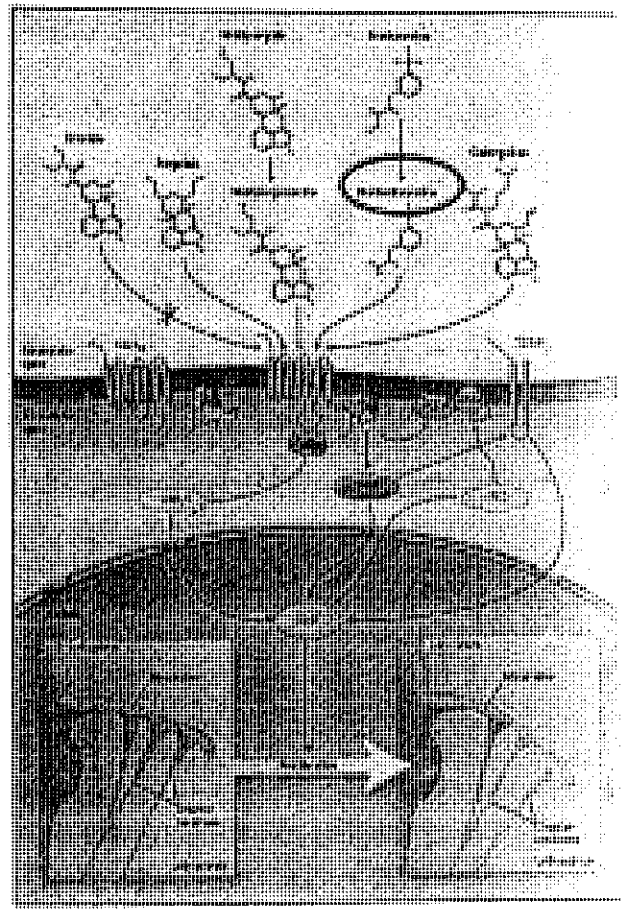
En cours : analyse systématique de toutes les "insuffisances mitrales" isolées ou associées vues au CHU depuis 2003

- 622 dossiers d'insuffisance mitrale triés en 2 groupes :
  - Groupe 1 : IM apparue dans un contexte étiologique bien identifié (RAA, coronaropathie, CMD, Maladie de Barlow avec rupture de cordage, endocardite…)
  - Groupe 2 : IM inexpliquée
  - Comparaison de l'exposition au Médiator à partir des cas identifiés par la requête du PMSI et sur enquête téléphonique (patient + médecin traitant) sur un modèle cas-témoin.

- A partir des 400 dossiers déjà analysés il apparaît qu'une large majorité d'insuffisances mitrales inexpliquées (ou qualifiées "rhumatismales" sans RAA connu) est associée à l'exposition au Médiator^{R}

CONCLUSION

- Notre étude monocentrique retrouve un signal important en faveur d'1 association "Médiator^{R}-valvulopathies cardiaques" :
  - Nombre élevé de cas décrits compatibles (série du NEJM : 24 patientes, 5 cas chirurgicaux)
  - Etude comparative macroscopique et microscopique des valves
  - Revue de dossiers exposés/non exposés (en cours)
- Il existe des arguments théoriques pour suspecter une telle association (schéma)
- Point important : association à risque Médiator^{R} + ISRS ?
- Nos propositions :
  - Collaboration urgente avec un autre centre sur un schéma proche de Brest : proposition d'un travail en commun avec Amiens (C.Tribouilloy, A. Jacques)
  - Retrait de Médiator^{R} ?



Roth et al, NEJM 2007

CONCLUSIONS

- Un signal de cardiotoxicité (atteintes valvulaires) a été détecté par l'analyse de la notification spontanée et des données issues du PMSI du CHU de Brest.
- Nécessité de confirmer ce signal par une étude rétrospective cas témoins basée sur l'exploitation du codage PMSI effectuée par plusieurs CRPV (AP-HP, Brest, Reims, Grenoble..) selon une méthodologie commune d'après les propositions du groupe PGR-PEPI qui a examiné le sujet le 2 juin 2009
- La pharmacologie du benfluorex et de son métabolite , la nor-fenfluramine doivent être considérés dans le mécanisme de la cardiotoxicité (plausibilité biologique).
- Une nouvelle réèvaluation du bénéfice de benfluorex est à envisager compte tenu des nouvelles données de sécurité.

MEDIATOR® (benfluorex)

Enquête officielle

Hypertensions artérielles pulmonaires

Et

Valvulopathies

Commission Nationale du 7 juillet 2009

M. DAVID-LAROCHE
J.P. KANTELIP

Annexe 3-78

Suite à la publication de K. Boutet et coll. « *Fenfluramine-like cardiovascular side-effects of benfluorex* », rapportant 5 cas d'hypertension artérielle pulmonaire (HTAP) et un cas de valvulopathies cardiaques chez des patients ayant été exposés au benfluorex, le Comité Technique a demandé d'actualiser l'enquête officielle sur les HTAP sous benfluorex.
Un cas de valvulopathie étant rapporté dans cet article et suite au travail de l'équipe de Brest sur les cas extraits du PMSI, l'enquête a été étendue aux cas de valvulopathies de patients ayant reçu benfluorex.
Nous y avons ajouté les cas d'HTAP post-capillaires, lorsque la valvulopathie parait être postérieure à la prise de benfluorex.

Le MEDIATOR® (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg et par les laboratoires Mylan et Qualimed (Générique).

La seule indication est : « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale », car l'indication, « adjuvant du régime adapté dans les hypertriglycéridémies » a été supprimée, suite aux conclusions de la Commission Nationale de Pharmacovigilance du 27 mars 2007.

Le nombre d'HTAP d'allure idiopathique retrouvé dans l'enquête présentée à cette commission, ne constituait pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardiovasculaire.

Métabolisme : (rappel)

- In vivo : Chez l'homme, le MEDIATOR® est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases en S422 (dérivé alcool), puis transformé en 8 métabolites majeurs, par oxydation (S1475, dérivé acide) ou désalkylation (S585, norfenfluramine).
  Le métabolite majoritaire est le dérivé carboxylique : S1475.
  Le métabolite primaire S422 et la norfenfluramine sont retrouvés à des taux très inférieurs.

Après administration de benfluorex radioactif ; 87 à 99% de la radioactivité est présente dans les urines après 72 heures. L'absence de quantité significative dans les fécès montre que le produit est bien absorbé.
Il n'existe pas de phénomène d'accumulation.

L'élimination se fait en 2 phases :
- une première phase rapide (60% en 3 ou 4 heures)
- une seconde phase lente de 36 heures environ.

- In vitro : Après incubation d'hépatocytes frais humains, il a été montré que les principaux cytochromes P450 jouent un rôle très minoritaire dans le métabolisme du benfluorex.

Annexe 3-78

I. Hypertensions Artérielles Pulmonaires

28 notifications ont été rapportées (dont 8 depuis la Commission Nationale du 27 mars 2007) :

1. Notifications MEDIATOR® associé à un anorexigène :

13 notifications d'«Hypertension artérielle pulmonaire » ont été rapportées.

- 11 d'entre elles, expertisées par le Professeur WEITZENBLUM (Strasbourg), faisaient partie de l'enquête «Anorexigènes et hypertensions artérielles pulmonaires» présentée à la Commission Nationale du 27 mars 2007
Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® est :

- antérieure dans 2 cas : 1 HTAP post-capillaire (10052733)
  1 HTAP post-embolique (10840770)

- concomitante dans 5 cas : 5 HTAP d'allure idiopathique (PP890081, NC9300007, 10052455, 10840193, 10840D01)

- inconnue dans 1 cas : 1 HTAP post-capillaire (10840954)

- postérieure dans 3 cas : 2 HTAP d'allure idiopathique (10840255, 10840663)
  1 HTAP post-capillaire (1084B19)

- 2 nouveaux cas ont été rapportés :

BR20080383 : (cas n°5 de la publication de K. Boutet et al)

Femme de 55 ans, obèse (BMI= 41), diabétique et dépressive, prise en charge pour une dyspnée d'effort associée à un syndrome d'obésité/hypoventilation et d'apnée du sommeil, appareillée en avril 2006.
Lors d'une visite de suivi, on découvre à l'échocardiographie une dilatation des cavités droites.
La PAPs est évaluée à 59 mmHg.
Le cathétérisme (janvier 2007) montre une PAPm à 28 mmHg. L'HTAP modérée est prise en charge sans traitement médical.
En 2008, l'état clinique de la patiente est stable.
Le dossier médical retient une prise d'ISOMERIDE®, très ancienne, pendant moins de 3 mois et de MEDIATOR® pendant plusieurs années, arrêté 1 an avant le diagnostic d'HTAP.

PB0700302 :

Ce cas, très succinct, datant de 2002 est rapporté rétrospectivement.
Diagnostic d'HTAP précapillaire, chez une femme de 65 ans, alors qu'elle avait pris de l'ISOMERIDE® de 1992 à 1993 et du MEDIATOR® de 1996 à 1999. Au moment de la notification, la patiente n'était pas rétablie.

Annexe 3-78

2. Notifications MEDIATOR® non associé à un anorexigène :

15 notifications d'«Hypertension artérielle pulmonaire » ont été rapportées.

- 9 d'entre elles, expertisées par le Professeur WEITZENBLUM (Strasbourg), faisaient partie de l'enquête «Anorexigènes et hypertensions artérielles pulmonaires» présentée à la Commission Nationale du 27 mars 2007.

  - 1 HTAP post-embolique
    - MP0500189 →*Avis de l'expert : « Vraisemblable HTAP post-embolique »*

  - 2 HTAP post-capillaires :

    - TO040278 :

    →*Avis de l'expert: « cardiopathie valvulaire sévère, l'OAP ayant entraîné une HTAP post-capillaire. »*

    - NT0500397 = S05001666 :

    → *Avis de l'expert : « HTAP probablement post-capillaire, peu documentée »*

  - 6 HTAP d'allure idiopathique

    - 2 cas non pris en compte lors de la Commission Nationale (CN) du 27 mars 2007 :

    - S02001046 : dossier trop succinct.
    - BR0700050 (publication K. Boutet, cas n°3) : → *Avis de l'expert : « HTAP idiopathique »*, mais la patiente a été traitée par MEDIATOR® pendant 3 mois, 10 ans auparavant.

    - Les 3 cas retenus lors de la CN du 27 mars 2007 sont :

    - PS9900385 : cas n° 1 de la publication de K. Boutet et coll.
    - S02001877 = PB20090105 : cas n° 2 de la publication de K. Boutet et coll.
    - TO060957

    - Le cas de BR0700051 (publication K. Boutet, cas n°4) était incomplet lors de la CN et l'avis de l'expert *était : « probable HTAP idiopathique mais documentation incomplète » (manque cathétérisme cardiaque)*
    Depuis nous avons reçu, le résultat du cathétérisme cardiaque droit retrouvant une pression artérielle pulmonaire moyenne à 46 mmHg (systolique à 98 mmHg et diastolique à 30 mmHg).
    Il s'agit d'une femme de 58 ans, ayant un DNID, une HTA et une obésité morbide (BMI= 49), qui la fait passer du lit au fauteuil toute la journée et ce depuis plusieurs années.
    Elle a pris du MEDIATOR® pendant 10 ans. Au moment du diagnostic, la patiente prenait LANTUS®, metformine, TEMERIT®, APROVEL® et LASILIX®.
    Elle sort de l'hôpital avec un traitement comportant en plus TRACLEER® et DIAMOX®.

- 6 nouveaux cas notifiés depuis le rapport de mars 2007.

Ces cas n'ont pas été expertisés par le Professeur Weitzenblum, comme les cas antérieurs, mais :

- dans 1 cas, (MA20070346), il s'agit d'une patiente de 52 ans, ayant un BMI = 25,8, traitée pour une hypercholestérolémie par MEDIATOR® depuis 8 ans avec adjonction ensuite de LIPANTHYL®, qui souffre d'une dyspnée d'effort depuis 1 an. L'échocardiographie montre un ventricule droit non dilaté, la pression pulmonaire systolique (PAPs) est estimée à 45 mmHg. Le MEDIATOR® est arrêté. Une échographie cardiaque de contrôle, moins de 3 mois plus tard, montre la normalisation des PAPs, ainsi que l'absence d'insuffisance cardiaque clinique. Un cathétérisme cardiaque n'a pas été effectué.
Il est donc difficile de retenir ce cas comme HTAP d'allure idiopathique.

- dans 1 cas, une HTAP post-embolique est évoquée, (MA20070231) : la patiente âgée de 37 ans est hospitalisée pour péricardite chronique et pneumopathie interstitielle. Elle avait été traitée pendant 1 an par MEDIATOR®, qui a été arrêté 6,5 ans avant la survenue de l'HTAP. La scintigraphie pulmonaire est en faveur d'embolies pulmonaires.

- dans 4 cas, il existe une valvulopathie associée à l'HTAP.

Remarque : parmi ces 4 cas, lorsque le traitement par MEDIATOR semble antérieur à la valvulopathie : MP0700281 et BX20080964, ces cas seront repris dans la partie « II. Valvulopathies » (avec le cas *TO040278 rapporté antérieurement).*

Le nombre d'HTAP d'allure idiopathique passe de 3 à 4, depuis le dernier rapport de mars 2007, en comptant le cas BR0700051.

3. Fréquence :

Depuis le début de la commercialisation de MEDIATOR® à décembre 2008, le nombre de boites de 30 comprimés vendues est de : 139 816 678 correspondant à 57 490 410 mois de traitement*.

En prenant en compte toutes les HTAP, avec ou sans anorexigènes associés, et après élimination des HTAP post-emboliques (3) et post-capillaires (9), il reste 16 cas d'HTAP idiopathique soit :

- 1 cas pour 8 738 542 boites vendues
- ou 1 cas pour 3 593 150 mois de traitement.

Lors du précédent rapport de mars 2007, elle était de :

- 1 cas pour 9 655 713 boites vendues
- ou 1 cas pour 3 970 277 mois de traitement.

(*) Mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (1 mois = 30,4 jours).

Après élimination des 9 HTAP idiopathiques survenues lors de traitement par MEDIATOR® associé à un anorexigène, 3 dossiers succincts ou de chronologie douteuse :S02001046, MA20070346 (évolution favorable en 3 mois) et BR0700050 (3 mois de traitement par MEDIATOR®, 10 ans auparavant), il reste 4 cas d'HTAP d'allure idiopathique (PS9900385, S02001877, TO060957 et BR0700051) soit :

- 1 cas pour 34 954 169 boites vendues
- ou 1 cas pour 14 372 602 mois de traitement.

Lors du précédent rapport de mars 2007, elle était de :

- 1 cas pour 41 841 426 boites vendues
- ou 1 cas pour 17 204 533 mois de traitement.

4. Conclusion :

Compte tenu de l'incidence des HTAP d'allure idiopathique (1 à 2 cas par millions et par an), le nombre de cas d'HTAP d'allure idiopathique rapporté dans l'enquête, ne constitue pas un signal significatif de toxicité du MEDIATOR dans la classe organe cardiovasculaire.

*Les nouveaux cas notifiés depuis le rapport de mars 2007 sont inscrits **en gras***

Annexe 3-78

II. Valvulopathies

En France, 30 notifications ont été rapportées entre 1998 et 2009:
(Un cas espagnol rapporté par le laboratoire sera pris en compte dans la partie «8. Aspect des valves, page 15»: publication de Rafel Ribera J.)

- 19 notifications spontanées : 16 valvulopathies + 3 HTAP post-capillaires rapportées ci-dessus
- 11 notifications recueillies intensivement par le CRPV de Brest par l'intermédiaire du PMSI.

A. Notifications

1. Sexe/ Age :

Les notifications de valvulopathies concernent 24 femmes et 6 hommes.

a) Femmes :

La moyenne d'âge de survenue des valvulopathies est de 54,6 ans:
- 53,7 ans (de 34 à 78 ans) pour les notifications spontanées
- 56,4 ans (de 49 à 72 ans) pour les cas de Brest (PMSI)

b) Hommes

La moyenne d'âge de survenue des valvulopathies est de 62,2 ans:
- 54,6 ans (43, 54 et 67 ans) pour les notifications spontanées
- 69,7 ans (60, 70 et 79 ans) pour les cas de Brest (PMSI)

2. BMI : connu dans 20 cas

Dans 3/4 des cas, le BMI indique un surpoids ou une obésité.

BMI entre 18,5-24,9 : 5 cas
Notifications spontanées : 3 femmes
Brest PMSI: 2 (1homme, 1 femme)

Entre 25-29,9 (surpoids) : 7 cas
Notifications spontanées : 5 cas (1 homme, 4 femmes)
Brest PMSI: 2 femmes

Supérieur à 30 (obésité) : 8 cas
Notifications spontanées : 4 (1 homme, 3 femmes)
BMI = 33 et 34 concernant 2 valvulopathies
BMI = 35 et 36 concernant 2 HTAP
Brest PMSI: 4 femmes
BMI : 30, 32, 34, 44

3. Durée de traitement : (dates imprécises dans 4 cas)

La moyenne des durées de traitement est de 5,3
- 5,6 ans (8 mois à 15 ans) pour les notifications spontanées
- 4,6 ans (de 1 à 10 ans) pour les cas de Brest (PMSI)

4. Antécédents et terrain:

a) Tabac :

Un tabagisme est connu chez 13 patients :
- 10 fois dans les notifications spontanées. Il concerne 9 femmes et 1homme
- 3 fois dans les cas de Brest PMSI. Il concerne 2 femmes et 1 homme.

b) Hypothyroïdie

Une hypothyroïdie traitée par levothyroxine est connue dans 9 cas:
- 7 cas pour les notifications spontanées
- 2 cas pour les cas de Brest (PMSI)

c) Antécédents ou terrain cardiaque :

- Hypertension artérielle: rapportée 9 fois
- Infarctus du myocarde : 2 cas
- Angine de poitrine : 1 cas
- Thrombo-embolie : 1 cas
- Cardiomyopathie dilatée (avec HTA) : 1 cas
- Décompensation cardiaque sur bronchopathie (avec HTA) : 1 cas
- Insuffisance cardiaque non précisé mais traitement cardiaque connu dans 2 cas

d) divers

- Angines dans l'enfance sans RAA connu : rapportées 4 fois
- Polyarthrite rhumatoïde : 2 cas
- BPCO : 1 cas

5. Médicaments associés :

- Levothyroxine (9 fois : cf. ci-dessus)
- Antidépresseurs inhibiteurs de la recapture de la sérotonine (IRS)
  - Fluoxétine : 3 fois
  - Paroxétine : 2 fois
  - Vinlafaxine : 2 fois

Remarque : un antidépresseur (IRS) est connu dans 5 cas sur 11 pour Brest PMSI.

6. Insuffisances valvulaires :

a) Localisation :

En ce qui concerne les notifications spontanées, sur 19 cas:

- Insuffisance mitrale dans 4 cas
- Insuffisance aortique dans 2 cas
- Insuffisances mitrale + aortique dans 9 cas
- Insuffisances mitrale + tricuspide dans 1 cas
- Insuffisances mitrale + aortique + tricuspide dans 3 cas

En ce qui concerne les cas de Brest PMSI, sur 11 cas :

- Insuffisances mitrale + aortique dans 5 cas
- Insuffisances mitrale + tricuspide dans 1 cas
- Insuffisances mitrale + aortique + tricuspide dans 5 cas

b) Gravité :

- Une insuffisance mitrale (IM) est présente dans 28 cas sur 30.
  Remarque: Une IM sévère de grade 2-3 à 3 est rapportée dans 9 cas sur 15 pour les notifications spontanées et dans 8 cas sur 11 pour Brest (PMSI)
- Une insuffisance aortique (IAO) est présente dans 24 cas sur 30.
  Remarque :
  Une IAO de grade 1 et 2 est rapportée dans 11 cas sur 14 pour les notifications spontanées et dans 6 cas sur 11 pour Brest (PMSI)
  Dans 2 cas, il n'existe qu'une insuffisance aortique isolée, modérée.
- Une insuffisance tricuspide (IT) est présente dans 11 cas sur 28.
  Remarque : Une IT de grade 1 à 2 est rapportée dans 7 cas : (2 cas de valvulopathies et dans 5 cas sur 11 de Brest (PMSI))
  Une IT sévère de grade 3 est rapportée dans 4 cas : (2 cas de valvulopathies et dans 2 cas 11 de Brest PMSI)

7. Evolution des valvulopathies

- 4 valvulopathies sont bien tolérées sans traitement (dont 3/11de Brest PMSI), 5 ont nécessité un traitement médical ou changement du traitement.

- Dans 4 dossiers, l'évolution est inconnue et 5 dossiers sont en cours.

- Une chirurgie valvulaire a été effectuée dans 10 cas (dont 5 cas sur 11 pour les dossiers de Brest PMSI), elle est prévue dans 2 cas (cf. BR20090086 et GR20090107) décrits ici:

GR20090107
Une échographie cardiaque, début décembre 2008, découvre une HTAP de repos à près de 75 mmHG, chez une femme de 57 ans, pesant 105 Kg, qui a une HTA, une hypothyroïdie, une insuffisance mitrale et une fibrillation auriculaire, traitée par cardioversion externe. Son traitement habituel est HEMIGOXINE®, LEVOTHYROX®, LOGIRENE®, CORDARONE®, PREVISCAN® et FLECAINE®.
Elle a pris du MEDIATOR® d'octobre à décembre 2002, de janvier à avril 2004 et en 2008.
Le cathétérisme cardiaque réalisé en janvier 2009 retrouve une PAPs à 60 mmHG. L'insuffisance mitrale de grade 2 est plutôt centrale, la fuite va jusque dans les veines pulmonaires. L'oreillette gauche est dilatée en rythme sinusal. L'insuffisance mitrale sera traitée dans un premier temps avec des IEC et un diurétique en attendant un remplacement valvulaire.

BR20090086 (Brest PMSI)
Il s'agit d'une femme de 60 ans, ayant un BMI=27, qui présente à l'échocardiographie en mars 2008, un rétrécissement mitral avec insuffisance mitrale de grade 3, une insuffisance aortique de grade 1 et une HTAP. La pression artérielle pulmonaire systolique (PAPs) est égale à 44 mmHg). La valve mitrale est notée de mobilité réduite, épaissie et remaniée.
L'examen clinique retrouve un épanchement pleural droit récidivant de type transsudat. Dans ses antécédents, on retrouve des angines fréquentes sans RAA, une hypothyroïdie, une dépression, un alcoolisme sevré et un tabagisme. Son traitement habituel est LEVOTHYROX®, TAHOR®, PROZAC®, NEULEPTIL®, LAROXYL®, NOCTRAN®, ART 50®. Elle a pris du MEDIATOR® pendant une dizaine d'années (jusqu'en 2008)

Le bilan d'auto-immunité retrouve des IgM antihistones positives mais pas d'anticorps antiphospholipides.

La décision opératoire est en attente, elle permettra d'éliminer une maladie rhumatismale.

8. Aspects morphologique, macroscopique et microscopique des valves :

8.1. Valvulopathies opérées:

Nous rapportons ici les 10 cas de patients français ayant subi une chirurgie valvulaire, ainsi que le cas espagnol, publication de Rafel Ribera J, qui est rapporté par le laboratoire (S03000422).

a) cas où l'anatomo-pathologie serait compatible avec les anorexigènes : 4 cas

- TO060355=S06001104: Cas publié par P. Noize (2006)

Femme de 48 ans, dont le BMI est de 25, traitée par MEDIATOR® pendant 7 ans, dans le cadre d'une intolérance au sucre responsable d'hypoglycémies répétées jusqu'à décembre 2005. Dans ces antécédents, on note une BPCO et un tabagisme important depuis l'âge de 19 ans, sevré fin octobre 2005 avec la survenue d'une dyspnée.
L'échodoppler montre une insuffisance mitrale de grade 3, une insuffisance tricuspide de grade 2 et pas d'insuffisance aortique. L'échographie montre un épaississement de la grande valve qui reste bien mobile et rétraction de la valve postérieure.

Anatomopathologie, histologie :
1° avis : *« Sclérose collagénique englobant cordages et pilier*
Lésions histologiques inhabituelles. Sclérose dense, pauci cellulaire, fortement collagénisée, remaniée par des microfissures.
Valve : fibrose associée à de petits territoires d'œdème mixoïde.
Tissu sous-valvulaire : fibrose particulièrement dense qui englobe en monobloc des cordages mal identifiés et le pilier charnu ».

2° avis : « *Valve épaissie par une fibrose constituée d'accumulation de matrice extra-cellulaire avec peu de cellules fusiformes dans le territoire de l'endocarde, sans inflammation, sans néo-vaisseaux, sans calcifications, sans altération des tuniques sous-jacentes :*
Aspect non spécifique dans l'absolu de la toxicité des anorexigènes, mais correspondant parfaitement aux lésions décrites dans l'atteinte valvulaire des anorexigènes ».

- BR20080051= S08002916: Cas n°6 de la publication de Boutet K. (2009)

Femme de 50 ans, avec un BMI = 34, découverte en novembre 2007 d'une valvulopathie fuyante mitro-aortique responsable d'une décompensation cardiaque. Dans ses antécédents, on note une insuffisance hypophysaire, un DNID et un tabagisme. Elle est traitée par levothyroxine, ramipril, somatropine et depuis 6 ans (de 2001 à septembre 2007) par MEDIATOR®. L'insuffisance mitrale est de grade 3 et l'insuffisance aortique de grade 3. Il existe une HTAP (PAPs= 49 mmHg). L'histoire clinique de la patiente retient qu'elle a pris de l'ISOMERIDE® pendant 1 à 3 mois, 20 ans auparavant.

Anatomopathologie, histologie:
« Epaississement et rétraction des valves (particulièrement de la valve mitrale)
Fibrose dense, faite de myofibroblastes dans une matrice de mucopolysaccharides sans infiltration inflammatoire ».

BR20090080 (Brest PMSI)

Femme de 54 ans, avec un BMI = 30, traitée pendant 15 mois par MEDIATOR® (de septembre 2007 à décembre 2008) et pour une dépression par LAROXYL® en 2006 et par EFFEXOR® en 2001 et 2008. Le traitement associé est : CARDENSIEL®, TRIATEC®, LASILIX®, HEMIGOXINE® ET ATARAX®.
En octobre 2005, l'échographie cardiaque était normale avec absence de valvulopathie.
En décembre 2007, 3 mois après le début du traitement par MEDIATOR®, l'échocardiographie montre une insuffisance mitrale et une insuffisance aortique de grade 1.
En octobre 2008, une nouvelle échocardiographie conclut à une altération de la fonction ventriculaire gauche (52%), une insuffisance mitrale de grade 3, une insuffisance aortique de grade 3 et une insuffisance tricuspide de grade 1. La PAPs est à 44 mmHg.
En mars 2009, la dyspnée de grade IV entraîne la décision opératoire avec double remplacement valvulaire.
Il est a noté que la patiente avait pris des amphétamines (biphetamine) pour contrôle du poids pendant 7 à 8 ans jusqu'en 1986.

Anatomopathologie, histologie :
Valve mitrale : Lésions valvulaires intéressant essentiellement les cordages sous la forme d'un épaississement fibromyxoïde sans caractère de spécificité mais compatible avec une origine toxique.
Valve aortique :remaniements myxoïdes d'intensité modérée des sigmoïdes aortiques. Présence d'un petit foyer de calcification non spécifique.

S03000422 : Cas espagnol publié par Rafel Ribera J (2003)

Ce cas rapporte une atteinte des 3 valves mitrale, aortique et tricuspide, associée à une HTAP (PAPs: 72 mmHg) chez une femme de 50 ans (BMI non précisé) qui a été traitée pendant 12 mois par intermittence par benfluorex.

Anatomopathologie, histologie :
« Fibrose diffuse avec raccourcissement des cordages de la valve mitrale, une valve tricuspide épaissie et des sigmoïdes aortiques rétractées.
Les valves présentent des plaques fibreuses composées de myofibroblastes avec une matrice de mucopolysaccharides et de collagène, causant la rétraction des valves ».

b) 2 cas où l'anatomopathologie n'est pas spécifique :

TO051212=S05002371

Femme de 49 ans, (BMI inconnu), ayant une hypothyroïdie traitée par LEVOTHYROX® ayant débuté un traitement par MEDIATOR® en 2002.
Pendant ses vacances en Egypte apparaît alors une dyspnée.
En août 2005, elle est hospitalisée pour pneumopathie de la base droite.
En octobre 2005, elle présente une insuffisance mitrale de grade 3, sans rupture de cordage, qui est opérée en novembre 2005. La PAPm est à 22 mmHg. MEDIATOR® est alors arrêté.
Conclusion du cardiologue : *« il s'agit vraisemblablement d'une insuffisance mitrale qui a évoluée à bas bruits pendant de nombreuses années et qui devient symptomatique actuellement »*
Une pathologie post-rhumatismale est évoquée.

Anatomopathologie, histologie :
Les valves sont légèrement indurées sans végétations.
Les remaniements tissulaires associent des plages de fibrose cicatricielle dense, fortement collagénisée, à des territoires oedémateux et myxoïdes de caractère dégénératif, occupés par de nombreux fibroblastes.
On observe des micro-fissures et de rares îlots adipocytaires.
Il n'y a ni dépôt calcique, ni infiltrat inflammatoire, ni bourgeonnement capillaire.
Absence de lésions spécifiques.

S04000348= TO0400278 (dossier classé également dans les HTAP post-capillaires)

Il s'agit d'une femme de 36 ans, avec un BMI = 24, des antécédents d'hypothyroïdie traitée par LEVOTHYROX®, d'HTA et de tabagisme. Elle est traitée par MEDIATOR® de 2002 à 2004 et par PROZAC®, CANOL®, GINKOR FORT®, PRAXINOR®, HEPT A MYL®.
8 mois après l'introduction de MEDIATOR® (2003), est découverte une insuffisance aortique de grade 2 avec insuffisance mitrale minime.
La patiente est hospitalisée en décembre 2003 pour décompensation cardiaque avec une double insuffisance mitrale grade 3 et aortique grade 2, qui sera opérée en janvier 2004. La PAPs est à 50 mmHg.

Remarque : la sœur de la patiente est suivie également pour valvulopathie.

Anatomopathologie, histologie :
Lésions dégénératives non spécifiques.

c) 5 cas sans résultat d'anatomopathologie:

GR20090108

Une insuffisance mitrale de grade 3, associée à une HTAP (PAPs évaluée à 70-75 mmHg) est découverte chez une femme de 56 ans, (BMI inconnu) qui a été traitée pendant 14 ans (1994-2009) par MEDIATOR® pour dyslipidémie et diabète de type 2 associé à fenofibrate, GLUCOPHAGE® et CORDARONE®. Dans ses antécédents, on trouve une dépression, un tabagisme actif et des angines à 20 ans traitées par perfusion intraveineuse.

Aspect des valves :
Valve mitrale remaniée, épaissie, non calcifiée
Grande valve mitrale : aspect en crosse de hockey

BR20090084 (Brest PMSI)

Une double valvulopathie (mitrale et aortique) est découverte en 1998, chez une femme de 51 ans, ayant un BMI=32, qui a pris ISOMERIDE® pendant au moins un an en 1989, MEDIATOR® en 1988, 1999, et quelques mois en 2004. Elle a été traitée également pour état dépressif par PROZAC® pendant 4 ou 5 ans jusqu'en 1995.
En août 2004, l'examen cardiologique relève une valve aortique remaniée avec insuffisance aortique de grade 3, une insuffisance mitrale de grade 3 non calcifiée. Une insuffisance tricuspide et une ACFA sont rapportées.
Un double remplacement valvulaire est réalisé en novembre 2004.

BR20090079 (Brest PMSI)

Il s'agit d'un homme de 60 ans, diabétique chez lequel on a découvert une insuffisance mitrale sévère en septembre 2002. Un traitement par CARDENSIEL®, TRIATEC®, DIGOXINE®, LASILIX® et KALEORID® est instauré.
En mars 2003 l'échographie montre une insuffisance mitrale de grade 3 et une insuffisance aortique de grade 2, sans HTAP. Le traitement chirurgical est réalisé en mai 2003.
Le patient aurait pris du MEDIATOR® pendant une dizaine d'années jusqu'en mars 2003.
Il est suivi en 2009 pour insuffisance tricuspide.

Aspect des valves :
Petite valve mitrale rétractée

BR20090087 (Brest PMSI)

Début 2003, chez un homme de 79 ans, ayant un BMI = 24, une coronarographie réalisée dans le cadre d'une angine de poitrine conduit à une angioplastie et pontage de IVA. Ses antécédents sont un diabète, une hypercholestérolémie, une pancréatite et un tabagisme.
Son traitement habituel (durée inconnue) est PLAVIX®, KARDEGIC®, ZYLORIC®, TRIATEC®, LIPANTHYL®, LASILIX®, CARDENSIEL® et MEDIATOR®.

En juin 2003, lors d'un OAP, l'échographie cardiaque montre une insuffisance mitrale de grade 3, une insuffisance aortique de grade 1, une insuffisance tricuspide de grade 1 et une HTAP (PAPs: 77 mmHg). Une hypothèse rhumatismale non ischémique est évoquée.
Une intervention chirurgicale pour plastie et reconstruction valvulaire est réalisée en octobre 2003.
En février 2005, les bons résultats de la plastie sont notés, la valve aortique parait remaniée et une insuffisance tricuspide de grade 2 est rapportée.

Aspect des valves :
2003 : Cordages de la petite valve uniformément rétractées, mais encore souples et bien individualises
Le mécanisme de l'insuffisance mitrale est un basculement de la petite valve dans le VG. Elle est attirée par des cordages raccourcis.

BR20090078 (Brest PMSI)

En 2002, lors d'une consultation pour hypertension artérielle est noté une insuffisance mitrale de grade1 chez une femme de 53 ans, ayant un BMI= 21, traitée par LIPANTHYL® pour une hypercholestérolémie. Un diabète découvert en 2002 est traité par MEDIATOR® et GLUCOPHAGE® ;
En juin 2004, une échocardiographie met en évidence une insuffisance mitrale de grade 3, une insuffisance aortique de grade 2, une insuffisance tricuspide de grade 3 et une HTAP (PAPs: 90 mmHg).
Un double remplacement valvulaire est réalisé en août 2004.
On note dans ses antécédents, une amygdalectomie à l'âge de 18 ans, suite à de nombreuses angines et une dépression. Son traitement habituel comprend également LASILIX®, DIFFU K®, APROVEL®, PREVISCAN®, DIANTALVIC®, XANAX®, IMOVANE®, ELISOR® et DEROXAT®.

Aspect des valves :
Mitrale :
Epaississement fibreux des grandes et petites valves
Soudure de la commissure antérieure
Rétraction importante de l'appareil sous-valvulaire avec des valves et cordages irrécupérables.
Aortique :
Epaississement des sigmoïdes
Athérome minime à la coronarographie

8.2. Valvulopathies non opérées

TO020331 :

Il s'agit d'une femme de 60 ans, avec comme antécédents : diabète de type 2, hypercholestérolémie, macroadénome hypophysaire, hypothyroïdie, syndrome dépressif, obésité ancienne et dipsomanie, traitée par de nombreux médicaments dont MEDIATOR®, depuis 3 ans, LEVOTHYROX® et EFFEXOR®.
Lors de l'exploration d'un souffle cardiaque, est découvert une insuffisance aortique de grade 2, ainsi qu'une insuffisance mitrale de grade 1-2, et une faible insuffisance tricuspide.
L'évolution est inconnue.

Aspect des valves :
Grande valve mitrale légèrement ballonisée
Décalcification des sigmoïdes aortiques avec diminution de leur mobilité
Ouverture sigmoïdienne mesurée à 16 mm
Pas de rétrécissement aortique

TO070121 :

Femme de 44 ans, en surpoids (BMI= 25), tabagique modérée, traitée pour hypercholestérolémie par MEDIATOR® pendant 9 mois, hospitalisée pour décompensation cardiaque gauche. L'échocardiographie permet de découvrir une insuffisance aortique de grade 4 et une insuffisance mitrale de grade 3. Il existe un minime épanchement péricardique sans HTAP. L'angio-scanner élimine une embolie pulmonaire mais note une infiltration des septas pulmonaires. La patiente sort avec un traitement par LASILIX®, COVERSYL®, MOPRAL® et régime peu salé. Le MEDIATOR® est arrêté.

Aspect des valves :
Echocardiographie : Epaississement valvulaire sur la grande valve mitrale avec une image compatible avec une végétation mesurant environ 10 mm.
Echographie trans-oesophagienne : insuffisance mitrale de grade 2, centrale et commissure antérieure sur restriction du jeu valvulaire avec une rigidité du feuillet antérieur et une restriction du feuillet postérieur.
L'appareil sous-valvulaire est d'aspect brillant.
On note une insuffisance aortique centrale sur une valve à trois cuspides de grade 2 sur 4.

MP20080857 :

Patiente de 77 ans, obèse (BMI= 32,9), hypertendue, ayant une hypercholestérolémie et une hypertriglycéridémie, de multiples antécédents chirurgicaux (colectomie partielle, 4 éventrations, cholécystectomie, hernie et prolapsus) hospitalisée en octobre 2008 pour aggravation d'une dyspnée. Son traitement habituel est HYTACAND®, pravastatine, PLAVIX® et MEDIATOR® depuis plusieurs années. L'aortographie trouve une fuite aortique de grade 2-3 et une insuffisance mitrale de grade 2 confirmée par le cathétérisme. Un éventuel remplacement valvulaire est discuté, vu l'âge de la patiente.

Aspect des valves :
Rétraction de la petite valve mitrale
Calcification sur l'anneau

BR20090085 (Brest PMSI)

Femme de 49 ans, (BMI= 28), ayant dans ses antécédents, un AVC, une splénectomie, un tabagisme et un PTI. Son traitement habituel est : LIORESAL®, OGAST®, NEURONTIN®, URBANYL® et CORTANCYL®. Elle a pris du MEDIATOR® en 2002 et en 2003.
En 2002, lors d'une transfusion pour PTI, une suspicion d'OAP entraîne la réalisation d'une échographie cardiaque qui montre une insuffisance mitrale de grade 2 et une insuffisance aortique de grade 2.
En août 2003, suite à un OAP brutal, l'échocardiographie retrouve cette double valvulopathie avec un rétrécissement mitral non serré ainsi qu'une insuffisance tricuspide.

Aspect des valves :
Remaniement valvulaire au niveau des sigmoïdes et de la mitrale
Valve mitrale un peu épaissie et sténosante
Rétrécissement mitral lâche avec petite valve immobile.

BR20090092 (Brest PMSI)

Femme de 55 ans, hospitalisée en urgence en 2001 pour aggravation d'une dyspnée et suspicion d'OAP. Elle a une insuffisance aortique de grade 1. L'évolution est favorable sous diurétiques. Ses antécédents sont une obésité (BMI= 34), une HTA traitée par CELECTOL® et une cholécystectomie.
Un bilan en 2003 trouve une double fuite aortique et mitrale de grade 2.
En mars 2009, l'échocardiographie montre un aspect stable de la double valvulopathie.
La patiente prend du MEDIATOR® depuis au moins 1998 pour contrôler son poids et ne désire pas arrêté.

Aspect des valves :
Remaniement et rétraction de l'appareil sous-valvulaire sans calcification (en 2003)

S06001337 :

Homme, 54 ans traité pour dyslipidémie par MEDIATOR® de mars 2003 à septembre 2005. Le traitement associé est VASTEN®, KARDEGIC® et TENORMINE®. Suite à un épisode de tachycardie avec insuffisance cardiaque en septembre 2005, une coronarographie et une échocardiographie montrent une insuffisance mitrale de grade 2-3, une insuffisance aortique modérée, une sténose de 70% de l'artère coronaire droite et une hypokinésie du ventricule gauche. Le patient subit une angioplastie de l'artère coronaire avec insertion d'un stent.

Aspect des valves :
Pas d'anomalie sur valves à l'échocardiographie.

Remarque : dans 12 cas, nous n'avons aucune information sur les valves

9. Aspects des valves dans la publication de H. Conolly et coll. intitulée « Valvular heart disease associated with fenfluramine-phentermine».

La valve mitrale est scintillante et épaisse. La valve antérieure a une mobilité préservée tandis que la valve postérieure est immobile. Les cordages sont épaissis et raccourcis.
La valve aortique est épaisse.
L'histopathologie montre des plaques de myofibroblastes dans une matrice extracellulaire abondante de collagène.
L'aspect est semblable aux valvulopathies dues ergotamine et aux maladies valvulaires carcinoïdes.

B Propositions/avis :

1- un signal de cardiotoxicité (atteintes valvulaires) a été détecté par l'analyse de la notification spontanée et des données issues du PMSI de CHU de Brest
2- Nécessité de confirmer ce signal par une étude retrospective, cas temoins basée sur l'expoitation du codage PMSI effectuée par plusieurs CRPV (AP-HP, Brest, Reims, Grenoble ...) selon une méthodologie commune selon les propositions du groupe PGR-PEPI qui a examiné le sujet le 2 juin 2009.

3- La pharmacologie du benfluorex et de son metabolite la nor-fenfluramine,douivent être considerés dans le mécanisme de la cardiotoxicité (plausibilité biologique.)
4- Une nouvelle réévaluation du bénéfice de benfluorex est à envisager compte tenu des nouvelles données de sécurité.

III- ENQUETE DE PHARMACOVIGILANCE ET RESULTATS DE L'ETUDE BRESTOISE : HTAP / VALVULOPATHIES ET BENFLUROREX

Dossier suivi par Béatrice Porokhov

1. Introduction

Nom commercial	MEDIATOR®
DCI	Chlorhydrate de benfluorex
Formes pharmaceutiques	Comprimé pelliculé à 150 mg
Classe pharmacologique	Antidiabétique
Procédure d'enregistrement	Procédure nationale
Titulaire de l'AMM	Laboratoires Servier

MEDIATOR® (chlorhydrate de benfluorex) a obtenu une AMM en 1974 par une procédure d'enregistrement nationale. Il est commercialisé en France depuis 1976.
MEDIATOR® est indiqué comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ». Il est à noter que l'indication comme « adjuvant du régime adapté dans les hypertriglycéridémies » a été supprimée à la suite de l'avis émis par la Commission Nationale de Pharmacovigilance (CNPV) du 27 mars 2007.

Les résultats actualisés de l'enquête officielle relative au « benfluorex et hypertension artérielle pulmonaire », étendue aux valvulopathies en mai 2009, ainsi que les résultats préliminaires de la série des cas brestoise issus du PMSI ont été présentés à la CNPV du 7 juillet 2009.
Une actualisation de cette enquête et les résultats définitifs de l'étude brestoise ont été présentés à la CNPV du 29 septembre.

2. Commission nationale de pharmacovigilance du 7 juillet 2009 :

Lors de la réunion de la CNPV du 7 juillet 2009, le CRPV de Besançon, rapporteur de cette enquête, avait conclu à l'existence d'un signal de toxicité valvulaire détecté par la notification spontanée et les données issues du PMSI. Il convient alors de confirmer ce signal par une étude épidémiologique (cas-témoin).
Le rapporteur a également souligné que la pharmacologie du benfluorex et de son métabolite, la nor-fenfluramine, devra être prise en compte dans l'analyse du mécanisme de la toxicité valvulaire. Compte tenu de ces nouvelles données de sécurité, le rapporteur a proposé une réévaluation du bénéfice/risque de benfluorex.

De même, les données du PMSI de Brest ont permis d'identifier 15 cas dont 11 pris en compte dans le bilan effectué par le CRPV de Besançon et 4 cas très récents à l'étude. Il s'agit de 12 femmes et de 3 hommes. L'âge moyen est de 58 ans (49-78). 6 patients sur 12 sont diabétiques. La durée moyenne d'exposition est de 53 mois (12-144) avec un délai moyen de 97 mois (13-384) entre la première prise du médicament et le diagnostic. L'échographie cardiaque antérieure est normale dans 5 cas sur 7. L'exposition à d'autres anorexigènes concerne 5 patients sur 12 et à un antidépresseur de type inhibiteur de recapture de la sérotonine (IRSI) 8 patients sur 10.
Les valves atteintes sont la valve mitrale ou la valve aortique dans 100% des cas, avec une atteinte de la valve tricuspide dans 7 cas et de la valve pulmonaire dans un cas. Une chirurgie de remplacement valvulaire a été effectuée dans 8 cas.

Par ailleurs, une analyse systématique de toutes les insuffisances mitrales (IM), isolées ou associées, examinées au CHU de Brest depuis 2003, était en cours. Plus de 600 dossiers d'IM sont classés en 3 groupes: 1) IM dans un contexte étiologique bien identifié 2) IM inexpliquées 3) IM non classables.
Une recherche de l'exposition au benfluorex sur un modèle d'étude cas témoins est réalisée pour les cas identifiés par le PMSI et par une enquête téléphonique auprès du médecin et du patient.
Les résultats de cette étude étaient attendus pour fin juillet 2009.

A l'issue de la présentation de ces données, les laboratoires Servier ont proposé deux modèles d'études:
i) une étude anatomopathologique sur un modèle exposé/non-exposé (ce modèle a été récusé par la commission),

ii) une étude cas-témoins ayant pour objectif de quantifier un éventuel sur-risque de valvulopathie associé au Médiator® chez des patients atteints de valvulopathie idiopathique comparativement à des patients indemnes de valvulopathie. Cette étude se ferait sur une population de patients diabétiques ayant une échographie cardiaque. Le protocole serait disponible début Septembre 2009 et permettrait dans les meilleurs des cas d'avoir des résultats dans un an.

Par ailleurs, le laboratoire a informé la commission que l'étude « REGULATE », (Médiator®+sulfonylurée versus pioglitazone+ sulfonylurée) est en cours d'analyse. Cette étude incluant 840 patients dont 420 dans chaque bras, comporte une échographie cardiaque au début et à la fin (52ème semaine) de la période de traitement. Les résultats d'efficacité et de tolérance sont attendus pour la fin du premier trimestre 2010.

3. Conclusions de la CNPV du 7 juillet 2009 :

Les membres de la commission nationale avaient alors souhaité disposer des résultats de l'ensemble des études en cours ou planifiées (l'étude cas-témoins brestoise et les études des laboratoires Servier) avant de proposer d'éventuelles mesures.

4. Commission nationale de pharmacovigilance du 29 septembre 2009 :

Données de la pharmacovigilance :

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon. 11 nouveaux cas de valvulopathie associés au benfluorex sont rapportés dont 3 issus de la notification spontanée et 8 notifications sont des cas recherchés dans une base de données d'échographie cardiaque et provenant d'Amiens. L'analyse de ces 11 nouveaux cas montre une prédominance féminine, une durée moyenne de traitement de 3 ans et un âge de survenue le plus fréquemment identifié de 55 ans. Sur les 11 cas de valvulopathies, un cas était associé à une hypertension artérielle pulmonaire, un cas correspondait à une insuffisance mitrale et aortique et un cas était associé à une atteinte mitrale+aortique+tricuspide. Pour ces cas documentés sur le plan échographique, les données anatomopathologiques restent peu informatives.

Certains membres de la CNPV ont souligné qu'en cas de notification « recherchée » dans d'autres bassins de population, de nombreux autres cas de valvulopathie associés au benfluorex pourraient vraisemblablement être mis en évidence.

Données de l'étude Brestoise :

L'étude cas-témoin rétrospective menée par le CHU de Brest, a pour objectif la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait pas le diagnostic de diabète ou l'Indice de Masse Corporelle (IMC). L'exposition au benfluorex est recherchée auprès du patient, de sa famille et de ses médecins, par téléphone, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio (OR) = 40,4 (9,7- 168,3, IC à 95%)), soit un risque relatif très important d'IM en cas d'exposition au benfluorex. L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas la significativité du résultat. En effet, l'ajustement sur diabète et l'Indice de Masse Corporelle est associé à un OR de 27,6 (6,1-124,6), l'ajustement sur le diabète et l'obésité est associé à un OR de 35,2 (6,8-182) et l'ajustement à une exposition préalable à la dexfenfluramine est associé à un OR de 31,1 (7,2-134,1). Les résultats de cette étude confortent donc le signal de risque de valvulopathie associé au benfluorex.

Données de l'étude « REGULATE » :

Les résultats préliminaires de l'étude REGULATE ont été présentés par les laboratoires Servier. Il s'agit d'une étude multicentrique, en double aveugle, comparant pendant 52 semaines chez 840 diabétiques l'efficacité et la sécurité de 2 traitements, benfluorex et sulphonylurée versus pioglitazone et sulphonylurée. Deux échographies cardiaques ont été réalisées : avant exposition (T0) et à la 52ème semaine. La non-infériorité de l'association benfluorex + sulphonylurée par rapport à l'association pioglitazone + sulphonylurée sur la réduction de l'hémoglobine glycosylée n'a pas été démontrée. La baisse du LDL-cholestérol a été plus importante sous benfluorex que sous pioglitazone.

Concernant le profil de tolérance, dans cette étude, ont été observés :
- 115 patients avec anomalie fonctionnelle détectée : 82 (26,5%) sous benfluorex versus 33 (10,9%) sous pioglitazone (p<0,0001).
- 12 patients avec anomalie morphologique détectée : 8 (2,6%) sous benfluorex versus 4 (1,3%) sous pioglitazone (p=0,264).
- 5 patients avec anomalie fonctionnelle de grade ≥ à 2 : 2 sous benfluorex versus 3 sous pioglitazone.

Il est à souligner que les anomalies fonctionnelles apparues sous benfluorex n'ont pas de traduction clinique.

A l'issue de cette présentation, les laboratoires Servier ont proposé les modifications suivantes du Résumé des Caractéristiques du Produit de Médiator®:
- rubrique 4.2 « Indication » : *Restriction aux diabétiques en échec de traitement après les anti-diabétiques oraux*
-conditions de prescription et de délivrance : *Prescription réservée aux spécialistes tels que diabétologues/endocrinologues.*
- rubriques 4.3 « Contre-indications » : valvulopathie cardiaque et 4.8 « Effets indésirables »: valvulopathie cardiaque
- rubrique 4.4 « Mises en garde spéciales et précautions d'emploi » : mise en place d'un suivi écho cardiographique avant et pendant le traitement.

5. Discussion :

Les résultats de l'étude cas-témoin de Brest ont été largement débattus par l'Afssaps, les membres de la commission, les experts externes sollicités par l'Afssaps, les investigateurs et les laboratoires Servier.
Les experts ont regretté ne pas disposer du protocole de l'étude. Plusieurs biais ont cependant été identifiés:

- le choix des témoins : si la question posée est de savoir si le benfluorex peut ou non être responsable de valvulopathies, les témoins ne devraient alors pas présenter de valvulopathie,
- le choix des valvulopathies inexpliquées : il est difficile d'être absolument sûr que le diagnostic ne soit pas biaisé,
- les cas et les témoins ont des caractéristiques très différentes. Une confusion par indication (lien entre caractéristiques des patients témoins et l'absence de traitement par benfluorex) ne peut être exclue. Les témoins ont très peu de chance d'être exposés au benfluorex,
- le faible nombre de patients exposés,
- le choix de l'anomalie valvulaire (limité à la valve mitrale).

Toutefois, malgré certaines limites méthodologiques de cette l'étude, les experts et les membres de la commission considèrent que le signal d'une relation entre l'exposition au benfluorex et la survenue de valvulopathies se confirme. Ce signal est d'autant plus préoccupant que dans l'étude « REGULATE » une émergence d'anomalies morphologiques et fonctionnelles valvulaires a été observée à la suite d'une exposition d'environ un an au benfluorex (328 jours en moyenne). De plus, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne peut être exclue, notamment en raison des données d'utilisation du produit qui montrent une durée moyenne d'exposition d'environ 3 ans.

6. Conclusions de la CNPV du 29 septembre 2009 :

Les membres de la Commission Nationale de Pharmacovigilance considèrent (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex et ce, malgré certaines limites méthodologiques. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

Il est à noter que le dépôt par le laboratoire du protocole de l'étude cas-témoin, prévu initialement pour début septembre 2009 n'a pas encore été effectué.

La CNPV a été informée de la transmission de ces données à la Commission d'AMM au plus tard le 23 octobre 2009, afin qu'elle puisse se prononcer sur la balance bénéfice- risque du produit.

REGULATE STUDY - CL3 - 00780 - 148

Mediator versus pioglitazone in association with sulfonylureas :

"A one-year multicentre, international, Randomised, double-blind study with comparison of bEnfluorex (150 mg bid or 150 mg tid) versus pioGlitazone (30 mg od or 45 mg od) in combination with sULfonylurea administered orAlly for the Treatment of type 2 diabEtes"

Annexe 3-79

Proposition de RCP

- Modification du libellé de l' indication:
  - Restriction aux diabétiques en échec après les antidiabétiques oraux.
  - Prescription par un spécialiste (diabétologue, endocrinologue)
- Ajout de contre-indications (4.3) :
  - Valvulopathie cardiaque
- Ajout en section 4.8 Effets indésirables :
  - Valvulopathie cardiaque

Proposition de RCP

- Ajout de mises en gardes spéciales et précautions d'emploi (4.4) :

  - ***Avant de commencer le traitement*** :

  Évaluation cardiovasculaire par échocardiographie, afin d'évaluer la présence potentielle d'une pathologie valvulaire asymptomatique.

  - ***Pendant le traitement*** :

  Surveillance des signes et symptômes d'une atteinte valvulaire cardiaque

  Suivi échocardiographique

Etude cas-témoins Brest

- Difficile de « critiquer » une étude sans connaître très précisément la méthodologie utilisée
- Protocole « sommaire », 1 page recto-verso
- Peu d'informations disponibles :
  - Cas : recensement des insuffisances mitrales vues au CHU de Brest en cardiologie et chirurgie cardiaque depuis 2003 et **TRI** des observations entre insuffisances mitrales « expliquées » et « inexpliquées », cette dernière catégorie constitue les cas.
  - Témoins : appariement des cas (âge, sexe, période et unité d'hospitalisation) avec des témoins sélectionnés parmi les insuffisances mitrales « expliquées ».

2

Classification des valvulopathies et donc classification des cas et des témoins

- Réalisé par une infirmière de recherche clinique formée en fonction de mots clés
  - Compte-rendus de séjour
  - Dossier médical
  - Compte-rendu opératoire

3

Classement des cas

- Identification du signal à l'aide d'une recherche à partir de mots clés dans les compte-rendus

« atteintes valvulaires » comme code PMSI et « Benfluorex ou Médiator» dans le résumé de sortie

- Introduction du protocole de l'étude : mise en évidence rétrospectivement et prospectivement à partir de 2003 de 18 cas de valvulopathies cardiaques à type d'insuffisances multiples chez des patients exposés au Benfluorex et hospitalisés au CHU de Brest

Monsieur le Directeur général,
Monsieur le Directeur général de la santé, cher collègue,

Nous avons été informés, en marge d'un colloque sur l'épidémiologie du cancer le 12 octobre dernier, d'une relation de causalité possible entre la consommation de benfluorex (Médiator®) et certaines valvulopathies cardiaques. Après une revue rapide de la littérature sur le sujet, nous avons pris l'initiative de réaliser une enquête de cohorte exposé-non exposé dans une population de personnes diabétiques âgées de 40 à 69 ans, à partir des données chaînées du SNIIRAM et du PMSI.

Nous constatons que l'usage du benfluorex chez les malades diabétiques est associé significativement dans les deux années qui suivent à des valvulopathies de régurgitation mitrales, aortiques et tricuspidiennes, ainsi qu'à des actes chirurgicaux de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.

Nous tenions à vous informer très rapidement des conclusions de cette étude qui suggèrent fortement l'existence d'un effet indésirable sévère lié à l'utilisation de ce médicament, comme en attestent notamment les risques relatifs très élevés que nous avons calculés. Un rapport préliminaire détaillé est joint en annexe.

Je vous prie de croire, Monsieur le Directeur général, Monsieur le Directeur général de la santé, cher collègue, à l'assurance de mes sentiments les meilleurs.

Professeur Hubert ALLEMAND

Rapport préliminaire du 27/10/2009

Résumé

Contexte : Plusieurs cas cliniques rapportés dans la littérature suggèrent que le benfluorex commercialisé en France depuis 1976 et dérivé de la fenfluramine pourrait être associé avec des cardiopathies valvulaires de régurgitation. Depuis le 5 avril 2007 la commission d'autorisation sur le marché a limité la prescription du benfluorex à l'indication « *adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* ». L'objectif de ce travail était de préciser, chez les personnes diabétiques, un lien éventuel entre une exposition au benfluorex et une valvulopathie cardiaque de régurgitation et de tester dans l'affirmative un effet dose.

Méthode : étude de cohorte de type exposé-non exposé à partir des données du système national inter-régime de l'assurance maladie (SNIIRAM). Etaient éligibles les patients diabétiques traités (antidiabétiques oraux et/ou insuline) en 2006 et âgés de 40 à 69 ans. Les cas exposés étaient enregistrés de façon passive et définis par la délivrance et le remboursement en 2006 de benfluorex. Après chaînage des données les événements recherchés à l'année n+1 et n+2 dans le PMSI 2007 et 2008 étaient une hospitalisation pour une insuffisance valvulaire toutes causes confondues, une hospitalisation pour une insuffisance mitrale et chirurgie de remplacement valvulaire sous circulation extra-corporelle pour une insuffisance valvulaire toutes causes confondues.

Résultats : les résultats portaient sur 1 092 858 diabétiques de 40 à 69 ans dont 43 208 exposés au benfluorex en 2006. Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque était de 81 pour 100 000 dans le groupe exposé vs 29 pour 100 000 dans le groupe non exposé RR = 2,77 IC 95[1,95 ;3,93]. Le risque d'hospitalisation pour insuffisance mitrale était de 53 pour 100 000 dans le groupe exposé vs 20 pour 100 000 dans le groupe non exposé RR = 2,66 IC 95[1,7 ;4,1]. Le risque de chirurgie en 2007 avec un remplacement valvulaire sous circulation extracorporelle (CEC) pour une insuffisance

valvulaire toutes causes confondues était de 30 pour 100 000 dans le groupe exposé au benfluorex vs 9 pour 100 000 dans le groupe non exposé RR =3,4 [1,9 ; 6,1]. Parmi les 13 personnes diabétiques exposées et ayant subi un remplacement valvulaire sous CEC en 2007 une était décédée en milieu d'année 2008. Pour les exposés au benfluorex en 2006 les risques absolus et les risques relatifs étaient en 2008 très proches de ceux observés en 2007. Le risque relatif des exposés au benfluorex de chirurgie valvulaire sous CEC était identique (3,4).

Conclusion :

1. L'usage du Benfluorex chez les diabétiques est associé significativement dans les deux années qui suivent à des valvulopathies de régurgitation mitrales, aortiques et tricuspidiennes et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.
2. Transmission du dossier en urgence le 27/10/2009 à l'Agence française de sécurité sanitaire des produits de santé et à la Direction générale de la santé
3. Le SNIIRAM avec le chainage PMSI peut contribuer à montrer, en condition réelle d'utilisation pour des médicaments, des effets indésirables sévères mais restés longtemps méconnus ou mal évalués.

Mots clés : benfluorex, valvulopathie, insuffisance mitrale, effets indésirables, bases de données, SNIIRAM, PMSI

Le travail a été débuté le 13/10/2009 et le rapport préliminaire a été adressé le 27/10/2009 à l'Agence française de sécurité sanitaire des produits de santé et à la Direction générale de la santé.

Introduction

Aux Etats-Unis et en Europe la plupart des anorexigènes fenfluraminiques ont été retirés du marché et interdits en 1977 après la constatation d'effets indésirables rares mais graves : l'hypertension artérielle pulmonaire et les insuffisances valvulaires cardiaques[1,2,3].

Plusieurs cas cliniques rapportés dans la littérature suggèrent que le benfluorex commercialisé en France depuis 1976 et dérivé de la fenfluramine pourrait être également associé avec des cardiopathies valvulaires de régurgitation[4,5,6]. Depuis le 5 avril 2007 la commission d'autorisation sur le marché a limité en France la prescription du benfluorex à l'indication « *adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* »[7].

L'objectif de ce travail était de préciser, chez les personnes diabétiques, un lien éventuel entre une exposition au benfluorex et la survenue d'une valvulopathie cardiaque de régurgitation. En cas de liaison significative l'objectif secondaire était de vérifier s'il existait une relation dose-effets.

Méthode

Etude de cohorte de type exposé-non exposé à partir des données anonymes du système national inter-régime de l'assurance maladie (SNIIRAM)[8,9,10].

Etaient éligibles les patients diabétiques traités en 2006 et âgés de 40 à 69 ans en 2006. Le diabète traité était défini par le remboursement à au moins trois dates différentes en 2006 d'antidiabétiques oraux et/ou insuline appartenant à la classe ATC A10. Cette définition est similaire à celle utilisée pour estimer la prévalence du diabète traité en France [11] et à celle de l'étude Entred 2007[12] (tableau 1). La classe d'âge 40-69 ans a été choisie afin d'assurer une homogénéité de la population étudiée et de tenir compte de l'âge des cas ponctuels rapportés[13,14].

Les cas exposés enregistrés de façon passive étaient définis par la délivrance et le remboursement en 2006 de benfluorex, quelque soit la dose et la forme et le nombre de délivrance. Les cas non exposés étaient définis par l'absence de remboursement de benfluorex en 2006 (tableau 1). Après chaînage des données les événements recherchés à l'année n+1 et n+2 dans le PMSI 2007 et 2008 étaient une hospitalisation pour une insuffisance valvulaire toutes valves et toutes causes confondues, une hospitalisation pour une insuffisance mitrale et un remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues (tableau 2).

L'utilisation du SNIIRAM par les agents habilités de la Cnamts a fait l'objet d'un avis favorable de la Cnil en novembre 2001 et d'un arrêté ministériel du 11 avril 2002 relatif à sa mise en œuvre. En octobre 2007, un second arrêté a permis l'utilisation de la variable décès avec la date exacte issue des données de statut vital de l'Insee et de la Cnav.

Table 1 : critères utilisés pour l'inclusion des personnes dans la cohorte de diabétiques et pour définir l'exposition au benfluorex

patients de la cohorte	au moins 3 dates de remboursement différentes en 2006 de médicaments antidiabétiques (classe ATC A10) âge compris entre 40 et 69 ans en 2006
exposés	au moins un remboursement de benfluorex en 2006 cip = 3175579 (mediator® 150 mg boite de 30) cip = 3175591 (mediator® 150 mg boite de 100)
non exposés	pas de remboursement de benfluorex en 2006

Résultats :

Les résultats portaient sur 1 092 860 diabétiques de 40 à 69 ans dont 43 208 exposés au benfluorex en 2006.

Table 3 : caractéristiques des diabétiques exposés et de non-exposés

	exposés	non-exposés
effectifs	43 208	1 049 650
âge (moyenne)	57,24	58,15
%femme	56,38	42,39
%homme	43,62	57,61

Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque était de 81 pour 100 000 dans le groupe exposé vs 29 pour 100 000 dans le groupe non exposé RR = 2,77 IC 95[1,95 ;3,92]. Le risque d'hospitalisation pour insuffisance mitrale rhumatismale et non rhumatismale était de 53 pour 100 000 dans le groupe exposé vs 20 pour 100 000 dans le groupe non exposé RR = 2,66 IC 95[1,73 ;4,09]. Le risque de chirurgie en 2007 avec un remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues était de 30 pour 100 000 dans groupe exposé au benfluorex vs 9 pour 100 000 dans le groupe non exposé RR =3,4 [1,90 ; 6,06]. Parmi les 13 personnes diabétiques de 40 à 69 ans exposées au benfluorex et ayant subi un remplacement valvulaire en 2007 une était décédée en milieu d'année 2008.

Pour la même population exposé en 2006 le risque d'hospitalisation en 2008 pour insuffisance valvulaire cardiaque était de 74 pour 100 000 dans le groupe exposé vs 27 pour 100 000 dans le groupe non exposé RR = 2,66 IC 95[1,84-3,83]. Le risque d'hospitalisation pour insuffisance mitrale rhumatismale et non rhumatismale était de 37 pour 100 000 dans le groupe exposé vs 17 pour 100 000 dans le groupe non exposé RR = 2,13 [1,28-3,56]. Le risque de chirurgie en 2008 avec un remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues était de 25,4 pour 100 000 dans groupe exposé au benfluorex vs 7,5 pour 100 000 dans le groupe non exposé RR =3,4 [1,80-6,35]. Parmi les 11 personnes diabétiques exposées au benfluorex et ayant subi un remplacement valvulaire sous circulation extracorporelle en 2008 aucune n'était décédée à la date du 30 juin 2009.

La relation dose-effet a été testée pour le risque d'hospitalisation pour insuffisance valvulaire en 2007

Table 4 : relation entre la dose de benfluorex délivrée en 2006 et le risque d'hospitalisation en 2007 pour insuffisance valvulaire pour des personnes diabétiques de 40 à 69 ans.

dose cumulée de benfluorex* remboursée en 2006	effectif	Risque absolu d'hospitalisation pour insuffisance valvulaire en 2007 pour 100 000 personnes	risque relatif
0 gr	1 049 650	29,2	1.00
13,5gr à 40,5 gr	17 603	51,1	1.75
41 gr à 175,5 gr	25 605	101,6	3.47
41gr à 90 gr	*8 832*	*101,9*	*3.48*
91gr à 135 gr	*8 101*	*111,9*	*3.80*
136gr à 175,5 gr	*8 672*	*92,2*	*3.15*

* un comprimé de benfluorex est dosé à 150 mg

Les premiers constats montrent que les personnes ayant eu des doses cumulées plus faibles en 2006 ont eu de moindre risque de développer une insuffisance valvulaire avec une hospitalisation. A partir de 41 grs, soit environ 240 comprimés dosés à 150 mg en 2006, il n'apparaissait pas de dose effet.

Discussion

Ce travail conforte l'hypothèse de départ, à savoir l'existence d'un lien entre benfluorex et valvulopathie de régurgitation.

Il existait une relation positive entre le fait d'avoir fait l'usage (ou plus exactement d'avoir été remboursé) de benfluorex en 2006 et le fait d'avoir été hospitalisé en 2007 et en 2008 pour une insuffisance valvulaire cardiaque (risque relatif 2007 = 2.8 ; RR 2008 = 2.7), une insuffisance mitrale (RR 2007 = 2.8 ; RR 2008 = 2.1), une chirurgie de remplacement valvulaire avec circulation extracorporelle pour insuffisance valvulaire (RR 2007= 3.4 ; RR 2008 = 3.4).

Le choix d'un protocole d'étude observationnelle de type cohorte exposés-non exposés est réputé plus proche de l'approche expérimentale[15] et permet de calculer un risque absolu et relatif. L'estimation d'un risque absolu est importante pour une décision de santé publique. De plus ce choix s'est imposé en raison de l'impossibilité de disposer d'un codage

[15] Boyer J, Hemon D,... Chapitre 8 in Epidémiologie : principes et méthodes quantitatives. Les ed. INSERM, 1995.

étiologique des valvulopathies de régurgitation dans le PMSI (valvulopathies dégénératives, rhumatismales, post endocardite infectieuse, congénitale, ischémique, secondaire à un dysfonctionnement ventriculaire gauche, post radique, tumorale..). Il n'existait par exemple que deux codes de la classification internationale des maladies (CIM-10) pour l'insuffisance mitrale et les experts interrogés s'accordent sur le caractère très imprécis de l'utilisation d'un code ou de l'autre. En testant l'hypothèse « valvulopathie de régurgitation tous types confondus, les biais de classement potentiels étaient plus limités, mais la puissance de l'étude en était affectée.

Un élément positif est d'utiliser pour le suivi de cohorte l'enregistrement passif des expositions par la télétransmission par les pharmaciens d'officine aux CPAM pour obtenir le remboursement du benfluorex, données qui enrichissent de façon exhaustive le SNIIRAM ; l'enregistrement des maladies était également passif par les médecins qui complètent dans les résumés de sortie standardisés (RSS puis RSA) les diagnostics principaux et reliés[16] et les actes médicaux principaux, dit classant. Ces données sont enregistrées dans le PMSI MCO. Le chaînage de deux sources d'information totalement indépendantes permet d'éliminer en principe les biais de classement différentiels sur l'exposition comme sur la maladie.

Plusieurs facteurs peuvent contribuent à minimiser les risques relatifs obtenus.

1. L'exposition évaluée de façon dichotomique est sensiblement surestimée. Une personne ayant eu un remboursement d'une seule boite de benfluorex est présumée exposée, alors même, quelle n'a peut-être absorbé aucun comprimé. Les erreurs d'attribution de bénéficiaires sont en principe rares mais toujours possibles et contribuent également à sous estimer le risque. L'enquête « instauration des traitements médicaments hypolipémiants » menées en 2002 avait retrouvé parmi les nouveaux consommants ayant une seule délivrance ponctuelle jusqu'à 5% d'erreur de bénéficiaires [17]. Nous ne sommes pas dans cette situation car il ne s'agit pas d'une population débutant un traitement, mais des erreurs d'attribution de bénéficiaires entre conjoints notamment dans le cas présent sont toujours possibles.
2. Les non-exposés pourraient avoir été exposés en 2005 ou antérieurement ou à partir de 2007 ; ce dernier point pourrait être corrigé en introduisant dans l'algorithme des

[16] Le diagnostic principal est le motif qui a mobilisé l'essentiel de l'effort médical et soignant au cours de l'hospitalisation dans l'unité médicale. Le diagnostic relié est renseigné lorsque le diagnostic principal est insuffisant. Il rend compte de la prise en charge du patient en termes médico-économiques. C'est une maladie chronique ou de longue durée, ou un état permanent, présent au moment du séjour en hôpital.

Instauration des traitements médicamenteux hypolipémiants en France en 2002. Rev Med Ass Maladie 2003;34,4:221-231. Rapport complet http://fulltext.bdsp.ehesp.fr/Cnamts/Etudes/2003/traitementshypolipemiants.pdf?1M4M8-44714-XK96X-D1KX6-81X49

non-exposés le fait de n'avoir pas eu de remboursement en 2006 mais aussi en 2007 et 2008 ou encore avant l'effet indésirable recherchés.

3. Tous les patients diabétiques traités ne sont pas en théorie concernés par une éventuelle indication du benfluorex « *AMM limitée aux diabétiques avec surcharge pondérale* ». Un IMC < à 25 n'était retrouvé en 2007 que chez 20 % des diabétiques de type 2 et 80% était en surpoids ou obèse[18]. Encore faut-il se souvenir qu'en 2006 le benfluorex bénéficiait également de l'indication « adjuvant au régime adapté dans les hypertriglycéridémie ». En revanche l'inclusion de diabétique de type 1 dans l'enquête (5,6%) d'après l'étude entred[19] dans le groupe non exposé contribue à diminuer le risque relatif calculé.
4. Le caractère non spécifique « des insuffisances valvulaires tous types confondus » avec notamment des insuffisances dégénératives ou rhumatismales (principales causes habituelles dans cette tranche d'âge de l'insuffisance mitrale) qui ne peuvent être causées par le benfluorex diminue fortement le risque relatif calculé.
5. Un suivi limité à deux années immédiatement après l'année où l'exposition est enregistrée pourrait également diminuer le risque relatif.

Dans ces conditions le fait d'observer un risque relatif de près de 3 renforce d'autant l'hypothèse d'un lien très fort avec un risque relatif possiblement beaucoup plus élevé (plus de 10 selon toute vraisemblance).

Le jugement de causalité : plusieurs arguments peuvent militer en faveur d'une possible relation de cause à effet.

1. La connaissance d'un mécanisme d'action décrit antérieurement à cette étude pour les fenfluraminiques sérotoninergiques. Des études physiopathologiques ont expliqué les mécanismes en cause : activation des récepteurs sérotoninergiques présents à la surface des vaisseaux pulmonaires et des valves cardiaques par le métabolite toxique norfenfluramine.
2. Une relation dose effet qui semble se dessiner. Il faudrait pour démonter formellement cette relation connaître la totalité de la consommation dans les années antérieures.
3. Les résultats d'une étude cas-témoins menée par des cliniciens qui conclurait à une association benfluorex et valvulopathie spécifique serait un argument décisif en faveur de la relation de cause à effet.

BEH 2D09 ; 42-43,450-54 (sous presse).

[19] Cf réf 18.

Il convient toutefois d'indiquer que nos conclusions ne sont généralisables que dans la population de diabétiques de 40 à 59 ans. Si d'autres études s'avéraient nécessaire il serait toutefois prudent de suspendre temporairement le médicament. La limitation à une population homogène diabétique de 40-69 ans a permis de limiter certains facteurs de confusion. Les personnes traitées par médiator n'étaient en 2006 que dans 17% des cas diabétiques traités par hypoglycémiants oraux et/ou insuline. Des résultats non présentés dans ce rapport préliminaire sont également en faveur d'un risque relatif élevé et significatif de valvulopathie de régurgitation pour les non-diabétques.

Les traditionnelles limites des enquêtes de cohorte longue et coûteuses ont pu être surmontées. Cette enquête a pu être menée en moins de deux semaines par des personnes de l'assurance maladie expérimentées sur les analyses de données issues du SNIIRAM. Ceci conforte l'intérêt des bases de données médico-administratives chaînant SNIIRAM, PMSI, statut vital issu des données de l'Insee et de la Cnav et leur utilisation par des personnes en maitrisant la complexité.

L'ensemble des résultats présentés nous conduisent à suggérer à la tutelle un retrait immédiat de la commercialisation et un arrêt du remboursement de benfluorex dont l'effet est « modeste et mal évalué » et les effets indésirables potentiellement très sévères. Dans ce contexte la balance bénéfice-risque ne parait pouvoir être analysée que défavorablement. Selon les données de la cnamts il y avait en 2006 pour le seul régime général 340 000 personnes traitées en 2006, 320 000 en 2007 et 275 000 en 2008.

Conclusion :

1. L'usage du Benfluorex chez les diabétiques est associé significativement dans les deux années qui suivent à des valvulopathies de régurgitation mitrales, aortiques et tricuspidiennes et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.
2. Transmission du dossier en urgence le 27/10/2009 à l'Agence française de sécurité sanitaire des produits de santé et à la Direction générale de la santé
3. Le SNIIRAM avec le chainage PMSI et statut vital peut contribuer à montrer, en condition réelle d'utilisation pour des médicaments, des effets indésirables sévères mais restés longtemps mal évalués ou méconnus parfois depuis plusieurs dizaines d'années.

Benfluorex et valvulopathies cardiaques : une étude de cohorte sur 1 048 173 personnes traitées pour diabète

Alain Weill (alain.weill@cnamts.fr), Michel Païta, Philippe Tuppin, Philippe Ricordeau, Hubert Allemand

Caisse nationale de l'assurance maladie, Paris, France.

Rapport final du 09/11/2009

Résumé

Contexte : Plusieurs cas cliniques rapportés dans la littérature suggèrent que le benfluorex commercialisé en France depuis 1976 et dérivé de la fenfluramine pourrait être associé avec des cardiopathies valvulaires de régurgitation. Depuis le 5 avril 2007 la commission d'autorisation sur le marché a limité la prescription du benfluorex à l'indication « *adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* ». L'objectif de ce travail était de préciser, chez les personnes diabétiques, un lien éventuel entre une exposition au benfluorex et une valvulopathie cardiaque de régurgitation et de tester dans l'affirmative un effet dose.

Méthode : étude de cohorte de type exposé-non exposé à partir des données du système national inter-régime de l'assurance maladie (SNIIRAM). Etaient éligibles les patients diabétiques traités (antidiabétiques oraux et/ou insuline) en 2006 et âgés de 40 à 69 ans. Les cas exposés étaient enregistrés de façon passive et définis par la délivrance et le remboursement en 2006 de benfluorex. Après chaînage des données les événements recherchés à l'année n+1 et n+2 dans le PMSI 2007 et 2008 étaient une hospitalisation pour une insuffisance valvulaire toutes causes confondues, une hospitalisation pour une insuffisance mitrale, une hospitalisation pour une insuffisance aortique et une hospitalisation avec chirurgie de remplacement valvulaire sous circulation extra-corporelle pour une insuffisance valvulaire toutes causes confondues. Les risques relatifs sont présentés bruts et ajustés sur l'âge, le sexe et la présence d'une ALD cardio-vasculaire.

Résultats : les résultats portaient sur 1 048 173 diabétiques de 40 à 69 ans dont 43 044 exposés au benfluorex en 2006. Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque était de 81 pour 100 000 dans le groupe exposé au benfluorex en 2006 vs 28 pour 100 000 dans le groupe non exposé, soit un risque relatif de 2,9 [2,0 ;4,1] et un RR ajusté de 3,1 [2,2 ;4,5]. Les risques relatifs ajustés d'hospitalisation pour insuffisance mitrale

et insuffisance aortique étaient respectivement de 3,0 [1,9 ;4,7] et de 4,1[2,3 ;7,4]. Le risque de chirurgie en 2007 avec un remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues était de 30 pour 100 000 dans groupe exposé au benfluorex vs 8 pour 100 000 dans le groupe non exposé, soit un RR ajusté de 3,7[2,1 ;6,8]. Parmi les 13 personnes diabétiques de 40 à 69 ans exposées au benfluorex et ayant subi un remplacement valvulaire en 2007 une était décédée en milieu d'année 2008. Pour les exposés au benfluorex en 2006 les risques absolus et les risques relatifs étaient en 2008 très proches de ceux observés en 2007. Ainsi, le risque relatif ajusté des exposés au benfluorex en 2006 de chirurgie valvulaire sous CEC en 2008 était de 4,2 [2,2 ;8,1].

Par ailleurs, les personnes ayant eu des doses cumulées plus faibles en 2006 ont eu de moindre risque de développer une insuffisance valvulaire avec une hospitalisation en 2007.

Conclusion :

1. L'usage du Benfluorex chez les diabétiques en 2006 était associé significativement dans les deux années qui suivaient à des valvulopathies de régurgitation mitrales et aortiques et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.
2. Transmission en urgence le 27/10/2009 du rapport préliminaire à l'Agence française de sécurité sanitaire des produits de santé et à la Direction générale de la santé.
3. Le SNIIRAM avec le chainage PMSI peut contribuer à montrer, en condition réelle d'utilisation pour des médicaments, des effets indésirables sévères mais restés longtemps méconnus ou mal évalués.

Mots clés : benfluorex, valvulopathie, insuffisance mitrale, effets indésirables, bases de données, SNIIRAM, PMSI

Le travail a été débuté le 13/10/2009 et le rapport préliminaire a été adressé le 27/10/2009 à l'Agence française de sécurité sanitaire des produits de santé (Afssaps) et à la Direction générale de la santé. Le rapport final a été adressé à l'Afssaps le 9/11/2009.

1. Introduction

Aux Etats-Unis et en Europe la plupart des anorexigènes fenfluraminiques ont été retirés du marché et interdits en 1997 après la constatation d'effets indésirables rares mais graves : l'hypertension artérielle pulmonaire et les insuffisances valvulaires cardiaques[1,2,3].

Plusieurs cas cliniques rapportés dans la littérature suggèrent que le benfluorex commercialisé en France depuis 1976 et dérivé de la fenfluramine pourrait être également associé avec des cardiopathies valvulaires de régurgitation[4,5,6]. Depuis le 5 avril 2007 la commission d'autorisation sur le marché a limité en France la prescription du benfluorex à l'indication « *adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* »[7].

L'objectif de ce travail était de préciser, chez les personnes diabétiques, un lien éventuel entre une exposition au benfluorex et la survenue d'une valvulopathie cardiaque de régurgitation. En cas de liaison significative l'objectif secondaire était de vérifier s'il existait une relation dose-effets.

2. Méthode

Etude de cohorte de type exposé-non exposé à partir des données anonymes du système national inter-régime de l'assurance maladie (SNIIRAM)[8,9,10].

Etaient éligibles les patients diabétiques traités en 2006, âgés de 40 à 69 ans en 2006 et non décédés au 31/12/2006. Le diabète traité était défini par le remboursement à au moins trois dates différentes en 2006 d'antidiabétiques oraux et/ou insuline appartenant à la classe ATC A10. Cette définition est similaire à celle utilisée pour estimer la prévalence du diabète traité en France [11] et à celle de l'étude Entred 2007[12] (tableau 1). La classe d'âge 40-69 ans a été choisie afin d'assurer une homogénéité de la population étudiée et de tenir compte de l'âge des cas ponctuels rapportés[13,14].

Les cas exposés enregistrés de façon passive étaient définis par la délivrance et le remboursement en 2006 de benfluorex, quelque soit la dose, la forme et le nombre de délivrance. Les cas non exposés étaient définis par l'absence de remboursement de benfluorex en 2006, en 2007 et en 2008 (tableau 1). Après chaînage des données les événements recherchés à l'année n+1 et n+2 dans le PMSI 2007 et 2008 étaient une hospitalisation pour une insuffisance valvulaire toutes valves et toutes causes confondues, une hospitalisation pour une insuffisance mitrale, une insuffisance aortique et une hospitalisation avec remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues (tableau 2). Les risques relatifs (nombre de personnes malades chez les exposés/

nombre de personnes malades chez les non-exposés) sont présentés bruts et ajustés sur l'âge, le sexe et le statut d'ALD cardiovasculaire en 2006.

L'utilisation du SNIIRAM par les agents habilités de la Cnamts a fait l'objet d'un avis favorable de la Cnil en novembre 2001 et d'un arrêté ministériel du 11 avril 2002 relatif à sa mise en œuvre. En octobre 2007, un second arrêté a permis l'utilisation de la variable décès avec la date exacte issue des données de statut vital de l'Insee et de la Caisse ationale de l'assurance vieillesse.

Table 1 : critères utilisés pour l'inclusion des personnes dans la cohorte de diabétiques et pour définir l'exposition au benfluorex

patients de la cohorte	au moins 3 dates de remboursement différentes en 2006 de médicaments antidiabétiques (classe ATC A10) âge compris entre 40 et 69 ans en 2006
exposés	au moins un remboursement de benfluorex en 2006 cip = 3175579 (mediator® 150 mg boite de 30) cip = 3175591 (mediator® 150 mg boite de 100)
non exposés	pas de remboursement de benfluorex en 2006, en 2007 et 2008

Table 2 : critères utilisés pour définir la maladie valvulaire cardiaque de régurgitation

hospitalisation pour insuffisance valvulaire	PMSI MCO avec un diagnostic principal ou relié = I340 Insuffisance (de la valvule mitrale) non rhumatismale I051 Insuffisance (de la valvule mitrale) rhumatismale I351 Insuffisance (de la valvule) aortique non rhumatismale I061 Insuffisance (de la valvule) aortique rhumatismale I361 Insuffisance (de la valvule) tricuspide non rhumatismale I071 Insuffisance (de la valvule) tricuspide rhumatismale

Les traitements des données ont été réalisés avec le logiciel SAS version 9.01

3. Résultats

3.1. Description de la population de la population de la cohorte

L'étude portait sur 1 048 173 diabétiques de 40 à 69 ans dont 43 044 exposés au benfluorex en 2006.

Les personnes diabétiques traitées exposées au benfluorex étaient significativement plus jeunes que les non-exposés (57,3 ans vs 58,3 ans), plus souvent des femmes (56,4 % vs 42,0 %), et moins souvent en ALD 76,3% vs 81,1% (tableau 3).

Dans la cohorte des 1 048 173 diabétiques suivis l'exposition au benfluorex était maximale pour les femmes de 45 à 49 ans (6,5%) et minimale pour les hommes de 65 à 69 ans (2,6%) (tableau 4). En 2006 le taux d'ALD cardiovasculaire des personnes de la cohorte augmentait avec l'âge de 2,9% pour les, 40-44 ans à plus de 11% pour les 65-69 ans (tableau 5).

Table 3 : caractéristiques des diabétiques exposés et de non-exposés

	exposés	non-exposés	significativité
effectifs	43 044	1 005 129

65 à 69	82.7%	80.4%	11.6%	10.8%

*ALD 1 = Accident vasculaire cérébral invalidant, ALD 3 = Artériopathies chroniques avec manifestations ischémiques, ALD 5 = Insuffisance cardiaque grave, troubles du rythme graves, cardiopathies valvulaires graves, cardiopathies congénitales graves, ALD 13 = Maladie coronaire

Les hospitalisations en 2007 pour insuffisance valvulaire cardiaque par régurgitation augmentaient fortement avec l'âge de 4 pour 100 000 pour les 40-44 ans à plus de 40 pour 100 000 pour les 65-69 ans (tableau 6).

Table 6 Taux de diabétiques hospitalisés en 2007 pour insuffisance valvulaire cardiaque par régurgitation (pour 100 000 patients diabétiques)

classe d'âge	Hommes	femmes
40 à 44	3.6	4.1
45 à 49	11.8	19.2
50 à 54	36.2	15.8
55 à 59	21.9	29.9
60 à 64	39.1	28.2
65 à 69	48.0	38.2

3.2. Relation entre l'exposition au benfluorex et hospitalisation pour valvulopathie par régurgitation

Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque était de 81 pour 100 000 dans le groupe exposé au benfluorex en 2006 vs 28 pour 100 000 dans le groupe non exposé, soit un risque relatif de 2,9 [2,0 ;4,1] et un RR_a de 3,1 [2,2 ;4,5]. Les risques relatifs ajustés d'hospitalisation pour insuffisance mitrale et insuffisance aortique était respectivement de 3,0 [1,9 ;4,7] et de 4,1 [2,3 ;7,4]. Le risque de chirurgie en 2007 avec un remplacement valvulaire pour une insuffisance valvulaire toutes causes confondues était de 30 pour 100 000 dans groupe exposé au benfluorex vs 8 pour 100 000 dans le groupe non exposé, soit un RR ajusté de 3,7 [2,1 ;6,8]. Parmi les 13 personnes diabétiques de 40 à 69 ans exposées au benfluorex et ayant subi un remplacement valvulaire en 2007 une était décédée en milieu d'année 2008. (tableau 7).

En 2008 les risques relatifs ajustés d'hospitalisation pour des valvulapthies des exposés en 2006 comparés au non exposés étaient semblables à ceux de 2007. Ils étaient compris entre 2,4 et 4,5 : 3,0 [2,1 ;4,4] pour une hospitalisation pour insuffisance valvulaire, 2,4 [1,4 ;4,1] pour une hospitalisation pour insuffisance mitrale, 4,1 [2,3 ;7,4] pour une hospitalisation pour insuffisance aortique et 4,5 [2,6 ;7,6] pour un remplacement valvulaire pour insuffisance valvulaire. (tableau 8). Parmi les 11 personnes diabétiques exposées au benfluorex en 2006 et ayant subi un remplacement valvulaire sous circulation extracorporelle en 2008 aucune n'était décédée à la date du 30 juin 2009.

Tableau 7 : risque d'hospitalisation en 2007 pour valvulopathie de régurgitation selon l'exposition ou non au benfluorex en 2006 dans une cohorte de diabétiques – données SNIIRAM assurance maladie

	RA pour 100 000 personnes non-exposées	RA pour 100 000 personnes exposées	RR brut (IC 95%)	RR ajusté [1] (IC 95%)
hospitalisation pour insuffisance valvulaire	28	81	2,9 [2,0 ;4,1]	3,1 [2,2 ;4,5]
hospitalisation pour insuffisance mitrale	19	53	2,8 [1,8 ;4,3]	3,0 [1,9 ;4,7]
hospitalisation pour insuffisance aortique	8	30	3,7 [2,0 ;6,6]	4,1 [2,3 ;7,4]
remplacement valvulaire pour insuffisance valvulaire	8	30	3,6 [2,0 ;6,4]	3,7 [2,1 ;6,8]

[1] ajustement sur âge, sexe et ALD cardiovasculaire

Tableau 8 : risque d'hospitalisation en 2008 pour valvulopathie de régurgitation selon l'exposition ou non au benfluorex en 2006 dans une cohorte de diabétiques – données SNIIRAM assurance maladie

	RA pour 100 000 personnes non-exposées	RA pour 100 000 personnes exposées	RR brut (IC 95%)	RR ajusté [1] (IC 95%)
hospitalisation pour insuffisance valvulaire	26	74	2,8 [2,0 ;4,1]	3,0 [2,1 ;4,4]
hospitalisation pour insuffisance mitrale	17	37	2,3 [1,3 ;3,8]	2,4 [1,4 ;4,1]
hospitalisation pour insuffisance aortique	9	37	4,1 [2,4 ;7,0]	4,5 [2,6 ;7,6]
remplacement valvulaire pour insuffisance valvulaire	7	26	3,8 [2,0 ;7,1]	4,2 [2,2 ;8,1]

* un comprimé de benfluorex est dosé à 150 mg

Les premiers constats montrent que les personnes ayant eu des doses cumulées plus faibles en 2006 ont eu de moindre risque de développer une insuffisance valvulaire avec une hospitalisation. A partir de 41 grammes par an, soit environ 270 comprimés dosés à 150 mg en 2006, il n'apparaissait pas de dose effet.

4. Discussion

Ce travail conforte l'hypothèse de départ, à savoir l'existence d'un lien entre benfluorex et valvulopathie de régurgitation. Il existait une relation positive entre le fait d'avoir fait l'usage (ou plus exactement d'avoir été remboursé) de benfluorex en 2006 et le fait d'avoir été hospitalisé en 2007 et en 2008 pour une insuffisance valvulaire cardiaque (risque relatif ajusté RR_a 2007 = 3,1 ; RR_a 2008 = 3,0), une insuffisance mitrale (RR_a 2007 = 3,0 ; RR_a 2008 = 2,4), une insuffisance aortique (RR_a 2007 = 4,1 ; RR_a 2008 = 4,5), une chirurgie de remplacement valvulaire sous circulation extracorporelle pour insuffisance valvulaire (RR_a 2007= 3,7 ; RR_a 2008 = 4,2).

Le choix d'un protocole d'étude observationnelle de type cohorte exposés-non exposés est réputé plus proche de l'approche expérimentale[15] et permet de calculer un risque absolu et relatif. L'estimation d'un risque absolu est importante pour une décision de santé publique. De plus ce choix s'est imposé en raison de l'impossibilité de disposer d'un codage étiologique des valvulopathies de régurgitation dans le PMSI (valvulopathies dégénératives, rhumatismales, post endocardite infectieuse, congénitale, ischémique, secondaire à un dysfonctionnement ventriculaire gauche, post radique, tumorale..). Il n'existait par exemple que deux codes de la classification internationale des maladies (CIM-10) pour l'insuffisance mitrale et les experts interrogés s'accordent sur le caractère très imprécis de l'utilisation d'un code ou de l'autre. En testant l'hypothèse « valvulopathie de régurgitation tous types confondus », les biais de classement potentiels étaient plus limités, mais la puissance de l'étude en était affectée.

Un élément positif était d'utiliser pour le suivi de cohorte l'enregistrement passif des expositions par la télétransmission par les pharmaciens d'officine aux CPAM pour obtenir le remboursement du benfluorex, données qui enrichissent de façon exhaustive le SNIIRAM ; l'enregistrement des maladies était également passif par les médecins qui complètent dans les résumés de sortie standardisés (RSS puis RSA) les diagnostics principaux et reliés[16] et les actes médicaux principaux, dit classant. Ces données sont enregistrées dans le PMSI MCO. Le chaînage de deux sources d'information totalement indépendantes permet d'éliminer en principe les biais de classement différentiels sur l'exposition comme sur la maladie.

---

[15] Bouyer J, Hemon D, Cordier et al. Chapitre 8 in Epidémiologie : principes et méthodes quantitatives. Les ed. INSERM, 1995.

[16] Le diagnostic principal est le motif qui a mobilisé l'essentiel de l'effort médical et soignant au cours de l'hospitalisation dans l'unité médicale. Le diagnostic relié est renseigné lorsque le diagnostic principal est insuffisant. Il rend compte de la prise en charge du patient en termes médico-économiques. C'est une maladie chronique ou de longue durée, ou un état permanent, présent au moment du séjour en hôpital.

Plusieurs facteurs peuvent contribuent à minimiser les risques relatifs obtenus.

1. L'exposition évaluée de façon dichotomique est sensiblement surestimée. Une personne ayant eu un remboursement d'une seule boite de benfluorex est présumée exposée, alors même, quelle n'a peut-être absorbé aucun comprimé. Les erreurs d'attribution de bénéficiaires sont en principe rares mais toujours possibles et contribuent également à sous estimer le risque. L'enquête « instauration des traitements médicaments hypolipémiants » menées en 2002 avait retrouvé parmi les nouveaux consommants ayant une seule délivrance ponctuelle jusqu'à 5% d'erreur de bénéficiaires [17]. Nous ne sommes pas dans cette situation car il ne s'agit pas d'une population débutant un traitement, mais des erreurs d'attribution de bénéficiaires entre conjoints notamment dans le cas présent sont toujours possibles.
2. Les non-exposés pourraient avoir été exposés en 2005 ou antérieurement.
3. Tous les patients diabétiques traités ne sont pas en théorie concernés par une éventuelle indication du benfluorex « *AMM limitée aux diabétiques avec surcharge pondérale* ». Un indice de masse corporelle (IMC) inférieur à 25 n'était retrouvé en 2007 que chez 20 % des diabétiques de type 2 et 80% était en surpoids ou obèse[18]. Encore faut-il rappeler qu'en 2006 le benfluorex bénéficiait également de l'indication « *adjuvant au régime adapté dans les hypertriglycéridémies* ». En revanche l'inclusion de diabétiques de type 1 dans l'enquête, 5,6% d'après l'étude Entred[19], dans le groupe non exposé contribue à diminuer le risque relatif calculé.
4. Le caractère non spécifique « des insuffisances valvulaires tous types confondus » avec notamment des insuffisances dégénératives ou rhumatismales (principales causes habituelles dans cette tranche d'âge de l'insuffisance mitrale) qui ne peuvent être causées par le benfluorex diminue fortement le risque relatif calculé.
5. Un suivi limité à deux années immédiatement après l'année où l'exposition est enregistrée pourrait également diminuer les risques relatifs.

[19] Cf réf 18.

Dans ces conditions le fait d'observer des risques relatifs bruts et ajustés de près de trois renforce d'autant l'hypothèse d'un lien fort avec un risque relatif possiblement plus élevé.

Le jugement de causalité : plusieurs arguments peuvent militer en faveur d'une possible relation de cause à effet.

1. La connaissance d'un mécanisme d'action décrit antérieurement à cette étude pour les fenfluraminiques sérotoninergiques. Des études physiopathologiques ont expliqué les mécanismes en cause : activation des récepteurs sérotoninergiques présents à la surface des vaisseaux pulmonaires et des valves cardiaques par le métabolite toxique norfenfluramine.
2. Une relation dose effet qui semble se dessiner. Il faudrait pour démontrer formellement cette relation connaître la totalité de la consommation dans les années antérieures.
3. Les résultats d'une étude cas-témoins menée par des cliniciens [20] qui conclurait à une association entre benfluorex et valvulopathie spécifique seraient un argument supplémentaire en faveur de la relation entre le benfluorex et les valvulopathies.

Il convient toutefois d'indiquer que nos conclusions ne sont généralisables que dans la population de diabétiques de 40 à 69 ans. La limitation à une population homogène diabétique de 40-69 ans et l'ajustement sur l'âge, le sexe et les ALD cardiovasculaires ont permis de limiter le risque de facteurs de confusion. Toutefois, les personnes traitées par du benfluorex n'étaient en 2006 que dans 17% des cas des diabétiques traités par hypoglycémiants oraux et/ou insuline. Des résultats non présentés dans ce rapport étaient également en faveur d'un risque relatif élevé et significatif de valvulopathies de régurgitation pour les non-diabétiques exposés comparés aux diabétiques non-exposés.

Les traditionnelles limites des enquêtes de cohorte « longue et coûteuses »[21] ont pu être surmontées. Cette enquête a pu être menée en moins de quatre semaines par des personnes de l'assurance maladie expérimentées sur les analyses de données issues du SNIIRAM. Ceci conforte l'intérêt des bases de données médico-administratives chaînant SNIIRAM, PMSI, statut vital issu des données de l'Insee et de la Cnav et leur utilisation par des personnes en maitrisant la complexité.

L'effet du benfluorex est modeste et mal évalué. Il est notable que dans les recommandations publiées par l'Afssaps et la Haute autorité de santé en novembre 2006 sur

[20] Commission nationale de pharmacovigilance : Compte rendu de la réunion du mardi 7 juillet 2009 http://www.afssaps.fr/var/afssaps_site/storage/original/application/83e6e90a48d5beba0556099fa00be94d.pdf (consulté le 5/11/2009).

[21] Bouyer J, Hemon D, Cordier et al. Chapitre 8 in Epidémiologie : principes et méthodes quantitatives. Les ed. INSERM, 1995.

le traitement médicamenteux du diabète de type 2[22] le benfluorex n'est jamais cité. Les effets indésirables observés dans cette étude sont peu fréquents mais potentiellement très sévères. Dans ce contexte la balance bénéfice-risque ne parait pouvoir être analysée que défavorablement. Selon les données de la Cnamts il y avait en 2006 pour le seul régime général 340 000 personnes traitées par benfluorex, 320 000 en 2007 et 275 000 en 2008.

5. Conclusion :

1. L'usage du Benfluorex chez les diabétiques en 2006 était associé significativement dans les deux années qui suivaient à des valvulopathies de régurgitation mitrales et aortiques et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.
2. Transmission du dossier en urgence du rapport préliminaire le 27/10/2009 à l'Agence française de sécurité sanitaire des produits de santé et à la Direction générale de la santé
3. Le SNIIRAM avec le chainage PMSI et statut vital peut contribuer à montrer, en condition réelle d'utilisation pour des médicaments, des effets indésirables sévères mais restés longtemps mal évalués ou méconnus parfois depuis plusieurs dizaines d'années.

Analyse de cas de valvulopathies observées chez des patients traités par benfluorex.

Pr Bernard Iung, Département de Cardiologie, Hôpital Bichat, Paris, 5 octobre 2009

Ce rapport analyse 45 cas de valvulopathies mises en évidence chez des patients traités par benfluorex. Il s'agit de cas spontanément rapportés par différents centres dans le cadre de la pharmacovigilance et de cas issus d'une recherche rétrospective spécifique effectuée au CHU de Brest à partir des données du PMSI et de cas issus du CHU d'Amiens.

1. Valvulopathies en population générale et valvulopathies médicamenteuses

1.1. Prévalence des valvulopathies en population générale

Les valvulopathies demeurent fréquentes dans les pays occidentaux, avec une prévalence estimée à 2,5 % dans une étude américaine récente qui est la seule étude de grande ampleur basée sur des diagnostics échocardiographiques en population représentative (1). La prévalence des valvulopathies augmente nettement avec l'âge : elle est inférieure à 2% avant 65 ans puis augmente à 8,5% entre 65 et 74 ans et à 13,2% après 75 ans.

La prévalence est encore plus importante lorsque sont prises en compte des valvulopathies minimes, notamment des fuites de grade 1/4 d'après l'échocardiographie Doppler (2).

Parmi les mono-valvulopathies significatives, c'est-à-dire les sténoses au moins modérées ou les régurgitations de grade ≥ 2/4, la valvulopathie la plus fréquente est la sténose aortique, suivie par l'insuffisance mitrale, l'insuffisance aortique puis le rétrécissement mitral (3). Les polyvalvulopathies représentent 20% des valvulopathies natives (4). Malgré la prédominance des valvulopathies dégénératives, les valvulopathies rhumatismales représentent encore la seconde étiologie des valvulopathies en Europe, soit 22% des valvulopathies natives dans l'Euro Heart Survey et 51% parmi les polyvalvulopathies (3,4).

Compte-tenu de leur fréquence en population générale, la simple constatation d'une valvulopathie ne permet donc pas d'imputer celle-ci à un traitement médicamenteux.

1.2. Caractéristiques des valvulopathies médicamenteuses précédemment rapportées

Les premiers cas de valvulopathies susceptibles d'être imputées à des médicaments ont été rapportés dans les années 1970 avec l'observation d'épaississements valvulaires correspondant histologiquement à une fibrose chez des patients traités par un anti-migraineux, le méthysergide (5). Dans les années 1990, d'autres cas analogues ont été rapportés avec des dérivés de l'ergotamine, également prescrits

en tant qu'anti-migraineux (6). Les lésions macroscopiques et histologiques étaient voisines de celles observées dans les valvulopathies des tumeurs carcinoïdes.

La possibilité de survenue de valvulopathies induites par des traitements médicamenteux a surtout été documentée avec l'association de différentes classes d'anorexigènes combinant des dérivés amphétaminiques (fenfluramine et dexfenfluramine) et la phentermine (inhibiteur de la mono-amino-oxydase et agoniste dopaminergique). Après une première description de 24 cas dont les lésions macroscopiques et histologiques s'apparentaient aux valvulopathies des tumeurs carcinoïdes (7), l'imputabilité de ces drogues est devenue hautement plausible après la publication de plusieurs études cas-témoin (8-11). Une méta-analyse de 9 études cas-témoin comportant une confirmation échocardiographique a mis en évidence une association significative entre la survenue de régurgitations valvulaires au moins modérées (critères FDA : IM de grade ≥ 3 ou IA de grade ≥ 2) et la prise d'anorexigènes durant au moins 90 jours, l'association n'étant pas significative pour une durée de traitement inférieure à 90 jours (12).
La possibilité d'une régression des lésions après arrêt du traitement médicamenteux à été décrite, mais avec des données contradictoires (13,14).

La troisième classe de traitement imputée dans la survenue de valvulopathies est celle des antiparkinsoniens agonistes dopaminergiques représentés par le pergolide et la cabergoline. Comme dans le cas des anorexigènes, des cas isolés rapportés ont été suivis par des études cas-témoin concluant à une association statistiquement significative (15,16). Une méta-analyse de 8 études cas-témoin confirmait la significativité de l'association et mettait en évidence une corrélation avec la dose cumulée mais pas avec la durée du traitement (17).

Bien que faisant intervenir des classes pharmacologiques différentes, le point commun de ces valvulopathies médicamenteuses est l'aspect voisin des lésions observées dans les tumeurs carcinoïdes :
- épaississement valvulaire et restriction de la cinétique valvulaire, principalement à l'origine de régurgitations en echocardiographie-Doppler,
- épaississement valvulaire avec présence de plaques de fibrose lisse et blanchâtre à l'examen macroscopique des valves chez les patients opérés,
- apparition d'une fibrose dense en surface de valves dont l'architecture était par ailleurs peu modifiée en histologie.

Sur le plan physiopathologique, la sérotonine est apparue comme un médiateur potentiel commun à ces différentes classes médicamenteuses dans la mesure où toutes ces drogues ont des propriétés agonistes sérotoninergiques et où les lésions ont un aspect échocardiographique, macroscopique et surtout histologique voisin des valvulopathies observées dans les tumeurs carcinoïdes qui sont caractérisées par une hypersécrétion de médiateurs sérotoninergiques (18). Les conceptions physiopathologique actuelles ne privilégient pas le rôle de la sérotonine elle-même, mais plutôt celui des récepteurs sérotoninergiques 5HT2B. Ces récepteurs, présents dans le tissu valvulaire, stimulent la mitogénèse et ont une forte affinité pour toutes les classes médicamenteuses à l'origine de valvulopathies médicamenteuses (19-20). En revanche, d'autres classes médicamenteuses agissant sur le métabolisme de la sérotonine, en particulier les antidépresseurs inhibant la recapture de la sérotonine, ont une faible affinité pour les récepteurs 5HT2B, ce qui est corroboré au

fait que ces drogues n'ont pas été imputées dans la survenue de valvulopathies médicamenteuses (21).
Par ailleurs, des lésions valvulaires identiques ont pu être reproduites dans des modèles animaux par injection de sérotonine (22) ou de pergolide (23).
La forte présomption de l'imputabilité des récepteurs 5HT2B dans la genèse des valvulopathies médicamenteuses a conduit certains auteurs à proposer un screening de leur affinité aux drogues susceptibles d'être imputées dans des valvulopathies médicamenteuses (19).

1.3. Critères d'imputabilité d'une valvulopathie à un traitement médicamenteux

Les connaissances issues des données épidémiologiques contemporaines concernant les valvulopathies et celles issues des études portant sur les valvulopathies médicamenteuses conduisent à retenir un certain nombre de critères permettant de suspecter la responsabilité de drogues dans la survenue de lésions valvulaires :

- interférence de la drogue avec le métabolisme de la sérotonine,
- observation de valvulopathies plutôt régurgitantes que sténosantes, caractérisées par un épaississement valvulaire et une restriction de la cinétique valvulaire en échocardiographie (24),
- présence d'une régurgitation valvulaire au moins modérée, correspondant approximativement à un grade ≥ 2/4 (compte-tenu de la fréquence des valvulopathies de grade 1/4 en population générale) (24),
- épaississement valvulaire avec présence de plaques de fibrose blanchâtre sur les observations macroscopiques,
- présence d'une fibrose dense en surface des valves avec une architecture par ailleurs peu modifiée sur l'examen histologique des valves explantées lorsque les patients ont été opérés.

L'aspect échocardiographique et macroscopique diffère des valvulopathies dégénératives, qui sont les plus fréquentes dans les pays occidentaux, mais peut poser des problèmes diagnostiques différentiels à l'échocardiographie avec une valvulopathie rhumatismale. En revanche l'aspect histologique est plus spécifique car les valvulopathies rhumatismales s'associent à des anomalies histologiques différentes, plus diffuses, du tissu valvulaire.

2. Analyse des cas rapportés chez les patients traités par benfluorex

Les 45 cas rapportés ont été analysés selon l'existence d'une chirurgie valvulaire et, pour les patients non opérés, en fonction de la documentation échocardiographique.

Parmi les 17 cas de valvulopathies opérées (Tableau 1) :

- 6 cas sont fortement évocateurs d'une valvulopathie médicamenteuse liée au benfluorex. Ces 5 cas se caractérisent par des constatations histologiques correspondant aux descriptions de valvulopathies médicamenteuses et pour lesquels il n'existe pas d'autre prise médicamenteuse imputable. A noter que 2

de ces 5 patients avaient également reçu des anorexigènes mais ne présentaient pas de lésion valvulaire significative (régurgitation de grade ≥ 2/4) sur des échocardiographies effectuées plusieurs années après la prise des anorexigènes.

- 6 cas sont possiblement liés au benfluorex en raison de constatations échocardiographiques ou macoscopiques compatibles, mais sans confirmation histologique. Dans ces 6 cas, l'alternative d'une étiologie rhumatismale ne peut être formellement écartée.
- Pour les 5 derniers cas, l'imputabilité du benfluorex semble faible ou très faible. Dans 3 cas, l'absence de toute documentation échocardiographique ou macroscopique ne permet pas d'exclure une autre étiologie de valvulopathie. Dans 2 de ces cas, la description des lésions évoque une autre étiologie (une dégénérative et une insuffisance mitrale fonctionnelle) et l'imputabilité est donc très faible.

Parmi les 15 patients n'ayant pas été opérés mais pour lesquels l'échocardiographie décrit les lésions valvulaires (Tableau 2) :

- L'imputabilité du benfluorex est possible dans 10 cas dont les lésions valvulaires sont compatibles. L'alternative d'une étiologie rhumatismale ne peut cependant pas être écartée.
- Dans les 5 autres cas, l'imputabilité du benfluorex semble très faible car les données anamnestiques ou les descriptions échocardiographiques suggèrent une valvulopathie dégénérative dans 3 cas, une insuffisance mitrale fonctionnelle dans un cas, et une valvulopathie préexistante, possiblement rhumatismale, dans un cas.

Enfin, dans 13 cas, aucune documentation échocardiographique des lésions valvulaires n'est disponible et il n'est donc pas possible de conclure sur le degré d'imputabilité du benfluorex (Tableau 3).

En résumé, l'imputabilité du benfluorex paraît probable dans 6 cas et possible dans 16 cas, la principale alternative étant une valvulopathie rhumatismale. L'imputabilité est faible dans 16 cas où la présence de régurgitations valvulaires est difficile à interpréter en l'absence de tout détail concernant l'anatomie valvulaire. Enfin l'imputabilité est très faible dans 7 cas pour lesquels une autre étiologie paraît plus probable.

3. Perspectives d'analyses ultérieures

3.1. À partir des données existantes

Dans un premier temps, l'amélioration de la qualité des données collectées permettrait de confirmer les 6 cas dans lesquels l'imputabilité du benfluorex est forte est de mieux évaluer l'imputabilité dans les 16 cas où elle est possible.

3.1.1. Données anatomopathologiques

La relecture centralisée des lames d'histologie des valves explantées chez les patients opérés est souhaitable. En effet, les valvulopathies médicamenteuses sont

rares et la description des lésions n'est pas homogène. Le caractère normal ou anormal de l'architecture valvulaire sous-jacente à la fibrose et l'absence d'infiltrats inflammatoires ne sont notamment pas précisés de façon systématique. Une nouvelle analyse effectuée par un centre de référence à partir de critères standardisés permettrait d'améliorer le caractère informatif de l'analyse anatomopathologique, qui est essentielle au diagnostic.
Cette analyse devrait aux nouveaux cas documentés ou aux cas déjà documentés qui seraient opérés ultérieurement.

3.1.2. Données cliniques et échocardiographiques
Pour les patients qui n'ont pas été opérés, le diagnostic de valvulopathie médicamenteuse nécessite aussi d'éliminer d'autres étiologies plus fréquentes.

L'analyse des données échocardiographiques est souvent suffisante pour éliminer le diagnostic de valvulopathie dégénérative. Lorsque les lésions échocardiographiques sont suspectes d'une valvulopathie médicamenteuse, la principale alternative diagnostique est celle d'une valvulopathie rhumatismale.
L'analyse échocardiographique des lésions anatomiques manque parfois de précision. Une relecture centralisée des enregistrements échocardiographiques dynamiques (si elle est disponible) permettrait de mieux identifier les cas suspects. La seule mise en évidence d'une régurgitation valvulaire est moins évocatrice que l'analyse anatomique. La transposition des critères de la FDA, utilisés notamment dans des études sur les anorexigènes, peut poser des problèmes d'application en France car la cotation anglo-saxonne des régurgitations comprend 3 grades alors qu'il est usuel de coter les régurgitations en 4 grades en France (25).

Pour les cas suspects, aucun critère spécifique, hormis l'histologie, ne permet le diagnostic différentiel avec une valvulopathie rhumatismale. Toutefois, des données cliniques peuvent être contributives, en particulier l'origine ethnique. En effet, le diagnostic de valvulopathie rhumatismale est plus probable chez des patients originaires d'une région d'endémie rhumatismale que s'ils sont nés en France. Parmi les patients nés en France, le diagnostic de valvulopathie rhumatismale est plus plausible chez les patients âgés (âge > 60 ans), c'est-à-dire qui ont été enfants ou adolescents à une époque où le rhumatisme articulaire aigu était encore endémique en France.

Si elle est possible, la récupération de données échocardiographiques concernant les 13 cas qui ne font l'objet d'aucune documentation de l'anatomie valvulaire est souhaitable.

3.2. Etudes cliniques ultérieures

Comme pour les cas de valvulopathies médicamenteuses rapportées avec les anorexigènes et les antiparkinsoniens, la réalisation d'études cas-témoin semble la méthodologies la plus appropriée dans un premier temps pour préciser l'imputabilité du benfluorex dans la survenue de valvulopathies.

Idéalement, les témoins devraient être appariés pour les principaux facteurs de risque de valvulopathie en population générale: âge, sexe, facteurs de risque cardio-

vasculaire, indice de masse corporelle, présence d'un syndrome métabolique, origine ethnique (26-29).

3.3. Études pharmacologiques ou expérimentales

Par analogie avec des études rapportées dans d'autres cas de valvulopathies médicamenteuses, en particulier avec les antiparkinsoniens agonistes dopaminergiques (19,22), les deux approches suivantes sembleraient pouvoir contribuer à évaluer imputabilité du benfluorex dans la survenue de valvulopathies :

- étude de l'affinité des récepteurs sérotoninergiques 5HT2B au benfluorex,
- recours à des modèles animaux avec injection de benfluorex visant à reproduire la survenue de valvulopathies.

Recommandations ASE pour la Quantification des Régurgitations: IA

Table 6 Application of specific and supportive signs, and quantitative parameters in the grading of aortic regurgitation severity

	Mild	Moderate		Severe
Specific signs for AR severity	• Central Jet, width < 25% of LVOT[5] • Vena contracta < 0.3 cm[5] • No or brief early diastolic flow reversal in descending aorta	Signs of AR>mild present but no criteria for severe AR		• Central Jet, width ≥ 65% of LVOT[5] • Vena contracta > 0.6cm[5]
Supportive signs	• Pressure half-time > 500 ms • Normal LV size*	Intermediate values		• Pressure half-time < 200 ms • Holodiastolic aortic flow reversal in descending aorta • Moderate or greater LV enlargement**
Quantitative parameters*				
R Vol, ml/beat	< 30	30-44	45-59	≥ 60
RF, %	< 30	30-39	40-49	≥ 50
EROA, cm[2]	< 0.10	0.10-0.19	0.20-0.29	≥ 0.30

AR, Aortic regurgitation; *EROA*, effective regurgitant orifice area; *LV*, left ventricle; *LVOT*, left ventricular outflow tract; *R Vol*, regurgitant volume; *RF*, regurgitant fraction.
* *LV* size applied only to chronic lesions. Normal 2D measurements: LV minor-axis ≤ 2.8 cm/m^2, LV end-diastolic volume ≤ 82 ml/m^2 (2).
[5] At a Nyquist limit of 50–60 cm/s.
** In the absence of other causes of LV dilatation.
* Quantitative parameters can help sub-classify the moderate regurgitation group into mild-to-moderate and moderate-to-severe regurgitation as shown

(Zoghbi et al. J Am Soc Echocardiogr 2003;16:777-802)

Recommandations ASE pour la Quantification des Régurgitations: IM

Table 3 Application of specific and supportive signs, and quantitative parameters in the grading of mitral regurgitation severity

	Mild	Moderate		Severe
Specific signs of severity	• Small central jet < 4 cm² or < 20% of LA area[a] • Vena contracta width <0.3 cm • No or minimal flow convergence[c]	Signs of MR>mild present, but no criteria for severe MR		• Vena contracta width ≥ 0.7cm *with* large central MR jet (*area* > 40% of LA) or *with* a wall-impinging jet of *any size*, swirling in LA[a] • Large flow convergence[c] • Systolic reversal in pulmonary veins • Prominent flail MV leaflet or ruptured papillary muscle
Supportive signs	• Systolic dominant flow in pulmonary veins • A-wave dominant mitral inflow[a] • Soft density, parabolic CW Doppler MR signal • Normal LV size[a]	Intermediate signs/findings		• Dense, triangular CW Doppler MR jet • E-wave dominant mitral inflow (E >1.2 m/s)[a] Enlarged LV and LA size[a,e], (particularly when normal LV function is present).
Quantitative parameters[f]				
R Vol (ml/beat)	< 30	30-44	45-59	≥ 60
RF (%)	< 30	30-39	40-49	≥ 50
EROA (cm²)	< 0.20	0.20-0.29	0.30-0.39	≥ 0.40

CW, Continuous wave; *EROA*, effective regurgitant orifice area; *LA*, left atrium; *LV*, left ventricle; *MV*, mitral valve; *MR*, mitral regurgitation; *R Vol*, regurgitant volume; *RF*, regurgitant fraction.

[a] LV size applied only to chronic lesions. Normal 2D measurements: LV mass/ BSA ≤ 2.6 gm/m², LV end-diastolic volume ≤ 82 ml/m², maximal LA antero-posterior diameter ≤ 2.8 cm/m², maximal LA volume ≤ 36 ml/m² (2,35,35).

[b] In the absence of other etiologies of LV and LA dilatation and acute MR.

[c] At a Nyquist limit of 50–60 cm/s.

[d] Usually above 50 years of age or in conditions of impaired relaxation, in the absence of mitral stenosis or other causes of elevated LA pressure.

[e] Maximal and large flow convergence defined as a flow convergence radius < 0.4 cm and ≥ 0.9 cm for central jets, respectively, with a baseline shift at a Nyquist of 40 cm/s; Cut-offs for eccentric jets are higher, and should be angle-corrected (see text).

[f] Quantitative parameters can help sub-classify the moderate regurgitation group into mild-to-moderate and moderate-to-severe as shown.

Interprétation

- Les données pronostiques et de surveillance ne concernent que les valvulopathies ≥ « *mild* »
- Les valvulopathies « *trivial* » sont considérées comme physiologiques en position mitrale ou tricuspide
- La comparaison des prévalences des valvulopathies en fonction du temps ne suggère pas un potentiel évolutif majeur des valvulopathies « *trivial* »

Recommandation de Surveillance des Valvulopathies ESC Guidelines 2007

Insuffisance mitrale

Serial testing

Asymptomatic patients with moderate MR and preserved LV function can be clinically followed-up on a yearly basis and echocardiography should be performed every 2 years.

Asymptomatic patients with severe MR and preserved LV function should be seen every 6 months and echocardiography performed every year, the follow-up being closer if no previous evaluation is available, and in patients with borderline values, or significant changes since the last visit. These patients should be instructed to promptly report any change in functional status.

Patients asymptomatiques avec IM « *moderate* » et fonction VG normale : surveillance écho tous les 2 ans

Insuffisance aortique

Serial testing

Patients with mild-to-moderate AR can be seen on a yearly basis and echocardiography performed every 2 years.

All patients with severe AR and normal LV function should be seen for follow-up at 6 months after their initial examination. If LV diameter and/or EF show significant changes, or they become close to the thresholds for intervention, follow-up should continue at 6 month intervals. When parameters are stable, follow-up can be yearly.

Patients avec IA > « *mild* » : surveillance écho tous les 2 ans

(Eur Heart J 2007; 28:230-68)

Anorexigènes et Valvulopathies
Evolution après Arrêt

- 50 patients sous anorexigènes arrêtés depuis 6 mois en moy.
  - 86% IA ≥ *mild* (grade 2) , 76% IM ≥ *mild* (grade 2)
  - Echo répétée après 1 an de délai moyen
    - Amélioration ≥ 1 grade pour 44% des IA et 54% des IM
    - Aggravation ≥ 1 grade pour 2,3% des IA et 2,6% des IM

(Mast et al. Ann Intern Med 2001;134:261-6)

- 711 patients sous anorexigènes arrêtés depuis 18 mois en moy.

	IA		IM	
	Dexfen.	Fen./Phen.	Dexfen.	Fen./Phen.
↑ ≥ 1 grade	1.7	0	3.7	3.0
Inchangé	91.9	95.5	87.6	90.6
↓ ≥ 1 grade	6.4	4.5	8.7	6.3

(Gardin et al. JAMA 2001;286:2011-4)

Conclusion

- Un signal est détecté sur les valves cardiaques
- Les propositions du laboratoire sont :
  - Contre indication si anomalie valvulaire
  - Surveillance échocardiographique sous traitement
- La surveillance échocardiographique proposée dans le RCP est adéquate

Recommandations ASE pour la Quantification des Régurgitations

Insuffisance mitrale

The consensus of the Task Force is to classify grading of severity of regurgitation into mild, moderate, and severe. In cases of overlap or intermediate severity, the terms "mild-to-moderate" or "moderate-to-severe" can be used. "Trace" regurgitation is also used in the event that regurgitation is barely detected. Usually this can be physiologic, particularly in right heart valves and mitral valve, and may not produce an audible murmur.

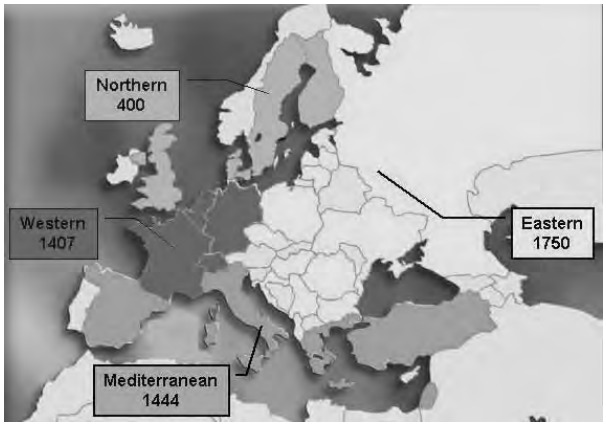
Euro Heart Survey on Valvular Heart Disease

- 5001 pts included between April and July 2001
- In 92 centres from 25 countries
- 1269 valvular interventions during the survey period

Primary and significant valve disease as defined by echocardiography :

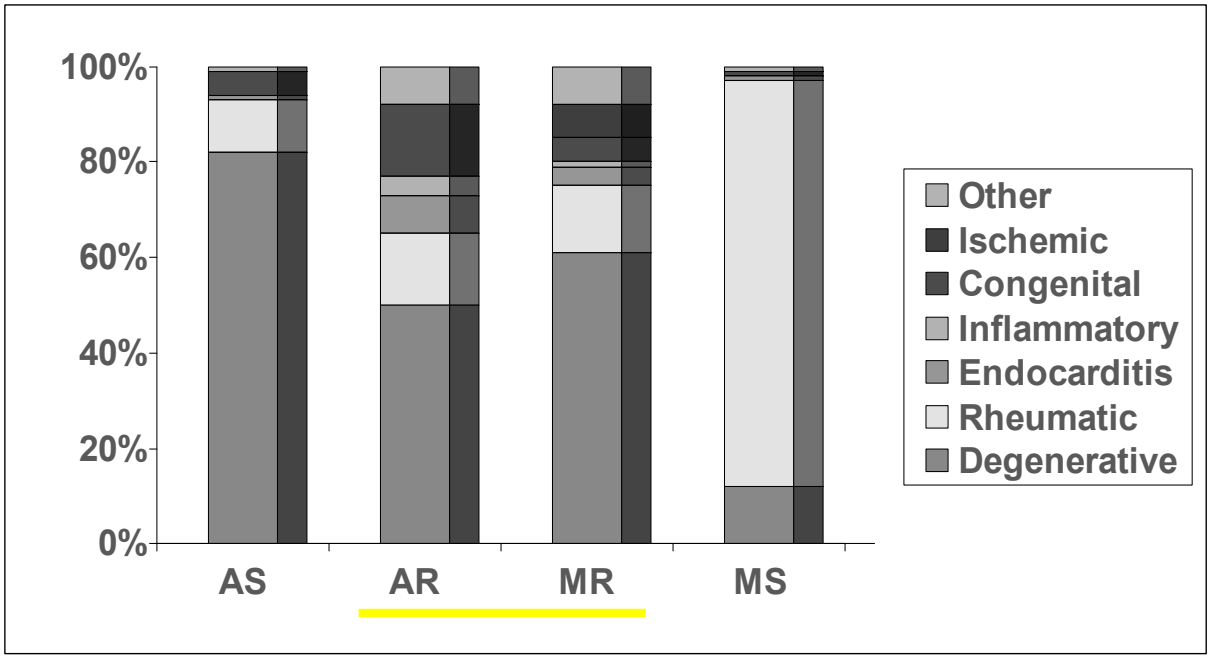
AS = max. jet velocity ≥ 2.5 m/s.
MS = valve area ≤ 2cm²
Mitral Regurgitation = grade ≥ mild
Aortic Regurgitation = grade ≥ mild



(Iung et al. Eur Heart J 2003;24:1244-53)

Single Native Valve Disease

Etiology

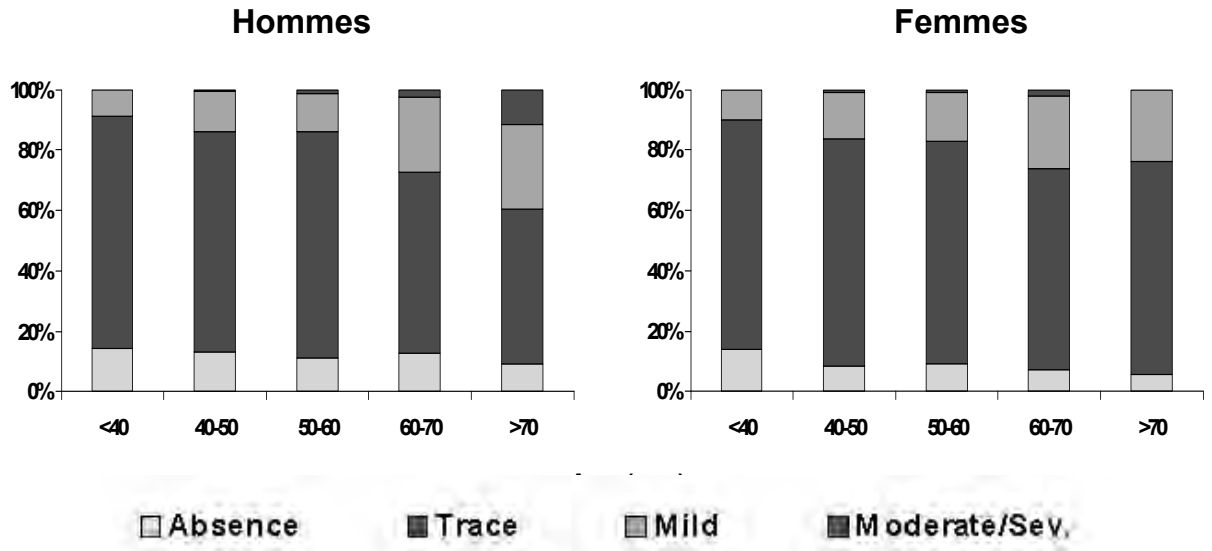


En population générale, la simple constatation d'une valvulopathie ne permet pas d'imputer celle-ci à un traitement médicamenteux

Valvulopathies en Population Générale

Insuffisance Mitrale

3589 échocardiographies issues de la cohorte de Framingham

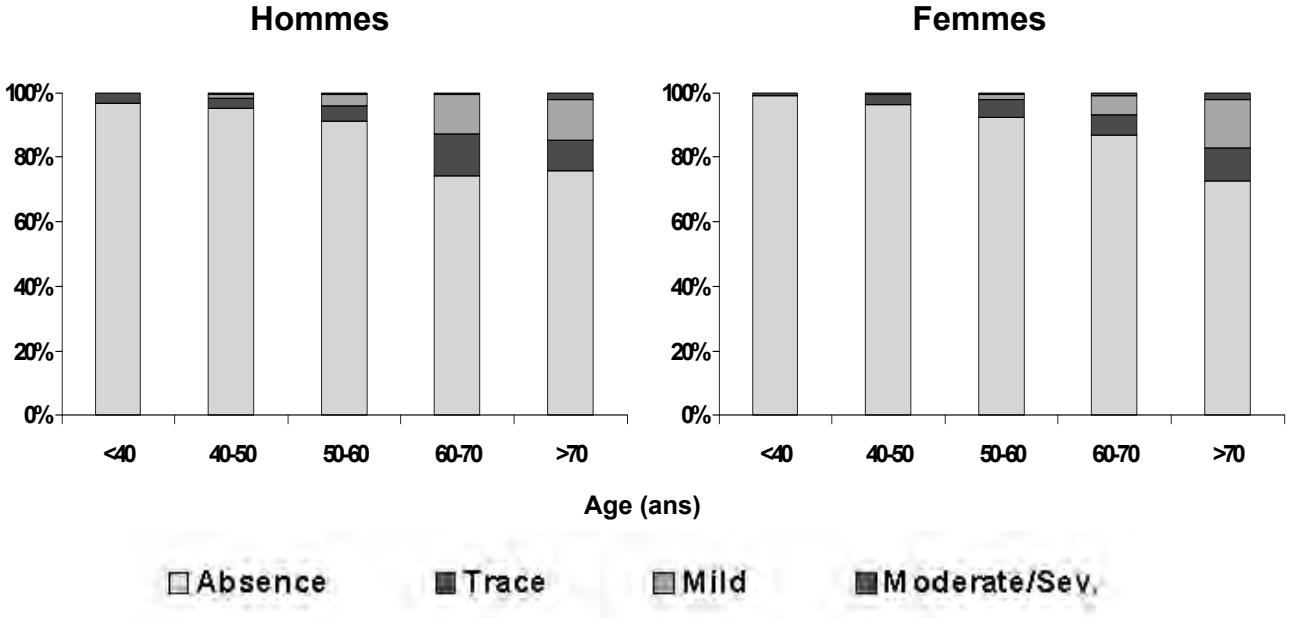


(Singh et al. Am J Cardiol 1999;83:897-902)

Valvulopathies en Population Générale

Insuffisance Aortique

3589 échocardiographies issues de la cohorte de Framingham



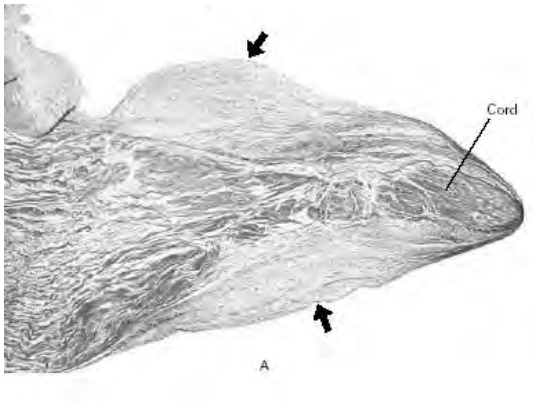
(Singh et al. Am J Cardiol 1999;83:897-902)

Critères d'imputabilité médicamenteuse

- **Échocardiographie**
  - Régurgitation plutôt que sténose, caractérisée par épaississement valvulaire et restriction de la cinétique valvulaire
  - Régurgitation au moins « *mild* » (aortique) ou « *moderate* » (mitrale) - critères FDA
- **Macroscopie**
  - Épaississement valvulaire avec plaques de fibrose blanchâtre
- **Anatomopathologie**
  - Fibrose dense en surface avec architecture valvulaire peu modifiée

Valvulopathies médicamenteuses

- valves épaissies et restrictives
- aspect macroscopique et histologique identique aux valvulopathies carcinoïdes ou secondaires au methysergide



- fibrose dense de surface sans modification de l'architecture

(Connolly N Engl J Med 1997;337:581-8)

Expertise des « cas benfluorex » : méthode

- **Cas opérés**
  - Documentation anatomique macroscopique
  - Documentation anatomopathologique
- **Cas non opérés**
  - Documentation échographique
- **Existence d'une autre cause possible**
  - Rhumatismale
  - Dégénérative
- **Autre prise médicamenteuse imputable**
  - Anorexigènes
  - Agonistes dopaminergiques
  - …/…

Expertise des « cas benfluorex »: critères

- **Fortement évocateur**
  - Anatomopathologie correspondant aux descriptions publiées
  - Pas d'autre prise médicamenteuse imputable
- **Possible**
  - Pas d'histologie
  - Échographie ou macroscopie compatible
  - Pas d'autre cause patente
- **Faible**
  - Documentation ne permettant pas de conclure
- **Très faible**
  - Autre cause très probable sur la conjonction :
    contexte clinique,
    échographie,
    ± anatomopathologie.

Expertise des « cas benfluorex » : résultats

Imputabilité	Forte	Possible	Faible	Très faible	Total
Opérés	6	6	3	2	**17**
Non-opérés, échographie		10		5	**15**
Non documentés			13		**13**
Total	**6**	**16**	**16**	**7**	***45***

Etude REGULATE
suivi échocardiographique (615 patients / 1 an)

La méthodologie, **rigoureuse, d'une grande sensibilité,**

montre :

A l'inclusion, chez les patients diabétiques en surpoids

- 51% des malades ont une ou des anomalies morphologiques prévalentes (33% aorte, 41% mitrale, 4% tricuspide)
- 84% des malades ont une ou des anomalies fonctionnelles prévalentes (17% aorte, 61% mitrale, 72% tricuspide)
- 8.9 % sans aucune anomalie

Etude REGULATE

suivi échocardiographique (615 patients / 1 an)

En final

- modification morphologique incidente chez 12 patients :

  8 Benfluorex vs 4 Pioglitazone (OR = 2.0, 95%CI [0.59 ; 6.69], p=0.26)

- modification fonctionnelle détectée chez 115 patients :

  82 Benfluorex vs 33 Pioglitazone (OR = 2.97, 95%CI [1.91 ; 4.63], p< 0.0001)

  5 patients ont une anomalie valvulaire fonctionnelle de grade ≥ 2 incidente

  2 Benfluorex vs 3 Pioglitazone (OR = 0.65, 95%CI [0.11 ; 3.94], p=0.64)

Sur le plan clinique : aucun signe ou symptôme évocateurs de valvulopathie émergente n'a été rapporté dans cette étude.

Interprétation

- Les données pronostiques et de surveillance ne concernent que les valvulopathies ≥ « *mild* »
- Les valvulopathies « *trivial* » sont considérées comme physiologiques en position mitrale ou tricuspide
- La comparaison des prévalences des valvulopathies en fonction du temps ne suggère pas un potentiel évolutif majeur des valvulopathies « *trivial* »

Recommandation de Surveillance des Valvulopathies ESC Guidelines 2007

Insuffisance mitrale

Serial testing

Asymptomatic patients with moderate MR and preserved LV function can be clinically followed-up on a yearly basis and echocardiography should be performed every 2 years.

Asymptomatic patients with severe MR and preserved LV function should be seen every 6 months and echocardiography performed every year, the follow-up being closer if no previous evaluation is available, and in patients with borderline values, or significant changes since the last visit. These patients should be instructed to promptly report any change in functional status.

Patients asymptomatiques avec IM « *moderate* » et fonction VG normale : surveillance écho tous les 2 ans

Insuffisance aortique

Serial testing

Patients with mild-to-moderate AR can be seen on a yearly basis and echocardiography performed every 2 years.

All patients with severe AR and normal LV function should be seen for follow-up at 6 months after their initial examination. If LV diameter and/or EF show significant changes, or they become close to the thresholds for intervention, follow-up should continue at 6 month intervals. When parameters are stable, follow-up can be yearly.

Patients avec IA > « *mild* » : surveillance écho tous les 2 ans

(Eur Heart J 2007; 28:230-68)

Anorexigènes et Valvulopathies

Evolution après Arrêt

- 50 patients sous anorexigènes arrêtés depuis 6 mois en moy.
  - 86% IA ≥ *mild* (grade 2) , 76% IM ≥ *mild* (grade 2)
  - Echo répétée après 1 an de délai moyen
    - Amélioration ≥ 1 grade pour 44% des IA et 54% des IM
    - Aggravation ≥ 1 grade pour 2,3% des IA et 2,6% des IM

(Mast et al. Ann Intern Med 2001;134:261-6)

- 711 patients sous anorexigènes arrêtés depuis 18 mois en moy.

	IA		IM	
	Dexfen.	Fen./Phen.	Dexfen.	Fen./Phen.
↑ ≥ 1 grade	1.7	0	3.7	3.0
Inchangé	91.9	95.5	87.6	90.6
↓ ≥ 1 grade	6.4	4.5	8.7	6.3

(Gardin et al. JAMA 2001;286:2011-4)

Conclusion

- Un signal est détecté sur les valves cardiaques

- Les propositions du laboratoire :
  - Contre indication si anomalie valvulaire
  - Surveillance échocardiographique sous traitement

Gérard BAPT
Député de la Haute – Garonne
Maire de Saint – Jean

Saint – Jean, le 13 novembre 2010

A

Monsieur Jean MARIMBERT
Directeur Général de l'AFSSAPS
143/147 Bd Anatole France
93285 SAINT DEINIS Cedex

Monsieur le Directeur Général,

J'accuse réception de votre réponse en date du 8 novembre à mon courrier du 13 septembre, et vous avoue d'emblée qu'elle me déçoit profondément.

1 – s'agissant de la formulation des comptes rendus, votre interprétation de la directive européenne 2001 – 83 – CE est très restrictive. Il n'est pas possible de mettre en rapport telle prise de position avec tel conflit d'intérêt. Il n'est pas possible non plus de savoir qui, lors du comité technique de pharmacovigilance du 10 septembre 1998 avait posé la question pertinente de la parenté chimique du Benfluorex avec les amphétaminiques…

2 – Concernant la nature chimique du Benfluorex, vous vous contentez de reprendre l'essentiel de la réponse faite par P. Schiavi, directeur de la Division Scientifique Pharmacologique de Servier, Trésorier de la Société Française de Pharmacologie, à l'interrogation du Dr D. Kowalski, du CHU de Brest, le 7 avril 2008.
Mais dès 1999, le Dr E. Fradet, du CRPV de Limoges, classe le Benfluorex dans la catégorie des anorexigènes centraux, dérivés amphétaminiques, dont on connaît les effets cardiovasculaires constatés aux USA depuis 1990. (Lyon Pharmaceutique, 1999, 50-2)
Mais dès 1978, le Dr H. Pradal décrivait, dans le « dictionnaire critique des médicaments » (éditions du Couloir) le Benfluorex comme « un dérivé de la molécule du Pondéral », coupe faim commercialisé par le même laboratoire Servier : il s'agit « d'une amphétamine modifiée par adjonction d'un radical organique » en faisant « le traitement logique des surcharges lipido glucidiques athérogènes »…Il ajoutait que « sa parenté avec les amphétamines devrait rendre très prudent en cas d'hypertension artérielle, d'insuffisance cardiaque et chez les sujets anxieux ou présentant des antécédents de suicide »…En 1998, l'URCAM de Bourgogne avait montré que 35 % des prescriptions de Médiator se faisaient hors AMM, en grande majorité chez des femmes non diabétiques, dont les 2/3 ne présentaient même pas d'obésité avérée ! La même année, l'Agence du Médicament dans un « avis aux prescripteurs d'anorexigènes », rappelait qu'en mai 1995, elle avait restreint l'utilisation de ces produits aux seules unités hospitalières spécialisées, pour s'appliquer à des obésités majeures, après échec d'un traitement diététique adapté, pour des durées de traitement n'excédant pas trois mois…en raison de « la survenue de quelques cas de maladie vasculaire pulmonaire graves et souvent mortels ». Pourquoi s'être contenté d'interdire le Benfluorex des seules prescriptions magistrales ?

Le Médiator pourtant, dans des conditions connues et très fréquentes de prescription « hors AMM » au titre de coupe-faim, a continué sa tranquille vie jusqu'en 2007, date à laquelle une restriction a supprimé l'indication de prescription pour les hypertriglycéridémies... huit ans après que son inutilité ait été signalée par la commission de pharmacovigilance de l'Afssaps et la commission de transparence !

3 – Vous m'indiquez « qu'à partir de septembre 1997, à la suite du retrait d'Isoméride et Pondéral en raison de cas de valvulopathie rapportés aux USA, une attention particulière s'est portée aussi sur le risque possible de telles complications avec Benfluorex ».
Je n'ai retrouvé aucune trace de cette attention portée aux valvulopathies dans les comptes - rendus de commissions dont j'ai eu connaissance, jusqu'aux deux simples lignes consacrées à la publication, en 2006, de l'observation toulousaine de valvulopathie sous Médiator chez une patiente de 48 ans sans antécédent. Vous indiquez à ce sujet qu'il s'agit du premier cas publié en France : il venait néanmoins après celui publié en Espagne en 2003, qui y avait conduit au retrait du Benfluorex en 2005. Vous dites considérer le lien de causalité certain sur le cas de 2006. Quelles en ont été les suites ? Pourquoi toujours aucune alerte jusqu'en 2009 ? ... Ce n'est qu'après l'initiative du Dr Frachon à Brest qu'apparaît dans les comptes - rendus une préoccupation vers les valvulopathies !

4 – Vous me proposez une évaluation rétrospective des cas de notifications spontanées vers la base de données de pharmacovigilance. Je n'ai pas eu le temps d'expertiser l'ensemble des cas que vous réfutez. Néanmoins l'un d'entre eux m'interpelle particulièrement, ayant eu l'opportunité récente d'échanger avec les deux médecins marseillais concernés. Les deux fiches de notification y sont remarquablement claires :

- La fiche n° MA 99 00 176 du 10.02.1999 du Dr Chiche, cardiologue traitant concernant un patient médecin, traité pendant six ans par deux comprimés de Médiator pour surpoids et hypercholestérolémie. Le Dr Chiche précise bien, dans la note d'accompagnement qu'il rédige le 7.02.1999 à l'intention du CRPV, que l'insuffisance aortique n'avait pas été notée par les examens de surveillance y compris coronarographie et échocardiographie réalisés après le petit infarctus du myocarde postérieur survenu en 1992 et qui avait entrainé une petite insuffisance mitrale.
Il suggère même que « le Vidal devrait mentionner l'appartenance du Benfluorex aux groupes des amphétamines, car pouvant être utilisé comme produit dopant » et rappelle sa présence sur la liste des anorexigènes fournie par l'agence du médicament !

- La fiche de transmission du 17.02.1999 du Dr Jean Pastor, du CRPV du CHU de Marseille qui validait l'imputabilité de l'insuffisance aortique au Médiator.

Il est dommage que la perspicacité du Dr Chiche n'ait été récompensée par aucun retour de la part du dispositif de pharmacovigilance...si ce n'est par la visite qu'il a reçue quelques semaines après la notification, d'un émissaire de Servier venu lui expliquer qu'aucune causalité n'existait entre valvulopathie et Médiator ! Vous m'indiquez vous – même, sur ce cas, Monsieur le Directeur, que l'on ne peut être formel en raison de l'antécédent d'infarctus du myocarde avant la prise de Médiator. Je serais curieux d'échanger avec le « cardiologue-expert » qui a indiqué qu'une insuffisance aortique pourrait avoir été causée par un infarctus du myocarde, de surcroit postérieur : il s'agirait d'une première mondiale !

Il paraît évident que si après le cas de Brest, fin 2008, de nombreux autres ont été déclarés courant 2009, en majorité à Brest et Amiens, c'est tout simplement parce qu'ils ont commencé à être recherchés à la seule initiative des médecins brestois.

J'ai moi-même pu constater auprès de mon ancien cabinet de cardiologie, mais aussi la semaine dernière encore auprès du nouveau « patron » de la chirurgie cardiaque du CHU, que le lien valvulopathie – Médiator était toujours totalement méconnu !

Annexe 3-83

Alors que deux génériques du Médiator recevaient encore leur AMM il y a moins de deux ans, tout était pourtant écrit depuis une décennie voire 30 ans si l'on relit les avertissements du Dr Pradal ancien de chez Servier et bien au fait des pratiques mensongères de ce laboratoire !

J'ai décidé d'arrêter les échanges avec l'Afssaps sur ce sujet, las que je suis d'avoir l'impression de me battre contre des moulins à vent !

Concernant les suites à donner à l'affaire du Médiator, la balle est dans le camp de la Ministre – que j'ai alertée régulièrement depuis le 28 juin – en ce qui concerne les décisions sanitaires à prendre en direction des millions de patients concernés. Elle est aussi dans le camp de la justice en ce qui concerne les dommages, trop souvent irréparables, causés aux victimes et à leurs familles. Il faut espérer que l'étude de la CNAM nous en donnera l'ampleur...

Concernant les produits de santé, ma préoccupation va désormais aller à la question des sels d'aluminium présents dans certains vaccins, et leur éventuelle imputabilité dans des affections neurodégénératives type SEP.

Concernant la sécurité sanitaire, je suis convaincu qu'une révolution démocratique s'impose, alliant la transparence du travail des commissions d'expertise, la clarté sur les conflits d'intérêt, l'exploitation systématique de toutes les bases de données existante, les moyens donnés à des études cliniques publiques, et la présence systématique de représentants des patients afin que les alertes ne soient pas annihilées par les influences marchandes.

Je vous prie d'agréer, ***Monsieur le Directeur Général***, l'expression de mes salutations.

Benfluorex, valvulopathies cardiaques et décès

Alain Weill, Michel Païta, Phillipe Tuppin, Michel Piolot

Caisse nationale de l'assurance maladie, Paris, France.

Rapport du 28/09/2010 adressé à l'Afssaps le 28/09/2010

Introduction

Quatre études observationnelles [1,2,3,4] ont montré que le benfluorex, dérivé de la fenfluramine, était significativement associé à des valvulopathies cardiaques de régurgitation mitrales et aortiques ainsi qu'à des chirurgies de remplacement valvulaire. Après exposition au benfluorex le risque de chirurgie de remplacement valvulaire cardiaque était multiplié par un facteur 4. Le mécanisme d'action rapporté est une activation des récepteurs sérotoninergiques présents à la surface des vaisseaux pulmonaires et des valves cardiaques par un métabolite toxique, la norfenfluramine [5,6,7].

Le 30 novembre 2009 l'Afssaps a suspendu l'AMM du benfluorex considérant que le rapport bénéfice-risque était défavorable compte tenu du risque avéré de valvulopathie associé à la prise de ce médicament et de son efficacité modérée dans l'indication octroyée par l'AMM : adjuvant du régime adapté chez les diabétiques avec surcharge pondérale (diabète de type 2). Suite à la décision de l'Afssaps l'European Medicines Agency (EMA) a également recommandé le 18 décembre 2009, le retrait des médicaments contenant du benfluorex dans l'Union européenne, parce que «leurs risques, notamment le risque de maladie des valvules cardiaques, sont plus importants que leurs avantages »[8].

Dans une thèse de diplôme d'État de docteur en pharmacie soutenue le 25 juin 2010 à Rennes et dont le sujet était *l'utilisation de nouveau outils en pharmacovigilance : à propos du retrait du Médiator® (benfluorex)* il est fait la mention suivante page 106 : « *En résumé, d'après les études réalisées, il semblerait qu'il y ait eu ces dernières années entre 150 et 250 hospitalisations chaque année en France, liées directement à une toxicité du Médiator et ayant entraîné une trentaine de décès. Si nous multiplions par 30 ans de commercialisation, le nombre de morts pourrait être entre 500 et 1000 morts. Ces dannés sont à tempérer. Il faudrait vérifier que le nombre de prescription a été stable au cours du temps.* »[9]
Le quotidien Le Monde a publié le 24 août 2010 un Point de vue intitulé « *Mediator : Combien de morts ?* » du député Gérard Bapt, rapporteur spécial de la mission santé pour la Commission des finances qui reprend ces informations : « *Une étude universitaire évalue entre 500 et 1000 le nombre de décès en relation directe avec le Médiator.* » [10]
A la suite de la parution de cet article l'Afssaps a saisi la CNAMTS dès le 25 août 2010 pour réaliser *une analyse épidémiologique sur une cohorte qui permettrait d'avoir un début de documentation de l'impact du benfluorex sur la mortalité.*

L'objectif de ce travail était de fournir des éléments objectifs pour savoir s'il existait une association possible entre des cas d'exposition au benfluorex et des décès consécutifs à une insuffisance valvulaire cardiaque.

2 Méthode

Nous avons réalisé une étude de suivi d'une cohorte de personnes exposées au benfluorex en 2006 à partir des données anonymes du système national d'information interrégimes de l'assurance maladie (SNIIRAM)[11,12]. A la date de ce travail nous ne disposions plus, dans le SNIIRAM, des données individuelles anonymes de consommation médicamenteuse d'avant 2006.

Toutes les personnes affiliées au régime général étaient éligibles à l'exception de celles des sections locales mutualistes (étudiants et fonctionnaires). La population source était ainsi

[10] Gérard Bapt. Point de vue : Mediator : Combien de morts ? Le monde du 24/08/2010. http://www.lemonde.fr/idees/article/2010/08/24/mediator-combien-de-morts_1402014_3232.html

[11] Tuppin P, de Roquefeuil L, Weill A, Ricordeau P, Merlière Y. French national health insurance information system and the permanent beneficiaries sample. Rev Epidemiol Sante Publique. 2010 Aug;58(4):286-90.

[12] Martin-Latry K, Bégaud B. Pharmacoepidemiological research using French reimbursement databases: yes we can! Pharmacoepidemiol Drug Saf. 2010; 19: 256-265.

composée de 48,4 millions de personnes assurées au régime général, soit environ 76% de la population résidente en France. Les personnes exposées étaient définies par le remboursement d'au moins une boite de benfluorex en 2006.

Après chaînage des données les événements recherchés dans le PMSI [médecine-chirurgie-obstétrique (MCO)] de la période 2006 à 2009 étaient une ou plusieurs hospitalisations pour une insuffisance valvulaire toutes valves cardiaques et toutes causes confondues (tableau 1).

Tableau 1 : critères utilisés pour définir la maladie valvulaire cardiaque de régurgitation

	PMSI MCO avec un diagnostic principal ou relié =
hospitalisation pour insuffisance valvulaire	I340 Insuffisance (de la valvule mitrale) non rhumatismale I051 Insuffisance (de la valvule mitrale) rhumatismale I351 Insuffisance (de la valvule) aortique non rhumatismale I061 Insuffisance (de la valvule) aortique rhumatismale I361 Insuffisance (de la valvule) tricuspide non rhumatismale I071 Insuffisance (de la valvule) tricuspide rhumatismale

Nous avons recherché pour chacune de ces personnes le statut vital jusqu'au 31 juillet 2010, soit un suivi de 55 mois. Le décès dans le SNIIRAM est connu pour les personnes du régime général (hors fonctionnaires et étudiants), à partir des données issues du statut vital Insee. Ces données sont alimentées par les fichiers du Répertoire national des identifiants des personnes physiques (RNIPP) puis du RNIAM (Répertoire national des identifiants de l'assurance maladie), du RFI (Référentiel individus) et enfin du SNIIRAM. Tous les décès certifiés par l'Insee sont transmis au RNIAM. Ce RNIAM est aussi enrichi de décès dit « non certifié » par l'INSEE (par exemple personne née à l'étranger, résidant en France et décédant à l'étranger).

Nous avons étudié pour chaque personne décédée toutes les hospitalisations à partir du PMSI (Groupe homogène de malade (GHM), diagnostic principal et relié, durée de chaque séjour, ainsi que le mode de sortie : transfert, domicile ou décès). Il existait environ 800 codes dans la nomenclature des GHM sur la période 2006-2008 (PMSI V9 puis V10) et près de 2 300 en 2009 (PMSI V11). L'hypothèse implicite est que les éléments médicaux contenus dans le résumé standardisé anonymisé (RSA) du PMSI, notamment pour les hospitalisations conduisant au décès, vont permettre de connaître la cause la plus probable du décès.

Deux exemples illustrent cette démarche.
Cas n° 1 : homme de 78 ans décédé en soins palliatifs avec un diagnostic de leucémie myéloïde chronique. La cause du décès retenue est une leucémie myéloïde chronique.
Cas n° 2 : femme de 53 ans décédée au cours d'une hospitalisation pour insuffisance de la valvule aortique non rhumatismale et insuffisance de la valve mitrale avec une chirurgie de remplacement valvulaire sous circulation extracorporelle. Cette hospitalisation suivait une

précédente en cardiologie avec un acte diagnostic de cathétérisme cardiaque avec un diagnostic d'insuffisance de la valvule aortique non rhumatismale et insuffisance de la valve mitrale. La cause du décès retenue est l'insuffisance valvulaire mitrale et aortique.
Pour chaque cas de décès l'ensemble des hospitalisations étaient analysées. Par ailleurs nous avons recueilli la notion d'Affection de Longue durée (ALD) avec le diagnostic (code CIM-10) et la date de début, la quantité de benfluorex délivrée entre le 1er janvier 2006 et la date du décès et les traitements antidiabétiques et anticoagulants.

En définitive la détermination des causes supposées de décès à l'aide du PMSI a répondu en règle générale au schéma suivant[13] :
Si le décès avait eu lieu à l'hôpital, la cause de décès supposée correspondait au diagnostic principal du séjour au cours duquel le décès est survenu, quand le code CIM 10 de ce diagnostic principal était une maladie. Lorsque le code CIM 10 était un traitement (chimiothérapie, radiothérapie...), on utilisait alors le diagnostic relié pour déterminer la cause de décès supposée (par exemple cancer du poumon).
Si le décès n'avait pas eu lieu à l'hôpital mais que l'individu avait été hospitalisé au cours des quatre derniers mois (c'est-à-dire au cours du mois de décès ou de l'un des trois mois précédents), on utilisait de la même manière les diagnostics principaux et reliés des deux derniers séjours à l'hôpital.
Si le décès n'avait pas eu lieu à l'hôpital et que l'individu n'avait pas été hospitalisé au cours des quatre derniers mois, la cause de décès retenue était déterminée de façon probabiliste en tenant compte des affections les plus graves. Il était tenu compte des comorbidités, notamment potentiellement létales comme les tumeurs et affections malignes, les autres pathologies cardiovasculaires et différents facteurs pouvant avoir une influence sur le décès (âge...).
A la date de ce travail nous ne disposions pas du PMSI 2010. Pour les décès survenus à la fin du premier semestre 2010 la cause était le plus souvent ignorée. Dans quelques cas néanmoins l'analyse de l'ensemble des hospitalisations de 2006 à 2009 a permis de donner des éléments d'orientation. Cette méthode de détermination des causes probables de décès produit un biais dû au fait que seuls les décès précédés d'une hospitalisation sont parfaitement documentés. En particulier, elle ne permet de renseigner aucun décès brutal à domicile ou sur la voie publique : AVC, arrêt cardiaque sur trouble du rythme, suicide, accident....

L'utilisation du SNIIRAM par les agents habilités de la CNAMTS a fait l'objet d'un avis favorable de la Cnil en novembre 2001 et d'un arrêté ministériel du 11 avril 2002 relatif à sa mise en œuvre. En octobre 2007, un second arrêté a permis l'utilisation de la variable décès

[13] Cette méthode de détermination des causes probables de décès a été utilisée pour un travail médico-économique : Myriam Mezzarobba. Les coûts de le dernière année de vie en 2008 et ses conséquences pour les dépenses de santé. DSES, Caisse nationale de l'assurance maladie.

avec la date exacte issue des données de statut vital de l'Insee et de la Caisse nationale de l'assurance vieillesse. Le statisticien ayant extrait les données était habilité « *profil 30* » pour le croisement de données médicales sensibles.

Les traitements des données ont été réalisés avec le logiciel SAS version 9.01.

3 Résultats

3.1. Description de la population de la cohorte

L'étude portait sur 303 259 personnes exposées au benfluorex en 2006 dont 72,6% de femmes (tableau 2). L'âge moyen était de 52,8 ans.

Tableau 2 : caractéristiques d'âge et de sexe des personnes exposées au benfluorex en 2006

classe d'âge	hommes	femmes	Total
0-19	630	2 314	2 944
20-24	677	5 273	5 950
25-29	1 303	9 136	10 439
30-34	2 458	13 169	15 627

3.2 Hospitalisations pour valvulopathie cardiaque par régurgitation et décès dans la cohorte des exposés

Parmi les 303 259 personnes 556 avaient été hospitalisées au moins une fois pour valvulopathie cardiaque par régurgitation durant la période 2006-2009 soit 184 pour 100 000 (46 pour 100 000 personnes-années). Pour 303 (54%) la ou les hospitalisations étaient motivées par une insuffisance de la valvule mitrale, pour 270 (48%) une insuffisance aortique et pour 77 (18%) une insuffisance tricuspidienne. Le total est supérieur à 100% en raison des atteintes polyvalvulaires.

Parmi les 556 personnes hospitalisées une ou plusieurs fois pour valvulopathie cardiaque par régurgitation durant la période 2006-2009 on a observé 58 décès (10,4%) en 55 mois (figure 1). Les taux de décès observés pour les différentes valvulopathies étaient respectivement de 12,5% pour les atteintes de la valve mitrale et de 7,4 % pour les atteintes de la valve aortique.

Dans le sous-groupe des 180 patients ayant eu une chirurgie de remplacement valvulaire pour insuffisance valvulaire 17 patients étaient décédés (9,4%).

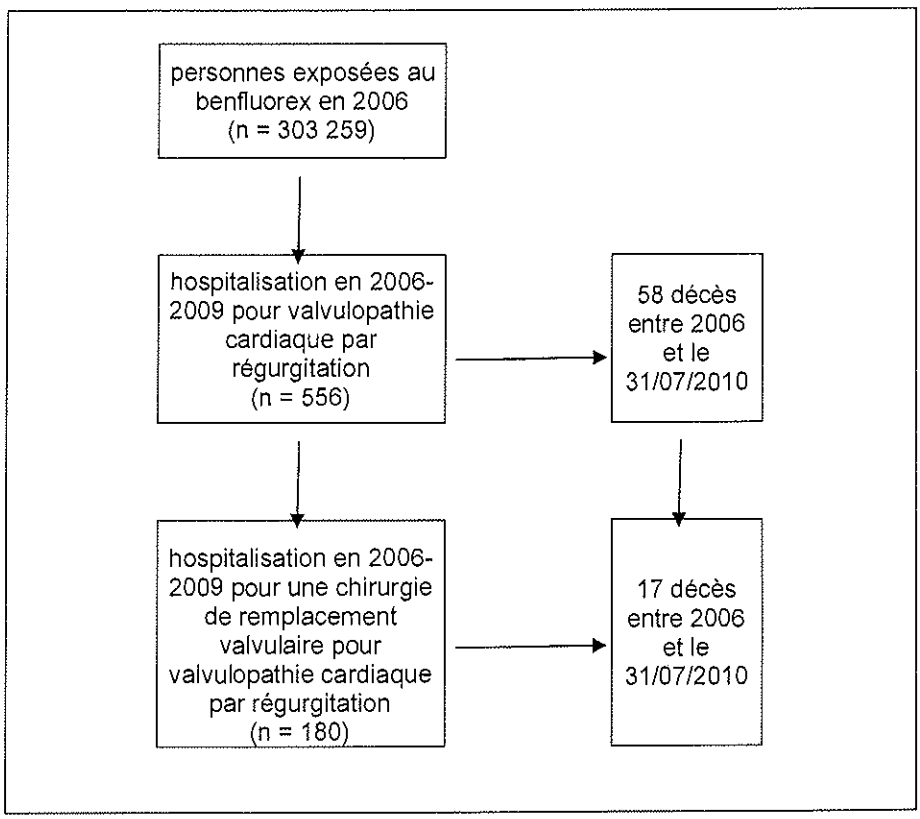

Figure 1 : suivi de la cohorte des personnes traitées pour benfluorex du 1er janvier 2006 au 31 juillet 2010. *Données SNIIRAM régime général hors SLM*

L'insuffisance valvulaire des personnes décédées était 54 fois décrite comme non rhumatismale et 13 fois rhumatismale (tableau 3). Parmi les 58 patients la valvulopathie était constamment codée comme non rhumatismale pour 47 d'entre eux, rhumatismale pour 7 et tantôt rhumatismale et non rhumatismale selon les hospitalisations pour 4 personnes.

Table 3 : type de valvulopathies codées dans le PMSI pour les valvulopathies cardiaques par régurgitation des personnes exposées au benfluorex en 2006 et décédées

CIM-10	libellé	effectif
I340	Insuffisance (de la valvule) mitrale (non rhumatismale)	32
I351	Insuffisance (de la valvule) aortique (non rhumatismale)	18
I051	Insuffisance mitrale rhumatismale	9
I361	Insuffisance non rhumatismale (de la valvule) tricuspide	4
I061	Insuffisance aortique rhumatismale	2
I071	Insuffisance tricuspidienne (rhumatismale)	2
	total des valvulopathies	67

Presque la moitié des 58 décès sont survenus en 2008 (23 décès). L'histogramme suivant présente la répartition selon la date du décès des personnes exposées au benfluorex en 2006 et ayant eu une hospitalisation dans la période 2006-2009 pour valvulopathie cardiaque par régurgitation. Les 9 décès en 2010 correspondaient à un suivi du statut vital jusqu'au 31 juillet 2010, soit 7/12ème d'une année pleine (figure 2). La figure 3 présente les mêmes données sous forme d'une courbe de survie avec son intervalle de confiance.

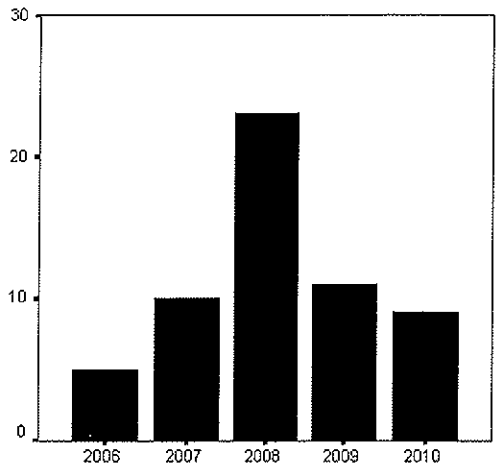

Figure 2 : histogramme présentant la répartition selon l'année du décès des personnes exposées au benfluorex en 2006 et ayant eu une hospitalisation dans la période 2006-2009 pour valvulopathie cardiaque par régurgitation (n = 58) *Données SNIIRAM régime général hors SLM*

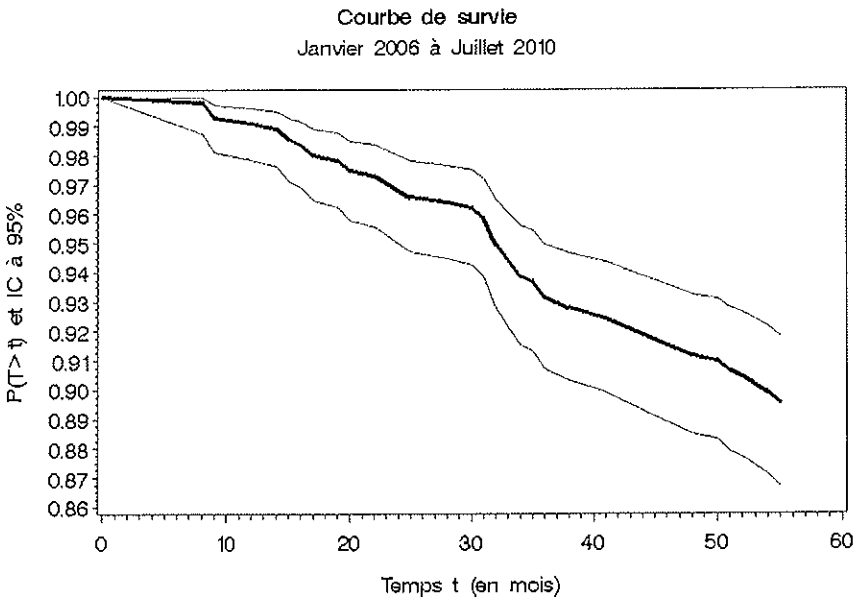

Méthode : Courbe de Kaplan–Meier (PROC LIFETEST de SAS)

Figure 3 : Courbe de survie de Kaplan-Meier des personnes exposées au benfluorex en 2006 et ayant eu une hospitalisation dans la période 2006-2009 pour valvulopathie cardiaque par régurgitation (n = 556) *Données SNIIRAM régime général hors SLM*

3.3 Etude des causes probables du décès

L'âge moyen des 58 personnes décédées était de 69 ans au jour du décès (extrême de 38 à 88 ans). Il y avait 36 femmes (62%) pour 22 hommes (38%). On retrouvait dans le PMSI en moyenne 9 séjours hospitaliers entre 2006 et le jour du décès. En moyenne les 58 patients avaient eu 165 grammes de benfluorex remboursés (extrême 4,5 grammes à 490 grammes, soit 1 à 109 boites entre le 1er janvier 2006 et le décès).

Plus de 90% des patients, soit 53 sur 58 patients, étaient en affection de longue durée (ALD) à la date du décès : la plupart des personnes étaient en ALD pour pathologie cardiovasculaire et/ou diabète. Il est notable de constater que six patients étaient en ALD pour affection psychiatrique de longue durée : épisodes dépressifs (3), troubles spécifiques de la personnalité (2) et psychose non organique (1). Pour deux personnes le diagnostic exact de l'ALD n'a pu être retrouvé.

Tableau 4 : nature des affections de longue durée des 58 patients décédés (à la date du décès)

Libelle de l'ALD	effectif
Insuffisance cardiaque grave, troubles du rythme graves, cardiopathies valvulaires graves, cardiopathies congénitales graves	24
Diabète de type 1 et diabète de type 2	19
Hypertension artérielle sévère	9
Maladie coronaire	9
Affections psychiatriques de longue durée	6
Artériopathies chroniques avec manifestations ischémiques	5
Tumeur maligne, affection maligne du tissu lymphatique ou hématopoïétique	5
Insuffisance respiratoire chronique grave	4
Polyarthrite rhumatoïde évolutive grave	2
Accident vasculaire cérébral invalidant	1
Déficit immunitaire primitif grave nécessitant un traitement prolongé et infection par le VIH	1
Néphropathie chronique grave et syndrome néphrotique primitif	1
Polypathologie invalidante	1
Spondylarthrite ankylosante grave	1

Données SNIIRAM régime général hors SLM

L'analyse de la consommation médicamenteuse montrait que 28 patients (48%) avaient consommé des antidiabétiques (hors benfluorex), 35 (60%) des anticoagulants de type antivitamines K (avec 17 délivrances médicamenteuses en moyenne) et 23 (40%) des héparíniques. Les deux tiers des personnes soit 39 (67%) des 58 avaient consommé soit des AVK soit de l'héparine.

Le tableau suivant présente les causes probables de décès des 58 personnes.

Tableau 5 : caractéristique d'âge et sexe, cause probable du décès de 58 personnes ayant consommé du benfluorex en 2006 et ayant été hospitalisées au moins une fois pour insuffisance valvulaire cardiaque sur la période 2006-2009

Cas n°	sexe	âge au décès	Conso benflu (grs) 2006 au décès.	nb hospit de 2006 au décès	cause la plus probable du décès	circonstance du décès
1	homme	70-74	9,0	41	Leucémie myéloïde aiguë	Leucémie myéloïde aiguë sous chimiothérapie
2	homme	65-69	216,0	10	Endocardite infectieuse précédant une insuffisance des valvules mitrale et aortique	décès hospitalier en post chirurgie valvulaire sous CEC
3	femme	70-74	94,5	5	Insuffisance des valvules mitrale et aortique	décès hospitalier en post chirurgie valvulaire sous CEC
4	femme	65-69	99,0	1	Insuffisance de la valvule mitrale	décès non hospitalier 5 mois après une hospitalisation pour ins mitrale sans notion d'aucune autre pathologie
5	homme	75-79	4,5	4	myopathie	décès hospitalier 1 mois après une chirurgie valvulaire mitrale sous CEC dans un contexte de myopathie
6	homme	75-79	40,5	4	Cardiovasculaire (insuffisance mitrale + sténose carotidienne)	décès non hospitalier 2 ans après une chirurgie de remplacement valvulaire mital
7	femme	65-69	490,5	6	cardiovasculaire : ins card et insuffisance mitrale	décès 7 mois après une hospit. pour insuffisance mitrale (PMSI 2010 absent)
8	femme	75-79	81,0	8	Ins. valvulaire mitrale, aortique et tricuspidienne	décès hospitalier en post chirurgie valvulaire sous CEC
9	femme	75-79	220,5	3	Insuffisance de la valvule mitrale	décès hospitalier en post chirurgie valvulaire sous CEC
10	femme	65-69	40,5	11	Tumeur maligne de l'encéphale	décès hospitalier avec un diagnostic de tumeur maligne de l'encéphale
11	femme	75-79	337,5	4	tumeur maligne utérus	décès hospitalier post chirurgical pour tumeur maligne utérus – contexte d'insuffisance mitrale
12	femme	60-64	13,5	9	Inconnue	décès non hospitalier ; contexte de tumeur maligne du sein (chimio) et d'insuffisance de la valve aortique
13	femme	55-59	472,5	5	Trouble vascul. aigu de l'Intestin	décès hospitalier au cours d'un séjour trouble vasculaire intestinaux avec un contexte d'insuffisance mitrale et d'infarctus 2 mois auparavant
14	femme	75-79	9,0	8	tumeur maligne secondaire des os et de la moelle	décès hors hôpital avec tumeur maligne secondaire ; chirurgie valvulaire 2 années avant
15	femme	60-64	54,0	2	Insuffisance cardiaque et état de choc circulatoire	décès hospitalier pour ins cardiaque 6 mois après un cathétérisme cardiaque pour ins mitrale ; pas d'autres pathologies retrouvées

16	femme	75-79	31,5	9	septicémie	décès hospitalier 7 mois après une 2ème chirurgie de remplacement valvulaire sous CEC (nombreuses complications endocardite, hémorragie, septicémie avec insuffisance rénale et cardiaque)
17	homme	55-59	310,5	8	tr du rythme	décès hospitalier pour tr de rythme et insuffisance cardiaque, ins. mitrale, VIH et carcinome hépatocellulaire
18	femme	70-74	13,5	10	insuffisance mitrale	décès hospitalier en post chirurgie valvulaire mitrale sous CEC ; contexte de cardiopathie hypertensive préalable
19	femme	60-64	310,5	13	tr du rythme	décès en 2010 (PMSI 2010 manquant) mais tableau caractéristique, insuffisance cardiaque, insuffisance aortique, hypertension artérielle pulmonaire (HTAP)
20	homme	60-64	189,0	2	insuffisance aortique.	décès hospitalier en post chirurgie valvulaire sous CEC ; aucune autre pathologie mentionnée
21	homme	70-74	202,5	13	tumeur maligne du cardia	décès soins palliatifs pour tumeur maligne
22	homme	70-74	153,0	43	insuffisance rénale et diabète	décès d'un patient diabétique dialysé
23	femme	55-59	297,0	12	Insuffisance tricuspidienne	décès hospitalier en post intervention card sous CEC pour insuffisance tricuspidienne ; ins mitrale et cardiaque connues
24	homme	55-59	13,5	8	IRC terminale	décès hospitalier dans un tableau IRC, insuffisance cardiaque 20 mois après remplacement valvulaire mitral ; insuffisance mitrale, insuffisance cardiaque, tr du rythme
25	femme	60-64	27,0	2	tr lignée érythrocytaire	décès non hospitalier ; insuffisance mitrale,
26	homme	55-59	288,0	3	insuffisance cardiaque	décès hospitalier en post chirurgie valvulaire mitrale sous CEC
27	homme	60-64	189,0	7	insuffisance mitrale	décès hospitalier en chirurgie cardiaque sous CEC pour insuffisance mitrale ; contexte de bronchopathie chronique
28	femme	70-74	72,0	2	insuffisance mitrale	décès hospitalier en post chirurgie valvulaire mitrale sous CEC
29	femme	80-84	207,0	3	encéphalopathie, insuffisance mitrale	décès non hospitalier
30	homme	65-69	297,0	13	Suite de péritonite	décès hospitalier par péritonite, stomie.13 mois après chirurgie valvulaire sous CEC ; insuffisance mitrale, insuffisance ventriculaire gauche
31	femme	75-79	337,5	8	infarctus	décès hospitalier par infarctus du myocarde ; insuffisance mitrale et insuffisance ventriculaire gauche
32	femme	85-89	4,5	7	anémie hémolytique	décès non hospitalier ; circonstances imprécises ; notion d'insuffisance valvulaire mitrale, insuffisance ventriculaire gauche

33	homme	70-74	301,5	73	insuffisance rénale terminale	décès d'un patient dialysé et avec une tumeur maligne (chirurgie majeure) ; tumeur maligne du caecum
34	femme	60-64	90,0	8	insuffisance mitrale	décès au cours du mois suivant une chirurgie valvulaire mitrale sous CEC ; contexte d'apnée du sommeil
35	femme	65-69	121,5	5	Insuffisance mitrale	décès hospitalier post chirurgical de remplacement valvulaire mitral
36	femme	60-64	351,0	2	insuffisance mitrale	décès en 2010 deux ans après un cathétérisme pour insuffisance mitrale (absence PMSI 2010)
37	femme	55-59	94,5	4	insuffisance mitrale	décès hospitalier en post chirurgie cardiaque pour insuffisance mitrale, ins cardiaque
38	femme	70-74	252,0	3	hémorragie intracérébrale hémisphérique	décès hospitalier pour hémorragie cérébrale 3 mois après une prise en charge pour insuffisance aortique
39	femme	75-79	130,5	3	choc cardiogénique	décès 2 ans par chirurgie de remplacement valvulaire par choc cardiogénique sans infarctus, sans autres pathologies
40	femme	80-84	189,0	1	insuffisance valvulaire aortique	décès hospitalier au cours d'une hospitalisation pour insuffisance aortique
41	femme	75-79	342,0	2	insuffisance valvulaire aortique	décès 2 mois après 2 hospitalisations pour insuffisance de la valve aortique
42	homme	85-89	49,5	2	insuffisance valvulaire tricuspide	décès hospitalier au cours d'une hospitalisation pour ins. valvulaire tricuspide
43	femme	75-79	202,5	12	insuffisance rénale	décès hospitalier au cours d'une hospitalisation avec ins rénale terminale et pancréatite ; contexte de valvulopathie aortique avec nombreuses hospitalisations
44	homme	55-59	72,0	3	ischémie cérébrale	décès hospitalier dans le mois suivant une chirurgie valvulaire sous CEC ; ins mitrale
45	femme	80-84	144,0	16	Ins respiratoire aiguë	décès en 2010 (pas de PMSI disponible pour 2010) ; oedème pulmonaire, ins card, ins valv. aortique
46	femme	75-79	121,5	6	lésion traumatique intracrânienne	décès hospitalier avec lésion cérébrale anoxique
47	femme	75-79	81,0	5	inconnue	décès en 2010 trois ans après une chirurgie pour insuffisance tricuspidienne (PMSI 2010 absent)
48	homme	65-69	54,0	3	patho cardiaque, insuffisance aortique	décès en 2010 27 mois après une chirurgie pour insuffisance aortique ; pas de pathologie autre déclarée en ALD
49	homme	55-59	72,0	5	inconnue	décès en 2010 4 ans après une chirurgie pour ins mitrale
50	homme	65-69	198,0	2	myocardiopathie ischémique	décès hospitalier en post chirurgie valvulaire mitrale sous CEC

51	homme	70-74	472,5	12	tr du rythme	décès hospitalier après 11 hospitalisations en cardiologie par trouble du rythme/ ins. ventriculaire G, chirurgie de rempl. valvulaire sous CEC ; , insuffisance cardiaque, insuffisance aortique et mitrale
52	homme	65-69	225,0	9	abcès de la rate	décès hospitalier dans les suites d'une endoscopie biliaire (abcès de la rate)
53	homme	80-84	99,0	7	insuffisance ventriculaire gauche	décès en 2010 ; 6 mois après une hospitalisation par ins ventr G et 3 ans après remp. val sous CEC ; autres pathologies connues bénignes
54	femme	80-84	252,0	3	endocardite	décès hospitalier pour endocardite inf après 2 transferts pour insuffisance aortique et embolie pulmonaire
55	femme	75-79	265,5	15	ins card congestive : ins aortique et mitrale	décès hospitalier pour insuffisance cardiaque 23 mois après une chir urgie de remplacement valvulaire (IM et Iao)
56	femme	55-59	229,5	6	embolie et thrombose des artères des MI	décès hospitalier embolie et thrombose des artères des MI au cours d'une intervention de chir. asc. Contexte insuffisance mitrale
57	femme	35-39	13,5	5	cardiovasculaire	décès 4 mois après chirurgie de rempacementl valvulaire tricuspidienne + Aortique et 2 mois après thrombose intracardiaque
58	homme	65-69	135	6	cardiovasculaire	décès non hospitalier 15 mois après chirurgie de remplacement valvulaire mitrale

4 Discussion

Cette étude montre qu'au sein de la population du régime général des consommations de benfluorex en 2006 étaient associées, dans les 55 mois suivant, à des valvulopathies cardiaques à l'origine de décès. Des atteintes plurivalvulaires sans contexte cardiologique préalable, des lésions de la tricuspide, l'âge relativement jeune de certains patients et un cas associé de valvulopathie et d'HTAP sont autant d'éléments qui pourraient conforter une hypothèse causale.

Plusieurs facteurs doivent être pris en compte :

1. la population concernée correspondait à 76% de la population résidente en France. Un facteur correctif de 1,33 devrait être appliqué pour extrapoler à la France entière.

2. Un deuxième élément est le codage des valvulopathies lors des hospitalisations. Il n'est pas exclu que des hospitalisations pour insuffisance valvulaire soit codées en rétrécissement valvulaire qui est presque 10 fois plus fréquent (source PMSI : Agence Technique de l'Information sur l'Hospitalisation (ATIH)[14]). Pour 180 remplacements valvulaires de notre cohorte le diagnostic d'insuffisance était mentionné, mais pour 350 autres remplacements valvulaires non pris en compte dans la présente analyse un diagnostic de rétrécissement ou sténose était indiqué. Dans certains cas rapportés les lésions valvulaires (remaniements importants) peuvent débuter par aspect de pseudo-sténose, notamment pour la valve aortique. Un des 58 patients présentait d'ailleurs un diagnostic de sténose de la valvule aortique avec insuffisance (I352 ; code non pris en compte dans notre étude) puis lors d'une hospitalisation ultérieure un diagnostic d'insuffisance de la valvule aortique (I351).

3. Certaines des valvulopathies rapportées sont décrites comme rhumatismales (pour 7 patients) et d'autres codées à la fois, selon les séjours, comme rhumatismale et non rhumatismale pour 4 personnes. Plusieurs experts interrogés s'accordent sur le caractère très imprécis de l'utilisation d'un code (non rhumatismal) ou de l'autre (rhumatismal), particulièrement pour d'éventuelles valvulopathies médicamenteuses opérées qui restent des pathologies extrêmement rares à l'échelle d'un chirurgien cardiovasculaire qui bien souvent ne pourra en préciser l'étiologie. De plus les cas d'insuffisance mitrale d'origine rhumatismales sont très rares dans la population française, mais ne peuvent être exclus pour des populations d'origine nord-africaine. En raison du caractère anonyme de ces données nous ignorons le pays de naissance des personnes concernées.

[14] Site de l'Agence Technique de l'Information sur l'Hospitalisation. http://www.atih.sante.fr/

4. Un suivi plus long serait nécessaire avec notamment le devenir des chirurgies de remplacement valvulaire, ainsi d'ailleurs que les complications des traitements associés (anticoagulants). La mortalité post-opératoire ne dépend pas du type de valves (mécaniques ou bioprothèses) mais essentiellement du type d'orifices traités[15]. Ainsi la mortalité hospitalière à 30 jours serait de 3 % pour un remplacement valvulaire aortique, 4 à 8 % pour un remplacement valvulaire mitral et 10 à 15 % pour un double remplacement mitro-aortique. La mortalité post-opératoire immédiate est essentiellement liée à l'état préopératoire et à l'âge du patient. Un des facteurs prédictif de mortalité constamment mis en avant est l'âge après 70 ans.
Globalement dans la littérature la survie moyenne à 10 ans après remplacement valvulaire aortique est de 60 à 70 %[16] ; elle est inférieure après remplacement valvulaire mitral (40 à 50 %). Nous retrouvons également une mortalité mitrale (12,5 %) supérieure à celle des remplacements aortiques (7,5 %) avec un recul moyen d'environ deux années. Soulignons que le calcul de nos taux de mortalité ne respecte pas strictement la méthodologie complexe conforme au *Guideline for reporting morbidity and mortality after cardiac valve operations*[17].

5. Une analyse plus fine des complications de l'insuffisance cardiaque et des valvulopathies avec un retour au dossier médical serait peut-être plus performante que notre méthode. On peut imaginer de retrouver les comptes rendus d'anatomopathologie des valves cardiaques remplacées par des prothèses. Toutefois la mise en œuvre prendrait plusieurs mois (ou années) sans compter un dossier informatique et liberté *a priori* très complexe car les données du SNIIRAM sont irréversiblement anonymes. Il est probable qu'il faille recourir à un décret en conseil d'Etat. Les complications les plus classiques comme les accidents de thromboses valvulaires, les maladies thromboemboliques, l'altération de la prothèse valvulaire, les complications hémorragiques et la contribution d'anémies hémolytiques sévères (un cas dans notre série) devraient être prise en compte. La question des décès brutaux sur la voie publique ou à domicile qu'il est recommandé d'inclure systématiquement dans les complications pour les registres de suivi de remplacement valvulaire mérite d'être mieux analysée que dans notre observation.

Ad Hoc Liaison Committee for Standardizing Definitions of Prosthetic Heart Valve Morbidity of The American Association for Thoracic Surgery and The Society of Thoracic Surgeons. J Thorac Cardiovasc Surg. 1996 Sep;112(3):708-11.

6. La prise en compte de l'hypertension artérielle pulmonaire (HTAP) (autre complication des fenfluraminiques avec des cas rapportés dans la littérature en lien avec le benfuorex)[18,19] pourrait augmenter le nombre de décès observé. Dans les 58 cas de valvulopathies présentées avec décès il existait un cas associé d'HTAP.

[18] EUROPEAN COMMISSION DECISION of 14.6.2010 concerning, in the framework of Article 107 of Directive 2001/83/EC of the European Parliament and of the Council, the marketing authorisations for medicinal products for human use which contain the active substance "benfluorex"

[19] Boutet K, Frachon I, Jobic Y, et al. Fenfluramine-like cardiovascular side-effects of benfluorex. Eur Respir J 2009 Mar; 33: 684-8.

Plusieurs facteurs pourraient être minorants

1. Tout d'abord toutes les valvulopathies de régurgitation ne sont pas associées au benfluorex. Le risque relatif ajusté était de 4 dans une population de diabétiques [4]. Il conviendrait d'appliquer un facteur correctif de 0.80.

2. Il n'est pas exclu que des expositions antérieures avec des fenfluraminiques retirés du commerce en 1997 aient pu provoquer des centaines de valvulopathies. L'hypothèse du benfluorex potentialisant après une courte exposition (et une faible dose) un premier effet de fenfluraminiques retiré du commerce depuis 1997 serait à tester.

3. Un autre point est celui d'une estimation par les autorités sanitaires sur plusieurs années à partir d'une cohorte d'exposés en 2006. Les patients sous benfluorex sont souvent restés plusieurs années sous traitement. L'assurance maladie ignore la durée moyenne par patient de la prise du benfluorex en France sur les trente dernières années ainsi que les quantités de benfluorex délivrés en France entre 1976 et 2000[20]. D'autres bases seraient susceptibles de répondre à ces questions.

4. La recherche des causes médicales de décès par le PMSI n'est pas la méthode de référence en France où la déclaration du décès est systématique avec un certificat médical complété par un médecin. La cause du décès est mentionnée *(maladie(s) ou affection(s) morbides ayant directement provoqué le décès - en dernière ligne la cause initiale) et dans la partie suivante - Autres états morbides, facteurs ou états physiologiques ayant contribué au décès).* Les données sur les causes médicales de décès constituent une source essentielle d'informations épidémiologiques avec la base nationale des causes médicales de décès, élaborées annuellement par le CépiDc-Inserm. Les différentes causes sont codées et catégorisées selon la Classification internationale des maladies [21,22]. La procédure habituelle dans les cohortes de recherche du statut vital et de la cause de décès est décrite dans le décret n° 98-37 autorisant l'accès aux données relatives au décès des personnes inscrites au Répertoire National d'Identification des Personnes Physiques (RNIPP) dans le cadre des recherches dans le domaine de la santé[23]. Mais ce dispositif ne peut s'appliquer dans notre cas, les données du SNIIRAM étant anonymes.

---

[20] Le codage dans les bases de l'assurance maladie des médicaments remboursés a débuté en mars 1997 et est devenu presque exhaustif en 2000.

[23] Procédure décrite : http://ifr69.vjf.inserm.fr/svcd.html

Le projet du chaînage des données anonymes du PMSI, du SNIIRAM et des causes médicales de décès a progressé avec des tests concluants : une convention tripartite (Drees, CépiDc-Inserm et CNAMTS) est en cours de signature avec une demande à la Cnil. Il est parfaitement concevable de suivre les personnes de cette cohorte (au moins les 556 personnes hospitalisées pour valvulopathie en utilisant les causes médicales de décès du CépiDc-Inserm : risque thromboembolique des prothèses mécaniques et le risque associé des anticoagulants notamment. Ces éléments permettront de compléter les dossiers pour lesquels la cause du décès était très incertaine.

Un dernier point pourrait être discuté : l'absence de groupe contrôle. Nous considérons comme acquis le lien entre benfluorex et valvulopathie après quatre études observationnelles avec des méthodologies très différentes, un mécanisme d'action décrit et les conclusions des autorités sanitaires française et européenne. Notre objectif était de vérifier s'il y avait ou non des consommations de benfluorex associées à des valvulopathies de régurgitation avec décès.

Une autre application de ce travail pourrait être la mesure du taux de notifications spontanées rapporté au nombre de cas observés pour différentes situations : par exemple benfluorex avec valvulopathie de régurgitation hospitalisée ; benfluorex et décès au cours d'une hospitalisation pour valvulopathies de régurgitation.

5. Conclusion

Le suivi, à partir du SNIIRAM, pendant 55 mois de 303 000 patients sous benfluorex en 2006 montre qu'il existait des cas de valvulopathie cardiaque avec décès associés au benfluorex. Un suivi à plus long terme et un chaînage avec les causes médicales de décès devrait permettre de mieux estimer le nombre de décès en France pour les effets indésirables graves de cette molécule. La connaissance précise de la quantité de benfluorex commercialisée en France en 33 années, devrait également améliorer l'estimation globale du risque.

Ce travail a été réalisé à la Caisse natianale de l'assurance maladie à la suite de la saisine de l'Afssaps le 25/8/2010.

Déclaration de conflit d'intérêt : les auteurs de ce travail sont salariés de la caisse nationale de l'assurance maladie (établissement public) ; aucun des auteurs de ce rapport n'a perçu dans les trois dernières années de revenu d'une entreprise de l'industrie pharmaceutique commercialisant un antidiabétique.

Annexe 3-85

Note complémentaire destinée à l'Afssaps : benfluorex et décès

CNAMTS-DSES-DEPP
(Département des études sur les pathologies et les patients)

Cette note complète et précise la précédente note intitulée « *Benfluorex, valvulopathies cardiaques et décès* » demandée par l'Afssaps le 25/8/2010 et transmise à cette dernière le 28/9/2010 par la Cnamts.

1 Introduction

La mise en œuvre de cette analyse complémentaire a été décidée lors de la réunion à l'Afssaps du 20/10/2010. L'objectif spécifique était de compléter les recherches précédentes en incluant une étude plus approfondie sur les atteintes pluri-valvulaires (deux ou trois valves cardiaques atteintes). Ce travail complémentaire s'inscrivait dans l'objectif plus général de mieux caractériser d'éventuels critères de risque d'événements indésirables graves au sein de la population exposée au benfluorex.

2 Méthode

Ce travail complémentaire a nécessité une approche méthodologique modifiée par rapport à celle de la précédente note du 28/09/2010. Schématiquement les apports supplémentaires ont consisté à analyser plus précisément les lésions multivalvulaires. Nous les avons caractérisées, à la fois par les actes chirurgicaux détaillés (CCAM), et par la recherche associée des codes CIM-10[1] en I08 (maladies multivalvulaires cardiaques) ; enfin les complications à type d'hypertension artérielle pulmonaire (HTAP) ont été prises en compte dans cette analyse.

Nous avons repris la cohorte des 303 336 personnes exposées au benfluorex en 2006 à partir des données anonymes du système national d'information interrégimes de l'assurance maladie (SNIIRAM)[2,3]. Toutes les personnes affiliées au régime général étaient éligibles à l'exception de celles des sections locales mutualistes (étudiants et fonctionnaires). La population source était ainsi composée de 48,4 millions de personnes assurées au régime général, soit environ 76% de la population résidente en France. Les personnes exposées étaient définies par le remboursement d'au moins une boite de benfluorex en 2006. La liste des codes utilisés pour sélectionner les patients exposés et pour mesurer la quantité de benfluorex remboursée est présentée en table 1

[1] CIM-10 : classification statistique internationale des maladies et des problèmes de santé connexes 10ème révision, est publiée par l'OMS pour l'enregistrement des causes de maladie et de mortalité touchant les êtres humains à travers le monde.

Table 1 Liste des codes CIP utilisés pour sélectionner les patients exposés au benfluorex et pour mesurer la quantité remboursée

Code CIP	nom du médicament
3175579	MEDIATOR 150MG CPR 30
3175591	MEDIATOR 150MG CPR 100
3790267	BENFLUOREX MYLAN 150 MG 1 BOITE DE 30, COMPRIMES
3828277	BENFLUOREX QUALIMED 150 MG 1 BOITE DE 30, COMPRIMES

Les deux derniers produits (génériques) n'ont été commercialisés qu'en 2009. Les codes ont été utilisés afin de pouvoir mesurer l'exposition au benfluorex jusqu'au retrait du benfluorex (30/11/2009) de chaque patient exposé au moins une fois en 2006.

Après chaînage des données, les événements recherchés pendant 48 mois dans le PMSI [médecine-chirurgie-obstétrique (MCO)] de la période 2006 à 2009, étaient une ou plusieurs hospitalisations pour une insuffisance valvulaire toutes valves cardiaques et toutes causes confondues (tableau 2) ou pour une maladie multivalvulaire cardiaque codée en un seul code (tableau 3). La recherche sur 48 mois correspond à 1,2 million de personnes-années analysées.

Table 2 : critères utilisés pour définir la maladie valvulaire cardiaque de régurgitation (critères de la note 28/9/2010)

	PMSI MCO avec un diagnostic principal ou relié =
hospitalisation pour insuffisance valvulaire	I340 Insuffisance (de la valvule mitrale) non rhumatismale
	I051 Insuffisance (de la valvule mitrale) rhumatismale
	I351 Insuffisance (de la valvule) aortique non rhumatismale
	I061 Insuffisance (de la valvule) aortique rhumatismale
	I361 Insuffisance (de la valvule) tricuspide non rhumatismale
	I071 Insuffisance (de la valvule) tricuspide rhumatismale

Table 3 : critères complémentaires utilisés pour définir les maladies multivalvulaires cardiaques

	PMSI MCO avec un diagnostic principal ou relié =
hospitalisation pour maladies de plusieurs valvules (DP ou DR)	I080 Atteintes des valvules mitrale et aortique (précisée ou non d'origine rhumatismales)
	I081 Atteintes des valvules mitrale et tricuspide (précisée ou non d'origine rhumatismales)
	I082 Atteintes des valvules aortique et tricuspide (précisée ou non d'origine rhumatismales)
	I083 Atteintes des valvules mitrale, aortique et tricuspide (précisée ou non d'origine rhumatismales)
	I088 Autres maladies valvulaires multiples (précisée ou non d'origine rhumatismales)
	I089 Maladie de plusieurs valvules (précisée ou non d'origine rhumatismales)

Nous avons recherché pour chacune des personnes exposées au benfluorex et ayant un diagnostic d'hospitalisation de la table 2 (insuffisance valvulaire cardiaque) ou de la table 3 (atteinte plurivalvulaire cardiaque) une chirurgie de remplacement valvulaire. A la différence de l'étude précédente du 28/9/2010, nous avons analysé les codes détaillés de la classification communes des actes médicaux (CCAM), utilisée par le PMSI tant pour les hospitalisations du secteur public et privé que pour la facturation des actes en médecine libérale. L'analyse précédente avaient été faite à partir des trois GHM : GHM 05C02Z Chirurgie de remplacement valvulaire avec circulation extracorporelle et avec cathétérisme cardiaque ou coronarographie ; GHM 05C03V Chirurgie de remplacement valvulaire avec circulation extracorporelle, sans cathétérisme cardiaque, ni coronarographie, sans CMA GHM 05C03W Chirurgie de remplacement valvulaire avec circulation extracorporelle, sans cathétérisme cardiaque, ni coronarographie, avec CMA. Elle ne permettait pas de savoir si les remplacements valvulaires concernaient une ou plusieurs valves. De plus certains remplacements valvulaires ne sont pas groupés par le groupeur de l'ATIH en un des trois GHM.

Les codes CCAM de remplacement valvulaire sont présentés dans la table 4 ; par exemple le code CCAM *DBKA009* correspond à l'intervention « *Remplacement de la valve aortique et de la valve atrioventriculaire gauche*[4] *par prothèse mécanique ou par bioprothèse avec armature, par thoracotomie avec CEC* » (c'est-à-dire un double remplacement de la valve aortique et mitrale).

Table 4 : liste exhaustive des actes de la CCAM correspondant à un acte de remplacement valvulaire cardiaque

Code	Libellé des actes de remplacement valvulaire
DBKA001	Remplacement de la valve aortique par homogreffe, par thoracotomie avec CEC
DBKA002	Remplacement de la valve atrioventriculaire gauche par prothèse en position non anatomique, par thoracotomie avec CEC
DBKA003	Remplacement de la valve aortique par bioprothèse sans armature, par thoracotomie avec CEC
DBKA004	Remplacement de la valve atrioventriculaire droite par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBKA005	Remplacement de la valve atrioventriculaire gauche par homogreffe, par thoracotomie avec CEC
DBKA006	Remplacement de la valve aortique par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBKA007	Remplacement de la valve pulmonaire par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBKA008	Remplacement de la valve atrioventriculaire droite par homogreffe, par thoracotomie avec CEC
DBKA009	Remplacement de la valve aortique et de la valve atrioventriculaire gauche par prothèse mécanique ou par bioprothèse avec armature, par thoracotomie avec CEC
DBKA010	Remplacement de la valve atrioventriculaire gauche par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBKA011	Remplacement de la valve aortique par prothèse en position non anatomique, par thoracotomie avec CEC
DBKA012	Remplacement de la valve pulmonaire par homogreffe ou bioprothèse sans armature, par thoracotomie avec CEC
DBLA004	Pose d'une bioprothèse de la valve aortique, par abord de l'apex du cœur par thoracotomie sans CEC
DBLF001	Pose d'une bioprothèse de la valve aortique, par voie artérielle transcutanée
DBMA001	Reconstruction de la voie aortique par élargissement antérodroit de l'anneau avec remplacement de la valve, par thoracotomie avec CEC
DBMA004	Reconstruction de la voie aortique par transfert de la valve pulmonaire en position aortique avec reconstruction de la voie pulmonaire, par thoracotomie avec CEC
DBMA005	Reconstruction de l'anneau atrioventriculaire gauche avec remplacement de la valve par homogreffe, par thoracotomie avec CEC
DBMA006	Reconstruction de l'anneau aortique avec remplacement de la valve par bioprothèse sans armature, par thoracotomie avec CEC

[4] Les termes officiels français de la nomenclature d'anatomie ont été modifiés en 1995. Néanmoins ils sont peu utilisés par les médecins et plus encore le grand public. Pour faciliter la compréhension le texte de ce document reprend l'ancienne nomenclature. (valve atrioventriculaire gauche = valve mitrale ; valve atrioventriculaire droite = valve tricuspide).

DBMA009	Reconstruction de l'anneau aortique avec remplacement de la valve par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBMA010	Reconstruction de l'anneau aortique avec remplacement de la valve par homogreffe, par thoracotomie avec CEC
DBMA013	Reconstruction de l'anneau atrioventriculaire gauche avec remplacement de la valve par prothèse mécanique ou bioprothèse avec armature, par thoracotomie avec CEC
DBMA015	Reconstruction de la voie aortique par élargissement antérogauche de l'anneau et ouverture de l'infundibulum pulmonaire, avec remplacement de la valve, par thoracotomie avec CEC

Le statut vital, avec la date éventuelle de décès, ont été analysé jusqu'au 31 juillet 2010, soit un suivi de 55 mois. Le décès dans le SNIIRAM est connu pour les personnes du régime général (hors fonctionnaires et étudiants), à partir des données issues du statut vital Insee. Ces données sont alimentées par les fichiers du Répertoire national des identifiants des personnes physiques (RNIPP) puis du RNIAM (Répertoire national des identifiants de l'assurance maladie), du RFI (Référentiel individus) et enfin du SNIIRAM. Tous les décès certifiés par l'Insee sont transmis au RNIAM. Ce RNIAM est aussi enrichi de décès dit « non certifié » par l'INSEE (par exemple personne née à l'étranger, résidant en France et décédant à l'étranger).

Nous avons étudié pour chaque personne décédée toutes les hospitalisations à partir du PMSI (Groupe homogène de malade (GHM), diagnostic principal et relié, durée de chaque séjour, ainsi que le mode de sortie : transfert, domicile ou décès). Il existait environ 800 codes dans la nomenclature des GHM sur la période 2006-2008 (PMSI V9 puis V10) et près de 2 300 en 2009 (PMSI V11). L'hypothèse implicite est que les éléments médicaux contenus dans le résumé standardisé anonymisé (RSA) du PMSI, notamment pour les hospitalisations conduisant au décès, vont permettre de connaître la cause la plus probable du décès.

Deux exemples illustrent cette démarche.
Cas n° 1 : homme de 78 ans décédé en soins palliatifs avec un diagnostic de leucémie myéloïde chronique. La cause du décès retenue est une leucémie myéloïde chronique
Cas n° 2 : femme de 53 ans décédée au cours d'une hospitalisation pour insuffisance de la valvule aortique non rhumatismale et insuffisance de la valve mitrale avec une chirurgie de remplacement valvulaire sous circulation extracorporelle. Cette hospitalisation suivait une précédente en cardiologie avec un acte diagnostic de cathétérisme cardiaque avec un diagnostic d'insuffisance de la valvule aortique non rhumatismale et insuffisance de la valve mitrale. La cause du décès retenue est l'insuffisance valvulaire mitrale et aortique.

Pour chaque cas de décès l'ensemble des hospitalisations étaient analysées. Par ailleurs nous avons recueilli la notion d'Affection de Longue durée (ALD) avec le diagnostic (code CIM-10) et la date de début, la quantité de benfluorex délivrée entre le 1er janvier 2006 et la date du décès et les traitements antidiabétiques et anticoagulants. Les points concernant les ALD et les traitements médicamenteux antidiabétiques (hors benfluorex) et anticoagulants ont été traités dans la note du 28/9/2010 et en sont pas repris dans cette analyse.
En définitive la détermination des causes supposées de décès à l'aide du PMSI a répondu en règle générale au schéma suivant[5].

- Si le décès avait eu lieu à l'hôpital, la cause de décès supposée correspondait au diagnostic principal du séjour au cours duquel le décès est survenu, quand le code CIM 10 de ce diagnostic principal était une maladie. Lorsque le code CIM 10 était un traitement (chimiothérapie, radiothérapie...), on utilisait alors le diagnostic relié pour déterminer la cause de décès supposée (par exemple cancer du poumon).
- Si le décès n'avait pas eu lieu à l'hôpital mais que l'individu avait été hospitalisé au cours des quatre derniers mois (c'est-à-dire au cours du mois de décès ou de l'un des trois mois précédents), on utilisait de la même manière les diagnostics principaux et reliés des deux derniers séjours à l'hôpital.

[5] Cette méthode de détermination des causes probables de décès a été utilisée pour un travail médico-économique : Myriam Mezzarobba. Les coûts de la dernière année de vie en 2008 et ses conséquences pour les dépenses de santé. DSES, Caisse nationale de l'assurance maladie.

- Si le décès n'avait pas eu lieu à l'hôpital et que l'individu n'avait pas été hospitalisé au cours des quatre derniers mois, la cause de décès retenue était déterminée de façon probabiliste en tenant compte des affections les plus graves. Il était tenu compte des comorbidités, notamment potentiellement létales comme les tumeurs et affections malignes, les autres pathologies cardiovasculaires et différents facteurs pouvant avoir une influence sur le décès (âge...).

A la date de ce travail nous ne disposions pas du PMSI 2010. Pour les décès survenus à la fin du premier semestre 2010 la cause était le plus souvent ignorée. Dans quelques cas néanmoins l'analyse de l'ensemble des hospitalisations de 2006 à 2009 a permis de donner des éléments d'orientation. Cette méthode de détermination des causes probables de décès produit un biais dû au fait que seuls les décès précédés d'une hospitalisation sont parfaitement documentés. En particulier, elle ne permet de renseigner aucun décès brutal à domicile ou sur la voie publique : AVC, arrêt cardiaque sur trouble du rythme, suicide, accident....

Ce travail complémentaire a aussi analysé, toujours dans la perspective de recommandations aux médecins et aux patients exposés les hospitalisations pour hypertension artérielle pulmonaire primitive (HTAP). Le Code CIM-10 de l'HTAP et I270 ; cette complication a été reconnu dans l'avis de la commission européenne du 14/6/2010.

L'utilisation du SNIIRAM par les agents habilités de la Cnamts a fait l'objet d'un avis favorable de la Cnil en novembre 2001 et d'un arrêté ministériel du 11 avril 2002 relatif à sa mise en œuvre. En octobre 2007, un second arrêté a permis l'utilisation de la variable décès avec la date exacte issue des données de statut vital de l'Insee et de la Caisse nationale de l'assurance vieillesse. Le statisticien ayant extrait les données était habilité « *profil 30* » pour le croisement de données médicales sensibles.

Les traitements des données ont été réalisés avec le logiciel SAS version 9.01 et le logiciel SPSS version 11.5.

3 Résultats

3.1 Caractéristiques d'âge et de sexe des personnes exposées au benfluorex en 2006

L'étude portait sur 303 336 personnes exposées au benfluorex en 2006 (au moins un remboursement) dont 72,6% de femmes (tableau 2). L'âge moyen des personnes était de 52,8 ans.

Table 5 : caractéristiques d'âge et de sexe des personnes exposées au benfluorex en 2006

*pour 107 personnes l'âge et/ou sexe sont inconnus

Cette population avait été remboursée entre le 1er janvier 2006 et le retrait du benfluorex le 30 novembre 2009 d'environ 10,3 millions de boites de benfluorex, soit en moyenne 34 boites (153 grammes de benfluorex) par personne.

Table 6 : consommation en benfluorex des 303 336 personnes exposées au benfluorex en 2006

Année	Effectif des patients de la cohorte ayant eu ≥ 1 remboursement de benfluorex	Nombre de boites	Moyenne
2006	303 336	3 792 275	13
2007	165 144	2 865 682	17
2008	118 407	2 085 332	18

2010	0	0	

3.2 Hospitalisations pour valvulopathie cardiaque et décès dans la cohorte des personnes exposées

Parmi les 303 336 personnes 556 avaient été hospitalisées au moins une fois avec un diagnostic de valvulopathie cardiaque par régurgitation codé en CIM-10 I340, I051, I351, I061, I361, I071. A ces 556 personnes s'ajoutaient 41 personnes supplémentaires hospitalisées pour une lésion multivalvulaire cardiaque codée en I08 (figure 1). Le total des personnes sélectionnées avec une valvulopathie d'insuffisance ou multivalvulaire par notre algorithme était de 597.

Parmi les 597 personnes hospitalisées pour valvulopathie le nombre de personnes ayant eu au moins un remplacement valvulaire chirurgical était de 298 (50,0%) . Nous avons distingué trois situations pour ces 298 personnes ayant subi un remplacement valvulaire : le remplacement valvulaire aortique isolé, le remplacement mitral ou tricuspidien isolé et les remplacements bi ou tri-valvulaire (le plus souvent associant mitral et aortique).

On observait (figure 2)

- 93 remplacements aortiques isolés avec 5 décès (taux de décès 5,4%) ;
- 72 remplacements mitraux ou tricuspidiens isolés avec 7 décès (taux de décès 9,7%) ;
- 133 remplacements bi ou trivalvulaire avec 21 décès (taux de décès 15,8%).

Entre les trois groupes les doses cumulées moyenne de benfluorex, les doses journalières moyenne et le taux de personnes consommant déjà du benfluorex en début d'année 2006 ne variaient pas de façon significative. Il n'existait pas non plus de différence avec le groupe de non-opérés.

3.3 Hospitalisations pour hypertension artérielle pulmonaire (HTAP) et décès dans la cohorte des exposés

Parmi les 303 336 personnes exposées au benfluorex en 2006, on a observé 99 personnes hospitalisées avec un diagnostic principal (ou relié) d'hypertension artérielle pulmonaire[6] (figure 3). L'âge moyen était de 60 ans et le rapport de 25 hommes pour 74 femmes. A la fin de la période d'observation de 55 mois le nombre de décès étaient de 22 (22,2%). Parmi les décédés la proportion d'hommes était supérieure (13 hommes pour 8 femmes). L'âge médian au décès était de 72 ans avec des extrêmes de 32 à 89 ans. Les 21 cas cliniques ayant conduit à un décès sont résumés dans le tableau 9. Aux 21 décès du tableau s'ajoute le décès (cas n°19 du tableau 7) qui concerne une pathologie valvulaire et une HTAP. Les cas cliniques décrit dans le tableau 9 sont souvent complexes semblant marqués par des difficultés au diagnostic, de très nombreuses hospitalisations et des complications multiples.

[6] G rounds for the revocation of the marketing autorisation : Whereas, The Committee considered the procedure under Article 107 of Directive 2001/83/EC, as amended, for medicinal products containing benfluorex. The Committee concluded, after having reviewed the available data, that benfluorex is harmful under normal conditions of use leading to pulmonary hypertension and cardiac valvulopathies..... Cet avis européen est notamment motivé par la publication *Boutet K et al. Fenfluramine-like cardiovascular side-effects of benfluorex. Eur Respir J 2009 Mar; 33: 684-8.*

10	femme	65-69	40,5	11	Tumeur maligne de l'encéphale	décès hospitalier avec un diagnostic de tumeur maligne de l'encéphale
11	femme	75-79	337,5	4	tumeur maligne utérus	décès hospitalier post chirurgical pour tumeur maligne utérus – contexte d'insuffisance mitrale
12	femme	60-64	13,5	9	Inconnue	décès non hospitalier ; contexte de tumeur maligne du sein (chimio) et d'insuffisance de la valve aortique
13	femme	55-59	472,5	5	Trouble vascul. aigu de l'Intestin	décès hospitalier au cours d'un séjour trouble vasculaire intestinaux avec un contexte d'insuffisance mitrale et d'infarctus 2 mois auparavant
14	femme	75-79	9	8	tumeur maligne secondaire des os et de la moelle	décès hors hôpital avec tumeur maligne secondaire ; chirurgie valvulaire 2 années avant
15	femme	60-64	54	2	Insuffisance cardiaque et état de choc circulatoire	décès hospitalier pour ins cardiaque 6 mois après un cathétérisme cardiaque pour ins mitrale : pas d'autres pathologies retrouvées
16	femme	75-79	31,5	9	septicémie	décès hospitalier 7 mois après une 2ème chirurgie de remplacement valvulaire sous CEC (nombreuses complications endocardite, hémorragie, septicémie avec insuffisance rénale et cardiaque)

17	homme	55-59	310,5	8	tr du rythme	décès hospitalier pour tr de rythme et insuffisance cardiaque, ins. mitrale, VIH et carcinome hépatocellulaire
18	femme	70-74	13,5	10	insuffisance mitrale	décès hospitalier en post chirurgie valvulaire mitrale sous CEC ; contexte de cardiopathie hypertensive préalable
19	femme	60-64	310,5	13	tr du rythme	décès en 2010 (PMSI 2010 manquant) mais tableau caractéristique, insuffisance cardiaque, insuffisance aortique, hypertension artérielle pulmonaire (HTAP)
20	homme	60-64	189	2	insuffisance aortique.	décès hospitalier en post chirurgie valvulaire sous CEC ; aucune autre pathologie mentionnée
21	homme	70-74	202,5	13	tumeur maligne du cardia	décès soins palliatifs pour tumeur maligne
22	homme	70-74	153	43	insuffisance rénale et diabète	décès d'un patient diabétique dialysé
23	femme	55-59	297	12	Insuffisance tricuspidienne	décès hospitalier en post intervention card sous CEC pour insuffisance tricuspidienne ; ins mitrale et cardiaque connues
24	homme	55-59	13,5	8	IRC terminale	décès hospitalier dans un tableau IRC, insuffisance cardiaque 20 mois après remplacement valvulaire mitral ; insuffisance mitrale, insuffisance cardiaque, tr du rythme
25	femme	60-64	27	2	tr lignée érythrocytaire	décès non hospitalier ; insuffisance mitrale,
26	homme	55-59	288	3	insuffisance cardiaque	décès hospitalier en post chirurgie valvulaire mitrale sous CEC
27	homme	60-64	189	7	insuffisance mitrale	décès hospitalier en chirurgie cardiaque sous CEC pour insuffisance mitrale ; contexte de bronchopathie chronique
28	femme	70-74	72	2	insuffisance mitrale	décès hospitalier en post chirurgie valvulaire mitrale sous CEC
29	femme	80-84	207	3	encéphalopathie, insuffisance mitrale	décès non hospitalier
30	homme	65-69	297	13	Suite de péritonite	décès hospitalier par péritonite, stomie.13 mois après chirurgie valvulaire sous CEC ; insuffisance mitrale, insuffisance ventriculaire gauche
31	femme	75-79	337,5	8	infarctus	décès hospitalier par infarctus du myocarde ; insuffisance mitrale et insuffisance ventriculaire gauche
32	femme	85-89	4,5	7	anémie hémolytique	décès non hospitalier ; circonstances imprécises ; notion d'insuffisance valvulaire mitrale, insuffisance ventriculaire gauche
33	homme	70-74	301,5	73	insuffisance rénale terminale	décès d'un patient dialysé et avec une tumeur maligne (chirurgie majeure) ; tumeur maligne du caecum
34	femme	60-64	90	8	insuffisance mitrale	décès au cours du mois suivant une chirurgie valvulaire mitrale sous CEC ; contexte d'apnée du sommeil
35	femme	65-69	121,5	5	Insuffisance mitrale	décès hospitalier post chirurgical de remplacement valvulaire mitral
36	femme	60-64	351	2	insuffisance mitrale	décès en 2010 deux ans après un cathétérisme pour insuffisance mitrale (absence PMSI 2010)
37	femme	55-59	94,5	4	insuffisance mitrale	décès hospitalier en post chirurgie cardiaque pour insuffisance mitrale, ins cardiaque
38	femme	70-74	252	3	hémorragie intracérébrale hémisphérique	décès hospitalier pour hémorragie cérébrale 3 mois après une prise en charge pour insuffisance aortique
39	femme	75-79	130,5	3	choc cardiogénique	décès 2 ans par chirurgie de remplacement valvulaire par choc cardiogénique sans infarctus, sans autres pathologies
40	femme	80-84	189	1	insuffisance valvulaire aortique	décès hospitalier au cours d'une hospitalisation pour insuffisance aortique
41	femme	75-79	342	2	insuffisance valvulaire aortique	décès 2 mois après 2 hospitalisations pour insuffisance de la valve aortique

42	homme	85-89	49,5	2	insuffisance valvulaire tricuspide	décès hospitalier au cours d'une hospitalisation pour ins. valvulaire tricuspide
43	femme	75-79	202,5	12	insuffisance rénale	décès hospitalier au cours d'une hospitalisation avec ins rénale terminale et pancréatite ; contexte de valvulopathie aortique avec nombreuses hospitalisations
44	homme	55-59	72	3	ischémie cérébrale	décès hospitalier dans le mois suivant une chirurgie valvulaire sous CEC ; ins mitrale
45	femme	80-84	144	16	Ins respiratoire aiguë	décès en 2010 (pas de PMSI disponible pour 2010) ; oedème pulmonaire, ins card, ins valv. Aortique
46	femme	75-79	121,5	6	lésion traumatique intracrânienne	décès hospitalier avec lésion cérébrale anoxique
47	femme	75-79	81	5	inconnue	décès en 2010 trois ans après une chirurgie pour insuffisance tricuspidienne (PMSI 2010 absent)
48	homme	65-69	54	3	patho cardiaque, insuffisance aortique	décès en 2010 27 mois après une chirurgie pour insuffisance aortique ; pas de pathologie autre déclarée en ALD
49	homme	55-59	72	5	inconnue	décès en 2010 4 ans après une chirurgie pour ins mitrale
50	homme	65-69	198	2	myocardiopathie ischémique	décès hospitalier en post chirurgie valvulaire mitrale sous CEC
51	homme	70-74	472,5	12	tr du rythme	décès hospitalier après 11 hospitalisations en cardiologie par trouble du rythme/ ins. ventriculaire G, chirurgie de rempl. valvulaire sous CEC ; , insuffisance cardiaque, insuffisance aortique et mitrale
52	homme	65-69	225	9	abcès de la rate	décès hospitalier dans les suites d'une endoscopie biliaire (abcès de la rate)
53	homme	80-84	99	7	Insuffisance ventriculaire gauche	décès en 2010 ; 6 mois après une hospitalisation par ins ventr G et 3 ans après remp. val sous CEC ; autres pathologies connues bénignes
54	femme	80-84	252	3	endocardite	décès hospitalier pour endocardite inf après 2 transferts pour insuffisance aortique et embolie pulmonaire
55	femme	75-79	265,5	15	ins card congestive : ins aortique et mitrale	décès hospitalier pour insuffisance cardiaque 23 mois après une chirurgie de remplacement valvulaire (IM et Iao)
56	femme	55-59	229,5	6	embolie et thrombose des artères des MI	décès hospitalier embolie et thrombose des artères des MI au cours d'une intervention de chir. asc. Contexte insuffisance mitrale
57	femme	35-39	13,5	5	cardiovasculaire	décès 4 mois après chirurgie de remplacement valvulaire tricuspidienne + Aortique et 2 mois après thrombose intracardiaque
58	homme	65-69	135	6	cardiovasculaire	décès non hospitalier 15 mois après chirurgie de remplacement valvulaire mitrale

Tableau 8: caractéristique d'âge et sexe, cause probable du décès de 6 personnes ayant consommé du benfluorex en 2006 et ayant été hospitalisées au moins une fois pour maladie multivalvulaire valvulaire cardiaque (codification en I08) sur la période 2006-2009 (cas numérotés 59 à 64)

Cas n°	sexe	âge au décès	Conso benflu (grs) 2006 au décès.	nb hospit de 2006 au décès	cause la plus probable du décès	circonstance du décès
59	femme	75-79	139,5	3	Insuffisance cardiaque congestive	Atteinte des valves mitrales et aortiques (notion de sténose aortique). Deux chirurgies de replacement valvulaire à 3 mois d'écart.la première ets un double remplacement mitral et aortique. Décès hospitalier lors du séjour pour la deuxième intervention.
60	femme	60-64	486	2	inconnue	Chirurgie de remplacement valvulaire cardiaque 10 mois avant le décès. Atteinte valvulaire mitrale, aortique et tricuspide ; pas d'autre pathologie mentionnée. Décès non hospitalier.
61	homme	65-69	76,5	11	Myocardiopathie avec dilatation.	11 hospitalisations en 40 mois, la plupart pour insuffisance cardiaque et insuffisance ventriculaire G. Intervention cardiaque sous CEC. Atteinte des valves mitrale et tricuspide. Décès hospitalier lors d'un séjour pour myocardiopathie avec dilatation
62	homme	80-84	135	13	Insuffisance rénale aigue ave nécrose tubulaire	Terrain athérosclérose. Sténose carotidienne opérée. Ins. Card. Et état de choc (IVG). Après cathétérisme, double remplacement valvulaire mital et aortique sous CEC. Dg atteinte des valvules mitrales et aortiques. Complication une année après Ins.VG + troubles du rythme ;. Décès hospitalier 2 années après un double remplacement mitral et aortique dans un tableau d'insuffisance rénale aigue.
63	femme	70-74	40,5	5	Atteinte valvulaire mitrale et aortique	2 séjours pour pneumopathie. Puis acte thérapeutique par voie vasculaire pour une sténose mitrale. Deux mois après cathétérisme avec un diagnostic d'atteinte des valves mitrale et aortique. 4 mois après décès hospitalier au cours d'un séjour pour chirurgie de remplacement valvulaire sous CEC.
64	femme	50-55	238,5	12	inconnue	Tableau complexe associant plusieurs épisodes de broncho-pneumopathie (6 hospitalisations), un diagnostic de sténose mitrale et 5 mois après une double chirurgie de remplacement valvulaire sous CEC pour atteinte des valvules mitrale et aortique. 6 mois après hospitalisation pour épisodes dépressif précédant une nouvelle hospitalisation « intoxication par médicament psychotropes » évoquant une tentative d'autolyse et une dernière hospitalisation pour « syndrome post-commotionnel ». La patiente décède 10 mois après (décès non hospitalier)

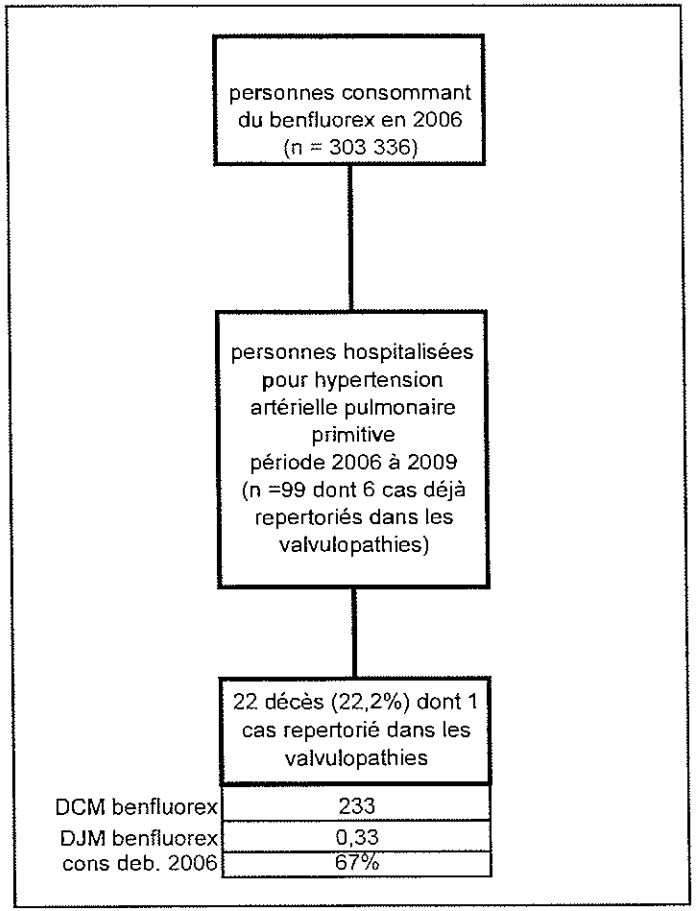

Figure 3 : suivi de la cohorte des personnes traitées pour benfluorex en 2006. Recherche d'hospitalisation pour hypertension artérielle pulmonaire I270. Suivi PMSI de 48 mois : 2006 à 2009. Suivi statut vital de 55 mois.

Données SNIIRAM régime général hors SLM

Tableau 9: caractéristique d'âge et sexe, cause probable du décès des 21 personnes ayant consommé du benfluorex en 2006 et ayant été hospitalisées au moins une fois pour hypertension artérielle pulmonaire (codification en I270) sur la période 2006-2009 (cas numérotés 65 à 85)

Cas n°	sexe	âge au décès	Conso benflu (grs) 2006 au décès.	nb hospit de 2006 au décès	cause la plus probable du décès	circonstance du décès
65	homme	70-74	180	13	Insuffisance respiratoire	Trois hospitalisations pour apnée du sommeil, bronchite chronique et insuffisance respiratoire ; un acte diagnostique par voie vasculaire porte le diagnostic d'hypertension artérielle pulmonaire ; un traitement est mis en route en hôpital de jour ; 8 mois après œdème pulmonaire, IVG, insuffisance respiratoire. Décès hospitalier en soins palliatif (diagnostic insuffisance respiratoire aigue)
66	homme	55-59	9	9	Inconnue (HTAP ?)	.En 18 mois 3 hospitalisations pour hypertension pulmonaire (primitive), 3 autres pour ins. ventriculaire gauche et une pour complication d'un traitement anticoagulant. La cause terminale du décès est inconnue ; le patient décède au milieu de l'année 2010. (PMSI 2010 absent).
67	homme	75-79	36	5	Tr mentaux d'origine organique	5 hospitalisation en moins de 6 mois : Tr du rythme, hémorragie digestive, HTAP, Diabète sucré insulino-dépendant, avec complications multiples et trouble mentaux d'origine organique lors de l'hospitalisation conduisant au décès
68	homme	75-79	279	23	ins. rénale terminale	23 hospitalisations en 29 mois. 5 pour ins ventriculaire G ou ins card cong. Embolie thrombose, apnée du sommeil. Un trait est mis en œuvre en hôpital de jour après un diagnostic d'hypertension artérielle pulmonaire. Ins rénale chronique, puis hémorragie gastro-intestinale. Décès hospitalier (ins. rénale terminale)
69	homme	75-79	243	5	HTAP.	Première hospitalisation pour ins. respiratoire aigue, pneumopathie bactérienne. Un mois avant le décès hospitalisation avec le dg principal d'hypertension artérielle pulmonaire. Décès non hospitalier le mois suivant.
70	femme	70-74	108	5	Insuffisance respiratoire	5 hospitalisation en 10 mois : embolie pulmonaire, un acte diagnostique par voie vasculaire porte le diagnostic d'HTAP, 2 hospitalisation rapprochée pour HTAP puis ins respiratoire aigue avec décès
71	homme	80-84	54	8	HTAP	Pathologie pulmonaire bronchite, mal pulmonaire obstructive. 3 hospitalisations avec le dg d'HTAP ; la dernière précède de 2 mois le décès non hospitalier.
72	femme	60-64	202,5	27	Insuffisance respiratoire	27 hospitalisations en 3 années dont 15 avec le dg principal d'HTAP. Par ailleurs diabète, obésité ; décès hospitalier (insuffisance respiratoire aigue)
73	femme	65-69	337,5	11	Inconnue (HTAP ?)	5 hospitalisations en 2 ans et demi avec pour dg principal HTAP avec à 3 reprise un acte dg par voie vasculaire ; pins card congestive et hémorragie gastro-intestinale ; la patiente décède au milieu de l'année 2010. (PMSI 2010 absent).
74	femme	60-64	184,5	25	Ins rénale	Le tableau débute par un syndrome de détresse respiratoire puis 14 hospitalisations en 2 années pour HTAP ; ins rénale et dialyse dans le mois qui précède le décès
75	homme	45-49	216	8	Insuffisance respiratoire	Ins cardiaque congestive puis acte dg par voie vasculaire avec dg d'HTAP ; 3 hospitalisations avec le dg principal d'HTAP et décès avec un dg d'ins. respiratoire aigue
76	femme	70-74	54	2	inconnue	Hospitalisation pour dyspnée puis acte dg par voie vasculaire avec dg d'HTAP ; décès en 2010 (PMSI absent)
77	femme	85-89	117	4	inconnue	HTAP, démence et lombalgie basse précédant un décès non hospitalier
78	femme	80-84	4,5	1	inconnue	Une seule hospitalisation pour HTAP 6 mois avant le décès en 2010 (PMSI 2010 absent).
79	homme	60-64	36	6	Inconnue (HTAP ?)	6 hospitalisations en une année dont 4 avec comme dg principal HTAP ; décès non hospitalier 7 mois après la dernière hospitalisation.

80	homme	50-54	27	3	inconnue	En moins d'une année, chez un homme de la cinquantaine 3 hospitalisations pour pneumopathie à pseudomonas, HTAP et autre pour affection pulmonaire interstitielle avec fibrose ; la dernière hospitalisation précède de 2 mois un décès non hospitalier.
81	homme	75-79	387	7	HTAP	4 hospitalisations pour HTAP et une pour ins. resp. aigue. Décès 4 mois après en 2010 (PMSI 2010 absent).
82	homme	50-54	13,5	13	Tumeur maligne du poumon	3 hospitalisations pour HTAP avec contexte de cirrhose du foie alcoolique. Tumeur du lobe moyen du poumon. Chimiothérapie décès hospitalier en soins palliatifs
83	homme	30-34	13,5	24	Syndrome de détresse respiratoire	Début 2008 maladie de Hodgkin traitée par chimiothérapie. En fin de la même année dg de synd. d'apnée du sommeil puis HTAP après acte dg par voie vasculaire. Plusieurs hospitalisations pour ins resp puis décès hospitalier en milieu d'année suivante lors d'une hospitalisation pour syndrome de détresse respiratoire.
84	homme	75-79	9	10	Paraplégie	En moins de 10 mois le patient est hospitalisé à plusieurs reprises pour des convulsions et un trouble du comportement avec un diagnostic de tumeur bénigne des méninges cérébrales. Par la suite une hospitalisation unique conduit au dg d'HTAP. Puis le patient présente une compression médullaire, une occlusion intestinale non due à une hernie et enfin une paraplégie 2 mois avant un décès non hospitalier
85	femme	65-69	495	6	Inconnue	3-4 années avant le décès 3 hospitalisations pour HTAP et trois autres pour trouble du rythme, cardiopathie hypertensive et ins. cardiaque. Décès en 2010 (PMSI 2010 absent)

3.4 Quantité de benfluorex délivrée et apparition d'une complication

Les quantités de benfluorex délivrées chez les non-malades étaient inférieures sur les trois paramètres analysés à celles délivrées aux personnes ayant contracté une complication.

Tableau 10 présentant les éléments connus sur la quantité de benfluorex délivrée chez les personnes exposées selon l'apparition ou non d'une complication (valvulopathie ou HTAP)

	Exposés au benfluorex (non malades) Non décédés n = 302 646	Exposés au benfluorex (malades : valvulopathie ou HTAP) Non décédés (n = 605)	Décédés (n = 85)
% consommateur de benfluorex en début d'année 2006[1]	53,7%	64,3%	80,0%
dose journalière moyenne[2]	246 mg	301 mg	327 mg
dose cumulée moyenne à compter du 1/1/2006[3]	153 grs	333 grs	162 grs*

(1) correspond à une consommation de benfluorex déjà observée en janvier ou février 2006 : cet indicateur est le reflet d'une consommation très probablement antérieur à 2006
(2) calculée par patient (quantité de benfluorex remboursée / (date de fin – date de début + 30))
(3) calculée par patient en cumulant tous les remboursements de benfluorex du 1/1/2006 à la fin 2009. (le médicament a été retiré de la commercialisation le 30/11/2009).
** censure liée au décès*

3.5 Délai d'apparition d'une complication après l'arrêt du benfluorex

Il faut souligner au préalable que l'apparition d'une complication peut entraîner l'arrêt du benfluorex. Nous avons analysé le sous groupe des 138 192 patients ayant consommé du benfluorex en 2006 et n'en ayant pas consommé dans les années suivantes. L'incidence d'une hospitalisation pour une complication valvulaire et/ou une HTAP a été suivie sur les 4 années. En 2006 (année de consommation) le taux d'incidence d'apparition d'une complication était de 0,82 pour 1000, puis 0,27 pour 1000 en 2007, 0,18 pour 1000 en 2008 et 0,05 pour 1000 en 2009. Le taux de 0,05 pour 1000 correspond à 7 patients différents pour les 138 000. Dans 62% des cas les complications étaient apparues dans l'année calendaire de l'arrêt, dans 21% dans l'année suivante et dans 14 et 4% dans les années n+2 et n + 3. Notons toutefois que cette information (Tableau 11) est d'interprétation délicate car les résultats portent sur un sous groupe de malades très spécifique (patients ayant arrêté leur traitement pour des raisons diverses) dont la durée totale des traitements nous est inconnue. Par ailleurs on ne peut exclure des effets décalés dans le temps (au-delà des 3 années d'observation).

Tableau 11 : délai d'apparition des complications chez les personnes ayant consommé du benfluorex en 2006 et n'en ayant pas consommé en 2007, 2008 et 2009.

		Délai d'apparition de la complication en année				
	Groupe	0	1	2	3	Total
1	diagnostic non opéré monovalvulaire	32	18	11	3	64
2	diagnostic non opéré plurivalvulaire	8	0	0	0	8
3	diagnostic opéré aortique	14	4	3	0	21
4	diagnostic opéré mitrale ou tricuspide	16	2	2	1	21
5	diagnostic opéré plurivalvulaire	26	4	4	1	35
10	HTAP	17	10	5	2	34
Total		113	38	25	7	183

Annexe 3-86

Point de presse sur Benfluorex (Médiator) du 16 novembre 2010

Intervention introductive de Jean Marimbert, Directeur Général de l'Afssaps

I – Le Benfluorex (Médiator), était un médicament autorisé en 1974 et commercialisé depuis 1976, pour deux indications : adjuvant du régime adapté dans les hyper-triglycéridémies et traitement des patients diabétiques en surcharge pondérale, en complément d'un régime adapté.

L'Afssaps a suspendu à compter du 30 novembre 2009 l'AMM de ce médicament, en considérant que la balance bénéfice/risque était désormais négative en raison d'un risque de valvulopathies établi en 2009 par la convergence de données nouvelles venant des signalements de pharmacovigilance, des résultats d'une étude d'efficacité et de sécurité que l'Afssaps avait demandée au laboratoire, ainsi que des résultats d'une étude cas/témoins réalisée dans la région Brestoise. Ce faisceau d'éléments qui fondait la position de l'agence était conforté par les résultats d'une étude que la Cnamts a réalisée à la fin de l'été 2009 et communiquée à l'Afssaps, et qui faisait apparaître, chez les patients diabétiques exposés au benfluorex en 2006, un risque nettement plus élevé d'hospitalisations et d'interventions chirurgicales pour valvulopathies.

Après confirmation de la position de l'Afssaps sur le rapport bénéfice/risque dans le cadre d'une procédure européenne d'harmonisation déclenchée par l'agence, la suspension a été transformée le 20 juillet 2010 en un retrait définitif.

II - L'agence a souhaité s'exprimer de nouveau sur ce sujet ce matin pour aborder essentiellement trois aspects.
Tout d'abord nous souhaitons remettre en perspective l'action qu'a menée l'Afssaps vis-à-vis de ce produit avant 2009, car certaines présentations du sujet qui ont été faites au cours des derniers mois étaient très discutables.

Ensuite l'agence souhaite vous livrer les éléments dont elle dispose aujourd'hui pour essayer de cerner l'impact de l'utilisation de benfluorex, en particulier sur le nombre de valvulopathies et de décès pour valvulopathies. L'existence d'un impact n'est pas douteuse, à partir du moment où, comme l'a exprimé notre décision de 2009, il est désormais établi que le benfluorex pouvait susciter ou favoriser l'émergence de ces atteintes valvulaires. Mais l'Afssaps a voulu essayer de cerner même approximativement cet impact en demandant à la Cnamts une étude à partir des bases de données de remboursements et d'hospitalisations qu'elle gère. Les possibilités d'utilisation de ces bases étaient fortement limitées jusqu'à récemment par des contraintes juridiques et surtout techniques, mais elles ont été desserrées récemment, ce qui ouvre, j'y reviendrai, des perspectives importantes pour une articulation renforcée entre la pharmacovigilance fondée sur la notification spontanée des effets indésirables et la pharmacoépidémiologie.

Annexe 3-86

Enfin et surtout, il s'agit pour nous de vous exposer aujourd'hui les conséquences que l'agence peut tirer de ces échanges récents avec la Cnamts en ce qui concerne le suivi des patients traités dans le passé avec benfluorex, qui avait fait l'objet de recommandations dans notre communication du 26 novembre 2009.

III - Je souhaite donc revenir en premier lieu sur l'action menée par l'agence vis-à-vis de ce médicament avant la nouvelle réévaluation de 2009 et la décision de suspension qui s'en est suivie. Il est important de le faire avec précision, pour tempérer la tentation toujours forte de l'anachronisme, c'est-à-dire d'apprécier ce qui a été fait ou aurait dû être fait hier ou avant-hier sur la base de toutes les données qui sont disponibles aujourd'hui. Cet examen rétrospectif montrera qu'il n'était nullement évident jusqu'en 2009, d'établir de façon étayée et robuste à la fois l'existence du risque de valvulopathie sur lequel l'agence s'est fondée pour mettre fin à la commercialisation du produit, et a fortiori l'étendue de ce risque.

Mais avant de venir à cette analyse rétrospective sur le risque, je voudrais souligner que ce produit autorisé il y a fort longtemps a donné lieu à partir de la fin des années 90 à plusieurs réévaluations qui ont concerné également son efficacité.
C'est ainsi que l'agence a refusé en 2000 une demande du laboratoire d'étendre les indications à un traitement de première ligne pour le diabète de type II lorsque le régime n'était pas suffisant pour rétablir à lui seul l'équilibre glycémique, en considérant que la démonstration d'efficacité (Etude Del Prato) était insuffisante pour une telle indication. A la suite de cette évaluation, l'agence a demandé au laboratoire concerné que soit réalisée une nouvelle étude (Etude Moulin) évaluant l'efficacité du benfluorex utilisé seul ou en association à d'autres médicaments pour traiter le diabète.
En 2007, sur la base notamment de cette étude qu'elle avait demandée au laboratoire, l'agence a retiré l'indication concernant les hyper-tryglycéridémies pour insuffisance de preuve de la taille effective de l'effet du médicament. Seule l'indication du benfluorex comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » a été maintenue. Néanmoins, l'Agence a demandé au laboratoire une nouvelle étude, selon les standards contemporains de démonstration, pour réévaluer l'efficacité du benfluorex dans la seule indication qui subsistait. Elle consistait à tester sa non-infériorité par rapport à un autre traitement du diabète, la pioglitazone, chez des patients diabétiques par ailleurs insuffisamment équilibrés pour leur diabète par un sulfamide hypoglycémiant (autre médicament antidiabétique). Cette nouvelle étude (Etude Regulate) comportait aussi un volet de sécurité d'emploi (ou de tolérance) dont les résultats connus en 2009 ont contribué à établir ce risque de valvulopathies.

En ce qui concerne la gestion du risque par l'agence avant la réévaluation de 2009, je voudrais insister sur quatre points essentiels.
Le premier point consiste à souligner que la problématique de ce produit n'était pas identique à celles des médicaments anorexigènes comme Isoméride et Ponderal qui ont été retirés par l'agence en 1996 et 1997, même s'il y a entre ces médicaments et benfluorex une parenté et des points de recoupement qui devaient retenir et qui ont effectivement retenu l'attention de l'agence, et justifié un suivi attentif du profil de sécurité de ce produit.

Annexe 3-86

Sans entrer dans le détail des précisions scientifiques qui pourront vous être apportées par celles et ceux qui m'entourent, il faut retenir que le benfluorex et les anorexigènes retirés antérieurement n'appartiennent pas à la même classe thérapeutique, et qu'ils ont des propriétés pharmacologiques et des modes d'action principaux distincts. Pour autant une partie de la structure chimique de benfluorex est commune avec celle des fenfluramines ; ils interagissent tous les deux (mais différemment) avec une substance physiologique, la sérotonine et ses récepteurs, et ils ont un métabolite commun, la norfenfluramine. En effet, la norfenfluramine est l'un des métabolites du benfluorex, c'est-à-dire une des substances dans lesquelles se transforment la molécule dans l'organisme. Or cette norfenfluramine, qui n'est présente que minoritairement dans le benfluorex, appartient au groupe des fenfluramines, qui étaient les composants principaux dans les anorexigènes retirés dans les années 90.

A la fin des années 90, ces anorexigènes de type isoméride ont été associés à des effets indésirables graves, principalement des cas d'hypertension artérielle pulmonaire (HTAP), et beaucoup plus rarement des cas d'atteintes valvulaires. Les mécanismes de développement de ces effets indésirables n'ont été élucidés qu'après le retrait des anorexigènes, par des études publiées successivement dans les années 2000. Ces études ont permis d'expliquer comment ces types d'effets indésirables pouvaient être déclenchés, mais elles ont aussi montré que ces mécanismes n'étaient vraisemblablement pas les mêmes dans les deux cas, HTAP et atteintes valvulaires.

En deuxième lieu, il faut souligner que cette parenté partielle du benfluorex avec les anorexigènes fenfluraminiques, liée notamment au fait que la norfenfluramine est un des métabolites du benfluorex,, a conduit l'agence à prendre des mesures de minimisation et de suivi du risque.

D'une part, dès 1996, les préparations magistrales à base de benfluorex ont été interdites, en vue de limiter le mésusage de ce médicament comme produit amaigrissant.
D'autre part, l'agence s'est attachée dès 1998 à suivre attentivement le risque potentiel d'HTAP, et elle a renforcé ce suivi à partir du signalement en mars 2005 d'un cas en pharmacovigilance.
Les points successifs qui ont été faits dans le cadre de la commission nationale de pharmacovigilance à partir de juin 2005 et qui sont accessibles en ligne sur le site de l'Afssaps depuis 2006 dans le cadre de sa démarche de transparence, n'ont pas fait apparaître de signal de toxicité cardiovasculaire significatif par rapport à l'incidence de ces troubles dans la population générale.

En ce qui concerne les valvulopathies, il faut avoir à l'esprit que le signal issu de la notification spontanée en pharmacovigilance avant la fin de l'année 2008 était extrêmement faible. Si l'on met à part le cas espagnol publié en 2003, il y a eu en tout et pour tout en France un cas bien documenté et confirmé par examen anatomopathologique qui a été signalé à Toulouse en 2006 et a donné lieu à une publication. Quelques autres cas signalés en pharmacovigilance faisaient intervenir une notion d'atteinte valvulaire, mais pour les plus documentés de ces quelques cas, d'autres causes que les médicaments pouvaient entrer en ligne de compte, par exemple un traitement antérieur par Isoméride.
Il n'y avait donc pas matière avant 2009 à prendre une décision de retrait, qui n'aurait pas pu être étayée par des données épidémiologiques robustes. Il est même vraisemblable, en l'état de

la jurisprudence qui exerce un contrôle approfondi sur les décisions de retrait, qu'une telle décision aurait été annulée par le juge en cas de contestation.

Le troisième point que je voudrais souligner est que le tableau d'évaluation du risque a changé de façon très nette à partir de fin 2008/début 2009.
En effet, plusieurs données nouvelles sont apparues et ont contribué à forger de façon convaincante une présomption sur le caractère significatif du risque valvulopathie.
Tout d'abord, à la suite du signalement d'un deuxième cas bien documenté et publié en provenance de Brest, l'Afssaps a déclenché une nouvelle réévaluation du risque, qui a donné lieu à trois passages en commission nationale de pharmacovigilance en quelques mois à partir du printemps 2009. Des cas d'atteintes valvulaires parfois antérieures, sont alors déclarés, notamment en provenance d'Amiens et de Brest à partir d'une exploitation des données de la base de PMSI sur les hospitalisations et d'un registre d'échographies. Au total, pas moins de 42 cas ont été déclarés entre janvier et novembre 2009, et depuis l'arrêt de commercialisation de novembre 2009, 18 cas se sont ajoutés ensuite, le plus souvent rétrospectifs.

Dans le même temps, les résultats de la deuxième étude (Etude Regulate) demandée par l'agence au laboratoire faisaient notamment ressortir un nombre préoccupant d'anomalies valvulaires après 52 semaines de traitement. Et les résultats de l'étude cas/témoins conduite à Brest, disponibles durant l'été 2009, allaient dans le même sens. Enfin, et à un moment où la procédure de réévaluation et de suspension était déjà bien avancée, les résultats de la première étude de la Cnamts que j'ai mentionnée au début de mon intervention sont venus apporter une confirmation nette du signal dégagé par toutes les données nouvelles de 2009.

IV - En ce qui concerne les résultats de la deuxième étude que l'Afssaps a demandé cet été à la Cnamts pour essayer de mieux cerner l'impact de l'utilisation de benfluorex sur les pathologies valvulaires, je laisserai les responsables scientifiques de l'agence qui m'entourent s'exprimer dans quelques minutes pour vous exposer à la fois la méthodologie et les conclusions.
Avec toutes les précautions qu'appelle ce type d'estimation nécessairement approximative, on peut tenir pour certain, que des décès ont pu être provoqués ou favorisés par l'utilisation de benfluorex dans quelques centaines de cas sur la période d'un peu plus de 30 ans pendant laquelle le produit a été disponible (1976-2009). L'ordre de grandeur, de l'ordre d'au moins 500, vous sera précisé tout à l'heure, et dépend des méthodes et hypothèses de calcul retenues.
Il va de soi que ces estimations à caractère statistique ne préjugent en rien de l'analyse au cas par cas qui s'impose pour apprécier l'imputabilité partielle ou totale au médicament dans des situations individuelles.

V – Reste un aspect essentiel qui est celui du suivi des patients ayant été traités sous benfluorex.

Lorsque l'agence a communiqué le 26 novembre 2009 pour annoncer la suspension de l'AMM, elle a formulé des recommandations à la fois auprès du public et des professionnels de santé.

Les patients ont été invités à rappeler à leur médecin qu'ils ont pris du benfluorex lors de leur prochaine consultation médicale de suivi. Les médecins ont reçu une lettre les incitant, pour les patients en cours de traitement à rechercher lors de l'interrogatoire et de l'examen clinique d'éventuels symptômes ou signes d'une atteinte valvulaire et de demander si nécessaire des examens complémentaires, voire une consultation spécialisée. S'agissant des patients traités par benfluorex dans le passé, les médecins ont été incités par mesures de précaution à interroger les patients diabétiques sur les expositions éventuelles au benfluorex et à procéder à un interrogatoire et à un examen clinique en vue de rechercher des symptômes ou des signes évocateurs d'une valvulopathie susceptible de rendre nécessaire la réalisation d'examens complémentaires, voire d'une consultation spécialisée.
Sans modifier fondamentalement ces recommandations, l'agence est conduite aujourd'hui à les préciser sur la base d'un examen à la fois des cas notifiés, des études publiées et de certaines données de la deuxième étude de la Cnamts. Il ressort en effet de ces éléments, d'une part que le risque de développer une valvulopathie paraît s'accroitre à partir d'un durée de consommation de benfluorex de l'ordre de 3 mois, et d'autre part que ce risque apparaît majoritairement dans les deux premières années d'utilisation, persiste dans les deux années qui suivent l'arrêt du benfluorex et devient très faible au-delà.
C'est pourquoi l'agence souligne aujourd'hui tout particulièrement la nécessité d'une consultation médicale chez le médecin traitant pour les personnes ayant consommé pendant au moins 3 mois du benfluorex au cours des quatre dernières années de sa commercialisation, c'est-à-dire entre le 1er janvier 2006 et le 30 novembre 2009. Cette consultation doit être suivie d'une consultation spécialisée cardiologique en cas de détection à l'auscultation de signes évocateurs d'anomalies valvulaires ou même simplement en cas de doute. Des échanges sont en cours avec la Cnamts en vue de l'envoi par les Caisses primaires d'assurance maladie de courriers individuels de rappel aux patients concernés. Il s'agit de s'assurer que toutes ces personnes ont bien été informées par leur médecin traitant des recommandations émises par l'Afssaps en novembre 2009. Cet envoi de lettre personnalisée n'est juridiquement et pratiquement possible que pour une partie de ces patients car les organismes d'assurance maladie ne peuvent pas conserver les données personnelles de consommation de médicament pendant une durée de 24 mois.

Mon dernier message, particulièrement important à mes yeux pour l'avenir, est de souligner l'enjeu majeur que représente la complémentarité entre la pharmacovigilance fondée sur la notification spontanée par les professionnels de santé et les études pharmacoépidémiologiques qui peuvent être réalisées notamment à partir de bases de données telles que celles de la Cnamts.

Bien entendu, il faut poursuivre sans relâche les efforts engagés pour encourager et favoriser la notification des effets indésirables par les professionnels de santé, y compris quand l'imputabilité n'est pas évidente à priori et qu'il y a une simple suspicion d'un rôle possible du médicament. La notification d'une masse critique de cas est « une matière première » indispensable pour pouvoir travailler efficacement à la minimisation du risque. Et la généralisation prochaine de la possibilité de déclaration par les patients eux-mêmes, expérimentée au cours de la pandémie grippale, pourra contribuer à renforcer le système de notification.

Mais, il est des situations dans lesquelles un système de pharmacovigilance, même organisé de façon structurée comme il l'est chez nous, peut ne produire qu'un signal faible voire très faible pour un risque qui s'avère ensuite plus net. C'est le cas en particulier lorsque l'effet indésirable est relativement répandu dans la population générale, et que les patients concernés ont d'autres pathologies proches ou similaires qui peuvent conduire le professionnel de santé à ne pas penser faire le lien entre l'effet indésirable et la prise du médicament.
Le cas de benfluorex illustre bien la répercussion de ces «effets confondants», puisque l'examen des données de la Cnamts montre que la plupart des patients sous benfluorex hospitalisés et le cas échéant opérés pour des atteintes valvulaires étaient en affection de longue durée (ALD), au titre d'autres affections cardiovasculaires ou bien d'un diabète chronique susceptible d'engendrer des troubles cardiovasculaires. Dans un tel contexte, la possibilité de recourir rapidement et facilement à des études utilisant de grandes bases de données pour confirmer ou non le signal faible est absolument cruciale. C'est pourquoi l'Afssaps s'est dotée depuis 3 ans d'une structure interne tournée vers la pharmacoépidémiologie, apte non seulement à identifier des besoins d'études dans le cadre des plans de gestion des risques mais aussi à dialoguer avec des équipes extérieures et notamment avec la Cnamts pour faire réaliser des études confirmatives. L'agence a également constitué en 2008 un groupe de travail spécialisé associant des scientifiques de ses propres équipes et des experts pharmacovigilants et pharmacoépidémiologistes issus d'horizons et d'organismes divers. Les freins juridiques et techniques qui entravaient l'utilisation des bases de données de l'assurance-maladie étant progressivement levés, la coopération opérationnelle entre l'Afssaps et la Cnamts, engagée récemment sur des sujets comme benfluorex ou Gardasil, va pouvoir se développer plus largement, dans le cadre d'une convention que nous sommes en train de mettre au point et qui sera signée dans les prochaines semaines.

Je m'arrête là pour céder la parole aux membres de l'équipe scientifique de l'Afssaps qui vont brièvement approfondir les aspects relatifs à la pharmacologie du benfluorex, aux résultats de la deuxième étude de la Cnamts et aux conséquences à tirer pour le renforcement du suivi des patients.

SOMMAIRE

PARTIE I : LES COMPTES 4

I. LES COMPTES EN JUGEMENT 4

A. LA PERIODE CONTRÔLEE 4

B. L'ENCHAÎNEMENT ET LA PRESENTATION DES COMPTES 4

1. L'enchaînement des comptes 4

2. La présentation des comptes 5

II. LE COMPTABLE 12

PARTIE II : LA GESTION DE L'AFSSAPS 14

I. L'ORGANISATION ET LE PILOTAGE DE L'AFSSAPS 14

1. L'exercice de la tutelle 14

2. Le projet d'établissement et le contrat d'objectifs et de moyens 15

3. Les évolutions de l'organigramme 18

II. LA GESTION ADMINISTRATIVE ET FINANCIERE DE L'AFSSAPS 20

A. LES RESSOURCES DE L'AGENCE 20

2. Les autres recettes propres 28

B. LE PATRIMOINE IMMOBILIER DE L'AGENCE 29

1. L'échec du projet d'édification d'un immeuble 30

2. Les acquisitions de locaux déjà construits 32

3. Les locaux pris à bail 35

C. LES DEPENSES DE FONCTIONNEMENT 37

1. L'attribution de subventions 37

2. La fonction « achats » 40

III. LES AUTRES FONCTIONS SUPPORT 43

A. LA GESTION DES EXPERTS 43

1. L'externalisation d'une partie de l'évaluation scientifique 43

2. Nombre et recrutement des experts 44

3. La rémunération des experts 45

4. La prévention et la gestion des conflits d'intérêts des experts 51

B. LA GESTION DES RESSOURCES HUMAINES 62

1. Le personnel de l'AFSSAPS 62

2. La DRH 68

3. Les mises à disposition et détachements 72
4. Les primes et indemnités 74
5. La réforme du statut des contractuels 81
6. La réforme statutaire des fonctionnaires : un retard qui nuit au climat social 90
7. La déontologie 90
8. La bureau de Londres 91
C. LE SYSTEME D'INFORMATION 93
1. Des moyens suffisants mais mal exploités 93
2. Le système d'information constitue la principale faiblesse de l'AFSSAPS 97
3. Des évolutions positives sont en cours 104
IV. LES FONCTIONS SCIENTIFIQUES 109
A. LA DEMEB 109
1. La gestion et l'archivage des dossiers 109
2. La procédure d'AMM 111
3. Les autres procédures d'autorisation ou de déclaration gérées par la DEMEB 117
4. La pharmacovigilance 121
5. La mission d'information du public 124
B. LA DIRECTION DES LABORATOIRES ET DES CONTROLES 140
1. Les missions de la DLC 140
2. La difficile gestion des ressources humaines de la DLC 141
3. L'informatique à la DLC 142
4. La gestion administrative et financière et le pilotage de la DLC 142
C. LA DIRECTION DE L'INSPECTION ET DES ETABLISSEMENTS 143
1. Les missions de la DIE 143
2. Le personnel et le système d'information de la DIE 144
3. Les délais de rédaction des rapports d'inspection 144

ANNEXES

c. Les préparations hospitalières

Autre exemple de missions remplies a minima faute de moyens : l'obligation faite aux les hôpitaux, depuis le mois de décembre 2004[59], de déclarer leurs préparations hospitalières (médicaments fabriqués en interne par les hôpitaux). 3000 déclarations ont été reçues en six mois. Seul un pharmacien à 60% de son temps est en charge de cette mission. Il n'est donc pas question d'évaluation du rapport bénéfices/risque comme pour l'AMM. La mission se borne à vérifier si la préparation hospitalièree est indispensable (absence de médicament équivalent) ou non.

Mais la contrainte de moyens peut également favoriser la créativité et susciter des procédures innovantes. En effet, la gestion administrative de cette nouvelle procédure a été simplifiée au maximum, grâce au développement d'une base de données avec télédéclaration (PROSPERH) directe par les hôpitaux. Ce projet-pilote PROSPERH va faire des émules : la base ATU, en cours de remodelage, et la base essais cliniques, en cours d'élaboration, auront une procédure de télédéclaration ou de soumission électronique des dossiers.

d. Les produits biologiques à effet thérapeutique

Issu de la loi du 1er juillet 1998, il s'agit d'un champ de compétence nouveau, à structurer et manifestement en souffrance. En effet, l'effectif actuel se réduit à 4,5 évaluateurs, ½ interne, 2 vacataires et ½ stagiaire. De plus, cette activité ne bénéficie pas du suivi organisationnel de la « GARE » (cf. plus haut). Les produits concernés sont les suivants :

- Les **produits de thérapie génique** (TG) démarrent : il y a des demandes d'essais cliniques, mais pas encore d'AMM ; presque tous auront un statut de médicament.
- Les **produits de thérapie cellulaire** (TC), issus de la directive européenne, peuvent être un médicament (donc soumis à AMM) ou non. La loi de 1998 a créé l'autorisation de TC, mais le département de l'évaluation des produits biologiques, au sein de la DEMEB, n'a pas les moyens de l'évaluer. Huit demandes avaient été reçues à la date de l'enquête, toutes insuffisantes.
- Les **produits thérapeutiques annexes** (PTA) sont des produits qui se trouvent en contact avec des tissus humains[60]. Leur statut juridique a tardé (le décret d'application de la loi de 1998 n'a été pris qu'en août 2004) et demeure spécifiquement français, n'existant pas ailleurs en Europe. Selon la chef de département, ce statut est complexe et conflictuel : les PTA ne sont a priori pas des médicaments (sauf peut-être l'albumine) et pourraient être des dispositifs médicaux au sens de la directive européenne... Entre 70 et 100 dossiers ont été déposés par des fournisseurs de matières premières depuis le début de 2005, la qualité en est médiocre. Malgré l'application de normes ISO et CE, d'importants problèmes de qualité ont été constatés (utilisation de l'eau du robinet...), qui ont conduit en particulier à la fermeture d'un site à Toulouse. Il manquerait ½ poste.
- Quant aux **tissus**, ils sont évalués par une seule personne, ce qui serait insuffisant. Il s'agit dans ce cas d'autoriser des procédés et non des produits (les autorisations d'établissement sont gérées depuis 1999 par la DIE et ont permis d'éliminer les

[59] Le décret d'application de la disposition de la loi du 1er juillet 1998, qui prévoyait la mise en place d'une déclaration à l'AFSSAPS des PH, n'a été pris qu'en décembre 2004.

[60] Il s'agit par exemple des milieux de cryoconservation des embryons congelés.

plus gros problèmes). L'exploration de ce nouveau domaine est réalisée progressivement. Un groupe de travail sur les cornées a été créé il y a deux ans : 20 à 25 banques de cornées ont déposé 70 dossiers, qui ont été examinés transversalement et ont fait l'objet d'une autorisation globale récemment. Le thème des os est abordé à partir de l'automne 2005.

Au sein de ce même département de la DEMEB, la cellule de biovigilance n'a qu'un demi poste, alors qu'il faudrait un poste à temps plein. Il est prévu qu'un groupe d'experts préfigure la future commission de biovigilance.

La lenteur des travaux dans ces nouveaux domaines ne suscite guère de protestations des firmes concernées. Contrairement aux génériqueurs qui se plaignent des délais d'autorisation, les fabricants de ces produits biologiques à effet thérapeutique se satisfont de cette lenteur, s'agissant d'un régime déclaratif.

L'agence devrait poursuivre ses efforts en matière de gestion des ATU et redéployer au sein de la DEMEB des moyens en direction des secteurs en expansion, comme les essais cliniques, les préparations hospitalières et les produits biologiques à effet thérapeutique.

4. La pharmacovigilance

La pharmacovigilance est l'une des vigilances gérées par l'AFSSAPS, à côté de l'hémovigilance[61], matériovigilance, cosmétovigilance, etc. Elle repose en France sur un réseau de surveillance des effets indésirables des médicaments constitué de 31 centres régionaux de pharmacovigilance (CRPV). Ces centres régionaux, situés dans de grands hôpitaux, sont subventionnés par l'AFSSAPS à hauteur de 2,9 M€ (montant assez stable depuis la création de l'agence).

Contrairement à certains pays et au projet initial de directive communautaire sur les médicaments parue en 2004), les patients ne peuvent signaler directement les effets indésirables aux autorités.

En 2004, 4 190 effets graves liés à des médicaments ayant eu une AMM centralisée ont été transmis par la France à l'EMEA. En sens inverse ont eu lieu 16 525 transmissions de l'EMEA vers la France. La France a donc notifié environ le cinquième des effets graves liés à des médicaments ayant eu une AMM centralisée. Ces nombres sont en forte augmentation : la transmission France vers EMEA était de 700 en 1997 et la notification EMEA vers France s'élevait à 2100 cette même année.

[61] Au sein de la DEMEB, l'unité d'hémovigilance est dépourvue de chef d'unité. La loi de 1993 avait confié à l'agence du médicament les médicaments dérivés du sang. La loi de 1998 a confié à l'AFSSAPS les produits sanguins labiles. Or, l'agence n'a pas les moyens d'évaluation suffisants : 2,3 ETP actuellement. L'EFS a plus de moyens.

a. Un système d'information longtemps insuffisant

Le rapport IGF-IGAS constatait en 2002 que la base nationale de pharmacovigilance présentait de sérieuses lacunes et qu'elle n'était pas reliée au système d'information d'AMM.

Depuis 2002, aucune interface entre les systèmes d'information de pharmacovigilance et d'AMM n'a été mise en place. Une nouvelle application de pharmacovigilance est fonctionnelle depuis le 20 novembre 2005, selon le secrétaire général de l'AFSSAPS. Elle intègre « *toutes les données migrées et transcodées de l'ancienne application, pour être éprouvée sur 6 semaines de tests* ». Cette application est conforme à la réglementation internationale, « *permettant d'adresser le flux des incidents graves recensés (statistiquement, 20 par jour) aux partenaires européens à partir de la base Eudravigilance* ».

Cette application s'appuie sur un progiciel standard (ArisG - éditeur américain) adapté aux besoins de l'agence. Elle est interfacée avec la base de données sur le médicament « Codex » et d'une manière générale avec le système d'information de l'agence grâce au code unique de spécialité pharmaceutique provenant de Codex associé à chaque incident répertorié. Le futur PDSI assurera l'interaction entre les applications de l'agence, en particulier la base de pharmacovigilance nouvellement installée.

b. Selon certains avis médicaux, la pharmacovigilance ne serait ni assez transparente, ni assez réactive en France

Les rapports d'enquête de pharmacovigilance ne sont pas publiés, ni, sauf exceptions, les données de pharmacovigilance qui ont conduit à des modifications de RCP ; le signalement par l'AFSSAPS des modifications de RCP pour raisons de pharmacovigilance n'est pas systématique d'après la revue indépendante *Prescrire*[62].

Les données de pharmacovigilance permettent de réaliser des synthèses : les études de pharmaco-épidémiologie. Seules six de ces études ont été réalisées entre 1999 et juin 2005. L'une de ces études, intitulée « iatrogénie médicamenteuse des 31 CRPV », a été réalisée en 2000 sur le thème de l'incidence des hospitalisations motivées par la survenue d'un effet indésirable. L'agence ne prévoit de la renouveler qu'en 2006 ou 2007.

Le choix des thèmes à retenir est déterminé, sur proposition des différentes directions opérationnelles, au cours d'un comité des études présidé par le directeur général de l'agence. Ces thèmes découlent des questions que se posent ces différentes directions dans l'accomplissement de leurs missions. Ils sont ensuite soumis au conseil scientifique de l'agence, sur la base de leurs protocoles, avant le déclenchement du financement par l'agence. Le budget annuel pour les études est de 800 000 euros en 2005.

La revue *Prescrire*, qui reconnaît que l'AFSSAPS a pris en 2004 « *quelques mesures de pharmacovigilance qui vont dans le bon sens* » (modifications de RCP signalant des effets indésirables, « mises au point » sur la sécurité d'emploi ou les indications de certains médicaments…)[63], relève néanmoins l'attentisme de l'agence sur certains dossiers :

---

[62] Prescrire, février 2004, page 145.

[63] Prescrire février 2005, page 143.

⇨ Pour les classes de médicaments à risques majeurs (coxibs, antidépresseurs, par exemple), la revue estime que les mesures sont longues à venir, l'AFSSAPS se retranchant derrière les travaux en cours à l'EMEA. « *Des communiqués toujours succints sont publiés tardivement, alors que les risques sont établis* ».

⇨ Associations de dextropropoxyphène + paracétamol (de type Di-Antalvic®) : alors que leur retrait du marché est programmé pour fin 2005 en Suède ou au Royaume-Uni, l'Agence les maintient sur le marché français. Est-ce à dire que ces médicaments, pourtant non indispensables [selon *Prescrire*], ne présentent pas les mêmes risques en France ?

⇨ Quand des médicaments dont la balance bénéfices-risques est connue depuis longtemps comme défavorable, tels le benfluorex (Mediator®) ou le véralipride (Agréal®), sont retirés du marché espagnol, l'AFSSAPS n'en dit rien, et ils continuent à être vendus en France.

Exemple du Reminyl®

Le 8 novembre 2005 est diffusée sur le site internet de l'agence une « lettre aux prescripteurs » du 21 octobre 2005 du laboratoire Janssen-Cilag au sujet du Reminyl®, indiqué dans le « traitement symptomatique de la maladie d'Alzheimer dans ses formes légères à modérément sévères ». Ce médicament, commercialisé en France depuis 2001, est le 3ème de la classe des anticholinestérasiques (après Aricept® et Exelon®). Cette lettre aux prescripteurs indique que les résultats finaux de deux études cliniques réalisées pendant deux ans chez des patients non déments présentant des troubles cognitifs légers montraient que :

-le taux de mortalité a été significativement plus élevé dans le groupe Reminyl (1,4%) que dans le groupe placebo (0,3%) ;

-le traitement par Reminyl n'a pas démontré de bénéfice dans le ralentissement du déclin cognitif et n'a pas retardé l'apparition de la démence[64].

Ces études démontrent clairement une balance bénéfices/risques défavorable (aucun bénéfice pour des risques accrus par rapport au placebo), qui devrait en principe conduire à s'interroger sur le maintien de l'AMM du produit. L'AFSSAPS a simplement diffusé la lettre d'information du laboratoire (qui conclut que les prescripteurs doivent respecter strictement l'indication) et modifié le RCP pour tenir compte des résultats des études. On peut s'interroger sur la faiblesse des conséquences tirées par l'agence de ces études de longue durée aux résultats significatifs.

Malgré des améliorations significatives, notamment sur le système d'information, la pharmacovigilance pourrait encore progresser sur le plan de sa réactivité et de la transparence des données.

[64] Déjà l'évaluation pré-AMM de chacun des 3 anticholinestérasiques avait montré, contre placebo, des résultats qualifiés par les experts de très modestes, à la limite du significatif, voire non significatifs.

Agence française de sécurité sanitaire des produits de santé

Le Directeur Général
Tél. +33 (0)1 55 87 30 14
Fax. : +33 (0)1 55 87 30 12

Saint-Denis, le 28 AVR. 2006

Le Directeur Général de l'Agence française de sécurité sanitaire des produits de santé
à
Monsieur le Président de la sixième chambre de la Cour des comptes
13 rue Cambon
75 100 PARIS cedex 01

Objet : Relevé de constatations provisoires sur les comptes et la gestion de l'Agence française de sécurité sanitaire des produits de santé

Réf. : Votre lettre RC 44250 du 28 mars 2006

P.J : Réponse de l'Afssaps au relevé de constatations provisoires

Suite aux investigations des rapporteurs de la Cour sur les comptes de l'Afssaps pour les exercices 1999 à 2004 et au relevé de constatations provisoires que vous m'avez transmis par lettre citée en référence, je vous prie de trouver ci-après les remarques et observations que ce document appelle de ma part.

Sur un plan général, je prends acte de ce que les rapporteurs ont bien pris en compte les importants chantiers d'amélioration des fonctions de gestion de l'agence et noté les progrès d'ores et déjà enregistrés, même si le chemin qui reste à parcourir est encore important, particulièrement en ce qui concerne les systèmes d'information.

S'agissant des principales problématiques qui concernent les fonctions médico-scientifiques – déontologie des experts, transparence, sécurité du médicament – vous noterez dans les observations qui suivent que l'agence ne partage pas toujours le point de vue des rapporteurs quant à l'importance des efforts entrepris et le niveau des résultats obtenus. Elle a donc cherché à préciser et compléter à chaque fois les données citées par les rapporteurs.

Pour plus de lisibilité, ces observations sont exposées selon la trame du relevé de constatations provisoires.

Par ailleurs, je vous indique que je ne demande pas à présenter d'observations orales devant la Cour, sauf à ce qu'elle le souhaite elle-même.

Le Directeur général

Annexe 3-87

27/04/06

REPONSE DE L'AGENCE DE SECURITE SANITAIRE DES PRODUITS DE SANTE AU RELEVE DE CONSTATATIONS PROVISOIRES DE LA COUR DES COMPTES POUR LES EXERCICES 1999 A 2004

(Les titres en italique sont repris du projet de relevé de constatations provisoires)

PARTIE I : LES COMPTES

I. LES COMPTES EN JUGEMENT

A. LA PERIODE CONTROLEE

B. L'ENCHAINEMENT ET LA PRESENTATION DES COMPTES

1. L'enchaînement des comptes

2. La présentation des comptes

Concernant les améliorations intervenues dans la gestion financière, il paraît utile de noter le recrutement d'un Contrôleur de Gestion au sein d'un pôle de l'Unité Budget qui permet aujourd'hui une nette amélioration des prévisions budgétaire de l'Afssaps notamment dans le cadre de la mise en place de la LOLF.

II. LE COMPTABLE

PARTIE II : LA GESTION DE L'AFSSAPS

I. L'ORGANISATION ET LE PILOTAGE DE L'AFSSAPS

1. L'exercice de la tutelle

Fin janvier 2006, la DAGPB a annoncé qu'elle cessait d'exercer la tutelle budgétaire de l'agence et qu'elle se retirait de son conseil d'administration.

Evaluer le bénéfice risque serait donc très difficile dans ce domaine si la mission en était confiée à l'agence. Celle-ci ne peut, comme le souligne la mission, que vérifier qu'il n'existe pas des spécialités pharmaceutiques rendant un service équivalent.

d. Les produits biologiques à effet thérapeutique

Un poste supplémentaire a été affecté dans ce secteur en 2006.

4. La pharmacovigilance

Page 121 : La pharmacovigilance – 2ème paragraphe
A ce jour, il n'existe pas de disposition, tant d'un point de vue légal que réglementaire, permettant la déclaration des événements indésirables des produits de santé directement par les patients ou les associations de patients. Toutefois, la Commission Européenne demande aux autorités nationales compétentes d'inciter les patients à signaler les évènements indésirables aux professionnels de santé (article 22 du règlement CE 726/2004 du 31 mars 2004 établissant des procédures communautaires pour l'autorisation et la surveillance en ce qui concerne les médicaments à usage humain et à usage vétérinaire, et instituant une Agence européenne des médicaments). A la connaissance de l'Agence, seul le Danemark a instauré, en juin 2003, un système permettant au patient de déclarer les événements indésirables : le « Council for Adverse Drug Reactions ». Cette notification directe est notamment possible sur Internet (www.laegemiddelstyrelsen.dk) ou dans les pharmacies.

En France, on constate, depuis quelques années, qu'il arrive que les patients contactent directement les centres régionaux de pharmacovigilance (CRPV) ou les industriels afin de signaler la survenue d'un événement indésirable. L'ouverture aux patients de la notification des événements indésirables apparaît donc comme une évolution logique du système. Sa mise en œuvre doit être considérée et précisée, non comme une remise en cause des capacités d'analyse et d'alerte du système actuel, mais plutôt comme une source complémentaire d'informations.

Dans le cadre du partenariat Afssaps / Associations de Patients, lancé en décembre 2004 et ayant déjà débuté en mars 2004 sur la présentation d'une gamme de mesures, le principe d'une association des patients aux mécanismes de déclaration a été retenu Une étude pilote est mise en place, à partir du mois de mai 2006 et pour 6 mois au moins, dont les objectifs sont d'évaluer la qualité et la pertinence des signalements adressés par les patients à une vingtaine d'associations qui se sont portées volontaires pour participer à cette expérience, ainsi que le circuit de recueil, de traitement et d'analyse qu'il serait nécessaire d'instaurer. A l'issue de la période test, il sera alors envisagé une généralisation du système.

S'agissant des progrès attendus en matière de transparence, l'Afssaps souligne que le communiqué de presse « Médicament et démarche de transparence » en date du 16 mars 2006 s'accompagne de la publication du premier compte-rendu de la commission nationale de pharmacovigilance du 29 novembre 2005. L'Afssaps est en

pratique une des premières agences en Europe, si ce n'est la première, à mettre effectivement en œuvre cette mesure de publication.

Page 122 et 123 :
De manière générale, la conception même du paragraphe qui débute à la page 122 est très discutable.
En effet, la mission esquisse une appréciation sur la réactivité et la transparence de la pharmacovigilance dans notre pays en s'appuyant sur « certains avis médicaux » dont la lecture attentive du paragraphe révèle qu'il s'agit uniquement d'opinions émises par la revue Prescrire dont elle reprend au demeurant deux ou trois exemples figurant dans une des livraisons de cette revue datant du second semestre 2006.

Une appréciation dans un domaine aussi sensible ne peut se fonder de façon robuste sur la reproduction des allégations d'un acteur parmi bien d'autres.

Plus spécifiquement, sur les points relevés par cette revue et repris par les rapporteurs , il y a lieu d'apporter les précisions suivantes.

Concernant le 1er point, où il est fait grief à l'Agence, par la revue Prescrire de communiquer tardivement alors que les risques sont établis, l'Afssaps a toujours joué la transparence en publiant des communiqués ou des points d'étapes faisant part de la problématique et dans l'attente de résultat de l'évaluation européenne diffusant des messages de mise en garde.

Concernant le 2ème point, relatif à l'association dextroproxyphène/paracétamol, le maintien sur le marché français se justifie à l'issue de l'évaluation du profil de sécurité d'emploi et d'une utilisation du produit plus encadrée, en 2e intention, ce qui n'était pas le cas au Royaume-Uni.

Enfin, le 3ème point mentionne l'absence du retrait du marché de 2 produits dont la balance bénéfice/risque serait connue pour être défavorable. Ces 2 produits ont fait l'objet d'une enquête approfondie : pour l'un, Agréal®, il a été considéré que la balance bénéfice/risque était favorable et pour l'autre après un examen des données de sécurité, la commission a demandé une réévaluation du bénéfice/risque et le produit a en définitive cessé d'être commercialisé en avril 2006 (voir PV du 26 novembre 2006).

Encadré « exemple du Reminyl® » : Contrairement à ce qui est écrit, la balance bénéfice/risque reste favorable dans l'indication du « traitement symptomatique de la maladie d'Alzheimer ». Cependant, il a été demandé une étude épidémiologique pour confirmer les conclusions de novembre 2005.

Objet : Relevé d'observations définitives sur les comptes et la gestion de l'Agence française de sécurité sanitaire des produits de santé

Après avoir examiné votre réponse à ma lettre du 28 mars 2006 et en avoir pris acte, la Cour a arrêté ses observations définitives dont vous trouverez ci-joint le relevé.

La présente lettre met fin à l'enquête.

Michel CRETIN

Annexe 3-87

Sixième chambre

OBSERVATIONS DEFINITIVES

AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ (AFSSAPS)

exercices 1999 à 2004

Le présent rapport, qui a fait l'objet d'une contradiction avec les personnes et les organismes concernés, a été délibéré par la Cour des comptes le 9 octobre 2006.

De son côté, l'AFSSAPS a pris du retard dans l'enregistrement des essais cliniques dans la base européenne EUDRAVIGILANCE, qui depuis novembre 2005 devrait recenser tous les effets indésirables graves et inattendus de ces essais.

Par ailleurs, l'attractivité de la France en matière de recherche clinique suppose des délais d'autorisation courts, et par conséquent un redéploiement des moyens de la DEMEB sur ce secteur. La Cour prend acte de ce qu'un poste supplémentaire d'évaluateur a été affecté à l'unité en 2006.

3. Les préparations hospitalières et les produits biologiques à effet thérapeutique

La Cour a constaté que le contrôle de ces secteurs en expansion était exercé *a minima* faute de moyens humains suffisants.

Les hôpitaux ont l'obligation, depuis le mois de décembre 2004[3], de déclarer leurs préparations hospitalières. Alors que 3000 déclarations ont été reçues en six mois, seul un pharmacien à 60% de son temps était en charge de leur contrôle fin 2005.

Le même manque de moyens humains a été constaté s'agissant du contrôle des produits biologiques à effet thérapeutique, confié à l'AFSSAPS par la loi du 1er juillet 1998. En effet, fin 2005, l'effectif se réduisait à 4,5 évaluateurs (½ interne, deux vacataires et ½ stagiaire).

La Cour prend toutefois acte de la réponse de l'AFSSAPS, qui a indiqué avoir redéployé deux postes dans ces secteurs en 2006.

D. LA PHARMACOVIGILANCE

Le système d'information dans le domaine de la pharmacovigilance, qui était très insatisfaisant, a été nettement amélioré grâce à la mise en place d'une nouvelle application fin 2005.

En matière de transparence, la Cour prend acte l'expérimentation en cours tendant à impliquer les associations de patients dans les mécanismes de déclaration des effets indésirables. Toutefois, les rapports d'enquête de pharmacovigilance ne sont pas publiés, ni, sauf exception, les études de pharmaco-épidémiologie ayant conduit à des modifications de résumés des caractéristiques du produit (RCP). Le signalement par l'AFSSAPS des modifications de RCP pour raisons de pharmacovigilance n'est pas systématique. Les comptes-rendus de la commission de pharmacovigilance sont été mis en ligne très tardivement (cf. *infra*).

Par ailleurs, la réactivité de l'AFSSAPS dans le domaine de la pharmacovigilance pourrait être améliorée. Seules six études de pharmacovigilance ont

---

[3] Le décret d'application de la disposition de la loi du 1er juillet 1998, qui prévoyait la mise en place d'une déclaration à l'AFSSAPS des PH, n'a été pris qu'en décembre 2004.

été réalisées entre 1999 et juin 2005. Certains médicaments dont la balance bénéfice/risques était controversée ont continué d'être commercialisés, tandis que d'autres médicaments, retirés du marché de pays européens en raison d'une balance bénéfice/risques jugée défavorable, ont mis plusieurs années à être retirés du marché français.

La Cour recommande par conséquent d'accroître la transparence et la réactivité de l'AFSSAPS en matière de pharmacovigilance.

E. LA MISSION D'INFORMATION DU PUBLIC

1. La directive communautaire 2004/27/EC du 31 mars 2004 relative au médicament

L'AFSSAPS a attendu l'automne 2005 pour préparer la mise en œuvre de la directive communautaire 2004/27/EC du 31 mars 2004 relative au médicament. La Cour observe que l'agence ne respecte pas toutes les obligations découlant de cette directive en matière de transparence. Certes, cette directive n'a pas encore été transposée en droit interne. Mais elle était prévue pour être appliquée dès le 30 octobre 2005, et reprend plusieurs obligations déjà en vigueur pour l'AFSSAPS.

a. Les déclarations d'intérêt des agents de l'AFSSAPS

Ainsi, la déclaration d'intérêts des agents de l'AFSSAPS, d'ailleurs mentionnée dans son règlement intérieur, n'a commencé à être mise en œuvre qu'au premier semestre 2006.

b. Les rapports d'évaluation d'AMM

La publication des rapports d'évaluation d'AMM (RAPPE), prévue par ce texte et figurant déjà à l'article 6 de loi de 1998 sur la sécurité sanitaire (art. L.793-1, devenu L.5311-1 du CSP), n'a débuté qu'en juin 2004.

Elle est encore loin de concerner toutes les AMM. Depuis janvier 2006, la commission d'AMM est saisie d'un projet de RAPPE pour toutes les AMM correspondant à de nouvelles entités chimiques ou biologiques ainsi que pour les extensions d'indications majeures qui, sans être directement concernées par la directive, présentent un intérêt particulier. Ce n'est que dans un second temps que les RAPPE seront réalisés pour l'ensemble des spécialités donnant lieu à l'octroi d'une AMM.

Par ailleurs, la Cour a constaté que la découverte de risques sanitaires sérieux peu après la délivrance de l'AMM de deux spécialités pharmaceutiques avait bloqué la publication des rapports publics d'évaluation, alors que c'est précisément dans de tels cas que la transparence des données aurait été la plus utile.

De : Jean MARIMBERT
À : Anne-Carole.BENSADON@igas.gouv.fr; aquilino morelle; etienne.marie@iga...
Date : 14/01/2011 10:46
Objet : A l'attention de Madame et Messieurs les membres de la mission IGAS,
Pièces jointes : cour dc 28.04.06.pdf; cour c 13.06.07.pdf

A l'attention de Madame et Messieurs les membres de la mission IGAS,

Dans le prolongement de la conversation téléphonique que j'ai eu hier soir avec M. Morelle, j'ai fait ce matin avec les secrétariats et personnes concernées des recherches documentaires sur les observations transmises en 2006 et 2007 à la Cour des Comptes.

Il en ressort que :

- l'envoi des observations en date du 28 avril 2006 a été géré matériellement par le secrétariat général, où l'on n'a pu retrouver ce matin , en l'absence du secrétaire général depuis mercredi-qu'une trace informatique de l'existence de l'envoi, le document lui-même n'étant pas disponible au secrétariat (peut-être est-il rangé dans les dossiers du secrétaire général ou son coffre?
- en revanche le chef du service juridique avait gardé une copie du document, que j'ai donc pu consulter (cf en pièce joint la lettre de couverture et la page correspondante);
- la page du document susceptible de faire référence à Médiator, qui n'est pas expressément cité, mentionne effectivement que la commission a demandé une réévaluation du bénéfice risque avant d'ajouter que "le produit a en définitive cessé d'être commercialisé en avril 2006 (voir PV du 26 novembre 2006 ";
-cette précision était évidemment inexacte , et le caractère matériel de cette erreur est attestée par la date de commiission qui est mentionnée et qui est...postérieure de plusieurs mois à la date d'envoi des observations de l'agence;
-au demeurant, les observations que l'agence enverront à la Cour un peu plus d'un an après, dans le cadre d'une enquête sur la consommation et la prescription des médicaments, et dont l'envoi a été matériellement géré par le secrétariat du directeur général-ce qui a permis d'en retrouver trace plus facilement dès hier soir-comportent un passage sur benfluorex qui évoque le sujet en des termes conformes à la chronologie réelle de la réevaluation , cet envoi faisant référence notamment à l'avis de la commission d'AMM en date du 5 avril 2007 (cf en pièce jointe la lettre-chapeau de transmission et le passage des observations de l'agence qui abordait ce sujet);
En outre, comme convenu au téléphone il y a quelques minutes avec M.Morelle, je vous fais porter immédiatement la copie du document intégral du 28 avril 2006 , telle que conservée par le chef du service juridique qui me l'a remise ce matin.

Bien cordialement,
J.M.

Saint Denis, le 04/01/2011

Note
relative aux vulnérabilités du management de la pharmacovigilance et de la surveillance du marché du médicament (affaire Mediator)

Dans le contexte du dossier Mediator, vous trouverez ci-après mes réflexions relatives à la qualité de la chaine décisionnelle en matière de pharmacovigilance et de surveillance des marchés du médicament à l'Afssaps.

Si l'analyse scientifique ne relève pas de ma compétence, le registre du management m'est en effet légitime compte tenu de ma position dans l'agence.

Ces réflexions pourront vous être utiles non seulement pour comprendre la possibilité de certaines défaillances dans la chaine décisionnelle, mais également et surtout pour préparer des décisions susceptibles de réduire les risques de rechute.

La chaine décisionnelle en matière de pharmacovigilance et de surveillance du marché des médicaments est composée comme suit :

- les chefs des unités pharmacovigilance, ces dernières comptant au total une vingtaine de personnes
- la chef du département de pharmacovigilance
- la chef du service de l'évaluation et de la surveillance du risque, et de l'information (SURBUM)
- le directeur de l'évaluation des médicaments et des produits biologiques (DEMEB)

Je n'ai rien à dire sur le premier niveau (les chefs d'unité) que je ne connais pas et avec qui je n'ai pas eu à traiter depuis mon arrivée à l'agence (2004).

Chacun des niveaux supérieurs présente depuis longtemps des failles managériales objectives et vérifiables dont le cumul peut expliquer pour partie la faiblesse d'une organisation qui n'a pas su capitaliser et exploiter les divers signaux remontés ces dernières années en ce qui concerne la dangerosité du Médiator.

1 – La chef du département de pharmacovigilance :

En l'occurrence, , la cher du département de pharmacovigilance a toujours systématiquement fait écran entre ses unités et la chef du SURBUM, et a constamment dénié à celle-ci le droit de s'immiscer dans la gestion de son département. Ce fait était connu de toute l'agence et reconnu et déploré par la chef du SURBUM.

2 – La chef du SURBUM :

Outre l'incapacité dans laquelle celle-ci était de pouvoir exercer correctement ses prérogatives managériales, elle présente également le grave inconvénient d'avoir été en charge de responsabilités dans le secteur de la pharmacovigilance pendant une période beaucoup trop longue.

Elle était déjà responsable de la pharmacovigilance en 1995 et l'était encore, si je ne me trompe, à l'époque des réexamens du Mediator à la fin des années 1990, puis a eu la responsabilité de la coordination des vigilances et de la surveillance du marché, puis a repris le secteur en direct comme chef du SURBUM.

C'est dire que la réévaluation du Médiator au cours des années 2000, à chaque fois qu'un signal est venu s'ajouter aux précédents, n'a pu bénéficier d'un regard neuf à son niveau de responsabilité.

3 – Le directeur de l'évaluation :

Pour remédier aux insuffisances de l'organisation qui lui était rattachée, il aurait fallu que celui-ci ait les moyens pleins et entiers attachés à sa fonction. Or la chef du Surbum a toujours bénéficié d'un statut de quasi directeur. Ainsi est-elle membre à part entière du comité de direction, et nombre de débats auxquels ce comité a pu assister ont montré que la chef du Surbum et le Demeb apparaissaient souvent comme des entités rivales plutôt que comme une chaine hiérarchique.

Un deuxième point de faiblesse du Demeb est qu'il est en déplacement à Londres une semaine par mois du fait de son assistance aux débats du CHMP.

Dans ces conditions, il est illusoire d'attendre de lui un management optimal d'une direction aussi complexe que la Demeb, qui compte plus de 300 personnes et opère sur des champs scientifiques et opérationnels aussi étendus.

Ce manque de proximité et de présence du directeur de la Demeb est une difficulté structurelle à laquelle il serait nécessaire de remédier, le choix devant lui être proposé d'opter clairement entre sa fonction managériale et une fonction d'expert européen. Une alternative pourrait consister à séparer clairement AMM et post AMM, en faisant du SURBUM une direction à part entière. La présence du directeur de l'AMM à l'Europe se justifierait donc mieux et aurait moins de conséquence sur le management.

*
* *

En conclusion de cette analyse, je recommande au nouveau directeur général, en liaison avec le Demeb :

- de renouveler prioritairement la responsable du SURBUM, puis la chef du département de pharmacovigilance, en insistant dans le recrutement sur le paramètre managérial de la fonction – l'agence ne manque pas d'experts ;
- de traiter avec le Demeb le problème de management que pose son absence de l'agence un quart de son temps pour cause d'assistance au CHMP
- d'engager sans tarder un chantier de revisitation des AMM susceptibles de poser problème parmi les 10 000 AMM de spécialités commercialisées, en priorisant leur examen en fonction de quelques critères à définir en liaison avec le Demeb et un groupe d'experts ad hoc (notamment, ancienneté de l'AMM, signaux connus par la littérature ou tous autres canaux tels ceux qui ont été négligés pour le Mediator : statut dans les autres pays développés, OMS, presse spécialisée. Un conseil des responsables des banques de données médicamenteuses - Vidal, Claude Bernard, Thesorimed- ne serait pas à négliger).

Outre ces sujets de personnel et d'organisation, je souhaite également évoquer deux aspects complémentaires :

- la question de la sécurisation juridique des décisions de l'agence ;
- la question des tutelles et des contrôles.

1/ La question de la sécurisation juridique des décisions de l'agence apparaît clairement dans les nombreuses interviews que la direction générale a données à l'occasion de l'affaire Mediator.

Ainsi dans l'interview parue dans le Journal du Dimanche du 28 novembre dernier : « *Les laboratoires peuvent engager des recours devant le conseil d'Etat, et si notre dossier n'est pas suffisamment étayé, la décision de l'Agence peut-être annulée* ».

Que la sécurité juridique des décisions de l'agence soit recherchée est de bonne administration. Mais quand sécurité juridique et sécurité sanitaire viennent à se contrarier, la priorité donnée à la sécurité juridique peut contribuer à affaiblir la sécurité sanitaire.

Cette question juridique soulève un problème plus général à l'agence : il est patent qu'il existe d'autres Mediator (à effets moins graves, il faut l'espérer) mais dont l'agence connaît les risques, tout en butant sur la difficulté que sauf effet nouveau et reconnu (« robuste », comme il est souvent dit), il lui serait impossible de demander le retrait de l'AMM au seul motif que celle-ci a été accordée dans des temps anciens où les préoccupations de sécurité sanitaire étaient moins pressantes, ou bien les connaissances générales sur le produit moins complètes qu'aujourd'hui.

Un exemple emblématique récent est celui du Ketum, suspendu par l'agence par une décision qui a été cassée par le Conseil d'Etat, parce que les motifs qu'elle invoquait étaient connus depuis longtemps, et accessoirement parce que le retrait nuisait aux intérêts économiques du laboratoire !

Il est dangereux que l'agence intériorise cette obsession de la sécurité juridique au détriment de la sécurité sanitaire. Si des considérations tenant à la loi, au règlement ou à la jurisprudence nuisent à la sécurité sanitaire, c'est au législateur, au ministre ou au juge d'en prendre la conscience et la responsabilité et, le cas échant, d'en tirer les conséquences. Mais il ne revient certainement pas à l'agence de s'autocensurer et de prendre sous son couvert les insuffisances éventuelles du dispositif juridique. Ce faisant, elle contribue à occulter celles-ci, et manque à sa mission.

2/ En dépit de la faible efficacité des tutelles et des contrôles externes portant sur l'agence, la Cour des comptes avait repéré la vulnérabilité de la pharmacovigilance et le sujet du Mediator.

En 2005, elle a en effet procédé à un audit des comptes et de la gestion de l'agence sur les années passées.

Dans son relevé d'observations définitives diffusé en novembre 2006, la Cour fait la constatation suivante (p. 27), à propos de l'action de l'Afssaps en matière de Pharmacovigilance :

« D. LA PHARMACOVIGILANCE

..... Par ailleurs, la réactivité de l'AFSSAPS dans le domaine de la pharmacovigilance pourrait être améliorée. Seules six études de pharmacovigilance ont été réalisées entre 1999 et juin 2005. Certains médicaments dont la balance bénéfices/risques était controversée ont continué d'être commercialisés, tandis que d'autres médicaments, retirés du marché de pays européens en raison d'une balance bénéfice/risque jugée défavorable, ont mis plusieurs années à être retirés du marché français.

La Cour recommande par conséquent d'accroître la transparence et la réactivité de l'AFSSAPS en matière de pharmacovigilance. *»*[1]

A ma connaissance, cette constatation de la Cour n'a donné lieu ni à audits complémentaires, ni à des investigations plus poussées de la part des tutelles. Le diagnostic était pourtant précisé dans le relevé de constatations provisoires que la Cour avait envoyé le 26 mars 2006 à l'Afssaps ainsi qu'à la direction générale de la Santé et à la direction du Budget, et la liste des spécialités pharmaceutiques en cause était donnée p. 123 :

- les coxibs
- les antidépresseurs
- les associations de dextropropoxyphène+paracétamol (de type Di-Antalvic)
- le benfluorex (Mediator)
- le veralipride (Agréal)
- le Réminyl.

Il est impressionnant de trouver sur cette courte liste non seulement le Médiator, retiré trois ans plus tard seulement, mais également le Di-Antalvic dont l'agence, après s'être battue contre toute l'Europe pendant un an, est actuellement conduite à accélérer le retrait.

Les tutelles ont manifestement des leçons à tirer elles aussi de l'affaire Mediator, en ce qui concerne la faible efficacité des contrôles et l'absence d'exploitation des signaux que ceux-ci remontent le cas échéant.

Saint Denis, le 05/01/2011

Note
pour M. Didier Banquy

Directeur de cabinet du ministre du Budget, des Comptes publics, de la Fonction publique et de la Réforme de l'État

Objet : affaire Mediator – situation de l'Afssaps

Bonjour Didier,

N'ayant pas été auditionné par la mission IGAS mandatée par Xavier Bertrand sur l'affaire du Mediator[1], je tiens à ce qu'au moins Bercy ait un écho de ma vision des choses sur ce sujet (je te rappelle que je suis secrétaire général de l'Afssaps depuis sept ans, où j'ai mené la conception et la mise en œuvre de l'informatisation de l'agence, mais où malheureusement je n'ai pas été associé à sa marche opérationnelle).

Tu trouveras ci-joint la note que j'ai préparée dans la perspective de l'arrivée du futur directeur général de l'Agence, qui j'espère ne tardera plus.

S'il sera difficile de faire à plus de dix années de distance le procès d'une décision de non retrait du Médiator suite à l'interdiction de l'Isoméride en 1997 (un autre coupe-faim au principe actif proche de celui du Mediator), la presse n'a pas manqué en revanche de relever que de nombreux signaux se sont accumulés tout au long des années 1999-2006 pour confirmer et attester la dangerosité de ce médicament, signaux que l'Afssaps n'a pas su ou voulu exploiter.

Sans avoir besoin de rechercher je ne sais quelles compromissions des experts ou de l'agence avec les laboratoires (les discussions à l'agence sur les médicaments sont suffisamment ouvertes, collégiales et transparentes pour limiter les risques de « complots »), je pense que les défaillances du management suffisent largement à expliquer cette inertie.

En deux mots : la personne responsable de la surveillance des marchés du médicament est en poste depuis beaucoup trop longtemps. C'est elle qui était en charge de la pharmacovigilance au moment de la réévaluation du Mediator, et c'est donc la dernière à pouvoir avoir le réflexe de se repencher

[1] Je fais la supposition que tu n'as pas pu échapper au déferlement médiatique sur le sujet et que tu sais que ce médicament « coupe-faim », soupçonné d'avoir causé au moins 500 morts en 36 ans d'activité, n'a été interdit par l'agence qu'en 2009, celle-ci étant accusée d'avoir énormément tardé à le faire.

ultérieurement sur le dossier. Même si elle était une excellente manageuse (et ce n'est pas le cas), la laisser quinze ans ou plus sur un secteur aussi risqué est une faute lourde de gestion

Son incapacité managériale est notoire et désastreuse pour quelqu'un qui a la charge d'animer vingt évaluateurs et un réseau de 35 centres de pharmacovigilance. Quant à leur patron à toutes deux, il est arrivé plus récemment (2007) et n'est pas là une bonne partie du temps pour cause de réunions à Londres.

Tu me diras que le directeur général de l'Afssaps en place depuis sept ans aurait pu s'en apercevoir et y remédier : le seul fait qu'il ne l'ait pas fait suffit à mon sens à objectiver son incompétence en matière de management, incompétence que je pourrais attester par vingt autres exemples

Tout ceci non pour « dénoncer » mon chef – je pense que X. Bertrand n'est pas aveugle et va lui réserver le sort qu'il mérite – mais pour que tu saches qu'il y a bien une réponse aux questions que l'on se pose sur Mediator – c'est bien d'une banale incompétence du service public qu'il s'agit et qui a permis à Servier de rouler l'agence dans la farine – et que tu jettes le cas échéant un coup d'œil sur mes –courtes- suggestions en matière de recrutement des hauts dirigeants du secteur public. En trente ans de carrière dans l'administration (Agriculture, Finances) et le management public (Monnaie, DCN, Afssaps), ce n'est pas le premier manager incompétent que je rencontre, et j'espère que tu es conscient comme moi que cette incompétence est à la source des principaux problèmes que rencontre le service public. Je pense qu'un filtrage obligatoire par un cabinet de recrutement, sans que l'avis soit liant pour le politique, serait rapide à mettre en place et améliorerait considérablement les choses.

Je te demande par ailleurs de porter une attention particulière au dernier paragraphe de ma note sur Mediator : la Cour des comptes avait vu la faiblesse de la pharmacovigilance et le sujet Mediator, et les tutelles –dont Bercy- en étaient informées depuis 2006 et n'ont pas bougé.

Il ne serait pas inutile que les Finances préparent préventivement des éléments de langage – même si elles ne sont pas en première ligne sur le sujet- avant que cette information ne finisse par sortir (ce n'est pas le cas actuellement à ma connaissance) et travaillent accessoirement à une meilleure exploitation des rapports de la Cour.

Je suis bien sûr à la disposition de Bercy pour toute information complémentaire sur le sujet si besoin. Je profite de ce courrier pour te présenter mes meilleurs vœux pour cette nouvelle année. Il est en outre vraisemblable que je te demanderai un entretien dans les mois qui viennent car mes chantiers informatiques se terminent, et je m'applique à moi-même le principe que sept années au même endroit sont largement suffisantes !

Amitié

Michel POT

Annexe 3-89

REUNION DE SECURITE SANITAIRE DU 28 OCTOBRE 2009 (SEMAINE 44)

Participants : Mmes F. BARTOLI (AFSSAPS), J. CARMES (DGS), M. FAVROT (AFSSA), C. MARCHAL (ASN), E. PRADA-BORDENAVE (ABM), Ch. SAURA (InVS), F. SIMON-DELAVELLE (cabinet) et M. VALTIER (DGS).
MM. B. BASSET (INPES), J-J. BERGER (DGCCRF), G. BRÉART (INSERM), G. CZERWINSKI (DGAl), Cl. FUILLA (DSC), M. GUESPEREAU (AFSSET), E. HERGON (EFS), D. HOUSSIN (DGS), Ph. MAGNE (DGS), G. NICOLAS (DHOS) et J. REPUSSARD (IRSN).

1. Epidémie de grippe H1N1 :

1.1. Épidémiologie

En métropole, nette augmentation de l'activité au travers des réseaux Sentinelles (incidence estimée à 216/100.000 [seuil épidémique à 122/100.000], +38% par rapport à la semaine précédente) et GROG (taux de positivité H1N1 passant de 9 à 16%), en particulier avec une nette augmentation du recours aux soins et aux urgences pour les moins de quinze ans en Île-de-France (activité x 2) et début d'évolution identique dans les grands centres urbains. Depuis le début d'épidémie, 70 hospitalisations dont 22 en SI). Au total 17 décès en métropole dont 4 en semaine 43.

Poursuite de décroissance d'incidence et d'activité dans les départements français d'outremer.

Continent Nord-américain : augmentation d'incidence au Mexique, Canada et USA où le taux de positivité est de 37% pour les virus *influenzae* dont 70% de A(H1N1), indiquant une co-circulation virale (74%).

En Europe, augmentation des incidences en Islande, République d'Irlande et Irlande du Nord, Royaume-Uni, Norvège, Suède, Roumanie. Stabilité en Espagne.

1.2. Gestion

Vaccination en cours dans les établissements de santé avec une faible adhésion. La circulaire sur les centres de vaccination pour la population générale a été signée par les ministres le 27/10 et est diffusée aux préfets. L'ouverture des centres est fixée au 12 novembre. Les vaccins Pandemrix® (GSK) ont été reçus, et Focetria® (Novartis) seront livrés en semaine 47. Les vaccins sans adjuvants devraient être disponibles à partir du 15-20 novembre (semaine 47). L'Inpes commence les tournages des spots pour la vaccination grand public, en vue d'une diffusion dès le 6 novembre.

1.3. Foyers animaux H1N1 : Vingt-et-un élevages touchés en Norvège (Cf. CR du 21/10/09). La République d'Irlande ne déclare plus les foyers. Premier foyer au Japon. Un foyer au Minnesota (USA) à l'occasion d'une foire. Contamination d'un élevage de dindes en Ontario (Canada) dont l'origine humaine (jamais décrite) est en cours d'analyse. Avis de l'Afssa sur les risques de recombinaison virale, l'absence d'impact sur les viandes et la possibilité de transmission virale entre homme et dinde.

En matière de grippe aviaire (H5N1), pas de nouveau signalement.

2. Points évoqués par l'**InVS** :

- **Surveillance aspécifique Sursaud® :** poursuite de l'augmentation modérée d'incidence des bronchiolites.
- **Dengue (type 3)** au Cap Vert (1ère épidémie, touchant 3400 personnes), probablement en lien avec l'épisode du Sénégal.
- **Chikungunya** au Vietnam : 6700 hospitalisations. Mission OMS sur place. Première circulation depuis 1970.
- **Légionellose :** deux cas (19/9 et 12/10) ayant séjourné au village de vacances « Cap Estérel » au lieu-dit d'Agay (Saint-Raphaël, 83), d'une capacité d'accueil de 8000 places. Dysfonctionnements de ballons d'eau chaude, du système de chloration en continu et

interconnexions entre les circuits d'eaux froide et chaude. Mesures de gestion locale suivies par le service communal d'hygiène et de santé et la DDASS, et information des personnes potentiellement exposées.

- **Contaminations de duodénoscopes par des souches de *Klebsiella pneumoniae*** (cf. CR du 7/10/09 et suivants) : deux nouveaux patients dépistés aux CH de Poissy et de Blois. L'Afssaps précise que sur trois endoscopes TJF-145 envoyés en expertise chez le fabricant, deux avaient pu être décontaminés après désinfection manuelle classique. L'enquête nationale mise en place a retrouvé une contamination d'endoscope par *Klebsiella spp.* et *Pseudomonas spp.* au CH d'Alençon (61). Poursuite de l'expertise en cours.

3. Points évoqués par l'**AFSSA** :

- **Foyer animal A(H3N2)** dans un élevage de visons d'Amérique (*Mustela ou Neovison vison*) à Holstebro (Danemark).
- **Trois foyers de TIAC dans le sud de la France** dues à des œufs importés d'Espagne, contaminés par *Salmonella enteritidis* et *S. typhymurium*. Retrait des produits.
- **Compléments alimentaires :** campagne de communication visant à développer la vigilance des consommateurs sur ces produits.

4. Points évoqués par l'**AFSSAPS** :

- **Matériovigilance : retrait immédiat de cryosondes à CO2 Wallach Surgical** dont la température n'est pas assez froide et pourrait entrainer des nécroses trop superficielles, inefficaces pour le traitement de dysplasies du col utérin.
- **Pharmacovigilance :** Nouvelles publications et étude cas-témoin démontrant un **risque accru de valvulopathies dues au benfluorex[1] (Médiator®**, laboratoires Servier). Vote unanime de la commission nationale de pharmacovigilance pour le retrait du produit. Procédure contradictoire en cours avec le laboratoire. La commission d'AMM examinera ce dossier le 12 novembre.
- **Communication sur les produits cosmétiques destinés aux enfants de moins de trois ans,** avec la DGCCRF : Absence d'éléments en faveur d'un risque immédiat de santé publique (conformité microbiologique et de l'étiquetage), mais besoin d'une évaluation toxicologique, en l'absence d'AMM pour ces produits dans la réglementation européenne.

5. Points évoqués par l'**EFS** :

- **Point d'étape sur l'enquête EIGD de Lyon** (Cf. CR du 30/09/09 et suivants) **:** L'IGAS organise une première restitution le 4 novembre. L'Afssaps s'étonne de ne pas en être informée.
- **Production retardée des PVA-SD** (Cf. CR du 14/10/09 et suivants) : poursuite du retard de production sur le site de Bordeaux. Un plan de substitution sera proposé en cas de persistance.
- **Panne de réfrigération** avec absence d'alarme ayant conduit à la destruction de stock de culots de globules rouges en Martinique. Révision de processus en cours.

6. Points évoqués par l'**IRSN** :

- **Evaluation de risque relative aux incidents de radiologie interventionnelle au CHU de Strasbourg** (Cf. CR du 23/09/09 et suivants) **:** L'IRSN demande une révision du projet de saisine conjointe ASN/DGS en vue de pouvoir accéder aux informations médicales des patients pour la réalisation de son expertise.

7. Points évoqués par la **DSC** :

- **Nombreuses intoxications au monoxyde de carbone (CO) ayant entrainé des décès.** DH demande de vérifier la coordination des actions de communication et les rappels des dispositifs préventifs saisonniers par voie de circulaires.

[1] Le benfluorex est un amphétaminique anorexigène dérivé de la fenfluramine, retirée du marché en raison d'hypertensions artérielles pulmonaires graves. Médicament prescrit dans les diabètes de type 2, à visée hypoglycémiante complémentaire, hypolipidémiante et hypouricémiante. SMR insuffisant (10/05/2006).

8. Points évoqués par l'**ASN** :

- **Réouverture du site de médecine nucléaire** du CH du Sud Francilien (Corbeil, 91) (Cf. CR du 7/10/09).
- **Suspension d'autorisation d'activité de radiothérapie** du CH de Poissy- Saint-Germain (78) en raison d'un manque d'effectif de radiophysiciens et de l'absence de correction d'un dispositif d'imagerie portale défectueux. L'ARH a également suspendu l'autorisation d'activité.
- **Perte d'une source radioactive d'entrainement** (Cf. CR du 21/10/09) : Procès-verbal établi par l'ASN à l'encontre de l'Unité d'instruction et d'intervention de la sécurité civile (UIISC n°1) de Nogent-le-Rotrou (28).

9. Points évoqués par la **DGCCRF** :

- **Champignons importés de Roumanie contaminés par du Césium 137 :** contamination alimentaire d'un employé de la CNPE de Paluel (76) détectée par la médecine du travail lors d'un examen d'anthropogammamétrie. Distribution régionale en Normandie. Enquête de traçabilité en cours au MIN de Rungis. L'activité massique de ces champignons, estimée par l'IRSN à partir de la charge corporelle mesurée (environ 1000Bq) et sur la base de 600g consommés, serait grossièrement de l'ordre de 1500 à 2000 Bq/kg frais, et la dose efficace engagée est estimée de l'ordre de 10µSv.
- **Graines de lin génétiquement modifié** provenant du Canada (où elles sont autorisées) incorporées dans des pains spéciaux. (Cf. CR du 7/10/09). Ces graines ne sont pas autorisées dans l'UE. Pour les produits transformés incorporant du lin issu des lots en cause, la France demande à la Commission européenne des mesures harmonisées de gestion.

10. Points évoqués par l'**INSERM** :

- **Thérapie génique :** communication prévue en semaine 45 à propos de traitements efficaces d'adrénoleucodystrophies par thérapie génique à vecteur rétroviral (équipe du Pr Aubourg, Saint-Vincent de Paul, Paris).

11. Points divers :

- DH demande qu'un point soit préparé pour la prochaine réunion de sécurité sanitaire, après la fin du procès de la clinique du sport, sur la **survenue tardive d'infections ostéoarticulaires dues à *Mycobacterium Xenopi*** chez des patients n'ayant pas présenté de lésion suspecte au cours de la campagne de dépistage organisée pour les personnes exposées.
- *Calendrier* : la réunion de sécurité sanitaire de la semaine 46 aura lieu le **jeudi 12 novembre** 2009 à 8h30.

☞ **Prochaine réunion le mercredi 4 novembre à 8 heures 30**

Annexe 3-89

REUNION DE SECURITE SANITAIRE DU 2 DECEMBRE 2009 (SEMAINE 49)

Participants : Mmes J. CARMES (DGS), Th. LE LUONG (INPES), E. PRADA-BORDENAVE (ABM) et F. SIMON-DELAVELLE (cabinet).
MM. J-L. ANGOT (DGAL), J-J. BERGER (DGCCRF), P. BRASSEUR (DGS), J-Cl. DESENCLOS (InVS), Cl. FUILLA (DSC), M. GUESPEREAU (AFSSET), D. HOUSSIN (DGS), Ph. MAGNE (DGS), J. MARIMBERT (AFSSAPS), M. MORTUREUX (AFSSA), J. REPUSSARD (IRSN) P. TIBERGHIEN (EFS), et D. VUILLAUME (INSERM).

1. Epidémie de grippe H1N1 :

1.1. Épidémiologie

En métropole, poursuite de la progression épidémique. Activité estimée par le réseau Sentinelles à 461.000 consultations (+20%). Réseau GROG (infections respiratoires aiguës – IRA) : 952.000 consultations estimées (+36%). Taux de positivité pour les virus influenza de 50%. Environ 3 millions de cas cumulés. Les résultats d'une étude de séro-épidémiologie seront disponibles en semaine 50.

Cinquante-six nouveaux cas graves hospitalisés en SI. Au total, 481 hospitalisations dont 21% de patients sans facteurs de risque, 18% de mineurs de quinze ans, 6% de femmes enceintes. Vingt-deux décès en semaine 48 dont 9 mineurs de quinze ans et 14 patients sans facteurs de risque.

Diminution d'incidence dans tous les départements et collectivités d'outre-mer sauf à St-Pierre-et-Miquelon où l'incidence augmente nettement.

1.2. Virologie

Sur 1400 virus analysés en France, un seul présentait la mutation H275Y[1] observée en Norvège (Cf. CR du 25/11/09).

1.3. Gestion

Une circulaire à l'attention des préfets, relative à la permanence des soins en milieu ambulatoire est en cours de signature. Par ailleurs la circulaire interministérielle du 30 novembre 2009 précisant les actions à mettre en œuvre au niveau local pour prévenir et faire face aux conséquences sanitaires propres à la période hivernale est en cours de diffusion.

1.4. Foyers animaux H1N1 : Deux cas chez des chiens en Chine. Plusieurs foyers porcins disséminés en Norvège, et un à Teuva (province de Finlande-Occidentale, *Länsi-Suomen lääni*, Finlande).

En matière de grippe aviaire hautement pathogène (H5N1), un nouveau cas humain en Egypte (enfant de trois ans, en état stable), un décès au Vietnam (homme de 23 ans) et une suspicion de cas en Indonésie. Ces trois cas ont été contaminés au contact de volailles.

2. Points évoqués par l'**InVS** :

- **Dengue à St-Barthélémy :** phase de circulation active du virus (niveau 2 du plan de surveillance, alerte et gestion des épidémies) avec nette augmentation d'incidence depuis la semaine 45.

3. Points évoqués par l'**AFSSA** :

- **Contamination de tomates séchées par du virus de l'hépatite A (VHA),** signalée par l'Australie. Enquête en cours par la DGCCRF.

[1] Substitution de l'histidine par une tyrosine en position 275 de la neuraminidase N1. Cette mutation est parfois notée H274Y par référence à la neuraminidase N2. Elle confère une résistance à l'oseltamivir mais pas au zanamivir, et ne modifie pas les caractères antigéniques.

4. Points évoqués par l'AFSSAPS :

- **Vaccination H1N1 et pharmacovigilance :** prochain bilan France le 3/12. Pour plus d'un million de personnes vaccinées (en semaine 48), l'incidence des déclarations d'EIG ne connaît pas d'augmentation sensible. Les retours sur les analyses d'imputabilité des précédents EIG feront l'objet de communication.
- **Erreurs de procédure pour la vaccination** concernant en particulier l'utilisation de doses adultes pour des enfants en Bretagne : l'Afssaps envisage une communication de rappel sur les indications et bonnes pratiques.
- **Benfluorex** (Cf. CR du 28/10/09 et suivants) : suspension effective avec rappel du produit.

Hémovigilance :

- **EIG receveur :** allergie après transfusion de plasmas viro-atténués par le bleu de méthylène (PVA- BM) chez un enfant de 7 ans. Analyse en cours (ETS de Rhône-Alpes).
- **Séroconversion VHB receveur** survenue chez un patient de 82 ans après transfusion de CGR. Le patient était suivi en hémodialyse au Maroc. Enquête d'imputabilité en cours.
- **EIG donneur après don de sang total :** malaise ayant entrainé une chute chez un homme de 36 ans, survenu 45 minutes après don. ECG normal. Analyse en cours (ETS de Bourgogne).

5. Points évoqués par l'AFSSET :

- **Rapport sur les nanoparticules** qui sera présenté le 10/12 à l'occasion d'une journée publique de rencontres parlementaires sur le thème « Le développement des nanomatériaux entre perspectives d'innovations et évaluation des risques ? », co-organisée par l'Afsset et le Groupe d'étude sur la santé environnementale de l'Assemblée Nationale.
- **Canapés contaminés par le diméthylfumarate (DMFu)** (Cf. CR du 25/11/09) : le collectif de victimes se déclare surpris par l'inhomogénéité de ces résultats, demande des investigations complémentaires, prévoit de saisir la justice et saisirait la ministre de la santé en vue de mesures de décontamination environnementale.
- **Un rapport sur la qualité de blouses de protection des travailleurs** sera rendu en semaine 50, qui retrouve 90% de produits non-conformes.

6. Points évoqués par l'ABM :

- **Prélèvement et greffe de face** au CHU d'Amiens réalisée par les équipes des Pr B. Devauchelle (CHU d'Amiens) et J.-M. Dubernard (Hospices civils de Lyon) à partir d'un donneur décédé d'un accident vasculaire cérébral. Le receveur est un sapeur-pompier de Montpellier présentant un délabrement facial et mandibulaire provoqué par une fusée d'artifice. Infusion *in situ* de cellules souches hématopoïétiques (CSH) du donneur, HLA non compatible, dans le but d'obtenir une chimère hématopoïétique. Le patient est suivi à Lyon. Pas de communication de la part de l'ABM.

7. Points évoqués par l'EFS :

- **Stocks :** le niveau baisse à 95.000 CGR avec un impact probable de la grippe A. La cible est de 100.000 avec l'objectif de 120.000 avant les fêtes pour aborder le début d'année dans de bonnes conditions. Des actions pour accroître la fréquentation des sites de collectes sont programmées.
- **Production de plasma viro-atténués** (Cf. CR du 14/10/09 et suivants) : la reprise de production de PVA-SD sur le site Bordeaux reste retardée avec pour conséquence la poursuite de la mesure transitoire d'acceptation au don de plasma monodonneur (PVA-BM ou PVA Amotosalen) de femmes non-nullipares, prise en juin dernier pour assurer l'autosuffisance pendant la période d'arrêt de production du PVA-SD (initialement estimée à 2 mois). L'utilisation de plasma monodonneur, incluant les femmes donneuses ayant eu une grossesse, est associée à une augmentation du risque de TRALI[2]. L'EFS va mettre en œuvre des mesures pour maîtriser autant que possible ce risque.

[2] Les grossesses sont une des causes de production d'anticorps pouvant être à l'origine du syndrome de détresse respiratoire aigu post-transfusionnel (*transfusion related acute lung injury – TRALI*).

8. Points évoqués par l'**IRSN** :

- **Incident classé par l'ASN niveau 2 de l'INES à la CNPE de Cruas-Meysse (07) :** le plan d'urgence interne (PUI) a été déclenché dans la nuit du 1 au 2/12/09 par EDF sur le réacteur n°4 de la centrale en raison de l'obturation de la prise d'eau alimentant le système de refroidissement par des débris végétaux charriés par le Rhône. Le PUI a été levé à 6h30. Pas de rejet dans l'environnement.
- L'IRSN souhaite être informé de l'état d'avancement de l'homologation[3] de la décision n°2009-DC-0153 de l'Autorité de sûreté nucléaire du 18 août 2009 relative aux niveaux d'intervention en situation d'urgence radiologique (Cf. CR du 9/09/09) : le dossier est à la validation du directeur de cabinet de la ministre.

8. Points évoqués par la **DSC** :

- **Vaccination H1N1 :** mise en place du dispositif de remontées d'informations entre les équipes opérationnelles départementales via les préfets et le COGIC, et participation des services de santé et de secours médical (3SM) pour armer des centres de vaccination, en activité partagée avec la vaccination spécifique des personnels des SDIS.

9. Points évoqués par la **DGAl** :

- **Foyers de toxi-infections alimentaires à staphylocoque producteur d'entérotoxine** liés à du vacherin de Mont-d'or (Cf. CR du 12/11/09 & suivants) : pas de nouveau signalement de TIAC.
- **Contamination par *Listeria Monocytogenes* de langue de porc en gelée** (Cf. CR du 25/11/09), terrines et andouillettes. Rappel élargi des produits. Pas de cas clinique signalé.

10. Points évoqués par la **DGCCRF** :

- **Contamination par de l'huile minérale d'une huile de noix** importée des USA en France et réexportée dans plusieurs Etats membres de l'UE, mise en évidence par autocontrôle. Cinq lots de bouteilles contaminés (jusqu'à 369 ppm) et six suspectés. Après mélanges, jusqu'à 500 tonnes de produits finis seraient concernés. Retrait sans rappel, dans l'attente de l'analyse de risque en cours par l'Afssa. Signalement RASFF prévu. Enquête complémentaire en lien avec la DGDDI sur la possibilité d'une telle contamination d'autres huiles de même provenance.
- **Retrait et rappel de plats à gratin en céramique** « terra toscana Italian style ceramics » et « rustica » en raison d'une migration de plomb dépassant la limite maximale autorisée.
- « **Boisson minérale Fangocur** » présentant des teneurs en métaux lourds (plomb, thallium et arsenic) élevées, assortie d'allégations thérapeutiques[4]. Saisine de la DGS qui examine l'alerte avec Afssa et Afssaps.

11. Points évoqués par l'**INSERM** :

- **Retard de l'étude SentiVir** (suivi virologique des syndromes grippaux, H1N1 et autres virus, Cf. CR du 21/10/09) conduite par l'unité 707 qui pourrait ne débuter qu'après le pic épidémique.

12. Points divers :

- Le DUS/DGS indique que le bulletin national des activités et capacités hospitalières du 1/12/09 ne montre **aucune région classée en fortes tensions** mais que l'évolution dans les régions Haute-Normandie et Bretagne est à surveiller.

☞ **Prochaine réunion le mercredi 9 décembre à 8 heures 30**

---

[3] L'article R.1333-112 du CSP prévoit qu'à réception de ladite décision par le ministre chargé de la santé l'homologation doit être notifiée ou refusée sous trois mois et est réputée acquise en l'absence de réponse dans ce délai.

[4] « La boue curative naturelle de fangocur purifie et désinfecte, (...) combat efficacement les gastrites chroniques, maladies inflammatoires de l'intestin et les ulcères gastroduodénaux ». [Source : site Internet fangocur.fr]. Ce produit, fabriqué en Autriche et vendu via Internet, a fait l'objet d'alertes au Royaume-Uni en janvier 2009 et au Canada en juin 2009.

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoires SERVIER

Demande déposée le 29 Mai 1998

Principe actif :	Chlorhydrate de benfluorex
Caractère d'originalité :	Modifications de la rubrique 4.8. Effets indésirables
Classe ATC :	Système cardio-vasculaire/ Hypolipidémiants (C10A : hypocholestérolémiants et hypotriglycéridémiants)

TYPE DE DEMANDE :

La demande actuelle concerne l'ajout d'effets indésirables au sein de la rubrique 4.8. « Effets indésirables » du RCP (nouveau texte proposé en gras) :

- *digestifs (nausées, vomissements, gastralgies, diarrhées), asthénie,* ***confusion,*** *somnolence ou états vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.*
- *très rares cas de réactions anaphylactiques, hypotension,* ***choc****, rash cutané, urticaire, œdème de Quincke ;*
- ***élévation des enzymes hépatiques, hépatite (très rare).***

Il s'agit d'une demande complémentaire de celle déposée en mars 2000 qui portait sur l'ajout d'effets indésirables de type cutanés et/ou allergiques) au sein de la rubrique 4.8., validée en GTI n° 113 du 30 juin 2000, en même temps qu'une modification de la rubrique 4.2 (ajout d'une contre-indication en cas d'hypersensibilité au benfluorex).

Pour rappel, cette modification de l'information scientifique fait suite à la demande des autorités italiennes auprès du CSP en septembre 1998 de revoir le profil de sécurité d'emploi du benfluorex.

La réévaluation avait été conduite par l'Italie et la France sur la base des données déposées par la firme (PSUR : période de janvier 1995 à décembre 1999). La demande complémentaire actuelle est également basée sur les données du même PSUR et est effectuée à la demande de l'Italie.

Note interne d'évaluation :

SAINT DENIS, le 02 SEP. 2002

Monsieur le Titulaire de
l'Autorisation de Mise sur le Marché
Les Laboratoires SERVIER
22 rue Garnier
92200 NEUILLY SUR SEINE Cedex

Dossier suivi par : Madame le Dr. Catherine REY QUINIO

Réf. à rappeler : VNL10008
GTI 120 - COM 315
CRQ/DN

Monsieur,

J'ai l'honneur de vous faire parvenir, ci-joint, l'ampliation de la décision portant modification de l'autorisation de mise sur le marché du médicament :

- MEDIATOR 150 mg, comprimé enrobé

que vous avez sollicité le 29 mai 1998.

Je vous informe que le pictogramme mentionné à l'avant dernier alinéa de l'article R 5143 du code de la santé publique tel qu'issu du décret N°99-338 du 3 mai 1999 doit être apposé sur le conditionnement extérieur de votre spécialité, celle-ci ayant des effets sur la capacité de conduire des véhicules ou d'utiliser des machines mentionnés dans la rubrique du résumé des caractéristiques du produit prévue à cet effet.

Le modèle de pictogramme devant être utilisé et libre de droit, est disponible sur le site internet de l'Agence Française de Sécurité Sanitaire des Produits de Santé : www.afssaps.sante.fr

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

02 OCT. 2002

DÉCISION DU DIRECTEUR GÉNÉRAL DE L'AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ

du 02 OCT. 2002

portant modification
de l'autorisation de mise sur le marché du médicament

MEDIATOR 150 mg, comprimé enrobé

VU le code de la santé publique, cinquième partie, notamment les articles L.5121-8, L5121-9, L.5121-20 et R.5128 à R.5140 ;

VU l'autorisation de mise sur le marché validée octroyée le **22 avril 1987** modifiée ;

Vu la demande de modification de l'autorisation de mise sur le marché présentée par LES LABORATOIRES SERVIER ;

le 29 mai 1998 ;

pour le médicament :

MEDIATOR 150 mg, comprimé enrobé

et concernant :

- la rubrique de l'annexe I (résumé des caractéristiques du produit)
  4.8. Effets indésirables

Les annexes I (RCP) et IIIB (Notice)sont modifiées en conséquence ;

Annexe 4-1

DÉCIDE

Article 1er

La demande de modification du dossier d'autorisation de mise sur le marché est acceptée et les annexes I, II, III_A, et III_B de la présente décision remplacent les dispositions prévues par les annexes I, II, IIIA et IIIB de l'Autorisation de Mise sur le Marché susvisée modifiée.

Article 2

Les Laboratoires SERVIER
22 rue Garnier
92200 NEUILLY SUR SEINE Cedex
sont destinataires de la présente décision.

FAIT A SAINT DENIS, le 02 SEP. 2002

LE DIRECTEUR GENERAL DE L'AGENCE FRANCAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE

Pour le Directeur Général
et par délégation
Par empêchement du Directeur de l'Évaluation des Médicaments et des Produits Biologiques
L'Adjointe au Directeur Chargée des Affaires Réglementaires

France ROUSSELLE

Pièces Jointes : 4 annexes

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

1. DENOMINATION

02 OCT. 2002

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé de 700 mg

Pour les excipients, voir rubrique 6.1..

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

- Adjuvant du régime adapté dans les hypertriglycéridémies;
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

4.2 Posologie et mode d'administration

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:
- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

En association à un régime adapté, Médiator constitue un traitement *adjuvant* : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3. Contre-indications

- Hypersensibilité au chlorhydrate de benfluorex ou à l'un des constituants ;
- Pancréatites chroniques avérées.

4.4. Mises en garde et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante de concentrations sériques de lipides ou de glucose n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5. Interactions avec d'autres médicaments et autres formes d'interactions

4.6. Grossesse et allaitement

Grossesse:
Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.
En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.
En conséquence, par mesure de prudence, il est préférable de ne pas utiliser ce médicament pendant la grossesse. En cas d'exposition fortuite, il conviendra d'interrompre ce traitement.

Allaitement
En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement.

4.7. Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

4.8. Effets indésirables

Les effets secondaires suivants ont été observés :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, confusion, somnolence ou états vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.
- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, oedème de Quincke,
- élévation des enzymes hépatiques, hépatite (très rare).

4.9. Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

HYPOCHOLESTROLEMIANT ET HYPOTRIGLYCERIDEMIANT
Code ATC : C10AX04

Actions de Médiator sur le métabolisme lipidique:
Chez l'animal (rat), Médiator diminue l'absorption intestinale des triglycérides.
Cet effet a été également observé chez l'homme en pharmacologie clinique et serait dû à une diminution de l'activité de la lipase pancréatique.

Les effets suivants ont été également observés chez l'animal:
- diminution de la synthèse hépatique des triglycérides et du cholestérol, *in vitro* et *in vivo* (rat);
- diminution de la stéatose hépatique induite par des régimes riches en lipides, riches en glucides (rat obèse) ainsi qu'au cours du diabète expérimental (rat);
- limitation de l'incorporation du cholestérol dans la paroi artérielle (lapin).
Ces différents mécanismes pourraient expliquer en partie la diminution du cholestérol et des triglycérides observée chez l'homme.

Actions de Médiator sur le métabolisme glucidique:
Chez l'animal, les effets suivants ont été observés:
- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat);
- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

Médiator n'a pas d'action sur l'insulino-sécrétion; la survenue d'hypoglycémie est peu probable.

Effet complémentaire de Médiator:
Une baisse de l'uricémie d'environ 14 % a été observée chez des patients obèses hyperuricémiques traités par Médiator en association à un régime adapté.

Annexe 4-1

5.2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.
Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :
- une première phase rapide (60 % en 3 ou 4 heures);
- une seconde phase lente, de 36 heures environ.

5.3 Données de sécurité précliniques

Sans objet.

6. DONNEES PHARMACEUTIQUES

6.1. Liste des excipients

Amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E 171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

6.2. Incompatibilités

Sans objet.

6.3. Durée de conservation

3 ans

6.4. Précautions particulières de conservation

Pas de précautions particulières de conservation.

6.5. Nature et contenu de l'emballage extérieur

Plaquettes thermoformées (PVC-Aluminium)

NOTICE

Lisez attentivement l'intégralité de cette notice avant de prendre ce médicament.
Elle contient des informations importantes sur votre traitement.
Si vous avez d'autres questions, si vous avez un doute, demandez plus d'informations à votre médecin ou à votre pharmacien.
Ce médicament vous a été personnellement prescrit. Ne le donnez jamais à quelqu'un d'autre, même en cas de symptômes identiques, car cela pourrait lui être nocif.
Gardez cette notice, vous pourriez avoir besoin de la relire.

MEDIATOR 150 mg, comprimé enrobé

La substance active est :
Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé

Les autres composants sont : amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E 171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

Titulaire/Exploitant :
LES LABORATOIRES SERVIER
22, rue Garnier
92200 NEUILLY SUR SEINE

Fabricant :
LES LABORATOIRES SERVIER INDUSTRIE
905, route de Saran
45520 GIDY

1. QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

MEDIATOR 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.
MEDIATOR 150 mg se présente sous la forme de comprimés enrobés.
Boîtes de 10, 20, 24, 30, 60 et 100 comprimés.

Ce traitement est en préconisé comme adjuvant à un régime adapté :
- dans les hypertriglycéridémies *(taux de lipides élevés dans le sang)* ;
- chez les diabétiques avec surcharge pondérale *(taux de sucre élevé dans le sang)*.

Annexe 4-1

2. INFORMATIONS NÉCESSAIRES AVANT D'UTILISER MEDIATOR 150 mg, comprimé enrobé

MEDIATOR 150 mg, comprimé enrobé NE DOIT JAMAIS ETRE UTILISE dans les cas suivants :

- allergie au chlorhydrate de benfluorex ou à l'un des composants du produit;
- en cas de pancréatite chronique *(insuffisance de fonctionnement chronique du pancréas)*.

MISES en GARDE et PRECAUTIONS PARTICULIERES D'EMPLOI avec MEDIATOR 150 mg, comprimé enrobé :

Un régime alimentaire adapté doit être poursuivi pendant toute la durée du traitement.

Si après une période de plusieurs mois (3 à 6 mois), une diminution des concentrations de lipides ou de glucose (sucre) dans le sang n'est pas obtenue, votre médecin pourra envisager d'autres moyens thérapeutiques adaptés à votre cas.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase *(maladies métaboliques rares)*.

Grossesse/Allaitement:
Il est préférable de ne pas utiliser ce médicament pendant la grossesse ou au cours de l'allaitement.
Si vous découvrez que vous êtes enceinte pendant le traitement, consultez votre médecin car lui seul peut juger de la nécessité de le poursuivre.

Conduite de véhicules et utilisation de machines:
L'attention est attirée sur le risque de somnolence pouvant survenir avec ce médicament.

Sportifs:
Attention, cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Liste des excipients à effet notoire:
Saccharose.

Prise ou utilisation d'autres médicaments:
Sans objet.

3. COMMENT PRENDRE MEDIATOR 150 mg, comprimé enrobé ?

Posologie:
RESERVE A L'ADULTE

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:
- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

La posologie peut-être ramenée à 2 comprimés par jour, voire 1 comprimé par jour, en fonction des résultats biologiques.

DANS TOUS LES CAS, SE CONFORMER STRICTEMENT A L'ORDONNANCE DE VOTRE MEDECIN.

Si vous avez pris plus de MEDIATOR 150 mg, comprimé enrobé que vous n'auriez dû:
Les signes de surdosage peuvent être des troubles digestifs (nausées, vomissements, diarrhée), une sensation vertigineuse voire une somnolence. En cas d'apparition de ces troubles, consultez votre médecin ou votre pharmacien.

Si vous oubliez de prendre MEDIATOR 150 mg, comprimé enrobé:
Ne prenez pas de double dose pour compenser la dose simple que vous avez oubliée de prendre.

Effets pouvant apparaître lorsque le traitement par MEDIATOR 150 mg, comprimé enrobé est arrêté :
Sans objet.

4. QUELS SONT LES EFFETS INDESIRABLES EVENTUELS avec MEDIATOR 150 mg, comprimé enrobé ?

Comme tous les médicaments, MEDIATOR 150 mg, comprimé enrobé est susceptible d'avoir des effets indésirables :
- troubles digestifs: nausées, vomissements, diarrhée, maux d'estomac ;
- sensation de fatigue, voire somnolence ;
- confusion ;
- sensations vertigineuses.

Ces effets ont été observés à des posologies supérieures à 3 comprimés par jour et varient en fonction de la susceptibilité individuelle des patients.

- très rares cas de manifestations allergiques : éruptions cutanées soudaines, urticaire, malaise brutal avec hypotension (diminution de la pression artérielle), oedème de Quincke (brusque gonflement du visage et du cou). Dans ce cas, le traitement devra immédiatement être interrompu.

- élévation des enzymes hépatiques (anomalies biologiques au niveau du foie). Très rares cas d'hépatite.

Si vous remarquez des effets indésirables non mentionnés dans cette notice, veuillez en informer votre médecin ou votre pharmacien.

5. COMMENT CONSERVER MEDIATOR 150 mg, comprimé enrobé ?

Pas de précautions particulières de conservation.

Ne laisser ni à la portée ni à la vue des enfants.

Ne pas utiliser après la date de péremption figurant sur la boîte.

La dernière date à laquelle cette notice a été approuvée est le (date).

Annexe 4-2

REUNION GROUPE DE TRAVAIL AD HOC SUR LES MEDICAMENTS UTILISES EN DIABETOLOGIE, ENDOCRINOLOGIE, UROLOGIE ET GYNECOLOGIE N° 6 DU 21 DECEMBRE 2006

PROCEDURE NATIONALE

- **MEDIATOR 150**, comprimé

Dossier n° VNL 10008

Laboratoire SERVIER

Demande déposée le

Principe actif:	**Benfluorex**
Caractère d'originalité	**Réévaluation de Bénéfice Risque**
Classe ATC:	**Système cardio-vasculaire/Hypolipémiants (C10A: hypocholestérolémiants et hypotriglycéridémiants**

TYPE DE DEMANDE:

Faisant suite à la demande de réévaluation de bénéfice Risque de la Commission Nationale de Pharmacovigilance de Juin 2006, une revue des études d'efficacité dans les deux indications actuelles de l'AMM a été déposée par la firme.

Pour rappel, MEDIATOR (chlhorydrate de benfuorex) est commercialisé depuis 1987 dans les indications suivantes:

- *« Adjuvant au régime adapté dans les hypertryglycéridémies. La poursuite du traitement est toujours nécessaire.*
- *Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.*

Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée».

HISTORIQUE DE L'EVALUATION DES DONNEES RELATIVES AU MEDIATOR

- Date d'AMM : 16-07-1976

- 1995. Inscription sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes. Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le CTPV a craint une dérive de l'utilisation du benfluorex comme anorexigène.

- 1998: 1ère enquête de Pharmacovigilance. Présentation des effets indésirables en CTPV (plusieurs séances) en 1998 ainsi qu'au groupe Européen de PV le 30-11-2000, entraînant des modifications de la rubrique 4.8. du RCP (ajout de « confusion » comme effet indésirable».

- 1987: validation de la 1ère tranche dans l'indication « hypertriglycéridémies »

- **1990 :** dépôt du dossier de la 8ème tranche de validation dans l'indication en « diabétologie » ; nombreux échanges entre l'Afssaps et la firme entre 1990 et 1995 sur la nature des données à soumettre afin de valider cette indication (type d'étude, population cible, etc.), aboutissant finalement en 1998 au dépôt de l'étude Del Prato (étude de l'efficacité du benfluorex versus placebo et metformine sur les paramètres glucidiques (voir ci-dessous données cliniques). En attente de cette étude, l'indication telle que libellée lors de l'octroi de l'AMM a été maintenue.

- **Septembre 2000:** demande d'extension d'indication au «*Diabète de type II insulino-dépendant, en association au régime adapté, lorsque ce régime n'est pas suffisamment suffisant pour rétablir à lui seul l'équilibre glycémique* ». Une seule étude de phase III **(Etude Del Prato)**, randomisée, en double insu, benfluorex versus placebo et metformine a été soumise à l'appui de cette demande (A noter, cette étude réalisée a été réalisée à la demande de l'Afssaps; protocole revu en concertation avec l'Afssaps). Un avis défavorable a été émis par le Groupe de Travail PTC2 ainsi que par la COM d'AMM. Après recours de la firme de cette décision, cet avis a été maintenu par la COM d'AMM. En effet, compte tenu des défauts de la qualité méthodologique de cet essai (ayant l'objet par ailleurs d'une inspection), aucune conclusion n'a pu être formulée sur la taille de l'effet: i) du benfluorex versus placebo; ii) du benfluorex versus metformine (non-infériorité non démontrée : déséquilibre des taux d'HbA1c entre les groupes à l'inclusion, 68% seulement inclus dans l'analyse per protocole, 25% de patients inclus à tort). A noter également, aucune efficacité sur les paramètres lipidiques n'a été mise en évidence dans cette étude. En conclusion, la COM d'AMM (20-09-2002) a demandé qu'une étude évaluant l'efficacité du benfulorex en monothérapie et en association avec d'autres antidiabétiques oraux soit effectuée; l'association devant être également étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisants rénaux, sujets âgés)

- **2004-2005/Seconde enquête de Pharmacovigilance**

Cette 2nd enquête fait suite à plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique rapportés avec le benfluorex. De ce fait, une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité a été décidée. L'enquête a ensuite été étendue aux hypertensions artérielles pulmonaires du fait de la notification d'un cas d'HTAP associé à la prise de benfluorex. Les conclusions de la CNPV sont les suivantes:

- en ce qui concerne les troubles neuro-psychiatriques: « *cette enquête confirme la réalité du risque de survenue de « confusions » en présence de Médiator. Il est proposé que cet effet, déjà mentionné dans le RCP soit détaillé comme suit :* ***« troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) ».***
- en ce qui concerne l'HTAP: « *compte tenu de l'incidence des HTAP idiopathiques (1 à 2 millions et par an), le nombre de cas d'HTAP idiopathique rapportés dans l'enquête ne constitue pas un signal significatif de toxicité du Mediator dans la classe organe cardio-vasculaire* ».

La discussion en CNPV (29-11-2005, adoptée le 16-06-2006) a par ailleurs porté sur les éléments suivants (extrait):

Les ventes de Médiator en Europe sont réalisées en quasi totalité en France. Les données DOREMA d'avril 2005 montrent une utilisation dans 46,3% dans les dylipidémies et dans 8,3% dans d'autres indications. L'effet anorexigène du benfluorex n'a pas été démontré. Toutefois, les membres de la CNPV craignent un mésusage, en particulier dans l'obésité. Dans ce contexte, une étude d'utilisation de prescription serait utile.

Il est à noter que le renouvellement quinquennal du produit intervient dans 2 ans en

France et que des données d'efficacité dans le diabète existent mais restent limitées et mériteraient d'être réévaluées.

Le bilan de pharmacovigilance confirme les données de sécurité d'emploi du Médiator déjà connues. Les effets neuro-psychiatriques décrits actuellement dans le RCP sous le terme « confusion » doivent être détaillés. Il n'y a pas actuellement assez de données pour affirmer l'existence de syndrome de sevrage. Le faible nombre de cas décrits d'HTAP idiopathique associés au Médiator doit être relativisé par rapport à la sous-notification habituelle en pharmacovigilance. Afin d'évaluer au mieux les risques potentiels de l'utilisation de Médiator, il conviendrait de réaliser:
i) une étude d'utilisation/prescription de Médiator;
ii) une étude expérimentale sur un modèle animal permettant d'évaluer le potentiel de Médiator à engendrer des HTAP;
iii) une étude au niveau des Centres d'évaluation et d'information sur la pharmacodépendance (CEIP) afin d'évaluer un éventuel problème de pharmacodépendance. A ce titre, une saisine de la Commission Nationale des stupéfiants et psychotropes sera effectuée.
Enfin, il a été proposé d'étudier la possibilité d'interroger les registres d'HTAP existant dans 17 centres, afin de rechercher, dans une étude rétrospective cas-témoins, le rôle éventuel du benfluorex.
Au vue des résultats présentés et des discussions, la CNPV a décidé une réévaluation de la balance Bénéfice-Risque de Médiator.

13 Octobre 2006/Réunion firme/Afssaps (PV, SURBOUM, PTC2/CRPV de Besançon)/Discussion des modalités de mise en oeuvre des études demandées par la CNPV, en particulier : i) étude sur un modèle animal d'HTAP; ii) étude d'utilisation-Prescription de Médiator.

=> Lors de cette réunion ont été présentés les types de modèle expérimentaux in vivo existants d'HTAP (modèle de stimuli patho-physiologique comme l'hypoxie aïgue ou chronique chez le rat ou la souris, stimulis chimiques comme la manocrotaline chez le rat, les modèles dits génétiques comme le rat Fawn-Hooded)

La firme retiendrait plus particulièrement un modèle d'étude de l'effet du benfluorex en conditions d'hypoxie ou de normoxie avec études des paramètres hémodynamiques, de l'index d'hypertrophie ventriculaire droit et du « remoduling » vasculaire pulmonaire (ou analyse histologique de la muscularisation des artérioles.

=> Données relatives à la commercialisation. A ce jour, le produit reste commercialisé dans 6 pays : Grèce, France, Pologne, Malte, Luxembourg et Chypre. L'Espagne et l'Italie n'ont pas demandé de renouvellement de l'AMM lors du dernier RQ dans ces deux pays.

=> Données de prescription. La firme a présenté des données de prescription issues de l'observatoire de prescriptions Thalès. 5 groupes ou populations pour lesquels Mediator est prescrit ont été identifiés (deux périodes d'observation: de 05/04 à 04/05 et de 05/05 à 04/05).
A - Patients dyslipidémiques +/- 50% des patients traités
B – Patients diabétiques de type 2 soit 1,8% (à confirmer)
C (A+B) - soit 15,2%
D – Ni A ni B (patients en **surpoids ou obèses, soit 14,3%)**
E – Ni A ni B + autre diagnostic (non précisé, HTA? Rapport Taille/Hanche élevé ?), **soit 8,1%.**
A noter, les chiffres de prescription sont stables pour les deux périodes étudiées.
Au total, +/- 20% de patients reçoivent du Médiator hors indications de l'AMM (14,3% + 8,1%). Des précisions seraient à apporter sur cette population de patients traités (leur

poids?, sont-ils obèses ou non?, Quelles sont les raisons de la prescription de Médiator (prescription saisonnière à l'automne ou non?). D'autres réunions sont envisagées avec la firme afin d'étayer les différents points discutés lors de cette réunion.

CONTENU DU DOSSIER:

En vue de la réévaluation de bénéfice Risque, le dossier déposé par la firme repose essentiellement sur des données d'études anciennes et ayant déjà l'objet d'expertise depuis la commercialisation du produit. Seule une nouvelle étude clinique : l'étude MOULIN apporte de nouvelles données dans l'indication en « diabétologie ».

Le rapport est structuré en 3 parties:

1. Un rappel du mécanisme d'action supposé de la molécule;
2. Des données d'efficacité dans chacune des 2 indications actuelles, avec une analyse plus particulière des données de l'étude MOULIN (indication « diabétologie »).
3. Une synthèse des données de sécurité d'emploi issues des études cliniques et de la pharmacovigilance.

1. MECANISME D'ACTION DE MEDIATOR

1. Activité hypoglycémiante

La firme met en avant des propriétés insulino-sensibilisatrices chez l'Homme avec un effet sur les transporteurs de glucose, un effet direct sur le foie avec augmentation de la synthèse du glycogène et inhibition de la néoglucogenèse et enfin une réduction du contenu musculaire en triglycérides. Les données suivantes sont soumises:

=> Etude in vitro sur modèles cellulaires chez le rat => action sur le métabolisme du glycogène : augmentation de la synthèse du glycogène et diminution de la glycogénolyse stimulée par le glucagon (Melin, 1991).

=> Diminution de la production hépatique de glucose et effet sur la néoglucogenèse (Tielens 1993 et Zorzano 1996 et Kohl 2002

=> 4 études sur l'amélioration de l'insulinosensibilité (Brindley 1991, Portha 1993, Serrasas 1993 et Storlien 1993).

=> 4 études sur l'amélioration de l'insulino-résistance musculaire avec effet de majoration du transporteur GLUT-4 (Sevilla 1999, Storlien 1993, Zorzano 1996) et l'oxydation du glucose (Bailey 1992)

=> Pas d'effet sur le sécrétion basale d'insuline (chez le rat normal ou diabétique (Portha 1993 et Serradas 1993). Voir Note interne ci-dessous.

Note interne:

D'après la firme, ces données permettent de conclure que le benfluorex a un effet insulino-sensibilisateur chez l'Homme démontré par les 3 études citées de clamp hypersinsulinique. Un effet direct sur le foie avec augmentation de la synthèse du glycogène et inhibition de la néoglucogenèse aurait également été mis en évidence.

Annexe 4-2

Le benfluorex améliorerait l'insulino-sensibilité musculaire avec un effet sur les transporteurs de glucose. Enfin, la firme souligne que le mécanisme d'action du benfluorex diffère de celui des autres insulino-sensibilisateurs comme la metformine et les glitazones.

En effet, la mesure de l'expression des enzymes clés contrôlant le métabolisme du glucose et des acides gras libres après 48 heures d'incubation aurait montré une diminution franche de la CPT1, enzyme responsable de l'entrée des acides gras dans la mitochondrie, et de la PEPCK impliquée dans l'activation de gluconéogenèse. Cet effet serait propre à Médiator (déjà mis en exergue en 2000) puisque dans les mêmes conditions expérimentales, l'action inhibitrice de la metformine est indépendante de l'oxydation des acides gras et semble être en rapport avec une augmentation du potentiel redox de la cellule hépatique, les glitazones (étude avec la troglitazone) freine l'activation des acides gras en inhibant l'acyl-CoA synthase, réaction préalable à leur oxydation.

Il est noter qu'en 2000 (lors de la soumission de l'étude versus placebo et metformine, des données relatives à l'activité hypoglycémiante avaient déjà été soumises. D'après les experts mandatés, les données du dossier ne permettaient pas à l'époque de conclure à une augmentation de la sensibilité à l'insuline sous benfluorex Les conclusions suivantes avaient été émises:

- l'absence d'effet direct de Médiator sur la sécrétion d'insuline induite par le glucose ou l'arginine avait été confirmée in vitro à partir de cellules de pancréas isolées perfusées de rats témoins et de rats diabétiques (Serradas, Portha 1993);

- 3 études de pharmacodynamie contrôlées en double aveugle utilisant des techniques de clamp hyperinsulinique euglycémique (Biancchi 1993, Ricchio 1993) et isoglycémique (De Feo 1993 ont étudié l'utilisation périphérique de glucose. Deux de ces études ont étudié la production hépatique de glucose; une (De Feo) a montré une diminution de cette production; l'autre étude (De Ricchio) n'a pas mis en évidence de variation. Une étude complémentaire de Bianchi réalisée en 1996 n'avait pas montré d'amélioration de la consommation de glucose sous benfluorex. Sur la base de ces éléments, aucune certitude

Tableau 1 Evolution de la sensibilité à l'insuline

	Nb patients	Traitt	Valeurs basales	Valeurs finales	p**

sur le mécanisme d'action de cette molécule n'avait pu être mis en évidence.

Dans le présent argumentaire déposé, la firme s'appuie sur ces 3 mêmes études et conclut que ces études permettent de confirmer l'action de benfluorex sur le métabolisme glucidique et le situe clairement dans la classe des insulino-sensibilisateurs. L'ensemble

des résultats et leur cohérence ont conduit à mettre en place deux études pivot visant à confirmer l'efficacité hypoglycémiante du benfluorex chez les patients diabétiques de type 2 (Moulin 2006, Del Prato 2003). Voir données d'efficacité plus loin.

Un avis d'expert sur le mécanisme d'action de cette molécule est requis.

2. Activité hypolipémiante

Une action sur les différentes étapes enzymatiques régulant le métabolisme des acides gras, des triglycérides et du cholestérol aurait été mise en évidence in vitro. Aucune donnée dynamique ou clinique n'est fournie par la firme afin d'étayer le mécanisme d'action annoncé.

Note interne:
A noter qu'en 2000 lors de l'analyse des données de l'étude clinique versus placebo et versus metformine (Del Prato) les experts mandatés avaient tous souligné l'absence d'effet du benfluorex sur les paramètres lipidiques.

Extrait du rapport d'expertise sur le mécanisme d'action de l'activité hypolipémiante:

Benfluorex exerce une action sur différentes étapes enzymatiques regulant le métabolisme des acides gras, des triglycérides et du cholestérol.

In vitro, les données expérimentales sur hépatocytes isolés et homogénats de foie montrent que benfluorex diminue l'incorporation de C^{14} acétate dans les acides gras (Melin, 1991 ; Beynen 1992) et réduit l'activité de la phosphatidate-phosphorylase (Geelen,1977), enzyme responsable de la conversion du phosphatidate en diglycérides. Benfluorex et son principal métabolite (S 422) provoquent une inhibition dose dépendante d'une enzyme microsomiale, l'Acyl CoA cholestérol acyltransférase, augmentant le catabolisme des LDL (Low Density Lipoprotein) (Mazière,1991 ; Orsière, 1995).

Les effets inhibiteurs sur la synthèse des triglycérides sont confirmés *in vivo* sur différents modèles d'insulino-résistance chez le rongeur. L'administration de benfluorex (50 mg/kg) pendant un mois améliore l'action de l'insuline et réduit l'accumulation de triglycérides dans les muscles squelettiques (Storlien, 1993). L'administration à court terme de benfluorex diminue la triglycéridémie et la cholestérolémie chez le rat hyperphagique (Brindley, 1991). L'administration de benfluorex (10 mg/kg), à long terme (9 mois) entraîne une diminution des taux circulants de triglycérides et de cholestérol, ainsi que de l'insulinémie et de la glycémie post prandiale chez le rat obèse (Marquié, 1998).

En résumé, un effet hypolipémiant, portant sur les triglycérides et sur le cholestérol total, est observé sur de nombreux modèles animaux, après une administration courte ou prolongée de benfluorex.

2. DONNES D'EFFICACITE DE MEDIATOR

Présentation et analyse des données soumises par indication

=> Traitement adjuvant du régime adapté dans les hypertriglycéridémies.

Dix études sont soumises par la firme pour soutenir cette indication: i) versus placebo (chez 394 patients) ;ii) 4 études versus fibrates (chez 163 patients) chez des patients présentant une hyperlipidémie associée ou non à un diabète de type 2.

Etudes versus placebo (réalisées entre 1978 et 2006). Il s'agit d'études anciennes à l'exception de l'étude MOULIN (soumise 2006).

Annexe 4-2

Quand les mesures ont été effectuées sur les différentes fractions du cholestérol total, on observe une réduction significative du taux de LDL-cholestérol après traitement par benfluorex de 29.3%, ($p<0.05$) (Soltero, 1988) et de 5 % ($p < 0.05$) en comparaison au placebo (Moulin, 2006). Par ailleurs une augmentation significative du taux de HDL-cholestérol de l'ordre de 7.8 à 44.3% a été rapportée dans les études Mazzi et Di Martino.

Ces études ont inclus des patients de pathologies diverses (anomalies polymétaboliques, hyperlipidémie, diabète ou intolérance au glucose). Elles ont été menées selon un schéma croisé, parallèle ou séquentiel durant une période de 15 à 180 jours. A noter que dans l'étude Di Martino, le comparateur est le régime seul et que dans les études Del Prato et Moulin chez le diabétique de type 2, il s'agit de sous-groupes de 87 et 112 patients respectivement dont le taux de triglycérides à l'inclusion est >2.2mmol/L.
Les résultats figurent dans le tableau 8.

L'analyse de ces études a montré qu'un traitement par benfluorex diminue le taux de triglycérides (-8.3% à -56.1%) et du cholestérol total (-4.8% à -36.6%). L'importance de la diminution est dépendante de la valeur initiale ce qui explique la large fourchette des variations observées. Cet effet hypolipémiant, à la fois sur les triglycérides et le cholestérol, est démontré dans chaque catégorie de patients (hyperlipidémiques, diabétiques et polymétaboliques).

Etudes versus produit de référence (fibrates), réalisées entre 1980 et 1986 => 5 études dont les conclusions apportées par la firme sont le suivantes.

Quatre études ont comparé l'activité hypolipémiante de MEDIATOR® à celle du clofibrate selon un schéma croisé (Graisely, 1980) ou en groupes parallèles (Di Perri, 1981 ; Nathan, 1981 ; Balestreri, 1982) et une étude en groupes parallèles au fénofibrate et au bézafibrate (Sommariva, 1986b). Ces études ont inclus des patients présentant une hyperlipidémie (IIa, IIb, IV) associée ou non à un diabète de type 2. Le traitement durait de 30 à 112 jours selon les études (tableau 9).

L'ensemble des résultats démontrent qu'un traitement par benfluorex entraîne une diminution des triglycérides (-20.5% à -52.7%) et du cholestérol (-9.6% à -20.9%). L'amplitude de l'effet hypolipémiant est comparable à celui obtenu avec les fibrates (-19.0% à -49.7% et -4.9% à -22.7% respectivement).

Annexe 4-2

La dyslipidémie des patients inclus est fréquemment associée à une intolérance au glucose et à une hyperuricémie dans le cadre d'un syndrome plurimétabolique. Dans ces études, on observe une diminution significative de l'uricémie sous benfluorex (-11.3%) (Graisely, Balestreri, Nathan) tandis que les fibrates ne la modifient pas (−1.4%), à l'exception du fénofibrate (Sommariva). Chez les patients non diabétiques, une amélioration de la tolérance au glucose est rapportée, et chez les patients diabétiques une réduction de l'hémoglobine glyquées qui ne sont pas observées sous fibrates (Graisely, di Perri, Balestreri, Sommariva).

=> Traitement adjuvant au régime adapté chez les diabétiques avec surcharge pondérale

Pour rappel, en réponse à la demande de l'Afssaps de validation de l'indication «en « diabétologie » en 1990, la firme avait mis en place un programme d'études de l'efficacité du benfluorex dans différentes populations. Le programme d'étude avait pour but d'explorer l'efficacité et la sécurité d'emploi du benfluorex dans différentes populations (extrait relevé d'avis GT PTC2 N°1 du 21-09-2000)

- Patients insuffisamment contrôlés par régime seul (**Velussi**, 1996) => comparaison à un placebo en monothérapie;
- Patients insuffisamment contrôlés par un SU en monothérapie
  Deux anciennes études : Stucci 1996, **Louvet** 1995) => comparaison de Médiator à un placebo en association à un traitement par SU à dose maintenue constante pendant l'étude.
- Patients insuffisamment contrôlés par une insulinothérapie (Bianchi et Pontiroli 1996);
- Patients insuffisamment contrôlés par metformine en monothérapie (Pr Roger) => comparaison de Médiator à un placebo en association à la metformine à dose maintenue constante pendant l'étude, après une période de pré-inclusion de 2 mois sous metformine seule,
- Patients insulino-requérants (Pr Leutenegger) => comparaison de Médiator au placebo en association à l'insuline, dont la dose pouvait être modifiée en cours d'étude.

Seules trois de ces études (Velussi, Tomassi et Louvet) sont reprises par la firme dans le présent rapport soumis (noms des auteurs en gras dans le texte ci-dessous).

Annexe 4-2

Etudes versus placebo

=> La firme fait référence à trois anciennes études versus placebo dont les résultats sont présentés dans le tableau ci-dessous

Auteurs (réf)	Durée	Effectif	Traitement associé	HbA1c initiale (SD)	HbA1c différence versus placebo
Velussi 1996 (rapport en annexe 5)	3 mois	32	Regime seul	6.7 % (± 0.8)	-0.9 % p = 0.024
Tomasi 1996 (rapport en annexe 6)	3 mois	68	Regime + sulfamide hypoglycemiant	8.7 % (± 0.9)	-0.8 % p = 0.007
Louvet 1996 (rapport en annexe 7)	3 mois	35	Regime + sulfamide hypoglycemiant	8.5 % (± 1.7)	-1.7 % p = 0.023

=> la firme présente de manière détaillée les résultats du bras placebo de l'**étude Del Prato** (1998, publiés dans Acta Diabetologica en 2003) déposée dans le cadre de la validation de l'indication en « diabétologie ». Cette étude avait fait l'objet d'une expertise en plusieurs étapes.

Rappel de la méthodologie de l'étude:

Cette etude internationale multicentrique, conduite en double aveugle et groupes parallèles, a porté sur 438 patients diabétiques de type 2 insuffisamment contrôlés par régime seul. L'étude comportait une période de pré-inclusion de 2 mois pendant laquelle les patients recevaient du placebo (en simple insu) et des conseils diététiques. Les traitements ont été randomisés, soit benfluorex soit placebo, selon une répartition non équilibrée (2:1). Le traitement de 6 mois a été administré en trois prises quotidiennes, la dose passant de 1 cp/j (benfluorex 150 mg) à 2 cp/j au bout de 2 semaines et à 3 cp/j si la glycémie à jeun restait ≥ 7.8 mmol/L.

Critères d'inclusion

Patients diabétiques de type 2, en surpoids (IMC compris entre 25 et 40Kg/m^2), insuffisamment contrôlés par régime seul (HbA1c initiale comprise entre 7.5 et 10 % ou glycémie à jeun comprise entre 7.8 et 13.9 mmol/L).

Critères d'évaluation

Le critère principal d'efficacité était l' HbA1c (dosage centralisé, méthode HPLC).
Les critères secondaires d'efficacité étaient : glycémie à jeun, insulinémie, bilan lipidique.
Les critères de tolérance étaient : données de l'examen clinique (poids, fréquence cardiaque, PA), créatininémie et recueil des événements indésirables reportés spontanément.

Analyse statistique

L'analyse principale a été réalisée selon une approche en ITT dans la population FAS définie par l'ensemble des patients inclus ayant au moins une valeur du critère principal sous traitement.

La population FAS est constituée de 259 patients et 128 patients respectivement pour le groupe benfluorex et pour le groupe placebo, soit 88 % et 89 % de la population incluse (répartition : 2:1).
Les groupes sont comparables à l'inclusion. La moyenne d'âge est de 56 ± 9 ans, le diabète connu depuis 5 ± 5.5 ans. Les valeurs basales d'HbA1c sont de 7.7 % ± 1.6 dans le groupe benfluorex et de 7.4 % ± 1.5 % dans le groupe placebo, traduisant une sévérité modérée du diabète comme attendu dans cette population.

Conclusions de la firme:

L'HbA1c est significativement améliorée sous benfluorex et s'altère sous placebo ce qui conduit à une différence entre les groupes de 0.86% (p<0.001) et de 1.01 % (p < 0.001) après ajustement sur la valeur basale d'HbA1c. L'analyse en per protocole confirme ces résultats.
Des résultats identiques sont observés pour la glycémie à jeun avec une différence entre les groupes de 1.33mmol/L (p<0.001) (tableau 6). Le nombre d'arrêts de traitement pour inefficacité thérapeutique est plus important sous placebo (10.4 %) que sous benfluorex (6.8 %) (p = 0.19).

Note interne :

Pour rappel, les conclusions de la COM d'AMM du 09-12-1999 avaient été les suivantes: « ... Il est noté une efficacité du benfluorex versus placebo. Néanmoins, il n'est pas possible d'évaluer sur la taille de l'effet compte tenu des défauts de qualité des données. ... En effet, compte tenu des défauts de la qualité méthodologique de cet essai, aucune conclusion n'avait pu être formulée sur la taille de l'effet; i) du benfluorex versus placebo; ii) du benfluorex versus metformine. L'octroi d'une AMM dans le diabète de type 2 avait été rejetée. De manière plus précise, le groupe placebo de cette étude avait également soulevé de nombreuses remarques sur la qualité des analyses et résultats.

=> Etude MOULIN

An 18-week multinational, randomised double-blind study of the effect of benfluorex versus placebo in combination with SU for the treatment of type 2 diabetes, followed by a 16-week open label period with benfluorex given as combination with SU or in multiple combination.

Annexe 4-2

Méthodologie

Etudes comportant 2 périodes ii) période en ouvert de 16 semaines.

i) période en double aveugle (DA) de 18 semaines dont l'objectif principal était de démontrer la supériorité du benfluorex versus placebo, en association à un SU, sur l'évolution de l'HbA1c sur une période de 18 semaines chez des patients diabétiques de type 2 mal contrôlés par SU en monothérapie et chez qui l'utilisation de la metfomrine est contre-indiquée ou non recommandée. Etude multicentrique, en double aveugle, en groupes parallèles, comparative versus placebo.

ii) période en ouvert 16 semaines ayant pour objectif d'obtenir des données d'efficacité et de sécurité d'emploi à long terme du benfluorex en association avec un SU et, si nécessaire, à l'acarbose (3ème ADO pouvant être prescrit).

Période 1 : étude en double aveugle de 18 semaines

Population : 325 patients diabétiques de type 2 avec HbA1c entre 7 et 10% à l'inclusion insuffisamment équilibrés par SU (pendant 4 mois avant l'inclusion ou 2 mois à dose maximale tolérée, en surpoids (IMC entre 25 et 40 kg/m²).

Objectifs : principal : démontrer la supériorité du benfluorex versus placebo, en association à une SU, sur l'évolution de l'HbA1c pendant une période de 18 semaines chez des patients diabétiques de type 2 mal contrôlés par SU en monothérapie, et chez qui l'utilisation de la metformine n'est pas recommandée (problèmes de tolérance) ou est contre indiquée. L'objectif de la phase d'extension en ouvert est d'obtenir des données d'efficacité et de tolérance du benfluorex en association aux SU et si nécessaire à un 3 ème agent l'acarbose.

Méthodologie: étude multicentrique (63 centres et 7 pays), randomisée, stratifiée à « baseline » sur le taux d'HbA1c et le pays.

Critères d'efficacité. Principal : HbA1c à chaque visite. Secondaires :glycémie à jeun, insulinémie à jeun, paramètres lipidiques (TG, Hdl, LDL cholestérol). Analyse de la sécurité d'emploi : poids, tension artérielle, recueil des événements indésirables, etc.).

Résultats (phase en double aveugle seulement)

1 Caractéristiques démographiques des patients inclus

Annexe 4-2

Evolution des autres paramètres:

Diminution du poids observée dans les deux groupes de traitement: -1,3 kg sous Méditaor et -0,7 sous placebo (significative), amélioration de l'insulinorésistance, amélioration de la glycémie à jeun (significativement entre les 2 groupes) dès la 4ème semaine,

Paramètres lipidiques: diminution des TG de 7% (diminution modeste mais significative dans le groupe Médiator vs placebo). Diminution modeste du LDL, de -5,1ù sous Médiator versus +2,3% sous placebo. Variations du HDL-c non significatives.

Absence de modification de la Pression artérielle :

Analyses des résultats dans les sous groupes pré- définis: Baisse de l'HbA1c plus importante dans le groupe avec une HbA1c > 8% versus la population générale. Chez les patients avec une HbA1c < 8% à « baseline », diminution de -0,6% dans le groupe traité par Médiator versus +0,53% sous placebo. D'après la firme, la baisse de l'HbA1c est du même ordre de grandeur chez les patients âgés de plus de 65ans versus la population générale de l'essai. Idem résultats identiques chez les patients présentant une insuffisance rénale versus la population générale.

Note d'évaluation :

1. Faisant suite à la réunion d'Octobre 2006, un avis a été demandé au Groupe Pré-Clinique de l'Afssaps sur la pertinence des modèles animaux proposées afin d'étudier les éventuels effets du benfluorex sur l'hypertension artérielle pulmonaire. Leurs conclusions feront l'objet d'un relevé d'avis spécifique.

2. Analyse des données d'efficacité soumises pour chacune des deux indications :

2.1. Indication en tant qu'« ***Adjuvant au régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours nécessaire*** ».

=> Le mécanisme d'action du benfluorex sur les lipides reste difficile à préciser malgré les études soumises :

- les effets in vitro les plus fréquemment retrouvés sont une inhibition de la synthèse des acides gras, entraînant une baisse des triglycérides dans certains modèles animaux. Néanmoins, de nombreuses autres substances donnent des résultats similaires dans les modèles animaux.

- dans les modèles animaux in vivo (Etude de Brindley), il est difficile de différencier les résultats sur le lipides de la diminution de la prise alimentaire dans le groupe des animaux traités.

Une inhibition de l'ACAT in vitro a été montrée mais son retentissement clinique n'est pas démontré ; les études utilisant des inhibiteurs de l'ACAT n'ont pas toutes rapporté une réduction du LDLc et une étude récente parue dans le NEJM en 2006 (ACTIVATE) a montré l'absence d'effet sur la progression de l'athérome évaluée par écho-endoscopie coronaire chez 408 patients avec CAD angiographiquement documentée.

- Les études cliniques des effets sur les paramètres lipidiques peuvent être scindées en deux groupes : celles antérieures à 1992 et celles postérieures à 1992. En effet, après cette date, les effets hypotriglycéridémiants du produit sont devenus plus discrets et plusieurs études ne montrent pas de différence par rapport au placebo.

A noter que les études anciennes comportaient un nombre de sujets faible (n <40), avec une dyslipidémie plus prononcée que dans l'étude Moulin (TG environ 4 mmol/l), avec des valeurs initiales des paramètres lipidiques pas toujours identiques entre les groupes des traitement (étude versus clofibrate de Graisely), les valeurs du LDL-cholestérol n'étaient pas toujours disponibles.

Une méta-analyse de l'efficacité sur les TG dans les études les plus récentes montre que l'action du produit sur les TG est inconstante et ne correspondant pas à ce qui est attendu pour une molécule avec cette indication. Sur 6 études (avec des effectifs variés, de 10 à 242 patients), mais comportant un placebo et un tirage au sort, 5 études ne montrent pas de diminution significative des TG par rapport au groupe placebo (Louvet, Tomasi, Moulin, Velusi, Del Prato, Biancchi).

Dans l'indication de traitement adjuvant des hypertriglycéridémies, l'étude Moulin montre une réduction de seulement 7% des triglycérides sous benfuorex (p = 0,027) et de 6% du LDLc (p = 0,001). La différence entre le groupe benfluorex et le groupe placebo à la 18ème semaine était de -0,28 mmol/l (0,10 g/l) pour le LDL et de – 0,16 mmol/l pour les triglycérides. La répercussion clinique de cette différence est très faible et inférieure à celles observée avec les autres hypolipidémiants (statines, ézétrol pour le LDL, fibrates pour les TG). De plus, aucune donnée de protection cardiovasculaire n'est disponible. A noter par ailleurs que la publication de l'étude Moulin dans la revue Diabetes Care (en 2006) ne fait pas mention de l'effet du benfluorex sur les TG, ni dans l'abstract ni dans la discussion.

Au total, les données d'efficacité soumises montrent une efficacité très modeste voire inexistante sur les triglycérides y compris dans l'étude Moulin récente, l'efficacité sur les autres paramètres lipidiques n'étant pas démontrée. A noter que dans les étude soumises, les paramètres lipidiques sont uniquement étudiées comme critères secondaires. Compte tenu de ces éléments il semble difficile de maintenir l'indication actuelle en comme « Traitement adjuvant des hypertriglycéridémies ». Des études complémentaires d'efficacité sur l'efficacité du benfluorex sur les paramètres lipidiques en tant que critère primaire seraient nécessaires afin de mieux étayer cette efficacité. De plus, compte tenu des alternatives thérapeutiques actuelles, le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier sur les triglycérides et ayant démontré par ailleurs un efficacité en termes de prévention cardiovasculaire. Des études complémentaires versus placebo et comparatives seraient nécessaires chez des patients dyslipidémiques et/ou diabétiques.

2.2. Indication en tant qu '« ***Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale ».***

Pour rappel, dans cette indication, il avait été demandé à la firme de soumettre d'autres études pour valider cette indication. A cet effet, la firme a soumis en Septembre 2000 l'étude Del Prato pour laquelle seul le bras placebo a été considéré comme recevable, les résultats du bras versus metformine n'étant pas recevables compte tenu d'insuffisances méthodologiques relevées par les experts.

En 2002, il avait été demandé à la firme de réaliser une nouvelle étude évaluant l'effet du benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux, en particulier chez des patients pour lesquels la metformine est contre-indiquée ou mal

tolérée.

L'étude Moulin (publiée dans Diabetes Care en 2006) est une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par SU et intolérants ou ayant une contre indication à la metformine. Le critère principal était l'HbA1c ; les critères secondaires : insulinémie, glycémie à jeun, paramètres lipidiques, index d'insulino-résistance HOMA. Trois sous-groupes ont été analysés : HbA1c > 8%, âge > 65 ans et clairance de la créatininémie < 80ml/mn. Etude de supériorité avec une différence de 0.6% entre les groupes sur l'HbA1c.

Résultats :

Après 18 semaines de traitement, les résultats d'efficacité sur les paramètres glucidiques de cette étude montrent que :

- l'HbA1c est diminuée de -0.82% dans le groupe benfluorex (versus baseline) et de -1% versus le groupe placebo. 34.2% et 19% arrivent à une HbA1c ≤ 7% et > 6.5% contre 11% et 5% respectivement sous placebo. Baisse de l'HbA1c significative dès la 4ème semaine ; d'après la firme, l'effet est du même ordre entre les trois sous groupes pré définis ;
- l'insulinorésistance s'améliore significativement sous benfluorex ; la glycémie à jeun baisse significativement dès la 4ème semaine sous benfluorex.
- la perte de poids était de 1.3 kg sous benfluorex et de 0.7kg sous placebo ;
- noter, dans cette étude, la dose de SU utilisée n'était pas maximale puisqu'elle correspondant à la dose maximale tolérée soit ≥ 50% de la dose maximale de l'AMM chez 86% des patients.
- concernant les analyses en sous-groupes : la baisse de l'HbA1c est très faible chez les patients avec une HbA1c < 8% :-0.36% (-0.57 ;-0.15) sous benfluorex versus +0.53 % (0.25 ;0.80) sous placebo ;

En termes de sécurité d'emploi, dans cette étude, 53% des patients ont présenté un EI sous benfluorex et 51% sous placebo :

- les troubles neurologiques ont été plus fréquents sous benfluorex (9% versus 6.3%) ;
- les troubles digestifs sont rapportés chez 15.1% des patients sous benfluorex et 10% sous placebo : il s'agit d'une diarrhée la plupart du temps (trois fois plus fréquente sous traitement). Chez les patients intolérants à la metformine (n=184), 15.2% sous benfluorex versus 15.3% sous placebo ont présenté une EI de type gastro-intestinal. Chez les patients sans intolérance digestive à la metformine (n=142), 13.4% sous benfluorex et 4% sous placebo ont présenté des désordres gastro-intestinaux. Globalement la tolérance digestive est du même ordre que les patients soient intolérants ou non à le metformine ; une intolérance à la metformine en prédispose donc pas à une intolérance au benfluorex ;
- Aucune modification significative de la pression artérielle, de la fréquence cardiaque, des paramètres biologiques ou à l'ECG n'a été observée ;
- Hypoglycémies : 20 patients rapportent 37 épisodes (sans confirmation biologique). Elles ont tendance à être plus fréquents sous benfluorex que sous placebo ce qui est attendu compte tenu de la baisse plus importante de l'HbA1c sous benfluorex. Aucun épisode n'a été considéré comme sévère. Elles seraient cependant légèrement plus fréquentes chez les patients > 65 ans et chez les patients ayant une clairance de la créatinine < 8 ml/min.

Annexe 4-2

Commentaires :

- les données de compliance au traitement ne sont que partiellement fournies ;
- d'un point de vue méthodologique, la validité du modèle utilisé pour l'analyse de la variation de l'HbA1c est douteuse dans la mesure où des tests viennent rejeter l'hypothèse de normalité des résidus. L'impact de ces résultats aurait dû être discuté et des modèles ne requérant pas la normalité des résidus auraient dû être utilisés. Cette remarque vaut non seulement pour l'analyse du critère principal mais également pour l'analyse du glucose, de l'insuline et du HDL-cholestérol.
- Concernant la prise en compte de covariables, on peut noter que l'analyse de la variation de l'HbA1c a été ajustée sur la valeur de l'HbA1c à la baseline, toutefois il semblerait que l'ajustement soit réalisé avec la variable utilisée pour stratifier la randomisation (≤ ou > 8%). Les résultats devraient également être ajustés sur la variable continue (et pas seulement qualitative).
- On peut ajouter que si les résultats de la variation de l'HbA1c sont présentés avec ajustement sur la variation de poids, on ne sait pas s'ils sont également ajustés sur la valeur de l'HbA1c à la baseline et le centre (ou la zone géographique).
- A noter, la définition des hypoglycémies dans l'étude Moulin serait à préciser ;

A noter, d'autres études sont soumises dans le dossier par la firme mais ne sont pas considérées comme recevables compte tenu du faible nombre de patients inclus.

En conclusion :

Les experts sont unanimes pour affirmer que les données d'efficacité du benfluorex sur les paramètres lipidiques ne sont pas suffisantes pour maintenir cette indication.

En ce qui concerne l'indication relative au métabolisme glucidique, les données soumises et en particulier les résultats de l'étude Moulin récente (en seconde intention, en association à un SU) semblent montrer une efficacité sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids. Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu des réserves méthodologiques soulevées par les experts (voir ci-dessus). D'un commun accord, les experts sont cependant d'avis que bien qu'obsolète, l'indication telle que libellée peut être maintenue dans l'attente d'un dépôt complet de données d'efficacité et de sécurité d'emploi sur les paramètres glucidiques (études en cours, dépôt de dossier prévu en 2007 d'après la firme). A noter enfin, aucune demande de modification de cette indication n'a été demandée par la firme dans le cadre de cette réévaluation du bénéfice/risque.

AVIS DU GT AD HOC SUR LES MEDICAMENTS UTILISES EN DIABETOLOGIE, ENDOCRINOLOGIE, UROLOGIE ET GYNECOLOGIE N° 6 DU 21 DECEMBRE 2006 :

- **AVIS DEFAVORABLE** au maintien de l'indication : *« Adjuvant au régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours nécessaire. Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée».*

En effet, les données soumises montrent une efficacité très modeste voire inexistante sur les triglycérides y compris dans l'étude Moulin récente ; l'efficacité sur les autres paramètres lipidiques n'étant pas démontrée. A noter que dans les études soumises, les paramètres lipidiques sont uniquement étudiées comme critères secondaires et non comme critères primaires comme cela est requis pour des études cliniques visant à l'obtention d'une telle indication. Compte tenu de ces éléments il semble difficile de maintenir l'indication actuelle en comme « Traitement adjuvant des hypertriglycéridémies ». Des études complémentaires d'efficacité sur l'efficacité du

Annexe 4-2

benfluorex sur les paramètres lipidiques en tant que critère primaire seraient nécessaires afin de mieux étayer cette efficacité. De plus, compte tenu des alternatives thérapeutiques actuelles, le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier sur les triglycérides et ayant démontré par ailleurs un efficacité en termes de prévention cardiovasculaire.

- **AVIS FAVORABLE** au maintien de l'indication suivante : « *Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale* ». En effet, les données soumises et en particulier celles de l'étude Moulin semblent montrer une efficacité sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids.

Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu des réserves méthodologiques soulevées concernant la validité du modèle utilisé pour l'analyse du critère principal, la manière de prendre en compte la valeur de l'HbA1c à la baseline, et la prise en compte simultanée de la variation de poids, de la zone géographique et de la valeur de l'HbA1c à la baseline.

D'un commun accord, les experts sont cependant d'avis que bien qu'obsolète, l'indication telle que libellée peut être maintenue en l'état dans l'attente d'un dépôt complet de données d'efficacité et de sécurité d'emploi plus solides du benfluorex permettant de revoir le libellé de cette indication.

Les rubriques concernées du RCP et de la Notice sont modifiées en conséquence comme suit :

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

1. DENOMINATION

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé de 700 mg

Pour les excipients, voir rubrique 6.1..

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

~~- Adjuvant du régime adapté dans les hypertriglycéridémies;~~
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

4.2 Posologie et mode d'administration

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:

- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

En association à un régime adapté, Médiator constitue un traitement *adjuvant* : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3. Contre-indications

- Hypersensibilité au chlorhydrate de benfluorex ou à l'un des constituants ;
- Pancréatites chroniques avérées.

4.4. Mises en garde et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante de concentrations sériques de lipides ou de glucose n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5. Interactions avec d'autres médicaments et autres formes d'interactions

4.6. Grossesse et allaitement

Grossesse:
Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.
En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un

éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.
En conséquence, par mesure de prudence, il est préférable de ne pas utiliser ce médicament pendant la grossesse. En cas d'exposition fortuite, il conviendra d'interrompre ce traitement.

Allaitement
En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement.

4.7. Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

4.8. Effets indésirables

Les effets secondaires suivants ont été observés :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, confusion, somnolence ou états vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles;

- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, oedème de Quincke;

- élévation des enzymes hépatiques, hépatite (très rare).

4.9. Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

HYPOCHOLESTEROLEMIANT ET HYPOTRIGLYCERIDEMIANT
Code ATC : C10AX04

~~Actions de Médiator sur le métabolisme lipidique:~~
~~Chez l'animal (rat), Médiator diminue l'absorption intestinale des triglycérides.~~
~~Cet effet a été également observé chez l'homme en pharmacologie clinique et serait dû à une diminution de l'activité de la lipase pancréatique.~~

~~Les effets suivants ont été également observés chez l'animal:~~
~~- diminution de la synthèse hépatique des triglycérides et du cholestérol, *in vitro* et *in vivo* (rat);~~
~~- diminution de la stéatose hépatique induite par des régimes riches en lipides, riches en glucides (rat obèse) ainsi qu'au cours du diabète expérimental (rat);~~
~~- limitation de l'incorporation du cholestérol dans la paroi artérielle (lapin).~~
~~Ces différents mécanismes pourraient expliquer en partie la diminution du cholestérol et des triglycérides observée chez l'homme.~~

Annexe 4-2

Actions de MEDIATOR sur le métabolisme glucidique:

Chez l'animal, les effets suivants ont été observés:

- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat);

- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

MEDIATOR n'a pas d'action sur l'insulino-sécrétion; la survenue d'hypoglycémie est peu probable.

Effet complémentaire de MEDIATOR:

Une baisse de l'uricémie d'environ 14 % a été observée chez des patients obèses hyperuricémiques traités par Médiator en association à un régime adapté.

5.2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.

Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :

- une première phase rapide (60 % en 3 ou 4 heures);
- une seconde phase lente, de 36 heures environ.

5.3 Données de sécurité précliniques

Sans objet.

Annexe 4-2

ANNEXE III B

NOTICE

.....

1. QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

MEDIATOR 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.

MEDIATOR 150 mg se présente sous la forme de comprimés enrobés.

Boîtes de 10, 20, 24, 30, 60 et 100 comprimés.

Ce traitement est en préconisé comme adjuvant à un régime adapté :

~~- dans les hypertriglycéridémies *(taux de lipides élevés dans le sang)* ;~~

- chez les diabétiques avec surcharge pondérale *(taux de sucre élevé dans le sang)*.

2. INFORMATIONS NÉCESSAIRES AVANT D'UTILISER MEDIATOR 150 mg, comprimé enrobé

MEDIATOR 150 mg, comprimé enrobé NE DOIT JAMAIS ETRE UTILISE dans les cas suivants :

- allergie au chlorhydrate de benfluorex ou à l'un des composants du produit;

- en cas de pancréatite chronique *(insuffisance de fonctionnement chronique du pancréas)*.

MISES en GARDE et PRECAUTIONS PARTICULIERES D'EMPLOI avec MEDIATOR 150 mg, comprimé enrobé :

Un régime alimentaire adapté doit être poursuivi pendant toute la durée du traitement.

Si après une période de plusieurs mois (3 à 6 mois), une diminution des concentrations ~~de lipides ou~~ de glucose (sucre) dans le sang n'est pas obtenue, votre médecin pourra envisager d'autres moyens thérapeutiques adaptés à votre cas.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase *(maladies métaboliques rares)*.

Grossesse/Allaitement:

Il est préférable de ne pas utiliser ce médicament pendant la grossesse ou au cours de l'allaitement.

Si vous découvrez que vous êtes enceinte pendant le traitement, consultez votre médecin car lui seul peut juger de la nécessité de le poursuivre.

Conduite de véhicules et utilisation de machines:

L'attention est attirée sur le risque de somnolence pouvant survenir avec ce médicament.

Sportifs:

Attention, cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Liste des excipients à effet notoire:

Saccharose.

Prise ou utilisation d'autres médicaments:

Sans objet.

3. COMMENT PRENDRE MEDIATOR 150 mg, comprimé enrobé ?

Posologie:

RESERVE A L'ADULTE

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:

- 1ère semaine: 1 comprimé par jour, au cours du dîner;

- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;

- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

La posologie peut-être ramenée à 2 comprimés par jour, voire 1 comprimé par jour, en fonction des résultats biologiques.

DANS TOUS LES CAS, SE CONFORMER STRICTEMENT A L'ORDONNANCE DE VOTRE MEDECIN.

Si vous avez pris plus de MEDIATOR 150 mg, comprimé enrobé que vous n'auriez d :

Les signes de surdosage peuvent être des troubles digestifs (nausées, vomissements, diarrhée), une sensation vertigineuse voire une somnolence. En cas d'apparition de ces troubles, consultez votre médecin ou votre pharmacien.

Si vous oubliez de prendre MEDIATOR 150 mg, comprimé enrobé:

Ne prenez pas de double dose pour compenser la dose simple que vous avez oubliée de prendre.

Effets pouvant apparaître lorsque le traitement par MEDIATOR 150 mg, comprimé enrobé est arrêté :

Sans objet.

4. QUELS SONT LES EFFETS INDESIRABLES EVENTUELS avec MEDIATOR 150 mg, comprimé enrobé ?

Comme tous les médicaments, MEDIATOR 150 mg, comprimé enrobé est susceptible d'avoir des effets indésirables :

- troubles digestifs: nausées, vomissements, diarrhée, maux d'estomac ;

- sensation de fatigue, voire somnolence ;

- confusion ;

- sensations vertigineuses.

Ces effets ont été observés à des posologies supérieures à 3 comprimés par jour et varient en fonction de la susceptibilité individuelle des patients.

- très rares cas de manifestations allergiques : éruptions cutanées soudaines, urticaire, malaise brutal avec hypotension (diminution de la pression artérielle), œdème de Quincke (brusque gonflement du

visage et du cou). Dans ce cas, le traitement devra immédiatement être interrompu.

- élévation des enzymes hépatiques (anomalies biologiques au niveau du foie). Très rares cas d'hépatite.

Si vous remarquez des effets indésirables non mentionnés dans cette notice, veuillez en informer votre médecin ou votre pharmacien.

MEDIATOR 150, comprimé

(Benfluorex)

Revue des données d'efficacité

Conclusions du Groupe DEUG

Agence française de sécurité sanitaire des produits de santé

afssaps

C. REY-QUINIO

COM d'AMM du 5 Avril 2007

MEDIATOR :

Indications actuelles

afssaps

AMM octroyée en 1976, 1ère tranche de validation en 1987 (hypertriglycéridémies), 2nde tranche en 1990 (indication « diabète »:

- Adjuvant au régime adapté dans les hypertriglycéridémies.

- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Annexe 4-2

MEDIATOR et activité hypolipémiante

afssaps

Le mécanisme d'action sur les lipides reste difficile à préciser malgré les données soumises :

- Effets *in vitro* : inhibition de la synthèse des acides gras entraînant une baisse des TG (modèles animaux)

- Etudes *in vivo* chez l'animal (Brindley): inhibition de l'ACAT mais retentissement clinique non démontré (pas de diminution du LDL-c) et effet indépendant de la prise alimentaire non démontré

MEDIATOR et lipides Données d'efficacité clinique (1)

afssaps

10 études cliniques soumises :

- Etudes versus placebo (entre 1978 et 2006) anciennes à l'exception de l'étude MOULIN
=> au total : 394 patients traités
Remarques : faible nombre de patients, dyslipidémie variable selon les études, LDL-c non toujours disponible
Etude MOULIN : diminution de -7% des TG et de -6% du LDL-c

- 4 études versus produits de référence (fibrates)
=> 163 patients traités présentant une hyperlipidémie (IIa, IIb, IV)

Annexe 4-2

MEDIATOR et lipides
Données d'efficacité clinique (2)

afssaps

Méta-analyse de l'efficacité de MEDIATOR sur les triglycérides :
- 6 études (Louvet, Tomasi, Moulin, Velusi, Del Prato et Biancchi)
- effectifs variés de 10 à 242 patients
- études comportant un placebo, et TAS

=> 5 études sans effet sur les TG versus placebo
=> diminution inconstante des TG, ne correspondant pas à l'effet attendu pour une molécule dans cette indication
=> efficacité sur les autres paramères lipidiques non démontrée

Au total, **efficacité très modeste sur les TG** et **non démontrée sur les autres paramètres lipidiques** (paramètres uniquement étudiés comme critères secondaires)

MEDIATOR
et activité hypoglycémiante

afssaps

Plusieurs mécanismes d'action évoqués :
- Action sur le **métabolisme du glycogène** (rat): augmentation de la synthèse du glycogène, **diminution de la glycogénolyse** stimulée par le glucagon (Melin)
- Diminution de la **production hépatique de glucose** et **effets sur la néoglocogenèse** (Tielens, Zorzano)
- Amélioration de la **sensibilité à l'insuline** (4 études: Brindley, Portha, Serrasas et Storlien)
- **Amélioration de l'insulino-résistance musculaire** avec **effet de majoration du transporteur GLUT-4** (Sevilla, Storlien, Zorzano er l'oxydation du glucose(Bailey)
- **Pas d'effet sur la sécrétion basale d'insuline** (rat normal ou diabétique)

=> **Effet insulino- sensibilisateurs chez l'Homme** avec **effet sur les transporteurs de glucose, effet direct sur le foie** et enfin **réduction du contenu musculaire en TG.**

Annexe 4-2

MEDIATOR et glucides
Données d'efficacité clinique (1)

afssaps

Etudes anciennes analysées lors de la validation de l'indication en 1990 dans différentes populations :

3 études versus placebo retenues par la firme (Velussi, Tomassi et Louvet).
HbA1c : diminution de – 0.8 (Tomassi) sous régime seul , sous régime seul + SU de -0.9% (Velussi) et de -1.7% (Louvet)

Etude Del Prato versus placebo et versus metformine (1998):
- 0.86% entre le groupe placebo et le groupe benfluorex mais qualité de l'essai médiocre (défauts méthodologiques)

Etude MOULIN
Méthodologie (1)

afssaps

Méthodologie: étude multicentrique, randomisée en DA de 18 semaines de l'efficacité et la sécurité d'emploi de 450 mg/jour de benflurex vs placebo chez 325 patients diabétiques de type 2 mal équilibrés (HbA1c entre 7 et 10%) **par un SU, ou intolérants ou ayant une CI à la metformine.**
Deux phases :
- période en DA de 18 sem.: supériorité du benfluorex vs placebo sur l'HbA1c (différence attendue de 0.6%)
- période en ouvert de 16 sem. : données de safety à long terme en association à un SU ou à l'acarbose
Critères d'évaluation: HbA1c, GAJ, insulinémie à jeun/Critères secondaires (TG, HDL, LDL-c)
3 sous-groupes : HbA1c > 8%, âge > 65 ans et clairance de la créatini. < 80ml/ml

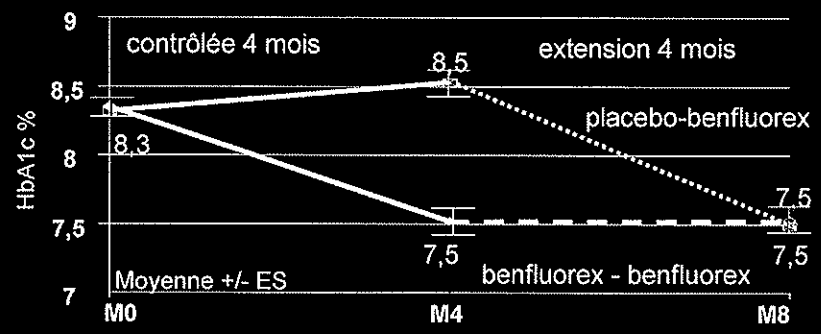
EVOLUTION DE L'HbA1c

Effet maintenu jusqu'à 8 mois



L'effet de benfluorex est reproductible dans le groupe initialement traité par placebo

MEDIATOR et glucides

En résumé ....

afssaps

- Diminution de l'HbA1c de - 0.82% dans le groupe benfluorex (vs baseline) et de -1% vs placebo
- Baisse signifcative dès la 4ème semaine, identique dans les 3 sous-groupes étudiés
- HbA1c ≤ 7% chez 34.2% sous benfluorex et 11% sous placebo
- HbA1c > 6.5% chez 19% sous benfluorex et 5% sous placebo
- GAJ significativement diminuée dès la 4ème semaine
- Perte de poids de 1.3 kg sous benfluorex et 0.7 kg sous placebo
- Baisse de l'HbA1c très faible pour HbA1c < 8% soit -0.36% sous benfluorex et +0.53% sous placebo
=> L'efficacité en seconde intention en association à un SU semble démontrée et ceci indépendemment de la perte de poids MAIS réserves méthodologiques soulevées par les experts

Annexe 4-2

MEDIATOR
Libellé d'indication retenu :

afssaps

- Adjuvant au régime adapté dans les hypertriglycéridémies.

- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

COM d'AMM du 05-04-2007

Annexe 4-3

COMMISSION d'AMM N° 419 DU 5 AVRIL 2007

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoire SERVIER

Demande déposée le

Principe actif:	**Benfluorex**
Caractère d'originalité	**Réévaluation de Bénéfice Risque**
Classe ATC:	**Système cardio-vasculaire/Hypolipémiants (C10A: hypocholestérolémiants et hypotriglycéridémiants)**

TYPE DE DEMANDE:

Faisant suite à la demande de réévaluation de bénéfice Risque de la Commission Nationale de Pharmacovigilance de Juin 2006, une revue des études d'efficacité dans les deux indications actuelles de l'AMM a été déposée par la firme.

Pour rappel, MEDIATOR (chlhorydrate de benfuorex) est commercialisé depuis 1987 dans les indications suivantes:

- *« Adjuvant au régime adapté dans les hypertryglycéridémies. La poursuite du traitement est toujours nécessaire.*
- *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.*

Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée».

HISTORIQUE DE L'EVALUATION DES DONNEES RELATIVES AU MEDIATOR

- Date d'AMM : 16-07-1976

- 1995. Inscription sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes. Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le CTPV a craint une dérive de l'utilisation du benfluorex comme anorexigène.

- 1998: 1ère enquête de Pharmacovigilance. Présentation des effets indésirables en CTPV (plusieurs séances) en 1998 ainsi qu'au groupe Européen de PV le 30-11-2000, entraînant des modifications de la rubrique 4.8. du RCP (ajout de « confusion » comme effet indésirable».

- 1987: validation de la 1ère tranche dans l'indication « hypertriglycéridémies »

Annexe 4-3

- **1990 :** dépôt du dossier de la 8ème tranche de validation dans l'indication en « diabétologie » ; nombreux échanges entre l'Afssaps et la firme entre 1990 et 1995 sur la nature des données à soumettre afin de valider cette indication (type d'étude, population cible, etc.), aboutissant finalement en 1998 au dépôt de l'étude Del Prato (étude de l'efficacité du benfluorex versus placebo et metformine sur les paramètres glucidiques (voir ci-dessous données cliniques). En attente de cette étude, l'indication telle que libellée lors de l'octroi de l'AMM a été maintenue.

- **Septembre 2000:** demande d'extension d'indication au «*Diabète de type II insulino-dépendant, en association au régime adapté, lorsque ce régime n'est pas suffisamment suffisant pour rétablir à lui seul l'équilibre glycémique* ». Une seule étude de phase III **(Etude Del Prato)**, randomisée, en double insu, benfluorex versus placebo et metformine a été soumise à l'appui de cette demande (A noter, cette étude réalisée a été réalisée à la demande de l'Afssaps; protocole revu en concertation avec l'Afssaps). Un avis défavorable a été émis par le Groupe de Travail PTC2 ainsi que par la COM d'AMM. Après recours de la firme de cette décision, cet avis a été maintenu par la COM d'AMM. En effet, compte tenu des défauts de la qualité méthodologique de cet essai (ayant l'objet par ailleurs d'une inspection), aucune conclusion n'a pu être formulée sur la taille de l'effet: i) du benfluorex versus placebo; ii) du benfluorex versus metformine (non-infériorité non démontrée : déséquilibre des taux d'HbA1c entre les groupes à l'inclusion, 68% seulement inclus dans l'analyse per protocole, 25% de patients inclus à tort). A noter également, aucune efficacité sur les paramètres lipidiques n'a été mise en évidence dans cette étude. En conclusion, la COM d'AMM (20-09-2002) a demandé qu'une étude évaluant l'efficacité du benfulorex en monothérapie et en association avec d'autres antidiabétiques oraux soit effectuée; l'association devant être également étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisants rénaux, sujets âgés)

- 2004-2005/Seconde enquête de Pharmacovigilance

Cette 2nd enquête fait suite à plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique rapportés avec le benfluorex. De ce fait, une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité a été décidée. L'enquête a ensuite été étendue aux hypertensions artérielles pulmonaires du fait de la notification d'un cas d'HTAP associé à la prise de benfluorex. Les conclusions de la CNPV sont les suivantes:

1. en ce qui concerne les troubles neuro-psychiatriques: « *cette enquête confirme la réalité du risque de survenue de « confusions » en présence de Médiator. Il est proposé que cet effet, déjà mentionné dans le RCP soit détaillé comme suit :* ***« troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) ».***
2. en ce qui concerne l'HTAP: « *compte tenu de l'incidence des HTAP idiopathiques (1 à 2 millions et par an), le nombre de cas d'HTAP idiopathique rapportés dans l'enquête ne constitue pas un signal significatif de toxicité du Mediator dans la classe organe cardio-vasculaire* ».

La discussion en CNPV (29-11-2005, adoptée le 16-06-2006) a par ailleurs porté sur les éléments suivants (extrait):

Les ventes de Médiator en Europe sont réalisées en quasi totalité en France. Les données DOREMA d'avril 2005 montrent une utilisation dans 46,3% dans les dylipidémies et dans 8,3% dans d'autres indications. L'effet anorexigène du benfluorex n'a pas été démontré. Toutefois, les membres de la CNPV craignent un mésusage, en particulier dans l'obésité. Dans ce contexte, une étude d'utilisation de prescription serait utile.

Annexe 4-3

Il est à noter que le renouvellement quinquennal du produit intervient dans 2 ans en France et que des données d'efficacité dans le diabète existent mais restent limitées et mériteraient d'être réévaluées.

Le bilan de pharmacovigilance confirme les données de sécurité d'emploi du Médiator déjà connues. Les effets neuro-psychiatriques décrits actuellement dans le RCP sous le terme « confusion » doivent être détaillés. Il n'y a pas actuellement assez de données pour affirmer l'existence de syndrome de sevrage. Le faible nombre de cas décrits d'HTAP idiopathique associés au Médiator doit être relativisé par rapport à la sous-notification habituelle en pharmacovigilance. Afin d'évaluer au mieux les risques potentiels de l'utilisation de Médiator, il conviendrait de réaliser:
i) une étude d'utilisation/prescription de Médiator;
ii) une étude expérimentale sur un modèle animal permettant d'évaluer le potentiel de Médiator à engendrer des HTAP;
iii) une étude au niveau des Centres d'évaluation et d'information sur la pharmacodépendance (CEIP) afin d'évaluer un éventuel problème de pharmacodépendance. A ce titre, une saisine de la Commission Nationale des stupéfiants et psychotropes sera effectuée.
Enfin, il a été proposé d'étudier la possibilité d'interroger les registres d'HTAP existant dans 17 centres, afin de rechercher, dans une étude rétrospective cas-témoins, le rôle éventuel du benfluorex.
Au vue des résultats présentés et des discussions, la CNPV a décidé une réévaluation de la balance Bénéfice-Risque de Médiator.

13 Octobre 2006/Réunion firme/Afssaps (PV, SURBOUM, PTC2/CRPV de Besançon)/Discussion des modalités de mise en oeuvre des études demandées par la CNPV, en particulier : i) étude sur un modèle animal d'HTAP; ii) étude d'utilisation-Prescription de Médiator.

=> Lors de cette réunion ont été présentés les types de modèle expérimentaux in vivo existants d'HTAP (modèle de stimuli patho-physiologique comme l'hypoxie aïgue ou chronique chez le rat ou la souris, stimulis chimiques comme la manocrotaline chez le rat, les modèles dits génétiques comme le rat Fawn-Hooded)

La firme retiendrait plus particulièrement un modèle d'étude de l'effet du benfluorex en conditions d'hypoxie ou de normoxie avec études des paramètres hémodynamiques, de l'index d'hypertrophie ventriculaire droit et du « remoduling » vasculaire pulmonaire (ou analyse histologique de la muscularisation des artérioles.

=> Données relatives à la commercialisation. A ce jour, le produit reste commercialisé dans 6 pays : Grèce, France, Pologne, Malte, Luxembourg et Chypre. L'Espagne et l'Italie n'ont pas demandé de renouvellement de l'AMM lors du dernier RQ dans ces deux pays.

=> Données de prescription. La firme a présenté des données de prescription issues de l'observatoire de prescriptions Thalès. 5 groupes ou populations pour lesquels Mediator est prescrit ont été identifiés (deux périodes d'observation: de 05/04 à 04/05 et de 05/05 à 04/05).
A - Patients dyslipidémiques +/- 50% des patients traités
B – Patients diabétiques de type 2 soit 1,8% (à confirmer)
C (A+B) - soit 15,2%
D – Ni A ni B (patients en **surpoids ou obèses, soit 14,3%)**
E – Ni A ni B + autre diagnostic (non précisé, HTA? Rapport Taille/Hanche élevé ?), **soit 8,1%.**
A noter, les chiffres de prescription sont stables pour les deux périodes étudiées.
Au total, +/- 20% de patients reçoivent du Médiator hors indications de l'AMM (14,3% +

Annexe 4-3

8,1%). Des précisions seraient à apporter sur cette population de patients traités (leur poids?, sont-ils obèses ou non?, Quelles sont les raisons de la prescription de Médiator (prescription saisonnière à l'automne ou non?). D'autres réunions sont envisagées avec la firme afin d'étayer les différents points discutés lors de cette réunion.

CONTENU DU DOSSIER:

En vue de la réévaluation de bénéfice Risque, le dossier déposé par la firme repose essentiellement sur des données d'études anciennes et ayant déjà l'objet d'expertise depuis la commercialisation du produit. Seule une nouvelle étude clinique : l'étude MOULIN apporte de nouvelles données dans l'indication en « diabétologie ».

Le rapport est structuré en 3 parties:

1. Un rappel du mécanisme d'action supposé de la molécule;
2. Des données d'efficacité dans chacune des 2 indications actuelles, avec une analyse plus particulière des données de l'étude MOULIN (indication « diabétologie »).
3. Une synthèse des données de sécurité d'emploi issues des études cliniques et de la pharmacovigilance.

1. MECANISME D'ACTION DE MEDIATOR

1. Activité hypoglycémiante

La firme met en avant des propriétés insulino-sensibilisatrices chez l'Homme avec un effet sur les transporteurs de glucose, un effet direct sur le foie avec augmentation de la synthèse du glycogène et inhibition de la néoglucogenèse et enfin une réduction du contenu musculaire en triglycérides. Les données suivantes sont soumises:

=> Etude in vitro sur modèles cellulaires chez le rat => action sur le métabolisme du glycogène : augmentation de la synthèse du glycogène et diminution de la glycogénolyse stimulée par le glucagon (Melin, 1991).

=> Diminution de la production hépatique de glucose et effet sur la néoglucogenèse (Tielens 1993 et Zorzano 1996 et Kohl 2002

=> 4 études sur l'amélioration de l'insulinosensibilité (Brindley 1991, Portha 1993, Serrasas 1993 et Storlien 1993).

=> 4 études sur l'amélioration de l'insulino-résistance musculaire avec effet de majoration du transporteur GLUT-4 (Sevilla 1999, Storlien 1993, Zorzano 1996) et l'oxydation du glucose (Bailey 1992)

=> Pas d'effet sur le sécrétion basale d'insuline (chez le rat normal ou diabétique (Portha 1993 et Serradas 1993). Voir Note interne ci-dessous.

Note interne:

D'après la firme, ces données permettent de conclure que le benfluorex a un effet insulino-sensibilisateur chez l'Homme démontré par les 3 études citées de clamp hypersinsulinique. Un effet direct sur le foie avec augmentation de la synthèse du glycogène et inhibition de la néoglucogenèse aurait également été mis en évidence.

Le benfluorex améliorerait l'insulino-sensibilité musculaire avec un effet sur les transporteurs de glucose. Enfin, la firme souligne que le mécanisme d'action du benfluorex diffère de celui des autres insulino-sensibilisateurs comme la metformine et les glitazones.

En effet, la mesure de l'expression des enzymes clés contrôlant le métabolisme du glucose et des acides gras libres après 48 heures d'incubation aurait montré une diminution franche de la CPT1, enzyme responsable de l'entrée des acides gras dans la mitochondrie, et de la PEPCK impliquée dans l'activation de gluconéogenèse. Cet effet serait propre à Médiator (déjà mis en exergue en 2000) puisque dans les mêmes conditions expérimentales, l'action inhibitrice de la metformine est indépendante de l'oxydation des acides gras et semble être en rapport avec une augmentation du potentiel redox de la cellule hépatique, les glitazones (étude avec la troglitazone) freine l'activation des acides gras en inhibant l'acyl-CoA synthase, réaction préalable à leur oxydation.

Il est noter qu'en 2000 (lors de la soumission de l'étude versus placebo et metformine, des données relatives à l'activité hypoglycémiante avaient déjà été soumises. D'après les experts mandatés, les données du dossier ne permettaient pas à l'époque de conclure à une augmentation de la sensibilité à l'insuline sous benfluorex Les conclusions suivantes avaient été émises:

- l'absence d'effet direct de Médiator sur la sécrétion d'insuline induite par le glucose ou l'arginine avait été confirmée in vitro à partir de cellules de pancréas isolées perfusées de rats témoins et de rats diabétiques (Serradas, Portha 1993);

- 3 études de pharmacodynamie contrôlées en double aveugle utilisant des techniques de clamp hyperinsulinique euglycémique (Biancchi 1993, Ricchio 1993) et isoglycémique (De Feo 1993 ont étudié l'utilisation périphérique de glucose. Deux de ces études ont étudié la production hépatique de glucose; une (De Feo) a montré une diminution de cette production; l'autre étude (De Ricchio) n'a pas mis en évidence de variation. Une étude complémentaire de Bianchi réalisée en 1996 n'avait pas montré d'amélioration de la consommation de glucose sous benfluorex. Sur la base de ces éléments, aucune certitude

Tableau 1 Evolution de la sensibilité à l'insuline

sur le mécanisme d'action de cette molécule n'avait pu être mis en évidence.

Dans le présent argumentaire déposé, la firme s'appuie sur ces 3 mêmes études et conclut que ces études permettent de confirmer l'action de benfluorex sur le métabolisme

Annexe 4-3

glucidique et le situe clairement dans la classe des insulino-sensibilisateurs. L'ensemble des résultats et leur cohérence ont conduit à mettre en place deux études pivot visant à confirmer l'efficacité hypoglycémiante du benfluorex chez les patients diabétiques de type 2 (Moulin 2006, Del Prato 2003). Voir données d'efficacité plus loin.

Un avis d'expert sur le mécanisme d'action de cette molécule est requis.

2. Activité hypolipémiante

Une action sur les différentes étapes enzymatiques régulant le métabolisme des acides gras, des triglycérides et du cholestérol aurait été mise en évidence in vitro. Aucune donnée dynamique ou clinique n'est fournie par la firme afin d'étayer le mécanisme d'action annoncé.

Note interne:
A noter qu'en 2000 lors de l'analyse des données de l'étude clinique versus placebo et versus metformine (Del Prato) les experts mandatés avaient tous souligné l'absence d'effet du benfluorex sur les paramètres lipidiques.

Extrait du rapport d'expertise sur le mécanisme d'action de l'activité hypolipémiante:

Benfluorex exerce une action sur différentes étapes enzymatiques régulant le métabolisme des acides gras, des triglycérides et du cholestérol.

In vitro, les données expérimentales sur hépatocytes isolés et homogénats de foie montrent que benfluorex diminue l'incorporation de C^{14} acétate dans les acides gras (Melin, 1991 ; Beynen 1992) et réduit l'activité de la phosphatidate-phosphorylase (Geelen,1977), enzyme responsable de la conversion du phosphatidate en diglycérides. Benfluorex et son principal métabolite (S 422) provoquent une inhibition dose dépendante d'une enzyme microsomiale, l'Acyl CoA cholestérol acyltransférase, augmentant le catabolisme des LDL (Low Density Lipoprotein) (Mazière,1991 ; Orsière, 1995).

Les effets inhibiteurs sur la synthèse des triglycérides sont confirmés *in vivo* sur différents modèles d'insulino-résistance chez le rongeur. L'administration de benfluorex (50 mg/kg) pendant un mois améliore l'action de l'insuline et réduit l'accumulation de triglycérides dans les muscles squelettiques (Storlien, 1993). L'administration à court terme de benfluorex diminue la triglycéridémie et la cholestérolémie chez le rat hyperphagique (Brindley, 1991). L'administration de benfluorex (10 mg/kg), à long terme (9 mois) entraîne une diminution des taux circulants de triglycérides et de cholestérol, ainsi que de l'insulinémie et de la glycémie post prandiale chez le rat obèse (Marquié, 1998).

En résumé, un effet hypolipémiant, portant sur les triglycérides et sur le cholestérol total, est observé sur de nombreux modèles animaux, après une administration courte ou prolongée de benfluorex.

2. DONNES D'EFFICACITE DE MEDIATOR

Présentation et analyse des données soumises par indication

=> Adjuvant du régime adapté dans les hypertriglycéridémies.

Dix études sont soumises par la firme pour soutenir cette indication: i) versus placebo (chez 394 patients) ;ii) 4 études versus fibrates (chez 163 patients) chez des patients présentant une hyperlipidémie associée ou non à un diabète de type 2.

Etudes versus placebo (réalisées entre 1978 et 2006). Il s'agit d'études anciennes à l'exception de l'étude MOULIN (soumise 2006).

Quand les mesures ont été effectuées sur les différentes fractions du cholestérol total, on observe une réduction significative du taux de LDL-cholestérol après traitement par benfluorex de 29.3%, ($p<0.05$) (Soltero, 1988) et de 5 % ($p < 0.05$) en comparaison au placebo (Moulin, 2006). Par ailleurs une augmentation significative du taux de HDL-cholestérol de l'ordre de 7.8 à 44.3% a été rapportée dans les études Mazzi et Di Martino.

Ces études ont inclus des patients de pathologies diverses (anomalies polymétaboliques, hyperlipidémie, diabète ou intolérance au glucose). Elles ont été menées selon un schéma croisé, parallèle ou séquentiel durant une période de 15 à 180 jours. A noter que dans l'étude Di Martino, le comparateur est le régime seul et que dans les études Del Prato et Moulin chez le diabétique de type 2, il s'agit de sous-groupes de 87 et 112 patients respectivement dont le taux de triglycérides à l'inclusion est >2.2mmol/L.
Les résultats figurent dans le tableau 8.

L'analyse de ces études a montré qu'un traitement par benfluorex diminue le taux de triglycérides (-8.3% à -56.1%) et du cholestérol total (-4.8% à -36.6%). L'importance de la diminution est dépendante de la valeur initiale ce qui explique la large fourchette des variations observées. Cet effet hypolipémiant, à la fois sur les triglycérides et le cholestérol, est démontré dans chaque catégorie de patients (hyperlipidémiques, diabétiques et polymétaboliques).

Mazzi 1985	hyperlipidémie IIb ou IV*	cross-over	7 (IV)	120	Bf : -30.0* Pl : -17.2		Bf : -56.1% Pl : -27.9*	-

Moulin, 2006	diabète type 2 + hypertriglycéridémie	groupe parallèle	112	126	Bf : -6* Pl : 0.0	-	Bf : -12* Pl : - 6	

a=classification de Fredrickson
ND=non déterminé
**=effet significatif valeur finale versus valeur initiale*
+ = différence intergroupe significative

Etudes versus produit de référence (fibrates), réalisées entre 1980 et 1986 => 5 études

La dyslipidémie des patients inclus est fréquemment associée à une intolérance au glucose et à une hyperuricémie dans le cadre d'un syndrome plurimétabolique. Dans ces études, on observe une diminution significative de l'uricémie sous benfluorex (-11.3%) (Graisely, Balestreri, Nathan) tandis que les fibrates ne la modifient pas (−1.4%), à l'exception du fénofibrate (Sommariva). Chez les patients non diabétiques, une amélioration de la tolérance au glucose est rapportée, et chez les patients diabétiques une réduction de l'hémoglobine glyquées qui ne sont pas observées sous fibrates (Graisely, di Perri, Balestreri, Sommariva).

L'ensemble des résultats démontrent qu'un traitement par benfluorex entraîne une diminution des triglycérides (-20.5% à -52.7%) et du cholestérol (-9.6% à -20.9%). L'amplitude de l'effet hypolipémiant est comparable à celui obtenu avec les fibrates (-19.0% à -49.7% et -4.9% à -22.7% respectivement).

=> Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale

Pour rappel, en réponse à la demande de l'Afssaps de validation de l'indication «en « diabétologie » en 1990, la firme avait mis en place un programme d'études de l'efficacité du benfluorex dans différentes populations. Le programme d'étude avait pour but d'explorer l'efficacité et la sécurité d'emploi du benfluorex dans différentes populations (extrait relevé d'avis GT PTC2 N°1 du 21-09-2000)

- Patients insuffisamment contrôlés par régime seul (**Velussi**, 1996) => comparaison à un placebo en monothérapie;
- Patients insuffisamment contrôlés par un SU en monothérapie
  Deux anciennes études : Stucci 1996, **Louvet** 1995) => comparaison de Médiator à un placebo en association à un traitement par SU à dose maintenue constante pendant l'étude.
- Patients insuffisamment contrôlés par une insulinothérapie (Bianchi et Pontiroli 1996);
- Patients insuffisamment contrôlés par metformine en monothérapie (Pr Roger) => comparaison de Médiator à un placebo en association à la metformine à dose maintenue constante pendant l'étude, après une période de pré-inclusion de 2 mois sous metformine seule,
- Patients insulino-requérants (Pr Leutenegger) => comparaison de Médiator au placebo en association à l'insuline, dont la dose pouvait être modifiée en cours d'étude.

Seules trois de ces études (Velussi, Tomassi et Louvet) sont reprises par la firme dans le présent rapport soumis (noms des auteurs en gras dans le texte ci-dessous).

Critères d'inclusion

Patients diabétiques de type 2, en surpoids (IMC compris entre 25 et 40Kg/m^2), insuffisamment contrôlés par régime seul (HbA1c initiale comprise entre 7.5 et 10 % ou glycémie à jeun comprise entre 7.8 et 13.9 mmol/L).

La population FAS est constituée de 259 patients et 128 patients respectivement pour le groupe benfluorex et pour le groupe placebo, soit 88 % et 89 % de la population incluse (répartition : 2:1).

Les groupes sont comparables à l'inclusion. La moyenne d'âge est de 56 ± 9 ans, le diabète connu depuis 5 ± 5.5 ans. Les valeurs basales d'HbA1c sont de 7.7 % ± 1.6 dans le groupe benfluorex et de 7.4 % ± 1.5 % dans le groupe placebo, traduisant une sévérité modérée du diabète comme attendu dans cette population.

Conclusions de la firme:

L'HbA1c est significativement améliorée sous benfluorex et s'altère sous placebo ce qui conduit à une différence entre les groupes de 0.86% (p<0.001) et de 1.01 % (p < 0.001) après ajustement sur la valeur basale d'HbA1c. L'analyse en per protocole confirme ces résultats.

Des résultats identiques sont observés pour la glycémie à jeun avec une différence entre les groupes de 1.33mmol/L (p<0.001) (tableau 6). Le nombre d'arrêts de traitement pour inefficacité thérapeutique est plus important sous placebo (10.4 %) que sous benfluorex (6.8 %) (p = 0.19).

Annexe 4-3

Pour rappel, les conclusions de la COM d'AMM du 09-12-1999 avaient été les suivantes: « ... Il est noté une efficacité du benfluorex versus placebo. Néanmoins, il n'est pas possible d'évaluer sur la taille de l'effet compte tenu des défauts de qualité des données. ... En effet, compte tenu des défauts de la qualité méthodologique de cet essai, aucune conclusion n'avait pu être formulée sur la taille de l'effet: i) du benfluorex versus placebo; ii) du benfluorex versus metformine. L'octroi d'une AMM dans le diabète de type 2 avait été rejetée. De manière plus précise, le groupe placebo de cette étude avait également soulevé de nombreuses remarques sur la qualité des analyses et résultats.

=> Etude MOULIN

An 18-week multinational, randomised double-blind study of the effect of benfluorex versus placebo in combination with SU for the treatment of type 2 diabetes, followed by a 16-week open label period with benfluorex given as combination with SU or in multiple combination.

Annexe 4-3

Méthodologie

Etudes comportant 2 périodes ii) période en ouvert de 16 semaines.

i) période en double aveugle (DA) de 18 semaines dont l'objectif principal était de démontrer la supériorité du benfluorex versus placebo, en association à un SU, sur l'évolution de l'HbA1c sur une période de 18 semaines chez des patients diabétiques de type 2 mal contrôlés par SU en monothérapie et chez qui l'utilisation de la metfomrine est contre-indiquée ou non recommandée. Etude multicentrique, en double aveugle, en groupes parallèles, comparative versus placebo.

ii) période en ouvert 16 semaines ayant pour objectif d'obtenir des données d'efficacité et de sécurité d'emploi à long terme du benfluorex en association avec un SU et, si nécessaire, à l'acarbose (3ème ADO pouvant être prescrit).

Période 1 : étude en double aveugle de 18 semaines

Population : 325 patients diabétiques de type 2 avec HbA1c entre 7 et 10% à l'inclusion insuffisamment équilibrés par SU (pendant 4 mois avant l'inclusion ou 2 mois à dose maximale tolérée, en surpoids (IMC entre 25 et 40 kg/m²).

Objectifs : principal : démontrer la supériorité du benfluorex versus placebo, en association à une SU, sur l'évolution de l'HbA1c pendant une période de 18 semaines chez des patients diabétiques de type 2 mal contrôlés par SU en monothérapie, et chez qui l'utilisation de la metformine n'est pas recommandée (problèmes de tolérance) ou est contre indiquée. L'objectif de la phase d'extension en ouvert est d'obtenir des données d'efficacité et de tolérance du benfluorex en association aux SU et si nécessaire à un 3 ème agent l'acarbose.

Méthodologie: étude multicentrique (63 centres et 7 pays), randomisée, stratifiée à « baseline » sur le taux d'HbA1c et le pays.

Critères d'efficacité. Principal : HbA1c à chaque visite. Secondaires :glycémie à jeun, insulinémie à jeun, paramètres lipidiques (TG, Hdl, LDL cholestérol). Analyse de la sécurité d'emploi : poids, tension artérielle, recueil des événements indésirables, etc.).

Résultats (phase en double aveugle seulement)

***p<0.001 **p<0.01 *p< 005 + test non parametrique

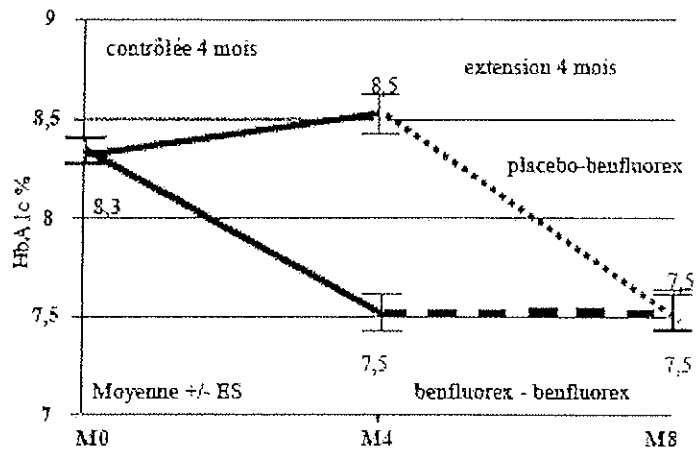
Diminution du poids observée dans les deux groupes de traitement: -1,5 kg sous Méditaor et -0,7 sous placebo (significative), amélioration de l'insulinorésistance, amélioration de la glycémie à jeun (significativement entre les 2 groupes) dès la 4ème semaine,

Paramètres lipidiques: diminution des TG de 7% (diminution modeste mais significative dans le groupe Médiator vs placebo). Diminution modeste du LDL, de -5,1ù sous Médiator versus +2,3% sous placebo. Variations du HDL-c non significatives.

Absence de modification de la Pression artérielle :

Analyses des résultats dans les sous groupes pré- définis: Baisse de l'HbA1c plus importante dans le groupe avec une HbA1c > 8% versus la population générale. Chez les patients avec une HbA1c < 8% à « baseline », diminution de -0,6% dans le groupe traité par Médiator versus +0,53% sous placebo. D'après la firme, la baisse de l'HbA1c est du même ordre de grandeur chez les patients âgés de plus de 65ans versus la population générale de l'essai. Idem résultats identiques chez les patients présentant une insuffisance rénale versus la population générale.

Figure 2 : Evolution de l'HbA1c pendant la période en double aveugle suivie de la période d'extension de l'étude



Annexe 4-3

- Les études cliniques des effets sur les paramètres lipidiques peuvent être scindées en deux groupes : celles antérieures à 1992 et celles postérieures à 1992. En effet, après cette date, les effets hypotriglycéridémiants du produit sont devenus plus discrets et plusieurs études ne montrent pas de différence par rapport au placebo.

A noter que les études anciennes comportaient un nombre de sujets faible (n <40), avec une dyslipidémie plus prononcée que dans l'étude Moulin (TG environ 4 mmol/l), avec des valeurs initiales des paramètres lipidiques pas toujours identiques entre les groupes des traitement (étude versus clofibrate de Graisely), les valeurs du LDL-cholestérol n'étaient pas toujours disponibles.

Une méta-analyse de l'efficacité sur les TG dans les études les plus récentes montre que l'action du produit sur les TG est inconstante et ne correspondant pas à ce qui est attendu pour une molécule avec cette indication. Sur 6 études (avec des effectifs variés, de 10 à 242 patients), mais comportant un placebo et un tirage au sort, 5 études ne montrent pas de diminution significative des TG par rapport au groupe placebo (Louvet, Tomasi, Moulin, Velusi, Del Prato, Biancchi).

Dans l'indication de traitement adjuvant des hypertriglycéridémies, l'étude Moulin montre une réduction de seulement 7% des triglycérides sous benfuorex (p = 0,027) et de 6% du LDLc (p = 0,001). La différence entre le groupe benfluorex et le groupe placebo à la 18ème semaine était de -0,28 mmol/l (0,10 g/l) pour le LDL et de – 0,16 mmol/l pour les triglycérides. La répercussion clinique de cette différence est très faible et inférieure à celles observée avec les autres hypolipidémiants (statines, ézétrol pour le LDL, fibrates pour les TG). De plus, aucune donnée de protection cardiovasculaire n'est disponible. A noter par ailleurs que la publication de l'étude Moulin dans la revue Diabetes Care (en 2006) ne fait pas mention de l'effet du benfluorex sur les TG, ni dans l'abstract ni dans la discussion.

Au total, les données d'efficacité soumises montrent une efficacité très modeste voire inexistante sur les triglycérides y compris dans l'étude Moulin récente, l'efficacité sur les autres paramètres lipidiques n'étant pas démontrée. A noter que dans les étude soumises, les paramètres lipidiques sont uniquement étudiées comme critères secondaires. Compte tenu de ces éléments il semble difficile de maintenir l'indication actuelle en comme « Traitement adjuvant des hypertriglycéridémies ». Des études complémentaires d'efficacité sur l'efficacité du benfluorex sur les paramètres lipidiques en tant que critère primaire seraient nécessaires afin de mieux étayer cette efficacité. De plus, compte tenu des alternatives thérapeutiques actuelles, le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier sur les triglycérides et ayant démontré par ailleurs un efficacité en termes de prévention cardiovasculaire. Des études complémentaires versus placebo et comparatives seraient nécessaires chez des patients dyslipidémiques et/ou diabétiques.

2.2. Indication en tant qu'« ***Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*** ».

Pour rappel, dans cette indication, il avait été demandé à la firme de soumettre d'autres études pour valider cette indication. A cet effet, la firme a soumis en Septembre 2000 l'étude Del Prato pour laquelle seul le bras placebo a été considéré comme recevable, les résultats du bras versus metformine n'étant pas recevables compte tenu d'insuffisances méthodologiques relevées par les experts.

En 2002, il avait été demandé à la firme de réaliser une nouvelle étude évaluant l'effet du

benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux, en particulier chez des patients pour lesquels la metformine est contre-indiquée ou mal tolérée.

L'étude Moulin (publiée dans Diabetes Care en 2006) est une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par SU et intolérants ou ayant une contre indication à la metformine. Le critère principal était l'HbA1c ; les critères secondaires : insulinémie, glycémie à jeun, paramètres lipidiques, index d'insulino résistance HOMA. Trois sous-groupes ont été analysés : HbA1c > 8%, âge > 65 ans et clairance de la créatininémie < 80ml/mn. Etude de supériorité avec un différence de 06% entre les groupes sur l'HbA1c.

Résultats :

Après 18 semaines de traitement, les résultats d'efficacité sur les paramètres glucidiques de cette étude montrent que :

- l'HbA1c est diminuée de -0.82% dans le groupe benfluorex (versus baseline) et de 1% versus le groupe placebo. 34.2% et 19% arrivent à une HbA1c ≤ 7% et > 6.5% contre 11% et 5% respectivement sous placebo. Baisse de l'HbA1c significative dès la 4ème semaine ; d'après la firme, l'effet est du même ordre entre les trois sous groupes pré définis ;
- l'insulinorésistance s'améliore significativement sous benfluorex ; la glycémie à jeun baisse significativement dès la 4ème semaine sous benfluorex.
- la perte de poids était de 1.3 kg sous benfluorex et de 0.7kg sous placebo ;
- noter, dans cette étude, la dose de SU utilisée n'était pas maximale puisqu'elle correspondant à la dose maximale tolérée soit ≥ 50% de la dose maximale de l'AMM chez 86% des patients.
- concernant les analyses en sous-groupes : la baisse de l'HbA1c est très faible chez les patients avec une HbA1c < 8% :-0.36% (-0.57 ;-0.15) sous benfluorex versus +0.53 % (0.25 ;0.80) sous placebo ;

En termes de sécurité d'emploi, dans cette étude, 53% des patients ont présenté un EI sous benfluorex et 51% sous placebo :

- les troubles neurologiques ont été plus fréquents sous benfluorex (9% versus 6.3%) ;
- les troubles digestifs sont rapportés chez 15.1% des patients sous benfluorex et 10% sous placebo : il s'agit d'une diarrhée la plupart du temps (trois fois plus fréquente sous traitement). Chez les patients intolérants à la metformine (n=184), 15.2% sous benfluorex versus 15.3% sous placebo ont présenté une EI de type gastro-intestinal. Chez les patients sans intolérance digestive à la metformine (n=142), 13.4% sous benfluorex et 4% sous placebo ont présenté des désordres gastro-intestinaux. Globalement la tolérance digestive est du même ordre que les patients soient intolérants ou non à le metformine ; une intolérance à la metformine en prédispose donc pas à une intolérance au benfluorex ;
- Aucune modification significative de la pression artérielle, de la fréquence cardiaque, des paramètres biologiques ou à l'ECG n'a été observée ;
- Hypoglycémies : 20 patients rapportent 37 épisodes (sans confirmation biologique). Elles ont tendance à être plus fréquents sous benfluorex que sous placebo ce qui est attendu compte tenu de la baisse plus importante de l'HbA1c sous benfluorex. Aucun épisode n'a été considéré comme sévère. Elles seraient cependant légèrement plus

fréquentes chez les patients > 65 ans et chez les patients ayant une clairance de la créatinine < 80 ml/min.

Commentaires :

- les données de compliance au traitement ne sont que partiellement fournies ;
- d'un point de vue méthodologique, l'analyse des résultats sur l'HbA1c a été ajustée en fonction du poids. Or, la méthode d'ajustement utilisée montre qu'une fois l'ajustement effectué, les « résidus » de l'effet n'ont pas une distribution normale. Ces résultats devraient à nouveau être analysés en utilisant une méthode d'ajustement permettant d'obtenir une distribution normale (voir la méthode utilisée pour l'ajustement de l'effet sur les paramètres lipidiques en fonction du poids).
- A noter que la randomisation a été stratifiée en fonction de l'HBA1c (≤ ou > 8%) ; les résultats sur l'HbA1c devraient être ajustés selon le taux de base ce qui n'est pas le cas dans les résultats soumis. De même, les résultats sur les paramètres devraient être ajustés en fonction des valeurs à l'inclusion ce qui n'est pas le cas.
- A noter, la définition des hypoglycémies dans l'étude Moulin serait à préciser ;

A noter, d'autres études sont soumises dans le dossier par la firme mais ne sont pas considérées comme recevables compte tenu du faible nombre de patients inclus.

En conclusion :

Les experts sont unanimes pour affirmer que les données d'efficacité du benfluorex sur les paramètres lipidiques ne sont pas suffisantes pour maintenir cette indication.

En ce qui concerne l'indication relative au métabolisme glucidique, les données soumises et en particulier les résultats de l'étude Moulin récente (en seconde intention, en association à un SU) semblent montrer une efficacité sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids. Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu des réserves méthodologiques soulevées par les experts (voir ci-dessus). D'un commun accord, les experts sont cependant d'avis que bien qu'obsolète, l'indication telle que libellée peut être maintenue dans l'attente d'un dépôt complet de données d'efficacité et de sécurité d'emploi sur les paramètres glucidiques (études en cours, dépôt de dossier prévu en 2007 d'après la firme). A noter enfin, aucune demande de modification de cette indication n'a été demandée par la firme dans le cadre de cette réévaluation du bénéfice/risque.

AVIS DU GT AD HOC SUR LES MEDICAMENTS UTILISES EN DIABETOLOGIE, ENDOCRINOLOGIE, UROLOGIE ET GYNECOLOGIE N° 6 DU 21 DECEMBRE 2006 :

- **AVIS DEFAVORABLE** au maintien de l'indication : *« Adjuvant au régime adapté dans les hypertriglycéridémies. Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée».*

En effet, les données soumises montrent une efficacité très modeste voire inexistante sur les triglycérides y compris dans l'étude Moulin récente ; l'efficacité sur les autres paramètres lipidiques n'étant pas démontrée. A noter que dans les études soumises, les paramètres lipidiques sont uniquement étudiées comme critères secondaires et non comme critères primaires comme cela est requis pour des études cliniques visant à l'obtention d'une telle indication. Compte tenu de ces éléments il semble difficile de maintenir l'indication actuelle en comme « Traitement adjuvant des hypertriglycéridémies ». Des études complémentaires d'efficacité sur l'efficacité du benfluorex sur les paramètres lipidiques en tant que critère primaire seraient nécessaires afin de mieux étayer cette efficacité. De plus, compte tenu des alternatives thérapeutiques actuelles, le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et

Annexe 4-3

en particulier sur les triglycérides et ayant démontré par ailleurs une efficacité en termes de prévention cardiovasculaire.

- **AVIS FAVORABLE** au maintien de l'indication suivante : « *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* ». En effet, les données soumises et en particulier celles de l'étude Moulin semblent montrer une efficacité sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids.

Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu des réserves méthodologiques soulevées : i) l'analyse des résultats sur l'HbA1c a été ajustée en fonction du poids. Or, la méthode d'ajustement utilisée montre qu'une fois l'ajustement effectué, les « résidus » de l'effet n'ont pas une distribution normale ce qui devrait être le cas. Ces résultats devraient à nouveau être analysés en utilisant une méthode d'ajustement permettant d'obtenir une distribution normale (voir la méthode utilisée pour l'ajustement de l'effet sur les paramètres lipidiques en fonction du poids).

De plus, la randomisation ayant été stratifiée en fonction de l'HBA1c (≤ ou > 8%), les résultats sur l'HbA1c devraient être également ajustés en fonction du taux de base de l'HbA1c ce qui n'est pas le cas dans les résultats soumis.

D'un commun accord, les experts sont cependant d'avis que bien qu'obsolète, l'indication telle que libellée peut être maintenue en l'état dans l'attente d'un dépôt complet de données d'efficacité et de sécurité d'emploi plus solides du benfluorex permettant de revoir le libellé de cette indication.

PRESENTATION DU DOSSIER EN COMMISSION D'AMM DU 5 AVRIL 2007:

Les conclusions du Groupe DEUG de l'évaluation des données d'efficacité dans les indications actuelles ainsi que les conclusions sur la sécurité d'emploi du benfluorex sont présentées à la Commission d'AMM pour discussion et décision finale sur le rapport Bénéfice/Risque de cette spécialité. Pour rappel, cette revue du Bénéfice/Risque a été initiée à la demande de la CNPV.

Résumé de la dernière étape de l'évaluation des données relatives au MEDIATOR :

1. Les conclusions du Groupe DEUG de l'évaluation des données d'efficacité ont été présentées à la Commission Nationale de Pharmacovigilance le 27 Mars 2007.

2. La firme a également été auditionnée lors de cette Commission. Une Mise à jour des données d'utilisation du benfluorex chez les médecins généralistes en fonction des indications, à partir de l'observatoire THALES, a été présentée par la firme. Ont été étudiées deux périodes : de mai 2004 à avril 2005 et de mai 2005 à avril 2006. Cinq groupes de patients ont été identifiés : A, B, C, D et E. En résumé, d'après ces données, la firme conclut (voir tableau ci-dessous) :

- qu'environ 80% des prescriptions de MEDIATOR sont réalisées chez des patients dyslipidémiques et / ou diabétiques (80,3% en 2004-2005 / 80,5 % en 2005-2006) ;
- qu'environ 11% des prescriptions MEDIATOR sont réalisées chez des patients « obèses » (11,5% en 2004-2005 / 10,7% en 2005-2006) ;
- que ces taux restent stables au cours du temps ;
- que concernant la saisonnalité des prescriptions de MEDIATOR, l'analyse n'a pas montré de différences entre le groupe « obésité » et le total de patients sous MEDIATOR ;
- le profil des patients traités par MEDIATOR (âge/sexe/IMC) reste stable sur les deux périodes.

Annexe 4-3

3. Une actualisation du rapport national de pharmacovigilance sur le benfluorex (mise à jour du rapport du 29 novembre 2005) a également été présentée par le CRPV chargé de l'enquête Nationale de Pharmacovigilance. Une revue des troubles neuropsychiatriques ainsi que des cas d'HTAP a été présentée (extrait) :
- au total : 39 notifications dont 4 cas nouveaux de troubles psychiatriques depuis novembre 2005 à type de dépression, agitation, délire de persécution et délire (2 cas nouveaux).

- HTAP : Fréquence : 13/20 cas d'HTAP (2 post embolique et 5 post capillaires) ont été observés. Nombre de boîtes vendues : 125 524 279 soit 51 613 601 mois de traitement. Ce qui représente 1 cas pour 9 655 713 boites vendues et 3 970 277 mois de traitement.
3 cas d'HTAP idiopathique ont été également observés soit 1 cas pour 41 0841 426 boites ou 17 204 533 mois de traitement. Au total, l'incidence de l'HTAP idiopathique est de 1 à 2 cas /million et par an.

AVIS DE LA COM d'AMM 419 DU 5 AVRIL 2007 :

Après présentation et discussion des conclusions du Groupe de Travail DEUG sur les données d'efficacité et des conclusions de la CNPV sur les données de sécurité d'emploi, les conclusions suivantes ont été émises :

1. La COM d'AMM suit l'avis DEFAVORABLE émis par le Groupe DEUG au maintien de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée*», les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante dans les études soumises sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol.

2. La COM d'AMM suit également l'avis du Groupe DEUG pour le maintien de l'indication : « *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* » dans son libellé actuel. En l'attente de données plus complètes sur l'efficacité du benfluorex en

association aux autres antidiabétiques oraux, la COM d'AMM n'a pas souhaité modifier le libellé actuel. A ce jour, seule l'étude MOULIN a permis de montrer une efficacité du benfluorex sur l'HbA1c en association à un sulfamide hypoglycémiant. D'autres études sont en cours dont une étude multicentrique, randomisée visant à comparer l'efficacité du benfluorex (150 mg bid ou 150 mg tid) à la pioglitazone (30 mg od ou 45 mg bid) en association à un sulfamide hypoglycémiant.

3. La COM d'AMM souhaite que les modifications d'ajout d'effets indésirables suivants tels que décidés par la CNPV soient mentionnées au sein de la rubrique 4.8. du RCP : *« troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) »* et de la rubrique correspondante de la Notice.

4. Une inspection de l'étude MOULIN, seule étude à ce jour ayant montré une efficacité sur les paramètres glucidiques a été proposée et acceptée par les membres de la COM d'AMM. Une saisine sera adressée en ce sens à la DIE (Direction de l'Inspection des Etablissements).

5. Enfin, les membres de la COM d'AMM souhaitent qu'une communication soit faite sur l'usage hors AMM de cette spécialité ainsi que sur la seule indication retenue après réévaluation des bénéfice/risque de cette spécialité.

Au total, le libellé de l'indication retenu est le suivant : «Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».

Le RCP modifié ainsi que la Notice dans leur intégralité figurent ci-après.

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

1. DENOMINATION

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé de 700 mg

Pour les excipients, voir rubrique 6.1..

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Annexe 4-3

4.2 Posologie et mode d'administration

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:

- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

En association à un régime adapté, MEDIATOR constitue un traitement *adjuvant* : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3. Contre-indications

- Hypersensibilité au chlorhydrate de benfluorex ou à l'un des constituants ;
- Pancréatites chroniques avérées.

4.4. Mises en garde et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par MEDIATOR sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante de concentrations sériques de glucose n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5. Interactions avec d'autres médicaments et autres formes d'interactions

4.6. Grossesse et allaitement

Grossesse:
Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.
En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.

En conséquence, par mesure de prudence, il est préférable de ne pas utiliser ce médicament pendant la grossesse. En cas d'exposition fortuite, il conviendra d'interrompre ce traitement.

Allaitement
En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement.

4.7. Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

4.8. Effets indésirables

Les effets secondaires suivants ont été observés :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou états vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles;

- **troubles de fonetions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations).**

- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke;

- très rares cas d'élévation des enzymes hépatiques, hépatite.

4.9. Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

~~HYPOCHOLESTEROLEMIANT ET HYPOTRIGLYCERIDEMIANT~~
~~Code ATC : C10AX04~~

Actions de MEDIATOR sur le métabolisme glucidique:

Chez l'animal, les effets suivants ont été observés:

- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat);

- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

MEDIATOR n'a pas d'action sur l'insulino-sécrétion; la survenue d'hypoglycémie est peu probable.

Annexe 4-3

5. 2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.

Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :

- une première phase rapide (60 % en 3 ou 4 heures);
- une seconde phase lente, de 36 heures environ.

5. 3 Données de sécurité précliniques

Sans objet.

ANNEXE III B

NOTICE

.....

1 - QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

MEDIATOR 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.

MEDIATOR 150 mg se présente sous la forme de comprimés enrobés.

Boîtes de 10, 20, 24, 30, 60 et 100 comprimés.

Ce traitement est en préconisé comme adjuvant à un régime adapté :

- chez les diabétiques avec surcharge pondérale *(taux de sucre élevé dans le sang)*.

2. INFORMATIONS NÉCESSAIRES AVANT D'UTILISER MEDIATOR 150 mg, comprimé enrobé

MEDIATOR 150 mg, comprimé enrobé NE DOIT JAMAIS ETRE UTILISE dans les cas suivants :

- allergie au chlorhydrate de benfluorex ou à l'un des composants du produit;
- en cas de pancréatite chronique *(insuffisance de fonctionnement chronique du pancréas)*.

MISES en GARDE et PRECAUTIONS PARTICULIERES D'EMPLOI avec MEDIATOR 150 mg, comprimé enrobé :

Un régime alimentaire adapté doit être poursuivi pendant toute la durée du traitement.

Si après une période de plusieurs mois (3 à 6 mois), une diminution des concentrations de glucose (sucre) dans le sang n'est pas obtenue, votre médecin pourra envisager d'autres moyens thérapeutiques adaptés à votre cas.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase *(maladies métaboliques rares)*.

Grossesse/Allaitement:

Il est préférable de ne pas utiliser ce médicament pendant la grossesse ou au cours de l'allaitement.

Si vous découvrez que vous êtes enceinte pendant le traitement, consultez votre médecin car lui seul peut juger de la nécessité de le poursuivre.

Conduite de véhicules et utilisation de machines:

L'attention est attirée sur le risque de somnolence pouvant survenir avec ce médicament.

Sportifs:

Attention, cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Liste des excipients à effet notoire:

Saccharose.

Prise ou utilisation d'autres médicaments:

Sans objet.

3. COMMENT PRENDRE MEDIATOR 150 mg, comprimé enrobé ?

Posologie:

RESERVE A L'ADULTE

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:

- 1ère semaine: 1 comprimé par jour, au cours du dîner;

- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;

- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

La posologie peut-être ramenée à 2 comprimés par jour, voire 1 comprimé par jour, en fonction des résultats biologiques.

DANS TOUS LES CAS, SE CONFORMER STRICTEMENT A L'ORDONNANCE DE VOTRE MEDECIN.

Si vous avez pris plus de MEDIATOR 150 mg, comprimé enrobé que vous n'auriez d :

Les signes de surdosage peuvent être des troubles digestifs (nausées, vomissements, diarrhée), une sensation vertigineuse voire une somnolence. En cas d'apparition de ces troubles, consultez votre médecin ou votre pharmacien.

Si vous oubliez de prendre MEDIATOR 150 mg, comprimé enrobé:

Ne prenez pas de double dose pour compenser la dose simple que vous avez oubliée de prendre.

Annexe 4-3

Effets pouvant apparaître lorsque le traitement par MEDIATOR 150 mg, comprimé enrobé est arrêté :

Sans objet.

4. QUELS SONT LES EFFETS INDESIRABLES EVENTUELS avec MEDIATOR 150 mg, comprimé enrobé ?

Comme tous les médicaments, MEDIATOR 150 mg, comprimé enrobé est susceptible d'avoir des effets indésirables :

- troubles digestifs: nausées, vomissements, diarrhée, maux d'estomac ;

- sensation de fatigue, voire somnolence ;

- sensations vertigineuses.

Ces effets ont été observés à des posologies supérieures à 3 comprimés par jour et varient en fonction de la susceptibilité individuelle des patients.

- très rares cas de manifestations allergiques : éruptions cutanées soudaines, urticaire, malaise brutal avec hypotension (diminution de la pression artérielle), œdème de Quincke (brusque gonflement du visage et du cou). Dans ce cas, le traitement devra immédiatement être interrompu.

- **troubles de fonctions cognitives (désorientation temporo-spatiale), troubles du comportement : agitation, délire, troubles de la perception (hallucinations).**

- élévation des enzymes hépatiques (anomalies biologiques au niveau du foie). Très rares cas d'hépatite.

Si vous remarquez des effets indésirables non mentionnés dans cette notice, veuillez en informer votre médecin ou votre pharmacien.

RÉPUBLIQUE FRANÇAISE

COMMISSION D'AUTORISATION DE MISE SUR LE MARCHE DES MEDICAMENTS

Réunion n° 419 du 5 avril 2007

Abréviations utilisées dans les tableaux :	
AMM ; autorisation de mise sur le marché*	**P.Nat** : Procédure Nationale
P.R.M : Procédure de reconnaissance mutuelle	**P.C** : Procédure Centralisée
P.D.C. Procédure décentralise	**RQ** : Renouvèlement Quinquennal
DMI : Demande de modification de l'information scientifique de l'AMM	

Après vérification du quorum, le Président de la Commission d'AMM ouvre la séance.

Un conflit d'intérêt important a été identifié concernant un membre de la commission au titre des dossiers du produit Mediator. (cf:IV point d'information et de suivi : Médiator)

I. Procès verbal de la Commission d'AMM n°418

Le procès verbal de la commission n° 418 du 22/03/07 a été présenté par le président de la commission d'AMM et approuvé à l'unanimité.

II. Présentation et discussion des dossiers[1] examinés par les groupes de travail thérapeutiques

Les dossiers suivants, ont été présentés à commission d'AMM et approuvés à l'unanimité :

1. Nutrition hépato gastroentérologie

CREON 40 000 U, granulés gastro-résistants en gélule	SOLVAY PHARMA	DMI	P.Nat
MOVIPREP, poudre pour solution buvable en sachet	NORGINE PHARMA	DMI	PRM

2. Anti-infectieux (V.I.H. et hépatites virales)

MAXEPA 1g, capsule molle	PIERRE FABRE	DMI	P.Nat

3. Cardio- thrombose

INTERCYTON 200 mg, gélule	UCB PHARMA	DMI	P.Nat
PRAVASTATINE MERCK 10 mg, 20 mg, 40 mg, comprimé pelliculé sécable	MERCK GENERIQUES	DMI	PRM
FOSINOPRIL/HYDROCHLOROTHIAZIDE TEVA 20mg/12.5 mg, comprimés sécables	TEVA	DMI	PRM

[1] Seuls les avis favorables, susceptibles de fonder une décision d'autorisation de mise sur le marché, sont retranscrits.

EZETROL 10 mg, comprimé **EZETIMIBE MSD 10 mg**, comprimé	MSD	DMI	PRM
FOSINOPRIL/HYDROCHLOROTHIAZIDE TEVA 20mg/12.5 mg, comprimés sécables	TEVA	Demande d'AMM	PRM

4. Onco-Hématologie

OXALIPLATIN MEDAC 5 mg/ml, poudre pour solution pour perfusion	Medac	Demande d'AMM	PRM
OXALIPLATIN RATIOPHARM, poudre pour solution pour perfusion	Ratiopharm	Demande d'AMM	PRM

5. Spécialités de prescription médicale facultative

ACTIFED ALLERGIE CETIRIZINE 10 mg, comprimé pelliculé sécable	PFIZER Santé Grand Public	DMI	P.Nat
HEXAMEDINE AGI PHARMA A 1 POUR MILLE, solution pour application locale	AGI Pharma	Demande d'AMM	P.Nat
HEXAMEDINE PHARMADEVELOPPEMENT A 1 POUR MILLE, solution pour application locale	Pharma Développement	Demande d'AMM	P.Nat

III. Présentation et discussion des dossiers examinés par les groupes de travail Pharmaceutique et les groupes de travail transversaux

1. Dossiers présentés par le Président de la Commission :

Les dossiers suivants, ont été présentés à la Commission d'AMM et approuvés à l'unanimité.

VAXIGRIP, suspension injectable vaccin grippal inactivé à virion fragmenté	SANOFI PASTEUR	DMI	P.Nat
VAXIGRIP, suspension injectable en ampoule vaccin grippal inactivé à virion fragmenté	SANOFI PASTEUR	DMI	P.Nat
TETAGRIP, suspension injectable en seringue préremplie vaccin tétanique et grippalinactivé à virion fragmenté	SANOFI PASTEUR	DMI	P.Nat
MUTAGRIP, suspension injectable seringue préremplie vaccin grippal inactivé à virion fragmenté	SANOFI PASTEUR MSD	DMI	PRM
VAXIGRIP, suspension injectable seringue préremplie vaccin grippa l inactivé à virion	SANOFI PASTEUR	DMI	PRM

fragmenté			
VAXIGRIP ENFANTS, suspension injectable seringue préremplie vaccin grippal inactivé à virion fragmenté	SANOFI PASTEUR	DMI	PRM
SPECIALITES RISPERDAL ET RISPERDALCONSTA L.P	JANSSEN-CILAG	DMI	P.Nat
ALCOOL MODIFIE 70%, solution pour application locale	API	Demande d'AMM	P.Nat
CELANCE 1 mg, **0,25 mg**, **0,05 mg**, comprimé sécable	LILLY France	DMI	P. Nat
DOGMATIL 200 mg, comprimé sécable	Sanofi Aventis France	DMI	P.Nat
DOGMATIL 50 mg, gélule			
DOGMATIL 100 mg/2ml, solution injectable (IM)			
DOGMATIL 0,5 g/100ml SANS SUCRE, solution buvable édulcorée au cyclamate			
DOGMATIL 0,5 g/100ml SANS SUCRE, solution buvable édulcorée à la saccharine			
JOSIR LP 0,4 mg, microgranules à libération prolongée en gélule	BOEHRINGER INGELHEIM France	DMI	P.Nat
MECIR LP 0,4 mg, comprimé pelliculé à libération prolongée	BOEHRINGER INGELHEIM FRANCE	DMI	P.Nat
OMEXEL LP 0, 4 mg comprimé pelliculé à libération prolongée	ASTELLAS PHARMA	DMI	P.Nat
OMIX LP 0,4 mg, microgranules à libération prolongée en gélule	YAMANOUCHI PHARMA	DMI	P.Nat
TAMSULOSINE BIOGARAN LP 0,4 mg, gélule à libération prolongée	BIOGARAN	DMI	P.Nat
TAMSULOSINE BIOORGANICS LP 0,4 mg, gélule à libération prolongée	BIOORGANICS BV	DMI	P.Nat
TAMSULOSINE EG LP 0,4 mg, gélule à libération prolongée	EG LABO	DMI	P.Nat
TAMSULOSINE MERCK LP 0,4 mg, gélule à libération prolongée	MERCK Géériques	DMI	P.Nat
TAMSULOSINE QUALIMED LP 0,4 mg, gélule à libération prolongée	QUALIMED	DMI	P.Nat

PROCUTA 5 mg, 10 mg, 20 mg, 40 mg, capsule molle	EXPANSCIENCE	DMI	PNat
RINGER LACTATE MACOPHARMA, solution pour perfusion	MACOPHARMA	DMI	PRM
RITALINE 10 mg, comprimé	NOVARTIS PHARMA	DMI	P. Nat
RITALINE LP, 20 mg, **30 mg**, **40 mg**, gélule à libération modifiée			
TAMSULOSINE KIRON LP 0,4 mg, gélule à libération prolongée	KIRON PHARMACEUTICA	DMI	PRM
TAMSULOSINE QUALIMED LP 0,4 mg, gélule à libération prolongée	QUALIMED	DMI	PRM
TAMSULOSINE MERCK GENERIQUES LP 0,4 mg, gélule à libération prolongée	MERCK GENERIQUES	DMI	PRM
TAMSULOSINE WINTHROP LP 0,4 mg, gélule à libération prolongée	WINTHROP MEDICAMENTS	DMI	PRM
TAMSULOSINE SANDOZ LP 0,4 mg, gélule à libération prolongée	SANDOZ	DMI	PRM
TAMSULOSINE DCI PHARMA LP 0,4 mg, gélule à libération prolongée	DCI PHARMA	DMI	PRM
TAMSULOSINE G CAM LP 0,4 mg, gélule à libération prolongée	GGAM	DMI	PRM
TAMSULIJN LP 0,4 mg, gélule à libération prolongée	KIRON PHARMACEUTICA	DMI	PRM
TAMSULOSIN RATIOPHARM LP 0,4 mg, gélule à libération prolongée	RATIOPHARM	DMI	PRM

Les dossier suivants, ont été présentés à la Commission d'AMM et approuvés à l'unanimité :

2. Dossiers étudiés par le groupe reproduction, grossesse & allaitement

3. Dossiers étudiés par le groupe pharmaceutique

4. Dossiers étudiés par le groupe pharmaceutique génériques

5. Dossiers étudiés par le groupe de travail Pharmaceutique des Produits Biologiques et des Produits issus des Biotechnologies

Annexe 4-3
REPUBLIQUE FRANÇAISE

IV Point d'information et de suivi

1. MEDIATOR

Avant d'ouvrir le débat sur cette spécialité, le Président demande au membre de la Commission identifié comme ayant un conflit d'intérêt avec le laboratoire de quitter la salle.

Mediator, comprimé pelliculé à 150 mg	Servier	bénéfice/risque	Proc.Nat

Après présentation et discussion des conclusions du Groupe de Travail sur les médicaments de diabétologie, endocrinologie, urologie et gynécologie sur les données d'efficacité et des conclusions de la Commission nationale de Pharmacovigilance sur les données de sécurité d'emploi, les conclusions suivantes ont été émises [1] :

1. Avis favorable à la mention des effets indésirables neuropsychiatriques tels que proposés par la Commission nationale de pharmacovigilance au niveau de la rubrique 4.8. "Effets indésirables" du RCP et de la notice : «troubles de fonctions cognitives : désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) ».

2. Avis DEFAVORABLE au maintien de l'indication : « Adjuvant au régime adapté dans les hypertriglycéridémies ». L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée, les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol. Le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier les triglycérides, ces hypolipémiants ayant démontré par ailleurs une efficacité en termes de prévention cardiovasculaire.

3. Avis FAVORABLE au maintien de l'indication : « Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » dans son libellé actuel. Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu de certaines réserves émises sur la méthodologie de l'étude MOULIN, étude pivot dans cette indication. De plus, dans l'attente des résultats d'une autre étude en cours sur les paramètres glucidiques (en association avec d'autres antidiabétiques oraux), aucun motif de protection de la santé publique ne s'oppose à ce que l'indication telle que libellée soit maintenue.

4. Compte tenu des éléments versés dans le dossier de réévaluation, proposition d'inspection de l'essai clinique MOULIN.

5. Les membres de la Commission d'AMM souhaitent qu'une communication soit faite sur l'usage hors AMM de ce médicament.

[1] Cette modification de l'AMM du médicament médiator à été notifiée à la firme le 25 juillet 2007

2. Avis sur le seuil d'éthanol dans les solutions buvables administrées à l'enfant

Ce rapport fait à la demande de l'Afssaps par le groupe de travail « médicaments » de la cellule opérationnelle de toxicovigilance, a été approuvé à l'unanimité par les membres de la Commission.
Ce document propose des valeurs de seuil d'éthanol dans les solutions buvables administrées à l'enfant.

3. Projets de fiches patients

Le projet de fiche patient " **le rhume de l'adulte** " a été présenté aux membres de la Commission d'AMM et approuvé à l'unanimité.

Ces fiches patients élaborées pas l'Afssaps, dans le cadre de la promotion du bon usage des produits de santé seront rassemblées pour constituer un guide sur le bon usage des médicaments à « prescription médicale facultative ».
Ces fiches seront publiées sur le site Internet de l'Afssaps.

4. Mise au point sur l'utilisation de la spécialité TYSABRI® 300 mg

La spécialité TYSABRI®(NATALIZUMAB) a fait l'objet d'une Autorisation de Mise sur le Marché européenne le 27 juin 2006. Elle est indiquée dans le traitement de fond des formes très actives de sclérose en plaques rémittente-récurrente (SEP RR) chez les patients adultes uniquement.

Le natalizumab est un anticorps monoclonal anti- α4-intégrine humanisé.

Le projet du plan de gestion des risques (PGR) a été présenté, pour avis aux membres de la Commission ainsi que la constitution du groupe référent qui aura pour mission d'établir de façon prospective des recommandations en cas de besoin afin de mieux encadrer les risques liés à ce médicament. Ce PGR est disponible sur le site Internet de l'Afssaps (afssaps.sante.fr dans la rubrique Sécurité sanitaire & vigilances/plan de gestion des risques)

5. Rapports publics d'évaluation & Fiches de synthèse

SEROPLEX, SIPRALEX, toutes formes

Une extension d'indication a été octroyée à Seroplex® et Sipralex® (escitalopram) dans le traitement des Troubles Obsessionnels Compulsifs de l'adulte. Cette extension d'indication fait l'objet d'un rapport public d'évaluation (RapPE) qui a été présenté pour Avis, aux membres de la Commission d'AMM.

Ce RapPE est disponible sur le site Internet de L'Afssaps. (afssaps.sante.fr dans la rubrique Documentation & publications/rapports publics d'évaluation)

V. Procédures décentralisées

Demandes d'AMM ou de modifications d'AMM étudiées par la commission et concernant des médicaments en procédure décentralisée.

- OXCARBAZEPINE MERCK 150 mg, comprimé pelliculé (Lab. MERCK GENERIQUES)
- OXCARBAZEPINE MERCK 300 mg, comprimé pelliculé (Lab. MERCK GENERIQUES)
- OXCARBAZEPINE MERCK 12 mg, comprimé pelliculé (Lab. MERCK GENERIQUES)
- OXCARBAZEPINE QUALIMED 150 mg, comprimé pelliculé (Lab. GENERICS UK LTD)
- OXCARBAZEPINE QUALIMED 300 mg, comprimé pelliculé (Lab. GENERICS UK LTD)
- OXCARBAZEPINE QUALIMED 600 mg, comprimé pelliculé (Lab. GENERICS UK LTD)

Les dossiers ont été approuvés par les membres de la Commission sans modification.

VI. Procédures de reconnaissance mutuelle

Demandes d'AMM ou de modifications d'AMM étudiées par la commission et concernant des médicaments en procédure de reconnaissance mutuelle.

- NAROPEINE 2 mg/ml, solution injectable en ampoule
- NAROPEINE 2 mg/ml, solution injectable en poche (Lab. ASTRAZENECA)
- LANZOR 15 mg, microgranules gastrorésistants en gélule
- LANZOR 30 mg, microgranules gastrorésistants en gélule (Lab. Sanofi-Aventis France)
- OGAST 15 mg, microgranules gastrorésistants en gélule
- OGAST 30 mg, microgranules gastrorésistants en gélule
- OGASTORO 15 mg, comprimé orodispersible
- OGASTORO 30 mg, comprimé orodispersible (Lab. Takeda)
- SUMATRIPTAN TEVA 50 mg, comprimé pelliculé sécable
- SUMATRIPTAN TEVA 100 mg, comprimé pelliculé (Lab. TEVA CLASSICS)

Les dossiers ont été approuvés par les membres de la Commission sans modification.

Monsieur,

Je vous prie de bien vouloir trouver ci-joint, l'ampliation de la décision portant modification de l'autorisation de mise sur le marché de la spécialité :

MEDIATOR 150mg, comprimé enrobé,

suite à la réévaluation du rapport bénéfice / risque du benfluorex.

La présente décision peut faire l'objet d'un recours contentieux devant le Conseil d'Etat dans un délai de deux mois à compter de la date de réception.

Je vous rappelle qu'il vous appartient de prendre toutes dispositions nécessaires à la mise en œuvre de ces modifications, dans les plus brefs délais.

Je vous prie d'agréer, Monsieur, l'expression de ma considération distinguée.

Pour le Directeur Général
et par délégation
Le Directeur de
l'Evaluation Thérapeutique et de
la Gestion des Procédures d'AMM

Monsieur le Docteur Eric ABADIE

DECISION

DU :

portant modification de l'autorisation de mise sur le marché de la spécialité :

MEDIATOR 150mg, comprimé enrobé

LE DIRECTEUR GENERAL DE L'AGENCE FRANCAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE

Vu le code de la santé publique, cinquième partie, notamment les articles L. 5121-8, L. 5121-20, R.5121-21 et suivants et R.5121-47 ;

Vu l'autorisation de mise sur le marché (AMM) validée octroyée le 22 avril 1987, modifiée ;

Vu la lettre du 16 mars 2006 demandant aux laboratoires SERVIER de soumettre toute donnée d'efficacité et de sécurité en vue de la réévaluation du rapport bénéfice/risque de la spécialité MEDIATOR 150mg, comprimé enrobé ;

Vu la réponse des laboratoires SERVIER en date du 16 juin 2006 ;

Vu l'avis de la Commission d'AMM prévu à l'article R. 5121-50 du code de la santé publique en date du 5 avril 2007 ;

Vu la lettre du 29 mai 2007 informant les laboratoires SERVIER de l'intention de l'Agence française de sécurité sanitaire des produits de santé de procéder à des modifications de l'AMM de la spécialité MEDIATOR 150mg, comprimé enrobé, concernant les rubriques « Indications thérapeutiques », « Mises en garde spéciales et précautions particulières d'emploi », « Propriétés pharmacodynamiques » et « Effets indésirables » du résumé des caractéristiques du produit (RCP), de la notice et de l'étiquetage et l'invitant à presenter ses observations ;

Vu les réponses des laboratoires SERVIER en date du 15 juin 2007 et 29 juin 2007 ;

Considérant le principe général de prééminence de la protection de la santé publique énoncé par le second considérant de la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire ;

Considérant que les notions de nocivité et d'effet thérapeutique ne peuvent être examinées qu'en relation réciproque et n'ont de signification relative qu'appréciées en fonction de l'état d'avancement de la science et compte tenu de la destination du médicament ;

Considérant que l'exigence d'une évaluation du rapport bénéfice/risque présenté par un médicament ne vise pas exclusivement l'octroi de l'AMM, mais implique une évaluation continue ;

Considérant, en l'espèce, que l'analyse des données actuellement disponibles relatives à la sécurité d'emploi et à l'efficacité du médicament MEDIATOR 150mg, comprimé enrobé, met en exergue les éléments suivants :

Annexe 4-4

Données d'efficacité :

Dans l'indication du traitement adjuvant du régime adapté dans les hypertriglycéridémies, les données d'efficacité soumises montrent une efficacité très modeste voire inexistante sur les triglycérides, y compris dans l'étude Moulin où l'efficacité sur les autres paramètres lipidiques tels que le LDL cholestérol n'est pas démontrée.
En l'absence d'étude complémentaire d'efficacité du benfluorex sur les paramètres lipidiques en tant que critère primaire et compte tenu de l'existence d'alternatives thérapeutiques, il n'est pas justifié de maintenir cette indication, qui pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier les triglycérides, ces hypolipémiants ayant démontré par ailleurs une efficacité en termes de prévention cardiovasculaire. Cette indication doit donc être supprimée.

Dans l'indication du traitement adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale, les résultats de l'étude Moulin semblent montrer une efficacité sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids.
Néanmoins, à ce jour, aucune conclusion définitive ne peut être portée sur cette efficacité.
Toutefois, dans l'attente de l'analyse des réponses complémentaires apportées sur les aspects méthodologiques de cette etude, ainsi que des résultats de l'inspection qui va être diligentée, aucun motif de protection de la santé publique ne s'oppose à ce que l'indication telle que libellée soit maintenue.

Données de sécurité :

Le bilan de pharmacovigilance réalisé en 2005 et complété en 2007 confirme les données de sécurité d'emploi du benfluorex déjà connues.
S'agissant des troubles neuropsychiatriques, les données disponibles confirment la réalité du risque de survenue de confusions. Cet effet indésirable, déjà mentionné dans le RCP, doit donc être détaillé comme suit : « Troubles des fonctions cognitives : désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception : hallucinations. ».
En revanche, il n'existe pas suffisamment de données permettant d'affirmer l'existence d'un syndrome de sevrage.
Enfin, le faible nombre de cas d'hypertension artérielle pulmonaire idiopathique associées au benfluorex (1 cas pour 17 204 533 mois de traitement) ne constitue pas un signal significatif de toxicité du benfluorex mais doit cependant être interprété par rapport à la sous-notification habituelle en pharmacovigilance.

Considérant que dans ces conditions, il apparaît nécessaire de modifier l'AMM de la spécialité MEDIATOR 150mg, comprimé enrobé, afin de supprimer l'indication du traitement adjuvant du régime adapté dans les hypertriglycéridémies et de détailler les effets indésirables neuropsychiatriques.
Les modifications liées aux indications concernent les rubriques « Indications thérapeutiques », « Mises en garde spéciales et précautions particulières d'emploi » et « Propriétés pharmacodynamiques » du RCP.
Les modifications liées aux troubles neuropsychiatriques, concernent la rubrique « Effets indésirables » du RCP.
Les autres annexes de l'AMM sont modifiées en conséquence.
En outre, compte tenu de la modification des indications de la spécialité MEDIATOR 150mg, le code ATC (Anatomical Therapeutic Chemical classification system) est remplacé par le code « A16AX / Divers médicaments des voies digestives et du métabolisme », dans l'attente du reclassement du benfluorex selon la classification ATC par l'Organisation Mondiale de la Santé (OMS), sur proposition des laboratoires SERVIER auprès de l'OMS ;

DECIDE :

ARTICLE 1er
L'autorisation de mise sur le marché validée octroyée le 22 avril 1987 à la spécialité pharmaceutique dénommée :

MEDIATOR 150mg, comprimé enrobé,

Annexe 4-4

dont le titulaire est :

Laboratoires SERVIER
22 rue Garnier
92578 NEUILLY SUR SEINE cedex

est modifiée.

ARTICLE 2
Les informations jointes à la présente décision remplacent les informations correspondantes des annexes de l'autorisation de mise sur le marché en vigueur.

ARTICLE 3
Le directeur de l'Evaluation des Médicaments et des Produits Biologiques est chargé de l'exécution de la présente décision.

FAIT A ST DENIS, le 25 JUIL. 2007

LE DIRECTEUR GENERAL

Pour le Directeur Général
et par délégation
Le Directeur de
l'Evaluation Thérapeutique et de
la Gestion des Procédures d'AMM

Monsieur le Docteur Eric ABADIE

P.J. : 4 annexes

Annexe 4-4

ANNEXE I

RÉSUMÉ DES CARACTÉRISTIQUES DU PRODUIT

1. DÉNOMINATION DU MÉDICAMENT

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex ..... 150,00 mg

pour un comprimé enrobé

Pour les excipients, voir rubrique 6.1

3. FORME PHARMACEUTIQUE

Comprimé enrobé.

4. DONNÉES CLINIQUES

4.1 Indications thérapeutiques

Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

4.2 Posologie et mode d'administration

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante :

- 1ère semaine: 1 comprimé par jour, au cours du dîner ;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner ;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

En association à un régime adapté, Médiator constitue un traitement adjuvant : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3 Contre-indications

- Hypersensibilité au chlorhydrate de benfluorex ou à l'un des constituants.
- Pancréatites chroniques avérées.

4.4 Mises en garde spéciales et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante des concentrations sériques de glucose n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5 Interactions avec d'autres médicaments et autres formes d'interactions

Sans objet.

4.6 Grossesse et allaitement

Grossesse

Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.

En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.

En conséquence, par mesure de prudence, il est préférable de ne pas utiliser ce médicament pendant la grossesse. En cas d'exposition fortuite, il conviendra d'interrompre ce traitement.

Allaitement

En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement

4.7 Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

4.8 Effets indésirables

Les effets secondaires suivants ont été observés :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou états vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles ;
- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quicke ;
- élévation des enzymes hépatiques, hépatite (très rares).
- Confusion, troubles des fonctions cognitives : désorientation tempo-spatiale, troubles du comportement : agitation, délire, troubles de la perception hallucinations (très rare).

4.9 Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIÉTÉS PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

Classe pharmacothérapeutique : DIVERS MEDICAMENTS DES VOIES DIGESTIVES ET DU METABOLISME

Code ATC : A16AX

Actions de Médiator sur le métabolisme glucidique:

Chez l'animal, les effets suivants ont été observés :

- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat) ;
- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

Médiator n'a pas d'action sur l'insulino-sécrétion ; la survenue d'hypoglycémie est peu probable.

Effet complémentaire de Médiator :

Une baisse de l'uricémie d'environ 14 % a été observée chez des patients obèses hyperuricémiques traités par Médiator en association à un régime adapté

5.2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.

Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :

- une première phase rapide (60 % en 3 ou 4 heures) ;
- une seconde phase lente, de 36 heures environ.

5.3 Données de sécurité précliniques

Sans objet.

6. DONNÉES PHARMACEUTIQUES

6.1 Liste des excipients

Amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

6.2 Incompatibilités

Sans objet.

6.3 Durée de conservation

3 ans.

6.4 Précautions particulières de conservation

Pas de précautions particulières de conservation.

6.5 Nature et contenu de l'emballage extérieur

10, 20, 24, 30, 60, 100 ou 270 comprimés sous plaquettes thermoformées (PVC-Aluminium)

6.6 Instructions pour l'utilisation, la manipulation et l'élimination

(Voir rubrique 4.2).

7. TITULAIRE DE L'AUTORISATION DE MISE SUR LE MARCHÉ

LABORATOIRES SERVIER
22, RUE GARNIER
92200 NEUILLY-SUR-SEINE CEDEX

8. PRÉSENTATIONS ET NUMÉROS D'IDENTIFICATION ADMINISTRATIVE

- 317 553-3 :10 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 317 555-6 : 20 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 317 556-2 : 24 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 317 557-9 : 30 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 317 558-5 : 60 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 317 559-1 : 100 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)
- 371 971-4 : 270 comprimés enrobés sous plaquettes thermoformées (PVC-Aluminium)

NOTICE

Concerne les médicaments pouvant être obtenus uniquement sur ordonnance :

Veuillez lire attentivement l'intégralité de cette notice avant de prendre ce médicament.

- Gardez cette notice, vous pourriez avoir besoin de la relire.
- Si vous avez d'autres questions, si vous avez un doute, demandez plus d'informations à votre médecin ou à votre pharmacien.

Ce médicament vous a été personnellement prescrit. Ne le donnez jamais à quelqu'un d'autre, même en cas de symptômes identiques, cela pourrait lui être nocif.

Dénomination du médicament

MEDIATOR 150 mg, comprimé enrobé

Liste complète des substances actives et des excipients

La substance active est :

Chlorhydrate de benfluorex ..... 150,00 mg

pour un comprimé enrobé

Les autres composants sont :

Amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

Nom et adresse du titulaire de l'autorisation de mise sur le marché et du titulaire de l'autorisation de fabrication responsable de la libération des lots, si différent

1. QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

Forme pharmaceutique et contenu ; classe pharmacothérapeutique

Médiator 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.

Médiator 150 mg se présente sous la forme de comprimés enrobés.

Boîtes de 10, 20, 24, 30, 60, 100 et 270 comprimés.

Annexe 4-4

Indications thérapeutiques

Ce traitement est préconisé comme adjuvant à un régime adapté chez les diabétiques avec surcharge pondérale (taux de sucre élevé dans le sang).

2. QUELLES SONT LES INFORMATIONS NÉCESSAIRES AVANT DE PRENDRE MEDIATOR 150 mg, comprimé enrobé?

Liste des informations nécessaires avant la prise du médicament

Sans objet.

Contre-indications

Ne prenez jamais MEDIATOR 150 mg, comprimé enrobé dans les cas suivants :

- allergie au chlorhydrate de benfluorex ou à l'un des composants du produit ;
- en cas de pancréatite chronique (insuffisance de fonctionnement chronique du pancréas).

Précautions d'emploi ; mises en garde spéciales

Faites attention avec MEDIATOR 150 mg, comprimé enrobé dans les cas suivants :

Un régime alimentaire adapté doit être poursuivi pendant toute la durée du traitement.

Si après une période de plusieurs mois (3 à 6 mois), une diminution des concentrations de glucose (sucre) dans le sang n'est pas obtenue, votre médecin pourra envisager d'autres moyens thérapeutiques adaptés à votre cas.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase (maladies métaboliques rares).

Interactions avec les aliments et les boissons

Sans objet.

Utilisation pendant la grossesse et l'allaitement

Grossesse et Allaitement

Il est préférable de ne pas utiliser ce médicament pendant la grossesse ou au cours de l'allaitement.

Si vous découvrez que vous êtes enceinte pendant le traitement, consultez votre médecin car lui seul peut juger de la nécessité de le poursuivre.

Sportifs

Attention, cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Effets sur l'aptitude à conduire des véhicules ou à utiliser des machines

Conduite de véhicules et utilisation de machines :

L'attention est attirée sur le risque de somnolence pouvant survenir avec ce médicament.

Liste des excipients à effet notoire

Liste des excipients à effet notoire : saccharose.

Interaction avec d'autres médicaments

Sans objet.

Annexe 4-4

3. COMMENT PRENDRE MEDIATOR 150 mg, comprimé enrobé ?

Instructions pour un bon usage

Sans objet.

Posologie, Mode et/ou voie(s) d'administration, Fréquence d'administration et Durée du traitement

Posologie

RESERVE A L'ADULTE.

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante :

- 1ère semaine: 1 comprimé par jour, au cours du dîner ;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner ;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

La posologie peut-être ramenée à 2 comprimés par jour, voire 1 comprimé par jour, en fonction des résultats biologiques.

Dans tous les cas, se conformer strictement à l'ordonnance de votre médecin.

Symptômes et instructions en cas de surdosage

Si vous avez pris plus de MEDIATOR 150 mg, comprimé enrobé que vous n'auriez dû :

Les signes de surdosage peuvent être des troubles digestifs (nausées, vomissements, diarrhée), une sensation vertigineuse voire une somnolence. En cas d'apparition de ces troubles, consultez votre médecin ou votre pharmacien.

Instructions en cas d'omission d'une ou de plusieurs doses

Si vous oubliez de prendre MEDIATOR 150 mg, comprimé enrobé :

Ne prenez pas de dose double pour compenser la dose simple que vous avez oublié de prendre.

Risque de syndrome de sevrage

Sans objet.

4. QUELS SONT LES EFFETS INDÉSIRABLES ÉVENTUELS ?

Description des effets indésirables

Comme tous les médicaments, MEDIATOR 150 mg, comprimé enrobé est susceptible d'avoir des effets indésirables.

- troubles digestifs : nausées, vomissements, maux d'estomac ;
- sensation de fatigue, voire somnolence ;
- sensations vertigineuses.

Ces effets ont été observés à des posologies supérieures à 3 comprimés par jour et varient en fonction de la susceptibilité individuelle des patients.

- très rares cas de manifestations allergiques : éruptions cutanées soudaines, urticaire, malaise brutal avec hypotension (diminution de la pression artérielle) œdème de Quicke (brusque gonflement du visage et du cou). Dans ce cas, le traitement devra immédiatement être interrompu.
- élévation des enzymes hépatiques (anomalies biologiques au niveau du foie). Très rares cas d'hépatite.
- Très rares cas de confusion, troubles des fonctions cognitives : désorientation tempo-spatiale, troubles du comportement : agitation, délire, troubles de la perception hallucinations.

Si vous remarquez des effets indésirables non mentionnés dans cette notice, veuillez en informer votre médecin ou votre pharmacien.

Annexe 4-4

5. COMMENT CONSERVER MEDIATOR 150 mg, comprimé enrobé ?

Conditions de conservation et date de péremption

Pas de précautions particulières de conservation.

Tenir hors de la portée et de la vue des enfants.

Ne pas utiliser après la date de péremption figurant sur la boîte.

Si nécessaire, mises en garde contre certains signes visibles de détérioration

Sans objet.

La dernière date à laquelle cette notice a été approuvée est le {date}

Saint-Denis, le 21 Mai 2007

Note à l'attention de M. BERTOYE
DIE/Inspection des Essais Cliniques

Objet : Médiator/Demande d'Inspection Etude Moulin

En date du 5 Avril dernier, les conclusions de la réévaluation du Bénéfice/Risque de la spécialité Médiator effectuées par le Groupe de Travail DEUG ont été présentées et validées par la Commission d'Autorisation de Mise sur le Marché, à savoir un avis défavorable au maintien de l'indication « adjuvant au régime adapté dans les hypertriglycéridémies », et un avis favorable au maintien de l'indication : « Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».

La Commission a par ailleurs souhaité devant les questions méthodologiques soulevées par les résultats de l'étude Moulin qu'une inspection de cette étude soit effectuée (voir relevé d'avis). **L'étude Moulin** (publiée dans Diabetes Care en 2006) est une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par SU et intolérants ou ayant une contre indication à la metformine. Le critère principal était l'HbA1c; les critères secondaires: insulinémie, glycémie à jeun, paramètres lipidiques, index d'insulino-résistance HOMA. Trois sous-groupes ont été analysés: HbA1c > 8%, âge > 65 ans et clairance de la créatininémie < 80ml/mn. Il s'agit d'une étude de supériorité avec une différence attendue de 0.6% entre les groupes sur l'HbA1c. Les résultats de cette étude (utilisation en seconde intention, en association à un sulfamide hypoglycémiant) semblent montrer une efficacité du benfluorex sur les paramètres glucidiques, en particulier l'HbA1c et ceci indépendamment de la perte de poids. Néanmoins, aucune conclusion définitive n'a été portée sur l'efficacité du benfluorex compte-tenu des réserves méthodologiques soulevées par les experts mandatés. A noter, cette étude est la seule étude à ce jour ayant montré une efficacité sur les paramètres glucidiques en seconde intention, en association à un autre antidiabétique oral.

Je vous remercie de me faire savoir dans quels délais l'inspection de cette étude pourra être menée par votre Département. A noter, en l'attente des résultats de cette inspection, ainsi que des résultats d'études complémentaires sur le métabolisme glucidique actuellement en cours, la Commission d'AMM a décidé, sur proposition du Groupe DEUG, qu'aucune modification du libellé de l'indication restante ne serait effectuée.

Vous souhaitant bonne réception de ces éléments, nous restons à votre entière disposition pour de plus amples renseignements sur ce dossier si besoin est.

Cordialement,

Copies

Objet:	Retour d'info inspections Médiator

Catherine,

Quelques mots pour te tenir informée de l'avancement du dossier Médiator. Informations préliminaires, la procédure contradictoire avec les différents sites inspectés est nécessaire pour que l'on puisse considérer ces observations comme définitives et en tirer des conclusions. Donc infos internes pour le moment.

4 inspections ont été menées :

- le promoteur, Servier. Quelques observations de forme, mais globalement on peut dire qu'ils ont correctement suivi leur essai, au moins en terme de fréquence de monitoring, et ce dans tous les pays impliqués (y compris Malaisie et Afrique du Sud).

- le labo centralisé en charge des dosages d'HbA1c, MDS Pharma Services à Hambourg. Quelques points à vérifier à partir de documents reçus après l'inspection, mais a priori pas de problème.

- centre n°201 (Dr Alawi, investigateur coordonnateur DE, 16 patients sélectionnés, 13 randomisés) : ça commence à se dégrader un peu. Nous avons revu les données de 12 patients. Pas mal de petites incohérences entre le rapport de l'essai et les dossiers médicaux, chacune sans impact sur les résultats (erreurs de dates, de début ou de fin de traitements ou d'événements indésirables, de comptabilité de médicaments...) mais montrant une qualité de monitoring un peu légère malgré sa fréquence. Une déviation au protocole non rapportée par l'investigateur et non vue par le moniteur est à noter : l'augmentation de dose du traitement d'un patient par glimépiride en cours d'essai., ce qui peut avoir un impact sur le critère d'évaluation principal.

- centre n°207 (Dr Müller, également en Allemagne, 40 patients sélectionnés, 27 inclus). Là, ça se gâte carrément. Nous avons revu les dossiers de 10 patients et les ECGs de tous les patients. Très peu d'information dans les dossiers médicaux. En particulier la dose du traitement de fond par sulfonylurée n'était que rarement enregistrée avant l'essai, ce qui ne permet pas de vérifier qu'elle était stable (c'était noté pour la période de l'essai lui-même). "Trous" dans les prescriptions de sulfonylurée, il nous a dit qu'il donnait des échantillons gratuits à ses patients (il en avait effectivement 2 pleins tiroirs). Généralement pas d'info dans les dossiers médicaux concernant l'intolérance à la metformine (critère d'inclusion). Et surtout, nous avons un gros problème sur les ECGs : pour un patient, l'ECG semaine 0 et l'ECG semaine 18 sont identiques, c'est juste une réimpression en mettant une date différente dessus. Et pour 2 patients, les ECGs de l'essai sont très différents de ceux

que nous avons dans le dossier médical du patient et ne proviennent manifestement pas de même bonhomme. S'il n'y avait qu'un ECG dans le dossier ou un ECG dans l'essai, on pourrait se dire que c'est une bête erreur, mais c'est un peu plus compliqué. Nous avons un patient pour lequel les 3 ECGs de l'essai proviennent bien d'une même personne et sont anormaux, avec des signes d'ischémie sur toutes les dérivations standard et en V5-V6 plus un rabotage de r en V1-V2-V3. Aucun de ces signes sur un ECG d'avant l'essai et 2 ECGs d'après l'essai trouvés dans le dossier médical (et les 3 ECGs du dossier ont un tracé tout à fait similaire). Pour un autre, le dossier médical mentionne une anomalie d'Ebstein, avec une insuffisance aortique et mitrale et une hypertrophie ventriculaire, mais il n'y en a aucun signe sur les 3 ECGs de l'essai, qui sont différents de ceux du dossier médical. L'investigateur nous dit que les ECGs ont été faits par son infirmière et que lui a fait tout le reste, mais que peut on croire dans ce cas... Mes collègues allemands doivent voir avec leur service juridique s'ils pourraient contacter les patients pour vérifier qu'ils ont bien participé à l'essai, comme nous le faisons dans ce genre de cas chez des investigateurs français.

Je te tiendrai au courant de l'avancement du dossier et des résultats de la procédure contradictoire.

Olivier

Saint-Denis, le 23 DEC. 2010

Note

à l'attention de la mission de l'Inspection Générale des Affaires Sociales sur le retrait du benfluorex

Objet : Eléments relatifs à l'octroi, suspension, retrait de l'AMM des spécialités génériques de MEDIATOR, ainsi qu'à l'instruction de la demande d'AMM.
Réf. : Demande des membres de la mission IGAS du 22 décembre 2010 dans le cadre de l'enquête relative au retrait du benfluorex

Lors de l'entretien mené avec Madame Rey-Quinio le 22 décembre 2010, dans le cadre de l'enquête de l'IGAS relative au retrait des spécialités à base de benfluorex, Monsieur Marie, Inspecteur de la Mission, a posé deux questions relatives aux spécialités génériques de MEDIATOR.

1. **Génériques de Médiator : type de procédure (positionnement réglementaire) ; type de données soumises (relevés d'avis), date de décision.**

Deux demandes d'Autorisation de Mise sur le Marché (AMM) ont été déposées à l'AFSSaPS le 8 décembre 2005 par les Laboratoires MERCK GENERIQUES (aujourd'hui nommés MYLAN) et QUALIMED. L'AMM des spécialités BENFLUOREX MERCK GENERIQUES et QUALIMED a été demandée dans le cadre de la procédure nationale, par référence à l'article 10 (1) de la Directive 2001/83/CE modifiée, qui définit les conditions d'autorisation d'un médicament générique, et en référence à la spécialité de référence MEDIATOR 150 mg, comprimé enrobé.

Le dossier versé à l'appui des demandes d'AMM comprenait, conformément aux dispositions de l'article R. 5121-28 du Code de la santé publique (CSP), outre les données chimiques et pharmaceutiques, une étude de biodisponibilité comparée démontrant la bioéquivalence avec la spécialité de référence (cf annexes I et II : relevés d'avis du groupe de travail sur les médicaments génériques (GTMG) n°126 du 5 octobre 2006).

En outre, la spécialité BENFLUOREX MYLAN 150 mg, comprimé enrobé (anciennement appelée BENFLUOREX MERCK 150 mg, comprimé enrobé) a été autorisée par décision du 10/03/2008, et la spécialité BENFLUOREX QUALIMED 150 mg, comprimé enrobé, par décision du 26/03/2008.

Par la suite, l'AMM des deux spécialités a été suspendue par décision du 24/11/2009, puis retirée le 20/07/2010.

2. **N'était il pas possible de suspendre l'évaluation de ces dossiers de génériques compte tenu de la révision du bénéfice risque en cours pour Médiator ? Ou était-on obligé d'octroyer les AMM pour ces deux génériques ? Sur quelle base réglementaire s'appuie-t-on ?**

Entre décembre 2005 et octobre 2006 (date du groupe de travail), ni même en mars 2008 (date d'octroi des AMM), aucun élément ne permettait de suspendre l'évaluation des demandes d'AMM pour des spécialités génériques de MEDIATOR. En effet, les motifs de refus d'AMM sont clairement définis par l'article L. 5121-9 du CSP qui dispose notamment que :

> *"L'autorisation prévue à l'article L. 5121-8 est refusée lorsqu'il apparaît que l'évaluation des effets thérapeutiques positifs du médicament ou produit au regard des risques pour la santé du patient ou la santé publique liés à sa qualité, à sa sécurité ou à son efficacité n'est pas considérée comme favorable, ou qu'il n'a pas la composition qualitative et quantitative déclarée, ou que l'effet thérapeutique annoncé fait défaut ou est insuffisamment démontré par le demandeur.*
>
> *Elle est également refusée lorsque la documentation et les renseignements fournis ne sont pas conformes au dossier qui doit être présenté à l'appui de la demande.*
>
> *Toutefois, dans des circonstances exceptionnelles et sous réserve du respect d'obligations spécifiques définies par voie réglementaire, concernant notamment la sécurité du médicament, la notification à l'Agence française de sécurité sanitaire des produits de santé de tout incident lié à son utilisation et les mesures à prendre dans ce cas, l'autorisation de mise sur le marché peut être délivrée à un demandeur qui démontre qu'il n'est pas en mesure de fournir des renseignements complets sur l'efficacité et la sécurité du médicament dans des conditions normales d'emploi. Le maintien de cette autorisation est décidé par l'agence sur la base d'une réévaluation annuelle de ces obligations et de leur respect par le titulaire.*
>
> *L'autorisation prévue à l'article L. 5121-8 est suspendue ou retirée dans des conditions déterminées par voie réglementaire et en particulier lorsqu'il apparaît que l'évaluation des effets thérapeutiques positifs du médicament ou produit au regard des risques tels que définis au premier alinéa n'est pas considérée comme favorable dans les conditions normales d'emploi, que l'effet thérapeutique annoncé fait défaut ou que la spécialité n'a pas la composition qualitative et quantitative déclarée."*

Or, au moment du dépôt du dossier (en décembre 2005) et à la date d'octroi des AMM génériques de MEDIATOR (en mars 2008), les résultats des études pour la réévaluation du rapport bénéfice/risque de la spécialité de référence étaient encore attendus.
En conséquence, l'AFSSPS ne disposait d'aucune base réglementaire pour suspendre l'évaluation et/ou refuser de délivrer les AMM génériques.
Néanmoins, tout élément nouveau issu du réexamen du MEDIATOR entraînait *de facto* un réexamen des spécialités génériques.

De plus, le groupe de travail (GTMG n°126) a prononcé un avis favorable à l'AMM en octobre 2006, confirmé par la Commission d'AMM n°410 du 09/11/2006.
Toutefois, les AMM n'ont été délivrées qu'en mars 2008, car leur octroi était conditionné à l'engagement des firmes sur un plan pour la minimisation du risque et le temps nécessaire à sa mise en place.
Il convient de noter que d'une manière générale, un délai est fréquemment observé entre le dépôt de la demande d'AMM, son octroi et la commercialisation du médicament. En effet, lorsque le dossier est jugé insuffisant, conformément à l'article R. 5121-34 du CSP, le Directeur général de l'AFSSaPS peut exiger du demandeur qu'il complète son dossier. En l'espèce, plus de deux ans séparent la demande et la décision d'AMM. Ce délai s'explique par le temps nécessaire, à l'obtention d'un plan de minimisation du risque et au recueil des informations complémentaires requises pour compléter le dossier de demande d'AMM initial.

Compte tenu de l'ensemble de ce qui précède, aucun élément ne permettait de fonder le refus des AMM demandées pour les spécialités génériques de la spécialité de référence Médiator. Et, dans ces conditions, refuser l'AMM aux spécialités génériques, alors que l'AMM de la spécialité de référence était toujours en vigueur, aurait entraîné un risque de rupture d'égalité entre les opérateurs concernés.

Mes services se tiennent à votre disposition pour tout complément d'information.

Le Directeur Général

N.B. Sont joints à cette note des courriers antérieurs échangés entre l'Afssaps et la Commission et relatifs aux génériques.

Jean MARIMBERT

ANNEXE I

REUNION GTMG N° 126 DU 05 OCTOBRE 2006

- **BENFLUOREX QUALIMED 150 mg**, comprimé enrobé

dossier n° NL 32453

Date de dépôt de la réponse : 03/07/2006

Procédure nationale

Principe actif : **CHLORHYDRATE DE BENFLUOREX**

Caractère d'originalité : 2.1.2 Essentiellement similaire de + 10 ans
MEDIATOR 150 mg, comprimé enrobé – VNL 10008
(AMM : 16/07/1974) - Lab. SERVIER

Classe ATC : **C : SYSTEME CARDIOVASCULAIRE**

Réf. LIBRA : Pharmaco : Inhibiteurs de la synthèse du cholestérol et des triglycérides (196)
Hypolipidémiants (13)
Autres hypocholestérolemiants (195)

AVIS DU GROUPE DE TRAVAIL SUR LES MEDICAMENTS GENERIQUES N° 117 DU 02 FEVRIER 2006 : SURSIS A STATUER dans l'attente de l'avis de la toxicologie sur le risque génotoxique potentiel de l'impureté E.

Au plan biopharmaceutique

Un essai de bioéquivalence réalisé avec le comprimé 150 mg est fourni à l'appui de la présente demande.

Bref descriptif de l'étude fournie :

- L'essai fourni a été réalisé en Mars-Avril 2005 par la société PAREXEL-FARMOVS en Afrique du Sud.
- Le schéma expérimental suivi est classique ; *cross-over* 2 bras randomisé.
- Dose unique de 150 mg administrée 5 min après un petit-déjeuner standard (soit un comprimé dosé à 150 mg).
- Monitoring des concentrations plasmatiques pendant 96 heures et une période de wash-out de 19 jours entre les deux séquences de traitement.
- 46 observations analysables sont prévues par le protocole. 48 volontaires sains ont été inclus, ont fini l'étude et ont été analysés.

Les produits comparés :

Produit test :
Comprimés Benfluorex 150 mg fabriqués par ROTTENDORF à Valenciennes, FRANCE. Ces comprimés sont issus du lot n° 4004 dont la taille théorique est de 200 000 unités.

Produit de référence :
MEDIATOR 150 mg comprimés commercialisés en France par SERVIER et issus du lot 3M5203.

Analytique :

Le dosage plasmatique des deux métabolites Norfenfluramine (NFF) et de la THEP a été réalisé par FARMOVS en Afrique du Sud au moyen d'une technique LC-MS-MS, dont la LOQ s'établit à 0.2 et 0.4 ng/ml pour respectivement chacun de ces deux analytes. Cette technique est clairement décrite et validée.
Le dosage plasmatique du Benfluorex a été tenté au moyen de la même technique LC-MS-MS avec une LOQ de 0.4 ng/ml. Cette technique n'a pas permis l'exploration du Benfluorex en raison des faibles concentrations circulantes.

Commentaires :
Le demandeur doit discuter si une amélioration des performances de la techniques analytique n'était pas possible, permettant ainsi l'exploration de la molécule mère.

Les résultats :

Les résultats obtenus pour les deux métabolites Norfenfluramine et THEP sont récapitulés dans le tableau ci-dessous.

Norfenfluramine:

	Test	Référence		ICS 90 %
AUC 0-t (ng.h/ml)	416 ± 114	403 ± 108	NS	[94 ; 101] %
AUC 0-∞ (ng.h/ml)	443 ± 144	433 ± 147	NS	[95 ; 101] %
Cmax (ng/ml)	16.0 ± 3.52	15 ± 2.29	P < 0.05	[91 ; 99] %
Tmax (h)	5.5	6	NS	----------

THEP:

	Test	Référence		ICS 90 %
AUC 0-t (ng.h/ml)	80.4 ± 39	80.6 ± 40.8	NS	[92 ; 110] %
AUC 0-∞ (ng.h/ml)	86.5 ± 38.6	86.3 ± 40.3	NS	[93 ; 107] %
Cmax (ng/ml)	16.3 ± 8.25	15.6 ± 8.17	NS	[86 ; 109] %
Tmax (h)	5.5	5.5	NS	----------

Conclusion :

Basés sur les données des deux métabolites, les résultats obtenus montrent la bioéquivalence entre les deux comprimés comparés.

Au plan biopharmaceutique

QUESTIONS

Il devra être discuté si une amélioration des performances de la techniques analytique n'était pas possible, permettant ainsi l'exploration de la molécule mère inchangée.

Au plan pharmaceutique

QUESTIONS

Module 3.2 S.3

- La démonstration de la structure pourrait être complétée par un spectre RMN 13C.

Module 3.2 P.1 et 3.2 P.5

- La viscosité de la carmellose sodique devra être précisée.

Module 3.2 P.1 et 3.2 P.3

- Il devra être précisé quelle quantité de suspension d'éthylcellulose est utilisée puisqu'en 3.2.P3 et 3.2.P1 seule la quantité d'éthylcellulose est mentionnée.
- Le laurilsulfate de sodium et l'alcool cétylique contenus dans la suspension aqueuse devront figurer dans la formule.

Module 3.2 P.3

- La taille du lot industriel devra être précisée.

Module 3.2 P.5

- Les spécifications en impuretés à libération sont supérieures à celles retenues pour la matière première. Celles-ci devront être resserrées.
- Dans la formule de calcul de l'essai de dissolution, il manque un facteur 100 au dénominateur. Ceci devra être corrigé.

Module 3.2 P.8

- L'augmentation de la limite en impuretés totales n'est pas acceptable. La limite en impureté E devra être revue conformément aux résultats expérimentaux obtenus.

La durée de conservation qui pourrait être accordée est de 12 mois à une température ne dépassant pas 25°C.

Note au groupe toxicologique

- Un module 4 a été déposé par la firme et transmis au groupe toxicologique pour évaluation. Il comprend 2 études mise en oeuvre pour qualifier **l'impureté E**. Ces 2 études documentent le **risque potentiel génotoxique** de cette impureté.

Note interne

- Le stéarate de magnésium est d'origine végétale, l'attestation de UNION DERIVAN est fournie.
- Le polysorbate 80 est d'origine végétale, l'attestation de SEPPIC est fournie.
- Les monooléates de glycérol sont d'origine végétale, l'attestation de GATTEFOSSE est fournie.

AVIS DU GROUPE DE TRAVAIL SUR LES MEDICAMENTS GENERIQUES N° 121 DU 18 MAI 2006 : MESURE D'INSTRUCTION

Avis du groupe toxicologique

Le groupe préclinique GTPC 126 du 15/03/2006 (com 401 du 11/05/2006) a émis un avis favorable. En effet :
- les données toxicologiques fournies par la firme relatives à l'impureté E sont satisfaisantes.

Note interne

- Le stéarate de magnésium est d'origine végétale, l'attestation de UNION DERIVAN est fournie.
- Le polysorbate 80 est d'origine végétale, l'attestation de SEPPIC est fournie.
- Les monooléates de glycérol sont d'origine végétale, l'attestation de GATTEFOSSE est fournie.

AVIS DU GROUPE DE TRAVAIL SUR LES MEDICAMENTS GENERIQUES N° 126 DU 05 OCTOBRE 2006 : AVIS FAVORABLE avec une durée de conservation de 12 mois à une température ne dépassant pas + 25°C

Cette spécialité est générique de MEDIATOR 150 mg, comprimé enrobé.

Au plan biopharmaceutique

Il n'était pas possible de diminuer la LOQ du benfluorex qui avait déjà été optimisée.

Au plan pharmaceutique

CLARIFICATIONS

Module 3.2.P.5

- Les nouvelles spécifications en impuretés dans le produit fini tant à libération qu'en stabilité doivent être confortées au vu des résultats sur les lots de taille industrielle.

Avis du groupe toxicologique

Le groupe préclinique GTPC 126 du 15/03/2006 (com 401 du 11/05/2006) a émis un avis favorable. En effet :
- les données toxicologiques fournies par la firme relatives à l'impureté E sont satisfaisantes.

Note Interne

- Le stéarate de magnésium est d'origine végétale, l'attestation de UNION DERIVAN est fournie.
- Le polysorbate 80 est d'origine végétale, l'attestation de SEPPIC est fournie.

AUC 0-t (ng.h/ml)	80.4 ± 39	80.6 ± 40.6	NS	[92 ; 110] %
AUC 0-∞ (ng.h/ml)	86.5 ± 38.6	86.3 ± 40.3	NS	[93 ; 107] %
Cmax (ng/ml)	16.3 ± 8.25	15.6 ± 8.17	NS	[86 ; 109] %
Tmax (h)	5.5	5.5	NS	----------

Conclusion :

Basés sur les données des deux métabolites, les résultats obtenus montrent la bioéquivalence entre les deux comprimés comparés.

Au plan biopharmaceutique

QUESTIONS

Il devra être discuté si une amélioration des performances de la techniques analytique n'était pas possible, permettant ainsi l'exploration de la molécule mère inchangée.

Au plan pharmaceutique

QUESTIONS

Module 3.2 S.3

- La démonstration de la structure pourrait être complétée par un spectre RMN 13C.

Module 3.2 P.1 et 3.2 P.5

- La viscosité de la carmellose sodique devra être précisée.

Module 3.2 P.1 et 3.2 P.3

- Il devra être précisé quelle quantité de suspension d'éthylcellulose est utilisée puisqu'en 3.2.P3 et 3.2.P1 seule la quantité d'éthylcellulose est mentionnée.
- Le laurilsulfate de sodium et l'alcool cétylique contenus dans la suspension aqueuse devront figurer dans la formule.

Module 3.2 P.3

- La taille du lot industriel devra être précisée.

Module 3.2 P.5

- Les spécifications en impuretés à libération sont supérieures à celles retenues pour la matière première. Celles-ci devront être resserrées.
- Dans la formule de calcul de l'essai de dissolution, il manque un facteur 100 au dénominateur. Ceci devra être corrigé.

Module 3.2 P.8

- L'augmentation de la limite en impuretés totales n'est pas acceptable. La limite en impureté E devra être revue conformément aux résultats expérimentaux obtenus.

La durée de conservation qui pourrait être accordée est de 12 mois à une température ne dépassant pas 25°C.

Note au groupe toxicologique

- Un module 4 a été déposé par la firme et transmis au groupe toxicologique pour évaluation. Il comprend 2 études mise en oeuvre pour qualifier l'impureté E. Ces 2 études documentent le risque potentiel génotoxique de cette impureté.

Note interne

- Le stéarate de magnésium est d'origine végétale, l'attestation de UNION DERIVAN est fournie.
- Le polysorbate 80 est d'origine végétale, l'attestation de SEPPIC est fournie.
- Les monooléates de glycérol sont d'origine végétale, l'attestation de GATTEFOSSE est fournie.

Avis du groupe toxicologique

Le groupe préclinique GTPC 126 du 15/03/2006 (com 401 du 11/05/2006) a émis un avis favorable. En effet :
- les données toxicologiques fournies par la firme relatives à l'impureté E sont satisfaisantes.

Note interne

- Le stéarate de magnésium est d'origine végétale, l'attestation de UNION DERIVAN est fournie.
- Le polysorbate 80 est d'origine végétale, l'attestation de SEPPIC est fournie.

Liberté • Égalité • Fraternité
RÉPUBLIQUE FRANÇAISE
Ministère de la santé et des solidarités

Le Ministre

Paris, le 12 MAR. 2007

Cab/MJ/DBS

Monsieur le Directeur général,

Le collège de la Haute Autorité de Santé a rendu un avis global suite à la réévaluation du service médical rendu des médicaments appartenant à la classe des vasodilatateurs.

J'ai pris la décision de maintenir la prise en charge de certains de ces médicaments aux conditions antérieures lorsqu'il n'existe pas d'alternatives thérapeutiques. J'ai aussi souhaité que des négociations de baisse de prix aient lieu entre le Comité Economique des Produits de Santé et les laboratoires concernés. Je suis convaincu qu'elles aboutiront prochainement et que l'Assurance Maladie y trouvera des satisfactions tout comme les patients prenant ces traitements.

Nous sommes associés dans la procédure d'inscription au remboursement d'un médicament, notamment au travers de la décision que vous prenez concernant le taux de participation de l'assuré. Vous avez récemment été sollicités par mes services pour attribuer un taux de remboursement à un médicament essentiellement similaire au Tanakan® dont le taux de remboursement a été maintenu à 35% en octobre dernier. Il s'agit du Vitalogink®.

Il me semble évident que tous les génériques ou médicaments essentiellement similaires à des médicaments qui n'ont pas été déremboursés ont vocation à être inscrits. En effet, cette inscription est dans tous les cas source d'économie et un refus pourrait être contesté pour rupture d'égalité.

Je vous confirme donc mon intention d'inscrire ce médicament.

Je souhaiterais qu'à l'avenir nous puissions réagir ensemble le plus rapidement possible et que ces demandes soient instruites selon la procédure normale.

Je vous prie de croire, Monsieur le Directeur général, à l'assurance de ma considération distinguée.

Xavier BERTRAND

UNION NATIONALE DES CAISSES D'ASSURANCE MALADIE

Décision fixant le taux de participation de l'assuré applicable à une spécialité pharmaceutique remboursable aux assurés sociaux

Le directeur général de l'UNCAM,

Vu le code de la sécurité sociale, notamment les articles L 322-2, R 163-10-1 et R 322-1 ;

DECIDE :

Article 1er : La participation de l'assuré pour les spécialités pharmaceutiques visées en annexe de la présente décision est fixée à 35 %.

Article 2 : La présente décision sera transmise au ministre chargé de la sécurité sociale et de la santé qui en assurera la publication au Journal officiel de la République française.

Fait à Paris, le 19 décembre 2008

Le directeur général de l'Union
Nationale des caisses d'assurance maladie

Frédéric van ROEKEGHEM

ANNEXE

Code CIP	Libellé	Taux de participation
3790267	BENFLUOREX MERCK 150 mg, comprimés enrobés, B/30 (laboratoires MYLAN SAS)	35%
3828277	BENFLUOREX QUALIMED 150 mg, comprimés enrobés, B/30 (laboratoires QUALIMED)	35%

Annexe 4-9

Rédactions successives de l'article R.163-3 du code de la sécurité sociale

Article R163-3 Version en vigueur du 21 décembre 1985 au 22 novembre 1990
Créé par Décret 85-1353 1985-12-17 art. 1 JORF 21 décembre 1985

Ne peuvent être inscrits sur la liste prévue à l'article R. 163-2, après avis de la commission prévue à l'article R. 163-9, que les médicaments qui sont présumés apporter une amélioration du service médical rendu ou une économie dans le coût de la santé.

A efficacité ou économie comparable préférence est donnée aux médicaments qui résultent d'un effort de recherche du fabricant.

Article R163-3 Version en vigueur du 22 novembre 1990 au 4 juillet 1999
Modifié par Décret n°90-1034 du 21 novembre 1990 - art. 2 JORF 22 novembre 1990

Ne peuvent être inscrits sur la liste prévue à l'article R. 163-2, après avis de la commission prévue à l'article R. 163-9, que les médicaments pour lesquels il est démontré qu'ils apportent :

- soit une amélioration du service médical rendu en termes d'efficacité thérapeutique ou, le cas échéant, d'effet secondaire ;

- soit une économie dans le coût du traitement médicamenteux.

A efficacité ou économie comparable préférence est donnée aux médicaments qui résultent d'un effort de recherche du fabricant.

Article R163-3 Version en vigueur du 4 juillet 1999 au 30 octobre 1999
Modifié par Décret n°99-554 du 2 juillet 1999 - art. 2 JORF 4 juillet 1999

Ne peuvent être inscrits sur la liste prévue à l'article R. 163-2, après avis de la commission prévue à l'article R. 163-9, que les médicaments pour lesquels il est démontré qu'ils apportent :

- soit une amélioration du service médical rendu en termes d'efficacité thérapeutique ou, le cas échéant, d'effet secondaire ;

- soit une économie dans le coût du traitement médicamenteux.

A efficacité ou économie comparable préférence est donnée aux médicaments qui résultent d'un effort de recherche du fabricant.

Article R163-3 Version en vigueur du 30 octobre 1999 au 1 janvier 2005
Modifié par Décret n°99-915 du 27 octobre 1999 - art. 1 JORF 30 octobre 1999

I. - Les médicaments sont inscrits sur la liste prévue à l'article L. 162-17 au vu de l'appréciation du service médical rendu qu'ils apportent indication par indication. Cette appréciation prend en compte l'efficacité et les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle il est destiné, le caractère préventif, curatif ou symptomatique

du traitement médicamenteux et son intérêt pour la santé publique. Les médicaments dont le service médical rendu est insuffisant au regard des autres médicaments ou thérapies disponibles ne sont pas inscrits sur la liste.

II. - Les spécialités génériques définies au premier alinéa de l'article L. 601-6 du code de la santé publique appartenant aux mêmes groupes génériques que des spécialités de référence inscrites sur la liste prévue à l'article L. 162-17 sont présumées remplir la condition mentionnée au I du présent article.

Article R163-3 Version en vigueur au 1 janvier 2005
Modifié par Décret n°2004-1398 du 23 décembre 2004 - art. 1 JORF 26 décembre 2004 en vigueur le 1er janvier 2005
Modifié par Décret n°2004-1398 du 23 décembre 2004 - art. 2 JORF 26 décembre 2004 en vigueur le 1er janvier 2005

I. - Les médicaments sont inscrits sur la liste prévue au premier alinéa de l'article L. 162-17 au vu de l'appréciation du service médical rendu qu'ils apportent indication par indication. Cette appréciation prend en compte l'efficacité et les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle il est destiné, le caractère préventif, curatif ou symptomatique du traitement médicamenteux et son intérêt pour la santé publique. Les médicaments dont le service médical rendu est insuffisant au regard des autres médicaments ou thérapies disponibles ne sont pas inscrits sur la liste.

II. - Les spécialités génériques définies au 5° de l'article L. 5121-1 du code de la santé publique appartenant aux mêmes groupes génériques que des spécialités de référence inscrites sur la liste prévue au premier alinéa de l'article L. 162-17 sont présumées remplir la condition mentionnée au I du présent article.

III. - Les spécialités bénéficiant d'une autorisation d'importation parallèle sont considérées comme remplissant la même condition de service médical rendu que la spécialité correspondante disposant d'une autorisation de mise sur le marché en France.

Mme Le Vaillant (Dominique), attachée principale d'administration centrale, adjointe au chef du bureau de l'administration des personnels et des relations sociales à la direction des services administratifs et financiers du Premier ministre ;

Mme Madelaigue (Florence), attachée principale d'administration centrale, adjointe au chef du bureau de la gestion des ressources humaines et de la formation à la direction des services administratifs et financiers du Premier ministre.

Représentants des services au sein desquels les agents non titulaires exercent leurs fonctions :

M. Louis (Jean-Robert), administrateur civil, chef du bureau de l'informatique et des télécommunications à la direction des services administratifs et financiers du Premier ministre ;

M. Brunaux (Didier), attaché principal d'administration centrale, chef du bureau du personnel et des affaires générales à la direction de la Documentation française.

Art. 3. – Le directeur des services administratifs et financiers du Premier ministre est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 26 octobre 1999.

Le Premier ministre,
Pour le Premier ministre et par délégation :
Le directeur des services administratifs et financiers,
P. PIERRARD

Le ministre de la fonction publique, de la réforme de l'Etat et de la décentralisation,
Pour le ministre et par délégation :
Par empêchement du directeur général de l'administration et de la fonction publique :
Le sous-directeur,
D. LACAMBRE

MINISTÈRE DE L'EMPLOI ET DE LA SOLIDARITÉ

Décret n° 99-915 du 27 octobre 1999 relatif aux médicaments remboursables et modifiant le code de la sécurité sociale (deuxième partie : Décrets en Conseil d'Etat)

NOR : *MESS9923357D*

Le Premier ministre,

Sur le rapport de la ministre de l'emploi et de la solidarité,

Vu le code de la sécurité sociale ;

Vu le code de la santé publique ;

Vu la loi n° 92-1477 du 31 décembre 1992 relative aux produits soumis à certaines restrictions de circulation et à la complémentarité entre les services de police, de gendarmerie et de douane, et notamment son article 17 ;

Vu l'avis du conseil d'administration de la Caisse nationale de l'assurance maladie des travailleurs salariés en date du 7 septembre 1999 ;

Le Conseil d'Etat (section sociale) entendu,

Décrète :

Art. 1er. – La section 1 du chapitre 3 du titre VI du livre Ier du code de la sécurité sociale est modifiée comme suit :

I. – Les articles R. 163-6 à R. 163-12 deviennent les articles R. 163-8 à R. 163-14.

II. – L'article R. 163-2 est ainsi modifié :

A. – Au premier alinéa :

1° Après les mots : « l'article L. 601 du code de la santé publique » sont ajoutés les mots : « , ainsi que ceux visés au premier alinéa de l'article 17 de la loi n° 92-1477 du 31 décembre 1992, » ;

2° La phrase : « L'arrêté mentionne les indications thérapeutiques retenues lors de l'inscription par la commission mentionnée à l'article R. 163-9 » est remplacée par la phrase suivante : « L'arrêté mentionne les seules indications thérapeutiques ouvrant droit à la prise en charge ou au remboursement des médicaments. »

B. – Au troisième alinéa :

1° Les mots : « l'article R. 163-9 » sont remplacés par les mots : « l'article R. 163-15 » ;

2° Le mot : « conditions » est remplacé par le mot : « modalités » ;

3° Après les mots : « durée de traitement », sont ajoutés les mots : « dans les indications ouvrant droit à la prise en charge ou au remboursement ».

C. – Le dernier alinéa est ainsi rédigé :

« Sous réserve des dispositions prévues au III de l'article R. 163-6, l'inscription sur la liste prévue à l'article L. 162-17 est prononcée pour une durée de cinq ans. »

III. – Les articles R. 163-3 à R. 163-5 sont ainsi rédigés :

« *Art. R. 163-3.* – I. – Les médicaments sont inscrits sur la liste prévue à l'article L. 162-17 au vu de l'appréciation du service médical rendu qu'ils apportent indication par indication. Cette appréciation prend en compte l'efficacité et les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle il est destiné, le caractère préventif, curatif ou symptomatique du traitement médicamenteux et son intérêt pour la santé publique. Les médicaments dont le service médical rendu est insuffisant au regard des autres médicaments ou thérapies disponibles ne sont pas inscrits sur la liste.

« II. – Les spécialités génériques définies au premier alinéa de l'article L. 601-6 du code de la santé publique appartenant aux mêmes groupes génériques que des spécialités de référence inscrites sur la liste prévue à l'article L. 162-17 sont présumées remplir la condition mentionnée au I du présent article.

« *Art. R. 163-4.* – L'inscription et le renouvellement de l'inscription des médicaments sur la liste prévue à l'article L. 162-17, ainsi que la modification des conditions d'inscription, sont prononcés après avis de la commission mentionnée à l'article R. 163-15, à l'exception des spécialités génériques définies au premier alinéa de l'article L. 601-6 du code de la santé publique, lorsque les spécialités de référence appartenant aux mêmes groupes génériques figurent sur ladite liste.

« *Art. R. 163-5.* – I. – Ne peuvent être inscrits sur la liste prévue à l'article L. 162-17 :

« 1° Les médicaments dont les éléments de conditionnement, l'étiquetage ou la notice, définis à l'article R. 5000 du code de la santé publique, ou la publicité auprès des professionnels de santé font mention d'une utilisation non thérapeutique ;

« 2° Les médicaments qui n'apportent ni amélioration du service médical rendu appréciée par la commission mentionnée à l'article R. 163-15 ni économie dans le coût du traitement médicamenteux ;

« 3° Les médicaments susceptibles d'entraîner des hausses de consommation ou des dépenses injustifiées ;

« 4° Les médicaments dont le prix proposé par l'entreprise ne serait pas justifié eu égard aux critères prévus au premier alinéa de l'article L. 162-16-1 ;

« 5° Les médicaments dont les forme, dosage ou présentation ne sont pas justifiés par l'utilisation thérapeutique. »

Les dispositions du 2° ci-dessus ne sont pas applicables aux spécialités génériques définies au premier alinéa de l'article L. 601-6 du code de la santé publique, lorsque les spécialités de référence appartenant aux mêmes groupes génériques figurent sur la liste prévue à l'article L. 162-17.

« II. – L'inscription des médicaments qui ont fait l'objet d'une publicité auprès du public au sens de l'article L. 551-3 du code de la santé publique peut être refusée. »

IV. – Sont insérés les articles R. 163-6 et R. 163-7 ainsi rédigés :

« *Art. R. 163-6.* – I. – L'inscription sur la liste prévue à l'article L. 162-17 ne peut être renouvelée, après avis de la commission mentionnée à l'article R. 163-15, que si le médicament continue de remplir la condition relative au service médical rendu prévue au I de l'article R. 163-3 dans les indications thérapeutiques pour lesquelles le renouvellement de l'inscription est demandé. Dans l'appréciation du service médical rendu, constaté dans les conditions habituelles d'utilisation du médicament, il est tenu compte des nouvelles données disponibles sur le médicament et l'affection traitée ainsi que des autres médicaments inscrits sur la liste depuis la précédente appréciation et des autres thérapies devenues disponibles depuis lors.

« Les spécialités génériques des spécialités de référence appartenant, en application du premier alinéa de l'article L. 601-6 du code de la santé publique, aux mêmes groupes génériques, sont présumées remplir la condition de service médical rendu prévue au premier alinéa ci-dessus, lorsque lesdites spécialités de référence figurent sur la liste prévue à l'article L. 162-17.

« II. – Le renouvellement de l'inscription d'un médicament est également soumis aux conditions prévues aux 1°, 3°, 4° et 5° du I et au II de l'article R. 163-5.

« III. – Lorsqu'une entreprise exploite plusieurs médicaments comportant la même composition qualitative en principes actifs sous des dosages, formes pharmaceutiques et présentations différents et inscrits sur la liste prévue à l'article L. 162-17, la validité de leur inscription sur cette liste expire à la date d'échéance de celle du médicament dont le renouvellement de l'inscription est sollicité en premier. L'entreprise doit adresser simultanément la même demande de renouvellement pour l'ensemble de ces médicaments.

« IV. – A l'occasion de l'examen du renouvellement de l'inscription d'un médicament sur la liste prévue à l'article L. 162-17, lorsque la Commission de la transparence propose de ne pas renouveler l'inscription ou propose de modifier le niveau de la participation de l'assuré, elle donne également un avis sur les médicaments appartenant à la même classe pharmacothérapeutique que le médicament dont le renouvellement de l'inscription est sollicité. Dans ce cas, la date fixée pour le renouvellement de l'inscription du médicament est reportée d'un mois pour permettre aux entreprises exploitant les médicaments de la même classe de présenter leurs observations sur l'avis qui leur est communiqué.

« *Art. R. 163-7.* – I. – Après avis de la commission mentionnée à l'article R. 163-15, peuvent être radiés de la liste prévue à l'article L. 162-17 par arrêté du ministre chargé de la sécurité sociale et du ministre chargé de la santé :

« 1° Les médicaments qui ne sont pas régulièrement exploités ;

« 2° Les médicaments dont la radiation est sollicitée par l'entreprise exploitant le médicament ;

« 3° Les médicaments qui ne peuvent plus figurer sur cette liste en vertu des dispositions prévues à l'article R. 163-3, aux 1°, 3°, 4° et 5° du I de l'article R. 163-5 et à l'article R. 163-6 ;

« 4° Les médicaments dont le conditionnement ne comporterait pas les informations destinées aux organismes d'assurance maladie, prévues en application de l'article L. 161-36 ;

« 5° Les médicaments pour lesquels l'entreprise exploitant le médicament n'a pas informé le ministre chargé de la sécurité sociale des modifications des données sur lesquelles l'inscription est fondée, en application de l'article R. 163-12.

« II. – Peuvent être radiés de la liste prévue à l'article L. 162-17, par arrêté du ministre chargé de la sécurité sociale et du ministre chargé de la santé, après avis de la commission mentionnée à l'article R. 163-15 et de celle mentionnée à l'article R. 5054 du code de la santé publique :

« 1° Les médicaments qui font l'objet d'une publicité auprès du public ;

« 2° Les médicaments dont la publicité auprès des professionnels de santé ne mentionne pas l'une des informations suivantes : le prix, la dénomination commune, les indications thérapeutiques retenues pour l'inscription sur la liste, signalées de manière spécifique, les modalités d'utilisation, le coût du traitement journalier ou, le cas échéant, le coût de cure, exprimé en prix de vente au public dans chacune de ces indications, le taux de participation des assurés à leurs frais d'acquisition, défini en application de l'article R. 322-1, l'inscription au titre de la clause mentionnée au troisième alinéa de l'article R. 163-2 ;

« 3° Les médicaments dont la publicité auprès des professionnels de santé n'est pas conforme au bon usage, au regard soit des références médicales opposables visées à l'article L. 162-12-15, soit des indications thérapeutiques ouvrant droit à la prise en charge ou au remboursement.

« Le directeur général de l'Agence française de sécurité sanitaire des produits de santé signale au ministre chargé de la sécurité sociale et au ministre chargé de la santé les médicaments dont la publicité ne serait pas conforme aux règles fixées ci-dessus.

« III. – Peuvent être radiées de la liste prévue à l'article L. 162-17, par arrêté du ministre chargé de la sécurité sociale et du ministre chargé de la santé, les spécialités figurant en qualité de génériques au répertoire mentionné à l'article R. 5143-8 du code de la santé publique, dont la dénomination est constituée d'un nom de fantaisie, lorsque cette dénomination n'est pas complétée par le suffixe prévu par l'article L. 162-17-1 du présent code dans l'étiquetage et la notice définis à l'article R. 5000 du code de la santé publique, dans le résumé des caractéristiques du produit prévu à l'article R. 5128-2 du même code, ainsi que dans toute publicité au sens de l'article L. 551 dudit code. »

V. – L'article R. 163-8 est ainsi modifié :

1° Au deuxième alinéa du I, les mots : « Pour l'application du présent article et des articles R. 163-7 à R. 163-17, ladite entreprise est celle... » sont remplacés par les mots : « A la présente section, ladite entreprise s'entend de celle... ».

2° Les mots : « articles R. 163-3 et R. 163-4 » et « article R. 163-14 » sont remplacés respectivement par les mots : « articles R. 163-3 et R. 163-5 » et « article R. 163-15 ».

VI. – Au II de l'article R. 163-9, au I de l'article R. 163-10 et aux articles R. 163-12 et R. 163-13, les mots : « article R. 163-14 » sont remplacés par les mots : « article R. 163-15 ».

VII. – Au I de l'article R. 163-9, les mots : « article R. 163-6 » sont remplacés par les mots : « article R. 163-8 ».

VIII. – L'article R. 163-10 est ainsi modifié :

1° Au I, les mots : « des articles R. 163-3 à R. 163-5 » sont remplacés par les mots : « de l'article R. 163-6 » ;

2° Le III est abrogé.

IX. – A l'article R. 163-12, les mots : « article R. 163-9 » sont remplacés par les mots : « article R. 163-11 » et les mots : « articles R. 163-11 et R. 163-12 » sont remplacés par les mots : « articles R. 163-13 et R. 163-14 ».

Art. 2. – La durée de validité de l'inscription des médicaments inscrits sur la liste prévue à l'article L. 162-17 du code de la sécurité sociale sans limitation de durée avant le 1er avril 1993 est fixée à cinq ans à compter de la date de publication du présent décret.

Art. 3. – Les dispositions du III de l'article R. 163-6 sont applicables aux médicaments ayant fait l'objet d'une inscription ou du renouvellement de leur inscription sur la liste prévue à l'article L. 162-17 à compter de la date d'entrée en vigueur du présent décret.

Art. 4. – A la section 2 du chapitre 3 du titre VI du livre Ier du code de la sécurité sociale (deuxième partie : Décrets en Conseil d'Etat), les articles R. 163-13 à R. 163-17 deviennent les articles R. 163-15 à R. 163-20 et sont ainsi rédigés :

« *Art. R. 163-15.* – La Commission de la transparence est composée de :

« 1° Un président et un vice-président nommés par arrêté du ministre chargé de la sécurité sociale et du ministre chargé de la santé pour une durée de trois ans renouvelable une fois ;

« 2° Trois membres de droit :

« – le directeur de la sécurité sociale ou son représentant ;

« – le directeur général de la santé ou son représentant ;

« – le directeur général de l'Agence française de sécurité sanitaire des produits de santé ou son représentant ;

« Chaque membre de droit peut se faire accompagner par une personne de ses services ;

« 3° Treize membres nommés dans les mêmes conditions que le président et le vice-président :

« *a)* Un médecin choisi sur une liste de deux noms proposés par l'ordre national des médecins ;

« *b)* Un pharmacien choisi sur une liste de deux noms proposés par l'ordre national des pharmaciens ;

« *c)* Le médecin-conseil national de la Caisse nationale de l'assurance maladie des travailleurs salariés et un médecin-conseil ou un pharmacien-conseil choisi sur une liste de deux noms proposés par la Caisse nationale de l'assurance maladie des travailleurs salariés ;

« *d)* Deux personnalités, médecins-conseils ou pharmaciens-conseils, choisies chacune sur une liste de deux noms proposés respectivement par la Caisse nationale d'assurance maladie et maternité des travailleurs non salariés des professions non agricoles et par la Caisse centrale de la mutualité sociale agricole ;

« *e)* Une personnalité choisie sur l'une des listes de deux noms établies par chacune des organisations syndicales les plus représentatives des fabricants de produits pharmaceutiques ;

« *f)* Six personnalités choisies en raison de leur compétence médicale, scientifique ou économique dans le domaine du médicament.

« Treize membres suppléants sont désignés dans les mêmes conditions que les membres titulaires ; le suppléant du médecin-conseil national de la Caisse nationale de l'assurance maladie des travailleurs salariés est un praticien-conseil choisi sur une liste de deux noms proposés par la Caisse nationale de l'assurance maladie des travailleurs salariés. Les membres suppléants peuvent remplacer les titulaires soit pour une ou plusieurs séances déterminées, soit s'il se produit une vacance au cours du mandat.

« *Art. R. 163-16.* – I. – Les délibérations de la commission mentionnée à l'article R. 163-15 ne sont valables que si au moins douze membres de la commission sont présents.

« II. – Les avis sont pris à la majorité des suffrages, le président ayant voix prépondérante en cas de partage égal des voix. Ils sont motivés.

« III. – Lorsque l'avis porte sur l'inscription, la modification des conditions d'inscription ou le renouvellement de l'inscription d'un médicament sur la liste prévue à l'article L. 162-17 ou sur l'inscription ou la modification des conditions d'inscription sur la liste prévue à l'article L. 618 du code de la santé publique, cet avis est immédiatement communiqué à l'entreprise qui exploite le médicament.

« L'entreprise peut, dans les huit jours suivant la réception de cet avis, demander à être entendue par la commission ou présenter ses observations écrites. La commission peut modifier son avis compte tenu des observations présentées.

« L'avis définitif est communiqué à l'entreprise, avec copie au Comité économique du médicament, et publié au *Bulletin officiel* du ministère chargé de la sécurité sociale. »

« *Art. R. 163-17.* – La commission mentionnée à l'article R. 163-15 se réunit sur convocation de son président, du ministre de la sécurité sociale, du ministre de la santé ou, pour l'exercice de ses compétences propres, du directeur général de l'Agence française de sécurité sanitaire des produits de santé. Son secrétariat est assuré par l'Agence française de sécurité sanitaire des produits de santé.

« La commission élabore son règlement intérieur.

« Son président peut faire appel à des rapporteurs extérieurs à la commission.

« Un rapporteur ou un expert intervenant dans l'examen d'un médicament devant la commission mentionnée à l'article R. 5140 du code de la santé publique ne peut intervenir comme expert représentant de l'entreprise exploitant le médicament pour l'examen du même médicament devant la commission mentionnée à l'article R. 163-15.

« Les membres de la commission, les personnes des services accompagnant les membres de droit et les rapporteurs doivent adresser à son secrétariat une déclaration mentionnant les liens directs ou indirects qu'ils peuvent avoir avec les titulaires d'autorisation de mise sur le marché et les entreprises dont les produits sont susceptibles de faire l'objet d'un examen par la commission, ainsi qu'avec les organismes professionnels ou les sociétés de conseil intervenant dans le secteur pharmaceutique. Ils s'engagent à signaler toute modification concernant ces liens. Ces déclarations sont publiées au *Bulletin officiel* du ministère chargé de la sécurité sociale.

« Les membres de la commission ne peuvent prendre part ni aux délibérations ni au vote s'ils ont un intérêt direct ou indirect à l'affaire examinée.

« *Art. R. 163-18.* – L'avis mentionné au premier alinéa de l'article R. 163-4, ainsi que celui rendu par la commission en application de l'article L. 619 du code de la santé publique, comportent notamment :

« 1° L'appréciation du bien-fondé, au regard du service médical rendu, de l'inscription du médicament sur les listes, ou l'une des listes, prévues à l'article L. 162-17 et à l'article L. 618 du code de la santé publique ;

« L'avis porte distinctement sur chacune des indications thérapeutiques mentionnées par l'autorisation de mise sur le marché, en distinguant, le cas échéant, des indications par groupes de populations pertinents au regard de l'appréciation du service médical rendu ;

« L'avis portant sur l'inscription du médicament sur la liste prévue à l'article L. 162-17 mentionne expressément les indications thérapeutiques pour lesquelles la commission estime fondée l'inscription. Il peut préconiser d'assortir l'inscription de la clause mentionnée au troisième alinéa de l'article R. 163-2 ;

« 2° Une comparaison du médicament, en termes de service médical rendu, avec ceux de la classe pharmaco-thérapeutique de référence ; pour les médicaments dont l'inscription sur la liste prévue à l'article L. 162-17 est sollicitée, cette comparaison est, sauf impossibilité signalée par la commission, effectuée au moins avec les médicaments inscrits venant en premiers par le nombre de journées de traitement, avec le médicament de cette classe dont le coût du traitement est le moins élevé et avec le dernier médicament inscrit dans la même classe ; le cas échéant, cette comparaison porte sur les médicaments à même visée thérapeutique ;

« L'avis comporte l'appréciation de l'amélioration du service médical rendu apportée par le médicament par rapport à ceux mentionnés ci-dessus et figurant sur la (ou les) liste(s) sur lesquelles l'inscription est sollicitée ; cette appréciation doit porter distinctement sur chacune des indications thérapeutiques mentionnées au 1° ci-dessus ;

« 3° Lors du renouvellement de l'inscription des médicaments sur la liste prévue à l'article L. 162-17, la réévaluation du service médical rendu dans les conditions prévues à l'article R. 163-6.

« 4° Une appréciation sur les modalités d'utilisation du médicament et notamment sur les durées de traitement, la posologie et les autres indications utiles à une bonne prescription du médicament ; pour les médicaments dont l'inscription ou le renouvellement de celle-ci sur la liste prévue à l'article L. 162-17 est demandée, ces modalités sont précisées à l'égard de chacune des indications thérapeutiques proposées ; à l'occasion du renouvellement de l'inscription, les modalités réelles d'utilisation et les indications thérapeutiques constatées sont comparées aux modalités d'utilisation et aux indications thérapeutiques retenues lors des avis précédents ;

« 5° L'estimation du nombre de patients relevant des indications thérapeutiques pour lesquelles la commission estime fondée l'inscription, selon les données épidémiologiques disponibles. Le cas échéant, l'avis mentionne l'impossibilité de réaliser des estimations précises ;

« 6° Pour les médicaments inscrits sur la liste prévue à l'article L. 162-17, leur classement au regard de la participation des assurés aux frais d'acquisition dans deux catégories déterminées en fonction de l'importance du service médical rendu ; l'avis précise, le cas échéant, si le médicament doit être considéré comme irremplaçable pour l'application du premier alinéa de l'article R. 322-1 ;

« 7° L'appréciation du conditionnement approprié au regard des indications thérapeutiques pour lesquelles la commission estime fondée l'inscription, de la posologie et de la durée de traitement ;

« La commission peut, en outre, indiquer les informations et études complémentaires indispensables à la réévaluation du service médical rendu par le médicament, qui devront être présentées par le demandeur à l'occasion du renouvellement de l'inscription sur la liste prévue à l'article L. 162-17.

« *Art. R. 163-19.* – A la demande du ministre chargé de la sécurité sociale ou du ministre chargé de la santé, la commission mentionnée à l'article R. 163-15 donne un avis sur :

« 1° Le bien-fondé de l'inscription, du renouvellement d'inscription ou de la modification des conditions d'inscription des spécialités génériques définies à l'article L. 601-6 du code de la santé publique, sur les listes prévues aux articles L. 162-17 du présent code et L. 618 du code de la santé publique ;

« 2° Le maintien du médicament sur les listes, ou l'une des listes, prévues aux articles L. 162-17 du présent code et L. 618 du code de la santé publique, compte tenu de la modification des données sur lesquelles est fondée l'inscription ; l'avis portant sur le maintien du médicament sur la liste prévue à l'article L. 162-17 peut préconiser d'assortir l'inscription de la clause mentionnée au troisième alinéa de l'article R. 163-2 ;

« 3° L'inscription des médicaments sur la liste mentionnée à l'article L. 595-7-1 du code de la santé publique ;

« 4° L'établissement de classifications des médicaments en fonction de leurs propriétés pharmacologiques et thérapeutiques ou de leurs indications ainsi que le classement des produits dans ces classifications ;

« 5° Les règles de conditionnement des médicaments par classe thérapeutique et la conformité à ces règles des conditionnements présentés ;

« 6° Toute question touchant à la consommation, au remboursement, à la prise en charge et aux conditions d'utilisation thérapeutique des médicaments figurant sur les listes prévues aux articles L. 162-17 du présent code et L. 618 du code de la santé publique.

« *Art. R. 163-20.* – I. – La commission mentionnée à l'article R. 163-15 donne un avis, à la demande du ministre chargé de la sécurité sociale, du ministre chargé de la santé, ou, pour l'exercice de ses compétences propres, du directeur général de l'Agence française de sécurité sanitaire des produits de santé, sur les documents suivants :

« 1° Les documents d'information à l'usage des praticiens portant sur la comparaison des médicaments de la même classe pharmaco-thérapeutique ou à même visée thérapeutique ;

« Ces documents doivent notamment rappeler les références médicales opposables visées à l'article L. 162-12-15 et les spécialités génériques commercialisées figurant au répertoire mentionné à l'article R. 5143-8 du code de la santé publique ;

« 2° Les fiches d'information thérapeutique préparées en vue d'être annexées aux arrêtés d'inscription des médicaments particulièrement coûteux et d'indications précises, prévues au troisième alinéa de l'article R. 163-2 ainsi que des fiches de même nature, publiées au *Bulletin officiel* du ministère chargé de la sécurité sociale, pour des médicaments dont les conditions d'utilisation nécessitent une information particulière des prescripteurs et notamment ceux qui sont soumis aux conditions de prescription restreinte prévues aux articles R. 5143-5-1 à R. 5143-5-6 du code de la santé publique ;

« 3° Des recommandations destinées aux prescripteurs et relatives à l'usage des médicaments.

« La publication et la diffusion de tous les documents précités ne peuvent intervenir qu'après accord du ministre chargé de la sécurité sociale et du ministre chargé de la santé.

« II. – La commission mentionnée à l'article R. 163-15 donne un avis sur les recommandations de bonne pratique et les références médicales établies par l'Agence française de sécurité sanitaire des produits de santé prévues à l'article L. 162-12-15.

« *Art. R. 163-21.* – La commission mentionnée à l'article R. 163-15 peut réévaluer le service médical rendu des médicaments inscrits sur les listes, ou l'une des listes, prévues à l'article L. 162-17 et à l'article L. 618 du code de la santé publique par classe pharmaco-thérapeutique ou à même visée thérapeutique, notamment lorsqu'elle propose l'inscription sur ces listes ou l'une de ces listes d'un médicament apportant une amélioration majeure du service médical rendu susceptible de modifier substantiellement les stratégies thérapeutiques antérieures. »

Art. 5. – Les dispositions prévues à l'article R. 163-15 entrent en vigueur à compter du 5 juin 2000.

Art. 6. – I. – L'article R. 322-1 du code de la sécurité sociale est ainsi modifié :

1° Au premier alinéa et au 5°, les mots : « article R. 163-8 » sont remplacés par les mots : « article R. 163-15 » ;

2° Au 5°, après les mots : « troubles ou affections sans caractère habituel de gravité », sont ajoutés les mots : « et pour les médicaments dont le service médical rendu, tel que défini au I de l'article R. 163-3, n'a pas été classé en application du 6° de l'article R. 163-18 comme majeur ou important ».

II. – A titre transitoire, les arrêtés en vigueur à la date de publication du présent décret, fixant la participation de l'assuré en ce qui concerne les médicaments aux taux prévus aux 5° et 6° de l'article R. 322-1, restent applicables jusqu'à l'intervention d'un arrêté modifiant cette participation en application du I ci-dessus et, au plus tard, jusqu'à l'expiration d'une période de cinq ans à compter de la publication du présent décret.

Art. 7. – I. – Le 3° du premier alinéa de l'article R. 5047-3 du code de la santé publique est ainsi rédigé :

« 3° De l'avis rendu en application de l'article R. 163-4 du code de la sécurité sociale par la Commission de la transparence mentionnée à l'article R. 163-15 du même code et le plus récemment publié dans les conditions prévues au dernier alinéa du III de l'article R. 163-16 du même code.

« Lorsque le médicament fait l'objet de plusieurs avis en raison d'une extension des indications thérapeutiques, la notion d'avis s'entend de l'ensemble des avis comportant une appréciation du service médical rendu dans chacune des indications thérapeutiques du médicament concerné. »

II. – Au 4° de l'article R. 5054 du code de la santé publique, les mots : « R. 163-9 » sont remplacés par les mots : « R. 163-15 ».

III. – L'article R. 5148 *bis* du code de la santé publique est ainsi rédigé :

« *Art. R. 5148* bis. – Toute ordonnance comportant une prescription de médicaments doit, pour permettre la prise en charge de ces médicaments par un organisme d'assurance maladie, indiquer pour chacun des médicaments prescrits :

« 1° La posologie ;

« 2° Soit la durée du traitement, soit le nombre d'unités de conditionnement.

« Si la durée du traitement est supérieure à un mois, l'ordonnance doit indiquer le nombre de renouvellements de la prescription par périodes maximales d'un mois dans la limite de six mois de traitement ou, pour les médicaments contraceptifs, par périodes maximales de trois mois dans la limite d'un an de traitement.

« Le pharmacien ne peut délivrer en une seule fois une quantité de médicaments correspondant à une durée de traitement supérieure à quatre semaines ou à trente jours selon le conditionnement. Toutefois, les médicaments contraceptifs peuvent être délivrés pour une durée de douze semaines.

« Le pharmacien est tenu de délivrer le conditionnement le plus économique compatible avec les mentions figurant sur l'ordonnance. »

Art. 8. – La ministre de l'emploi et de la solidarité, le ministre de l'économie, des finances et de l'industrie et la secrétaire d'Etat à la santé et à l'action sociale sont chargés, chacun en ce qui le concerne, de l'exécution du présent décret, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 27 octobre 1999.

LIONEL JOSPIN

Par le Premier ministre :

La ministre de l'emploi et de la solidarité,
MARTINE AUBRY

Le ministre de l'économie, des finances et de l'industrie,
DOMINIQUE STRAUSS-KAHN

La secrétaire d'Etat à la santé et à l'action sociale,
DOMINIQUE GILLOT

Arrêté du 26 octobre 1999 fixant la composition pour les organismes du régime général de sécurité sociale de la commission prévue à l'article R. 123-51 du code de la sécurité sociale

NOR : *MESS9923358A*

La ministre de l'emploi et de la solidarité,

Vu l'article R. 123-51 du code de la sécurité sociale ;

Vu l'arrêté du 26 mars 1966 modifié fixant les modalités d'application, en ce qui concerne les agents de direction et les agents comptables des organismes du régime général de sécurité sociale, des dispositions de l'article 19 du décret n° 60-452 du 12 mai 1960 modifié relatif à l'organisation et au fonctionnement de la sécurité sociale,

Arrête :

Art. 1er. – Sont nommés membres de la commission prévue à l'article R. 123-51 du code de la sécurité sociale :

1° Lorsque l'agent en cause est un agent de direction :

Représentants du ministre chargé de la sécurité sociale :

Un membre de l'inspection générale des affaires sociales, qui assure la présidence de la commission.

Le directeur de la sécurité sociale ou son représentant.

2° Lorsque l'agent en cause est un agent comptable :

Représentant du ministre chargé de la sécurité sociale :

Un membre de l'inspection générale des affaires sociales, qui assure la présidence de la commission.

Représentant du ministre chargé de l'économie et des finances :

Le directeur général de la comptabilité publique ou son représentant.

Art. 2. – Sont nommés membres de la commission prévue à l'article R. 123-51 du code de la sécurité sociale :

Représentants élus des agents de direction et agents comptables :

Premier groupe
(Directeurs)

Titulaires

M. Arcéga (Gérard), directeur de la caisse primaire d'assurance maladie de Vaucluse.

M. Delplanque (Jean-Jacques), directeur de la caisse d'allocations familiales de la Haute-Savoie.

Suppléants

M. Schaeffer (Daniel), directeur de la caisse primaire d'assurance maladie de la Corrèze.

M. Barry (Daniel), directeur de l'union régionale des caisses d'assurance maladie d'Auvergne.

M. Valenza (Claude), directeur de l'union de recouvrement des cotisations de sécurité sociale et d'allocations familiales de la Haute-Savoie.

M. Gilmant (Gérard), directeur de l'union de recouvrement des cotisations de sécurité sociale et d'allocations familiales de Rouen et du centre normand de formation et de perfectionnement.

M. Bussière (Alain), directeur de l'union de recouvrement des cotisations de sécurité sociale et d'allocations familiales de l'Indre.

M. Solé (Francis), directeur de la caisse primaire d'assurance maladie de l'Aude.

Deuxième groupe
(Agents comptables)

Titulaires

M. Henon (Dominique), agent comptable de la caisse primaire d'assurance maladie de Paris.

M. Challiol (Philippe), agent comptable de la caisse d'allocations familiales d'Anjou.

Suppléants

M. Bayard (Serge), agent comptable de la caisse d'allocations familiales de Lyon.

M. Quintana (Jacques), agent comptable de la caisse primaire d'assurance maladie de Valenciennes.

M. Audibert (Guy), agent comptable de la caisse d'allocations familiales du Puy-de-Dôme.

Mme Ravel (Hélène), agent comptable de la caisse d'allocations familiales des Alpes-Maritimes.

M. Cabot (Jean-Pierre), agent comptable de la caisse primaire d'assurance maladie du Gard.

M. Perros (André), agent comptable de la caisse primaire d'assurance maladie du Nord-Finistère, de la fédération de la caisse régionale d'assurance maladie de Bretagne et de la caisse primaire d'assurance maladie du Nord-Finistère et de l'union régionale des caisses d'assurance maladie de Bretagne.

Troisième groupe
(Directeurs adjoints)

Titulaires

M. Haurie (Jean-Louis), directeur adjoint de la caisse d'allocations familiales de la Gironde.

M. Louis (Daniel), directeur adjoint de la caisse d'allocations familiales de Meurthe-et-Moselle.

Suppléants

M. Lévèque (Claude), directeur adjoint de la caisse primaire d'assurance maladie de Roubaix.

M. Jourdan (Patrick), directeur adjoint de la caisse primaire d'assurance maladie du Havre.

M. Hoefman (Jacques), directeur adjoint de la caisse primaire d'assurance maladie de la Corrèze.

M. Dupont (Gilbert), directeur adjoint de la caisse régionale d'assurance maladie de Bretagne.

M. Rouvière (Daniel), directeur adjoint de la fédération des organismes de sécurité sociale du Sud-Est.

M. Emery (Michel), directeur adjoint de la caisse primaire d'assurance maladie des Hautes-Alpes.

Quatrième groupe
(sous-directeurs)

Titulaires

M. Guisgand (Pascal), sous-directeur de la caisse régionale d'assurance maladie du Centre-Ouest.

M. Gambier (Jocelyn), sous-directeur de la caisse primaire d'assurance maladie de Lens.

Suppléants

M. Lambert (Dominique), sous-directeur de la caisse primaire d'assurance maladie du Morbihan.

M. Pallarés (Jean-Pierre), sous-directeur de la caisse primaire centrale d'assurance maladie des Bouches-du-Rhône.

M. Dufour (Claude), sous-directeur de la caisse primaire d'assurance maladie du Cher.

M. Picaud (Jean-Pierre), sous-directeur de l'union de recouvrement des cotisations de sécurité sociale et d'allocations familiales de Charente-Maritime.

Mme Mollot-Derel (Martine), sous-directeur de la caisse primaire d'assurance maladie de la Côte-d'Or.

M. Auffret (Jean-Yves), sous-directeur de la caisse d'allocations familiales de Saint-Quentin.

Représentants élus des conseils d'administration :

Titulaires

M. Delorme (Jean), administrateur de l'union de recouvrement des cotisations de sécurité sociale et d'allocations familiales de la Manche, président du conseil d'administration.

LOIS

LOI n° 98-1194 du 23 décembre 1998 de financement de la sécurité sociale pour 1999 (1)

NOR : *MESX9800131L*

L'Assemblée nationale et le Sénat ont délibéré,

L'Assemblée nationale a adopté,

Vu la décision du Conseil constitutionnel n° 98-404 DC en date du 18 décembre 1998 ;

Le Président de la République promulgue la loi dont la teneur suit :

TITRE Ier

ORIENTATIONS ET OBJECTIFS DE LA POLITIQUE DE SANTÉ ET DE SÉCURITÉ SOCIALE

Article 1er

Est approuvé le rapport annexé à la présente loi relatif aux orientations de la politique de santé et de sécurité sociale, et aux objectifs qui déterminent les conditions générales de l'équilibre financier de la sécurité sociale pour l'année 1999.

TITRE II

DISPOSITIONS RELATIVES AUX RESSOURCES

Article 2

I. – Les dispositions du deuxième alinéa de l'article L. 651-2-1 du code de la sécurité sociale ne sont pas applicables au solde cumulé du produit de la contribution sociale de solidarité résultant de l'application du premier alinéa dudit article, constaté au 31 décembre 1998.

II. – Un prélèvement d'un milliard de francs est opéré en 1999 sur le produit de la contribution sociale de solidarité à la charge des sociétés, au profit du budget annexe des prestations sociales agricoles.

Les dispositions du *b* du 2° de l'article L. 139-2 du code de la sécurité sociale ne sont pas applicables, pour l'exercice 1999, au régime des exploitants agricoles.

III. – Le code de la sécurité sociale est ainsi modifié :

1° Au premier alinéa de l'article L. 651-1, les références : « aux articles L. 621-3, L. 721-1 et L. 723-1, » sont remplacées par les mots : « aux 1° et 2° de l'article L. 621-3, ainsi qu'au profit du Fonds de solidarité vieillesse mentionné à l'article L. 135-1, » ;

2° L'article L. 651-2-1 est ainsi modifié :

a) Le deuxième alinéa est ainsi rédigé :

« Le cas échéant, le solde du produit de la contribution résultant de l'application des dispositions de l'alinéa précédent est versé au Fonds de solidarité vieillesse mentionné à l'article L. 135-1. » ;

b) La première phrase du dernier alinéa est complétée par les mots : « et le Fonds de solidarité vieillesse » ;

3° Le premier alinéa de l'article L. 135-3 est complété par un 4° ainsi rédigé :

« 4° Une fraction, fixée par arrêté des ministres chargés de la sécurité sociale et du budget, du solde du produit de la contribution sociale de solidarité à la charge des sociétés visé au deuxième alinéa de l'article L. 651-2-1. »

Les dispositions du présent III entrent en vigueur à compter de l'exercice 1999.

IV. – Le code de la sécurité sociale est ainsi modifié :

1° L'article L. 135-1 est ainsi modifié :

a) Après le premier alinéa, il est inséré un alinéa ainsi rédigé :

« Le fonds a également pour mission de gérer un fonds de réserve pour les régimes d'assurance vieillesse visés à l'article L. 222-1 et aux 1° et 2° de l'article L. 621-3. » ;

b) Au deuxième alinéa, les mots : « qui est assisté d'un comité de surveillance composé notamment de membres du Parlement » sont remplacés par les mots : « qui est assisté dans les missions mentionnées aux premier et deuxième alinéas d'un comité de surveillance composé notamment de membres du Parlement, de représentants des assurés sociaux désignés par les organisations syndicales de salariés interprofessionnelles représentatives au plan national ainsi que de représentants des employeurs et travailleurs indépendants désignés par les organisations professionnelles d'employeurs et de travailleurs indépendants représentatives » ;

c) Avant le dernier alinéa, il est inséré un alinéa ainsi rédigé :

« Les opérations du Fonds de solidarité vieillesse correspondant à chacune des missions respectivement mentionnées au premier et au deuxième alinéas du présent article sont retracées en deux sections distinctes. » ;

2° Au premier alinéa de l'article L. 135-2, les mots : « Les dépenses prises en charge par le fonds visé à l'article L. 135-1 sont les suivantes » sont remplacés par les mots : « Les dépenses prises en charge par le Fonds de solidarité vieillesse au titre du premier alinéa de l'article L. 135-1 sont les suivantes » ;

3° L'article L. 135-3 est ainsi modifié :

a) Au premier alinéa, les mots : « Les recettes du fonds sont constituées par » sont remplacés par les mots : « Les recettes du fonds affectées au financement des dépenses mentionnées à l'article L. 135-2 sont constituées par » ;

b) Le dernier alinéa est ainsi rédigé :

« Les recettes et les dépenses du fonds de la première section doivent être équilibrées, dans des conditions prévues par les lois de financement de la sécurité sociale. » ;

4° Les articles L. 135-4, L. 135-5 et L. 135-6 deviennent respectivement les articles L. 135-1-1, L. 135-4 et L. 135-5 ;

5° Après l'article L. 135-1-1, il est créé une section 1 intitulée : « Opérations de solidarité » et comprenant les articles L. 135-2 à L. 135-5 ;

6° Après l'article L. 135-5, il est inséré une section 2 ainsi rédigée :

« Section 2

« Fonds de réserve

« *Art. L. 135-6.* – Les recettes du fonds affectées aux missions définies au deuxième alinéa de l'article L. 135-1 sont constituées par :

« 1° Une fraction, fixée par arrêté des ministres chargés de la sécurité sociale et du budget, du solde du produit de la contribution sociale de solidarité à la charge des sociétés visé au deuxième alinéa de l'article L. 651-2-1 ;

Rendue obligatoire, la formation médicale continue des médecins n'a pas connu les développements souhaitables. Le Gouvernement proposera au Parlement les dispositions législatives nécessaires pour lui donner une nouvelle impulsion. Une concertation est engagée sur ce thème avec les représentants des médecins libéraux mais également avec les médecins hospitaliers et salariés ;

Notre système de santé souffre de cloisonnements excessifs qui nuisent à la qualité des soins et sont source de dépenses inutiles. Le Gouvernement entend soutenir et favoriser les initiatives visant à une meilleure coordination des soins. Par ailleurs, le développement des réseaux pouvant associer médecine de ville et hôpital, professions médicales et paramédicales, permet d'améliorer la prise en charge des patients, de mieux concilier proximité et sécurité. La loi de financement ouvre, en ce domaine, des possibilités d'actions nouvelles aux partenaires conventionnels ;

L'exercice des professions paramédicales s'est profondément transformé au cours de ces dernières années pour répondre aux besoins de la population et à l'évolution de la science et des techniques. C'est pourquoi le Gouvernement entend clarifier les rôles respectifs des médecins et des professions paramédicales dans la prise en charge des malades par une adaptation des textes les rendant conformes aux pratiques et à leur évolution souhaitable. Le Gouvernement s'engage par ailleurs à doter les professions concernées de règles professionnelles et d'instances professionnelles propres permettant de favoriser les conditions d'un exercice de qualité ;

Notre système de santé est trop exclusivement centré sur l'acte curatif. La loi de financement ouvre la possibilité aux caisses de prendre en charge d'autres activités telles que la prévention, l'évaluation, l'éducation sanitaire. Il appartiendra aux caisses et aux professionnels de santé, dans le cadre conventionnel, de définir les dispositifs adaptés ;

La maîtrise de la démographie médicale est essentielle pour garantir le meilleur accès aux soins comme pour assurer la maîtrise des dépenses. Des dispositions législatives sont proposées au Parlement pour accroître la possibilité d'action des partenaires conventionnels en ce domaine et les autoriser à mener des politiques sélectives adaptées à la diversité des situations.

Des moyens sont nécessaires pour promouvoir l'ensemble de ces évolutions de notre système de soins ambulatoire. Un fonds d'aide à la qualité des soins de ville est créé et doté de 500 millions de francs.

b) Le médicament : rationaliser la prescription et les remboursements

La France se caractérise par un niveau global de consommation de médicaments très élevé, une surconsommation avérée pour certaines classes thérapeutiques telles que les antidépresseurs ou les antibiotiques, un faible développement des génériques. Cette situation est insatisfaisante au regard des exigences d'efficience de notre système de santé et préjudiciable en termes de santé publique. Les maladies iatrogènes représentent environ un million de journées d'hospitalisation.

Aussi le Gouvernement a-t-il engagé un ensemble de politiques structurelles visant à :

- lutter contre la surconsommation médicamenteuse. La taxe sur la promotion pharmaceutique a été augmentée dès 1998. La politique conventionnelle conduite par le Comité économique du médicament vise à obtenir une réduction du volume des classes où la surconsommation est avérée. Le développement des recommandations de bonnes pratiques permettra de réorienter les prescriptions ;
- développer les génériques. Un répertoire complet des génériques est disponible depuis juillet 1998. Le droit de substitution accordé aux pharmaciens, sauf refus explicite des médecins, permettra le développement de ce type de produit ;
- médicaliser le remboursement. La sécurité sociale doit concentrer ses efforts en matière de remboursement sur les médicaments dont l'efficacité médicale est avérée. Les critères de prise en charge des médicaments seront revus pour tenir compte tant de la gravité de la maladie que du service médical rendu. Une réévaluation de l'apport thérapeutique de l'ensemble des médicaments remboursables sera réalisée au cours des trois ans qui viennent.

Pour conduire l'ensemble de ces évolutions, le Gouvernement entend s'appuyer sur une politique conventionnelle active.

c) L'hôpital : promouvoir la qualité et adapter l'offre aux besoins

Promouvoir la qualité des soins, adapter notre offre hospitalière aux besoins, favoriser les coopérations entre établissements et, avec la médecine de ville, améliorer l'efficience globale du système hospitalier, tels sont les objectifs généraux de la politique hospitalière du Gouvernement.

En particulier, dans un souci d'accroissement de la sécurité sanitaire et de qualité des soins, la situation des professions hospitalières à forte pénibilité (anesthésistes, urgentistes, obstétriciens) doit être prise en compte. Des améliorations des conditions de travail de ces professions doivent être envisagées, en particulier au regard de la législation européenne (directive 93/104/CE) sur la question du temps de travail. Il importe d'augmenter l'attractivité de ces professions afin d'apporter une réponse allant dans le sens des conclusions du rapport Nicolas-Duret.

La promotion de la qualité à l'hôpital passe notamment par le développement de l'accréditation. Cette procédure permettra de vérifier sur la base d'une méthodologie fiable le niveau de performances sanitaires des établissements. L'ANAES a établi un référentiel d'accréditation. Il est en cours de test sur le terrain. Les premières démarches d'accréditation débuteront en 1999.

Notre offre hospitalière doit poursuivre son adaptation. C'est dans ce souci que la révision des schémas régionaux d'organisation sanitaire a été entreprise. Cet exercice de planification sanitaire est conduit avec le souci d'associer étroitement à la réflexion les établissements et leurs personnels, mais également les représentants des usagers et les élus locaux. Il permettra une meilleure prise en compte des besoins de santé.

La garantie offerte à tous d'un accès à des soins de qualité passe par l'organisation de réseaux entre établissements ou entre services qui garantiront à chacun une orientation vers une structure adaptée à son cas. Une telle organisation a été définie pour la sécurité périnatale et la cancérologie. Le Gouvernement entend poursuivre dans cette voie pour d'autres pathologies.

Le Gouvernement accentuera son effort de réduction des inégalités entre régions. Les dotations régionales seront différenciées à partir des besoins régionaux, des indicateurs sanitaires et des indicateurs d'efficience. La régionalisation de l'objectif clinique privé, entamée en 1998, sera accentuée. De même, la réduction des inégalités de dotation entre les hôpitaux, notamment à partir des indications fournies par le PMSI, sera poursuivie.

Le Gouvernement présentera un rapport sur l'évolution et la place des services de médecine non spécialisés à l'hôpital.

Le Gouvernement entend par ailleurs, en concertation notamment avec les caisses nationales d'assurance maladie et les syndicats médicaux, poursuivre sa réflexion sur l'adaptation de l'objectif des dépenses médicales par spécialité ou groupe de spécialités.

7. Assurer la régulation des dépenses

Le Gouvernement est convaincu que seules des politiques structurelles, destinées tant à accroître la qualité des soins

Le Secrétaire d'Etat à la Santé
et à l'Action Sociale

Paris, le 13 AVR. 1999

Monsieur le Président,

Dans le cadre de la réforme engagée par le Gouvernement pour rationaliser les dépenses consacrées par la collectivité en matière de médicament et fonder leur prise en charge par l'assurance maladie sur des critères de santé publique, nous souhaitons aujourd'hui que la Commission de la Transparence engage la deuxième phase du programme triennal de réexamen du service médical rendu et procède à la réévaluation de l'ensemble des classes thérapeutiques et des médicaments remboursables par l'assurance maladie en ville, selon le calendrier joint.

Nous vous demandons pour ce réexamen d'apprécier par indication le service médical rendu par un médicament ou par une classe médicamenteuse au regard de leur efficacité et de leurs effets indésirables, de leur place dans la stratégie thérapeutique au regard notamment des autres thérapies disponibles, de la gravité de l'affection à laquelle ils sont destinés ainsi que du caractère préventif, curatif ou symptomatique du traitement médicamenteux et de son intérêt pour la santé publique.

Vous voudrez bien évaluer pour chaque médicament son niveau de service médical rendu en vous référant à l'un des trois niveaux suivants : majeur ou important, modéré, ou plus faible mais justifiant néanmoins une prise en charge.

Vous veillerez à ce que les procédures d'examen suivies par la Commission comportent toutes les garanties d'objectivité et d'impartialité requises et à ce que les entreprises pharmaceutiques qui contesteraient l'avis de la commission concernant leurs propres spécialités puissent faire connaître leur position selon les modalités que vous jugerez appropriées.

Les dates du calendrier triennal que nous avons retenu et rendu public récemment ont été arrêtées au plus tard. Nous ne verrions que des avantages à ce que la réévaluation soit menée plus rapidement et aboutisse dans les meilleurs délais.

Nous vous prions d'agréer, Monsieur le Président, l'expression de nos sentiments les meilleurs.

REUNION DE LA COMMISSION DES COMPTES DE LA SECURITE SOCIALE

21 septembre 2000

Discours de Martine AUBRY,
Ministre de l'Emploi et de la Solidarité
COMMISSION DES COMPTES
DE LA SECURITE SOCIALE

retour au sommaire

Mesdames, Messieurs,

Le Secrétaire général vient de vous présenter la situation des comptes pour 2000 et 2001. Je remercie une fois de plus François MONIER pour la qualité de son travail. Il a confirmé le retour à l'équilibre des comptes dès 1999, et il vient de vous indiquer que l'excédent prévu en 2000 s'élève à 3,3 MdF et que l'excédent tendanciel devrait s'élever à 15,4 MdF en 2001.

Je note que sur 2000, nous aurions respecté les prévisions de mai (5 MdF d'excédent) si la sécurité sociale n'avait dû prendre en charge 2 MdF supplémentaires au titre de l'ARS.

Pour 2001, les mesures nouvelles arrêtées par le Gouvernement ramènent l'excédent tendanciel à 3,4 MdF.

Pour bien mesurer l'évolution il faut raisonner à structure constante. Ceci revient à neutraliser les conséquences de la budgétisation de l'Allocation Rentré Scolaire et des transferts au fonds de réserve des retraites. Pour 2000, à structure constante, l'excédent du régime général est ainsi de 16,2 MdsF. Il atteint 17,7 MdsF en 2001.

Vous le voyez, le redressement des comptes se poursuit et s'amplifie.

Si l'on considère non plus le seul régime général, mais l'ensemble des régimes sociaux (UNEDIC et protection sociale) l'excédent atteint 0.5 % du PIB, c'est à dire 45 MdsF environ en 2001. Les comptes sociaux aident désormais puissamment à la réduction des déficits publics.

Je crois que ces chiffres doivent être rappelés, sans triomphalisme mais d'abord pour montrer le chemin parcouru depuis les 54 MdsF de déficit du régime général en 1996 ou encore les 33 MdsF en 1997. Ces chiffres sont par ailleurs transparents car la situation des comptes sociaux fait l'objet, deux fois par an, grâce à la commission des comptes, d'un examen très attentif. J'en profite pour signaler que nous progressons dans la présentation des comptes puisque cette année, comme nous nous y étions engagés l'an dernier, nous présentons les comptes en encaissements–décaissements et en droits constatés et qu'une disposition du PLFSS prévoit la mise en place d'un plan comptable unique des organismes de sécurité sociale.

Les raisons de ce redressement des comptes, je tiens à les rappeler brièvement : la croissance économique bien sûr, que le Gouvernement a encouragée et qui est forte et riche en emplois, en particulier grâce à la réduction de temps de travail ; des mesures de redressement ensuite, prises dès l'automne 1997 et qui ont amélioré les comptes de 20 MdsF ; enfin des mesures structurelles concernant la dépense qui ont des effets positifs dans certains secteurs et qui restent insuffisants dans d'autres. Effets qui ont tout de même permis à la croissance des dépenses d'assurance maladie de rester inférieure à celle du PIB, contrairement à bien d'autres pays. De plus, ce redressement s'accompagne d'une amélioration du niveau de la protection sociale.

Si nous avons tant travaillé à ce redressement, si je me réjouis qu'il soit là et qu'il se confirme et s'amplifie, ce n'est pas pour le plaisir de constater des excédents, c'est parce qu'ils garantissent d'abord la pérennité de nos systèmes de protection sociale et nous permettent de mener à bien des politiques indispensables pour que la protection sociale de nos concitoyens aujourd'hui et demain soit améliorée. **La sécurité sociale, ce n'est plus un trou à boucher, c'est un instrument puissant pour améliorer la vie de nos concitoyens et mieux préparer leur avenir.**

Le projet de loi de financement de la sécurité sociale pour 2001, dont je vais vous présenter les grandes lignes, s'inscrit pleinement dans ces perspectives.

1 Accélérer la rénovation de la politique familiale, en faveur des jeunes enfants et du logement social

Lorsque nous sommes arrivés en 1997, la branche famille accusait un déficit de 14,5 MdsF. Grâce aux mesures de redressement qui ont été prises, la branche famille est redevenue excédentaire de 4,8 MdsF en 1999 et de 6,8 MdsF en prévisionnel pour 2000.

Ces mesures de redressement, tout en introduisant plus de justice sociale au niveau des prestations familiales, ont permis de dégager des marges de manœuvre pour mener une véritable politique familiale de grande ampleur. Chaque année la Conférence de la famille marque les étapes de cette rénovation, destinée à mieux répondre aux besoins des familles.

Toutes les mesures décidées depuis 1997 l'ont été en concertation avec la CNAF et le mouvement familial, dont je salue le rôle constructif.

Je ne citerai pas toutes les mesures qui ont été prises, j'en rappellerai seulement quelques unes :

- tout d'abord, l'extension de 18 à 19 ans puis à 20 ans de l'ensemble des prestations familiales,
- l'extension à 21 ans en 2000 du complément familial et des aides au logement,
- l'amélioration des loyers plafonds pour l'allocation de logement familiale,
- l'extension à toutes les familles de un enfant sous condition de ressources de l'allocation de rentrée scolaire,
- la forte progression du budget du FNAS afin d'aider les modes de garde collectifs (1 MdsF en 1999, 700 Millions en 2000).

Cette année encore, les actions décidées en faveur des familles à la Conférence de la famille du 15 juin dernier montrent la volonté du Gouvernement de poursuivre et accélérer la rénovation de la politique familiale. Deux axes principaux ont été privilégiés : les mesures en faveur de la petite enfance et les aides au logement. Ainsi, le Gouvernement a décidé, en concertation avec les mouvements familiaux :

1.1 En ce qui concerne la petite enfance

- la création d'un fonds d'investissement pour les crèches doté de 1,5 MdF, permettant d'accélérer la réalisation de places de crèches afin de répondre à la demande des familles,

- l'augmentation de 1,7 MdF du budget du FNAS pour améliorer l'aide au fonctionnement des crèches et des centres de loisirs,

- l'augmentation de l'AFEAMA pour les familles modestes qui souhaitent avoir recours à une assistante maternelle agréée,

2 En ce qui concerne les aides au logement, nous engageons une réforme fondamentale car elle conjugue trois objectifs :

- simplifier des aides pour les allocataires grâce à l'unification des barèmes des trois aides au logement (APL, ALF, ALS),

- éviter que la reprise d'activité pour un bénéficiaire du RMI ne se traduise par une diminution de son aide au logement,

- introduire plus de justice en améliorant le montant d'aide attribuée aux ménages modestes : à titre d'exemple, pour un couple avec deux enfants ayant un revenu égal au SMIC, l'aide va augmenter de 600 F par mois.

Je n'oublie pas non plus la création d'un congé assorti d'une allocation pour permettre aux parents de suspendre leur activité pour accompagner un enfant gravement malade. Cela constitue une véritable avancée sociale.

L'ensemble de ces mesures annoncées par le Premier ministre le 15 juin dernier représente un effort de

10,5 MdsF en faveur des familles (3,7 MdsF supportés par l'Etat et 6,8 MdsF par la branche famille).

Je me félicite de voir qu'à nouveau les décisions difficiles prises par le Gouvernement en 1997 et 1998 ont porté leurs fruits et permettent désormais d'envisager l'avenir avec sérénité.

1. Mieux indemniser les victimes d'accidents du travail et de maladies professionnelles

Depuis que ce gouvernement est en place, nous avons fait un important travail pour améliorer la reconnaissance et la réparation des accidents du travail et des maladies professionnelles. Je pense au raccourcissement des délais de réponse des caisses, à la réforme du tableau des maladies professionnelles, aux garanties sur les délais de réponse aux victimes.

Nous avons déjà pris un certain nombre de mesures particulières en faveur des victimes de l'amiante, comme le dispositif de cessation anticipée d'activité pour les travailleurs de l'amiante. Cette année, nous allons au-delà. Nous savons tous les souffrances qu'endurent les victimes de l'amiante et le drame que vivent ceux qui leur sont proches.

Il nous apparaît fondamental d'accorder à ces victimes une juste réparation. La législation sur les accidents du travail et les maladies professionnelles n'y parvient que partiellement et les victimes n'obtiennent actuellement qu'une indemnisation insuffisante après de longues années de procédure. En outre, certaines victimes ne disposent pas d'une couverture sociale contre les maladies professionnelles. Je pense notamment aux artisans mais aussi aux victimes dites " environnementales ", celles qui sans jamais avoir été en contact avec l'amiante en milieu professionnel, souffrent de pathologies liées à l'exposition à l'amiante.

Le gouvernement a donc décidé de créer un fonds d'indemnisation des victimes de l'amiante. Il assurera aux victimes et à leur famille la réparation intégrale des préjudices subis, quel que soit le statut de la personne ou les conditions de son exposition. Nous avons cherché à mettre en place une procédure simple, efficace dans le souci d'éviter que la recherche de l'indemnisation ne soit un véritable parcours du combattant.

Le fonds sera financé par les employeurs, via la branche accidents du travail et par le budget de l'Etat. Il sera doté de 2 MdsF dès 2001.

Le drame de l'amiante appelait une réponse rapide et forte mais je sais aussi qu'il a démontré les limites de la législation sur les accidents du travail et les maladies professionnelles en matière d'indemnisation ou de lourdeur des procédures. C'est pourquoi je vais demander au président de la commission spécialisée du Conseil supérieur de prévention des risques professionnels, en charge des maladies professionnelles, de lancer dans les plus brefs délais une réflexion large sur la réparation des risques professionnels, en concertation étroite avec l'ensemble des partenaires concernés.

1. **Améliorer la couverture maladie, amplifier les actions de santé publique tout en modérant l'évolution globale des dépenses grâce à la poursuite des politiques structurelles engagées.**

Depuis trois ans nous conduisons une politique déterminée d'amélioration de la couverture maladie des Français.

La loi du 27 juillet 1999 portant création d'une **Couverture Maladie Universelle,** permet depuis le 1er janvier 2000 à l'ensemble des résidents en France d'accéder à une couverture maladie de base.

De plus, elle a ouvert le droit à une couverture complémentaire gratuite pour les plus modestes de nos citoyens : 6 millions de personnes sont concernées. D'ores et déjà, l'accès à ce nouveau droit a été ouvert pour 4,3 millions de personnes. Je me félicite à ce propos de la mobilisation de l'ensemble des acteurs: professionnels de santé, caisses d'assurance maladie, collectivités locales, organismes de couverture complémentaire et associations humanitaires. Ils contribuent chaque jour sur le terrain à mettre en œuvre cette réforme ambitieuse.

Dans le secteur hospitalier, notre priorité, c'est d'améliorer la qualité de l'accueil et des soins des malades et des conditions de travail du personnel hospitalier. Dans le cadre des protocoles que nous avons conclus, nous avons notamment dégagé 10 MdsF dont 2 MdsF pour répondre aux remplacements.

Nous améliorons l'équipement sanitaire de la France en IRM. Rattraper notre retard en ce domaine est une priorité, car la demande des malades, c'est un accès à des examens plus faciles et des délais d'attente raccourcis.

C'est dans la durée que peut se mettre en œuvre efficacement la politique de santé publique. Le programme national de lutte contre le cancer que nous avons arrêté avec Dominique GILLOT le 1er février dernier propose pour la première fois une approche intégrée organisant la mobilisation de tous les acteurs, de la recherche à la prise en charge des personnes malades et de leurs familles.

Ce plan, qui représente un engagement de 1,8 MdsF, permettra de développer le dépistage systématique des cancers les plus dangereux : cancers du sein, de l'utérus et cancers colo-rectaux.

A la suite des Etats généraux de la santé, qui ont montré la forte attente de la population vis à vis de notre système de santé, le Gouvernement proposera dans les semaines qui viennent un **projet de loi de modernisation du système de santé qui s'articulera autour de cinq axes** : renforcer les droits fondamentaux de la personne et associer les citoyens à la gestion du système de santé, améliorer les mécanismes de pilotage du système de santé, améliorer la qualité du système de santé, renforcer la politique de prévention et instaurer une politique nationale d'éducation pour la santé, instaurer un dispositif de prise en charge des risques thérapeutiques.

Ce sera l'occasion d'un grand débat sur l'organisation et les priorités de notre système de santé. Ceci est nécessaire pour compléter une vision souvent présentée comme essentiellement financière du PLFSS.

3.1 Des dépenses de santé qui évoluent encore rapidement

En 2000, le dépassement de l'ONDAM devrait atteindre 1,6% par rapport à l'objectif fixé de 658,3 MdsF, en prenant en compte les reports de dépenses de la fin 1999. Le dépassement pour 2000 s'élèvera à 11 MdsF, déduction faite de la contribution de l'industrie pharmaceutique.

Quelles sont les raisons de ce dépassement ?

Ce sont les soins délivrés en ville qui sont, cette année encore, responsables du dépassement, puisque leur progression sera cette année de 5,5%.

Les dépassements sont principalement imputables à quatre postes de dépenses : le médicament à hauteur de 6,2 MdsF, les honoraires de certaines professions de ville pour 3,8 MdsF, les indemnités journalières pour 1,7 MdsF et les dispositifs médicaux (TIPS) pour 1,6 MdsF.

En revanche, pour les hôpitaux les objectifs ont été maintenus.

Quant aux dépenses des cliniques privées et les établissements médico-sociaux, elles progresseront en 2000 de 2,2% et de 4,9%, conformément, là aussi, aux objectifs qui leur avaient été impartis.

Au total, les dépenses d'assurance maladie de l'ONDAM se situeront sur un rythme un peu supérieur à 4% en 2000.

Tout en notant que les dépenses de santé continuent à évoluer à un rythme moins élevé que celui de la richesse nationale, je ne me satisfais pas d'une évolution qui, pour la deuxième année consécutive, reste supérieure aux objectifs fixés.

Il me paraît cependant plus que jamais nécessaire que les objectifs votés par le Parlement soient respectés. C'est en maîtrisant mieux les dépenses que nous trouverons les marges

de manœuvre permettant de couvrir de nouveaux besoins et d'améliorer le niveau de protection de nos concitoyens. Chaque franc dépensé doit l'être à bon escient. Les dépenses qui ne répondent pas aux besoins réels, ce sont des cotisations en trop ou des dépenses justifiées en moins : là aussi on pourrait dire que la mauvaise dépense chasse la bonne.

2. **Poursuivre les politiques structurelles engagées.**

C'est tout d'abord le cas dans le secteur de l'hôpital, dans lequel nous menons une politique active de recomposition du tissu hospitalier au service d'objectifs de santé publique.

L'hôpital connaît une réorganisation de grande ampleur :

Un mouvement de réorganisation sans précédent est aujourd'hui engagé dans toutes les régions. Cette politique volontariste menée depuis 1997 par le secteur hospitalier s'articule autour de trois priorités : la réduction des inégalités dans l'accès aux soins, l'adaptation de l'offre de soins aux besoins de la population et la promotion de la qualité et la sécurité des soins.

La réflexion pour fonder la tarification des établissements de santé sur les pathologies traitées est engagée. L'expérimentation de nouvelles modalités de tarification pour les établissements de santé doit reposer sur des données d'activité hospitalière fiables et rapidement disponibles. A cette fin, une agence technique de l'information sur l'hospitalisation sera créée afin d'améliorer le traitement des données et faciliter leur diffusion.

La politique de réduction des inégalités de dotation entre régions et entre établissements de santé se poursuit. L'ampleur de la redistribution est significative : ce sont près de 2.7 MdsF qui ont été apportés aux régions les plus en retard. Cette politique sera poursuivie.

Les schémas régionaux d'organisation sanitaire, adoptés dans toutes les régions à la fin de l'année 1999, fixent désormais les priorités sanitaires de la politique hospitalière. Pour faciliter la mise en œuvre de ces objectifs de santé publique, les établissements de santé ont particulièrement développé leur coopération. En juillet 2000, on recense 370 opérations importantes de coopération hospitalière. Les fusions juridiques d'établissement publics ainsi que le partage d'activités entre établissements publics et privés se sont intensifiées depuis 1998.

L'évolution des techniques médicales et de la demande des patients conduit à une transformation en profondeur des structures hospitalières. Les durées de séjours continuent de diminuer. Les hospitalisations d'un jour ou à domicile augmentent. Cela s'est traduit depuis 1997 par la fermeture de plus de 9500 lits de courts séjours.

Cette réorganisation améliore la qualité de la prestation offerte à la population

En effet, elle permet aux établissements de santé de mieux prendre en compte les priorités de santé publique définies par le gouvernement. Cette année la priorité est donnée au plan cancer arrêté par le gouvernement en 2000 avec notamment la poursuite du programme de développement de soins palliatifs ; l'augmentation du nombre de places d'hospitalisation à domicile ; l'installation de nouveaux appareils d'imagerie par résonance magnétique et de radiothérapie et la prise en compte des innovations thérapeutiques. Le parc des appareils IRM autorisés aura ainsi doublé entre 1997 et 2000 passant de 137 à 276.

La réorganisation des services de périnatalité qui s'achèvera au cours de l'année 2001 permettra, par la mise en réseaux des établissements de santé, d'améliorer la sécurité de la naissance pour la mère et l'enfant. Cette réorganisation se traduira par la transformation de 52 maternités en centre périnatal de proximité.

De même la réorganisation des urgences répond à la nécessité d'un meilleur traitement des urgences vitales. Les sites d'urgences autorisés vont passer de 820 à 600 sites organisés en un réseau gradué d'orientation et de prise en charge. Le gouvernement a renforcé les moyens des services d'urgence. Les établissements de santé renforcent leur coopération avec les médecins de ville.

Conformément au plan greffe présenté par le gouvernement le 22 juin 2000, les moyens des

établissements de santé seront renforcés de manière à favoriser l'accès à la greffe par le développement de réseaux des établissements pour le prélèvement de greffons.

En matière de sécurité sanitaire, des mesures importantes seront prises en 2001 pour améliorer la qualité des procédures de désinfection et de stérilisation et développer l'utilisation de dispositifs médicaux à usage unique. Ces actions se traduiront notamment par le renouvellement et l'achat de matériels.

L'ANAES a rendu publics en juin 2000, les premiers compte rendus d'accréditation. En juillet 2000 : 186 établissements de santé étaient engagés dans la procédure d'accréditation. 650 professionnels de santé seront formés d'ici le début de l'année 2001 permettant à l'ANAES d'assumer pleinement sa mission d'accréditation.

Le gouvernement accompagne de manière significative ce mouvement de recomposition de l'offre hospitalière.

Grâce aux accords conclus avec les représentants des personnels hospitaliers, une nouvelle dynamique a été créée. Les contrats d'amélioration des conditions de travail, la définition d'un projet social au sein du projet d'établissement ainsi que les mesures sans précédent prises pour favoriser la promotion sociale et professionnelle des agents dans les établissements publics de santé contribueront au progrès du système de santé dans son ensemble.

Ces efforts seront soutenus par le fonds de modernisation des établissements de santé (FMES) dont la création est proposée dans le projet de loi de financement de la sécurité sociale pour 2001.

Je n'oublie pas par ailleurs l'important chantier qui va s'ouvrir dans les prochaines semaines sur la réduction du temps de travail à l'hôpital et qui donnera lieu à une réflexion sur les modes d'organisation actuels, leur amélioration et qui se traduira par des créations d'emplois.

Je n'oublie pas que les cliniques privées participent activement à cet effort de recomposition de l'offre de soins. Désormais, la réforme de la fixation des tarifs au niveau régional et en concertation avec les professionnels de ce secteur permet de mieux valoriser l'activité de chaque établissement.

Le fonds de modernisation des cliniques privés est désormais en place. Les ARH instruisent actuellement les premiers projets déposés par les établissements.

L'ensemble de ces mesures structurelles et pérennes créent des conditions nouvelles permettant aux établissements d'évoluer et de mieux prendre en compte les objectifs de santé publique du gouvernement au plus grand bénéfice de la population.

Nous devons aussi modérer notre dépense de médicaments par des dispositifs structurels efficaces.

Les dépenses de médicament remboursées progressent de 6 à 7% en 2000, soit une évolution très proche de celle de l'année précédente. La France ne constitue pas, dans ce domaine, une exception puisque la plupart des pays occidentaux connaissent une évolution encore plus rapide de ces dépenses, mais le niveau de notre consommation médicale est plus élevé que dans nombre de pays voisins.

Nous ne pouvons nous satisfaire d'une telle situation. En 2000, les dépenses de médicament sont, avec plus de 6 milliards sur 11 au total, le premier motif de dépassement de l'ONDAM. Les politiques structurelles que nous avons décidées n'ont pas encore fait sentir leur plein effet. Elles doivent être poursuivies et amplifiées.

Le développement des génériques s'amorce. Il n'était pas normal que ces médicaments, dont le principe actif est aussi efficace que celui de leur princeps, mais qui sont 30% moins coûteux, soient moins utilisés en France que dans d'autres pays. En accord avec les représentants de la profession, avec lesquels nous avons signé un protocole l'année dernière, les pharmaciens disposent désormais d'un droit de substitution.

Nous ferons dans les premiers jours d'octobre un bilan précis de la progression des médicaments génériques et des économies dont la sécurité sociale a bénéficié. Le résultat est encourageant : la prescription et la substitution des médicaments génériques bousculent les mentalités tant des prescripteurs que des assurés. Il faut amplifier l'effort. Les économies tirées des génériques peuvent être évaluées à 500 millions de Francs.

La politique conventionnelle menée par le Comité économique des produits de santé porte elle aussi ses fruits. Le Comité a entrepris des campagnes d'harmonisation des prix sur les veinotoniques, les vasodilatateurs, les magnésium et les calcium que, dans le cadre de la négociation, les laboratoires ont accepté.

L'année 2000 marque une nouvelle étape. J'avais rappelé, l'année dernière, devant cette même commission, la nécessité d'adapter les niveaux de remboursement et les prix en fonction du service médical rendu (SMR). Je rappelle que le SMR prend en compte le rapport efficacité /sécurité du médicament, sa place dans la stratégie thérapeutique, la gravité de la maladie considérée, le caractère curatif, préventif ou symptomatique de l'action du médicament ainsi que son intérêt pour la santé publique. Ces éléments permettent de définir trois niveaux de SMR : majeur ou important, modéré ou faible, insuffisant. A chacune de ces catégories est associé un niveau de prise en charge : remboursement à 65%, remboursement à 35%, absence de remboursement.

La procédure d'évaluation est pratiquement achevée aujourd'hui. Au total, près de 2.663 spécialités ont été évaluées par la Commission de la transparence, soit plus des deux tiers des spécialités pharmaceutiques françaises. 60% ont été classées en SMR majeur ou important, 15% en SMR modéré ou faible, 25% en SMR insuffisant.

Nous avons, sans tarder, tiré les conséquences de cette évaluation et j'ai annoncé, en juillet dernier, les mesures que nous entendions mettre en œuvre. Le taux de remboursement des vasodilatateurs a été uniformisé : toutes les spécialités de cette classe sont désormais remboursées à 35%. Parallèlement, le Comité économique a conduit avec les laboratoires concernés des négociations pour faire baisser les prix des spécialités dont le SMR a été jugé insuffisant. Avec ces deux mesures, c'est plus d'un milliard de francs qui sera économisé sur l'année 2001.

Il faut souligner que ces économies, et c'était là tout l'objet de la politique que nous avons menée depuis deux ans, ne sont pas réalisées au détriment des patients ou de la santé publique. On ne fait pas du déremboursement " en aveugle ", par simple souci d'économies. C'est au contraire une mesure qui va dans le sens d'une amélioration de l'efficacité de la dépense de santé, donc de la santé elle même. Ce que nous ne dépensons plus ici, pour des produits qui n'améliorent pas l'état de santé de nos concitoyens, nous pourrons le consacrer à des produits plus efficaces, plus innovants mais aussi souvent plus onéreux. Nous ne pouvons en effet laisser à la porte du remboursement des médicaments dont on estime qu'ils apportent un plus en termes de santé publique, parce que nos habitudes en matière de prescription ne nous en laissent pas les moyens. C'est aussi cela la maîtrise structurelle de la dépense.

En effet, comme je l'ai annoncé en juillet dernier, les spécialités dont le service médical rendu a été jugé insuffisant ne seront, à terme, plus remboursées. Ceci ne doit cependant pas se faire dans la précipitation. Il importe de donner aux patients, aux prescripteurs mais aussi aux laboratoires, le temps de s'adapter aux changements qui s'annoncent. A l'issue d'une période transitoire de trois ans (2000,2001,2002), les médicaments à SMR insuffisant sortiront du remboursement.

J'avais également annoncé que je souhaitais apporter aux prescripteurs une autre information que celle dont ils disposent aujourd'hui et qui, nous le savons tous, est essentiellement diffusée par l'industrie pharmaceutique. Depuis trois ans, nous avons largement réformé le contrôle de la promotion des laboratoires. Rappelons que, chaque année, ce sont près de 12 milliards qui sont dépensés ainsi. Nous avons réformé la taxe sur la promotion pharmaceutique, introduit des sanctions financières conventionnelles en cas d'infraction constatée par rapport à la réglementation sur la publicité et encadré les dépenses promotionnelles dans le cadre des conventions signées par le comité économique des produits de santé.

Aujourd'hui nous souhaitons aller plus loin en cherchant les moyens d'apporter une information neutre, validée scientifiquement sur le bon usage du médicament. Un groupe confraternel

d'information des prescripteurs sera prochainement mis en place. Il diffusera auprès des prescripteurs une information objective et facilement utilisable sur les prescriptions, leurs coûts et leur stratégie thérapeutique. Il rassemblera notamment des médecins qui sont proches du terrain et proches des préoccupations des prescripteurs. Dès cette année, nous lui donnerons les moyens de fonctionner. A cette fin, la loi va créer un fonds de promotion de l'information médicale alimenté par une fraction de la taxe sur la promotion pharmaceutique.

Par ailleurs, je voudrais saluer l'action de la CNAM en faveur de l'information des usagers, que ce soit sur la surconsommation de certains médicaments ou sur les génériques.

La progression forte des ventes de médicaments a bénéficié à ses distributeurs. Il est normal que l'assurance maladie corrige les conséquences de cette croissance sur la marge de ces entreprises. J'ai donc souhaité que soient revus les taux de marges de la vente directe et de la répartition pharmaceutique. Après avoir reçu leurs représentants, j'ai décidé de procéder à un ajustement de la marge des distributeurs qui rapportera à l'assurance maladie 450 Millions de Francs en année pleine.

Enfin, nous allons modifier, par la loi, la contribution de l'industrie pharmaceutique que l'on appelle la " clause de sauvegarde ". Créée il y a deux ans, elle a permis de récupérer une partie du dépassement sur les dépenses de médicaments : près d'un milliard en 1999 et 2000. Mais son mode de calcul a aujourd'hui besoin d'être revu, car il comporte des effets de seuil peu lisibles. Aussi, la loi de financement pour 2001 va-t-elle retenir un mode de calcul plus simple, linéaire, avec pour objectif de récupérer 70 % du dépassement.

Pour les matériels médicaux (prothèses, accessoires, pansements), nous connaissons encore une forte croissance, de l'ordre de 15%. Ce résultat s'explique par un certain nombre de facteurs objectifs : réduction des durées de séjour, développement de l'hospitalisation à domicile... mais il nous faut, là comme ailleurs, expertiser la pertinence de ces dépenses.

C'est pourquoi, la loi de financement de la sécurité sociale pour 2000 avait prévu un changement fondamental dans la procédure d'inscription au TIPS. Celle-ci devrait très prochainement se mettre en œuvre. Le mode de régulation de ce secteur sera alors identique à celui qui existe pour le médicament et qui, comme nous venons de le voir, porte ses fruits.

Dans quelques semaines, l'Agence française de sécurité sanitaire débutera un processus d'évaluation du service rendu. Le Comité économique des produits de santé lancera, quant à lui, avec les industriels du secteur une politique conventionnelle.

La croissance des honoraires et des prescriptions autres que le médicament est également trop rapide en 2000.

Comme la majorité de gestion de la CNAM l'avait souhaité, la régulation de ces dépenses repose depuis la LFSS 2000 sur une large délégation de gestion aux caisses d'assurance maladie. Elles doivent ainsi gérer de façon concertée et négociée, les dépenses d'honoraires, de biologie et de transport sanitaire.

Dans ces secteurs aussi , la maîtrise structurelle doit s'appliquer.

Nous avons mis en place en trois ans les outils permettant d'assurer une meilleure qualité des soins dispensés. Car je crois profondément que c'est seulement grâce à ces instruments structurants mis à la disposition des professionnels et des caisses que nous résoudrons le problème récurrent de la progression trop rapide des dépenses de soins de ville.

Pour la première fois la CNAM a pris des mesures de redressement en juin qui ont validées. Il s'agissait d'une première application du nouveau dispositif dont j'espère que, dans l'avenir, il fera l'objet d'une application plus concertée.

Les médecins demandaient la possibilité de s'engager avec les caisses sur des objectifs permettant de sortir d'une régulation qui serait purement financière.

Nous avons donc donné en 1999 la possibilité aux partenaires conventionnels d'inclure dans les

conventions des outils permettant d'améliorer la qualité des soins et de déroger aux règles de tarification.

Depuis cette année, à travers les accords de bons usages des soins et les contrats de bonne pratique, les caisses et les professionnels libéraux peuvent s'entendre pour prévoir des incitations financières en contrepartie d'engagements sur la formation et la qualité des soins. Il faut maintenant que ces mécanismes fonctionnent.

Les dispositifs d'évaluation et d'entretien des connaissances des médecins sont désormais en place. Ainsi, le décret sur l'évaluation des médecins est paru en décembre 1999. L'ANAES travaille actuellement avec les syndicats de médecins aux modalités de sa mise en œuvre. Le fonctionnement de l'organisme de gestion conventionnel de la formation médicale continue des médecins a été fixé par un décret sorti le mois dernier.

Mais nous avons également donné aux caisses les moyens de mieux contrôler les prescriptions.

Les formulaires demandant aux médecins de mentionner la justification médicale de la prescription des arrêts de travail et des transports de malades ont été validés et sont d'ores et déjà en application.

Le mécanisme de contrôle des patients ayant une consommation excessive de soins est prévu dans un décret qui devrait être publié dans les jours qui viennent.

Concernant les professionnels paramédicaux, les orientations que j'ai décidées suite au rapport Brocas sont suivies. Ainsi, l'arrêté de 1962 fixant les règles de la prescription des soins a été aménagé pour permettre une plus grande responsabilisation de ces professionnels. Les décrets de compétence de ces derniers seront également adaptés – celui des masseurs-kinésithérapeutes a déjà été modifié en conséquence. Vous savez que je tiens également à donner aux paramédicaux une instance de réflexion et de gestion de leur exercice professionnel. L'office des professions paramédicales sera créé par la loi de modernisation du système de santé.

Le fonctionnement des soins de ville doit être décloisonné. De plus en plus, il faudra travailler en réseau non seulement entre professionnels de ville, mais aussi avec l'hôpital et les cliniques.

Le fonds d'aide à la qualité des soins de ville, créé à cet effet, a commencé à fonctionner.

Les réseaux de soins vont faire l'objet d'une refonte dans le sens de la simplification et de la régionalisation dans le cadre du projet de loi de modernisation du système de santé.

Enfin, l'informatisation du système de santé a fortement progressé en 2000. Plus du tiers de médecins envoient des feuilles de soins électroniques aux caisses – on monte à 50 % pour les généralistes. Les autres professions de santé montent très vite en puissance.

Nous devons également sanctionner les comportements abusifs d'une minorité de professionnels, qui, de ce fait, font du tort non seulement à leur profession mais aussi à la collectivité. Un nouveau dispositif de sanction des abus et des fraudes sera mis en place par la LFSS 2001. Trois principes devront nous guider : nous allons favoriser la conciliation préalable aux poursuites, nous allons garantir le droit à la défense des professionnels mis en cause, nous allons enfin permettre de sanctionner efficacement les professionnels dont la faute sera avérée. Ces dispositions feront l'objet d'une étroite concertation avec les professionnels concernés.

Les non salariés non agricoles bénéficient d'une amélioration de la couverture maladie.

Le projet de loi de financement de la sécurité sociale pour 2001 sera aussi l'occasion de mettre en œuvre les propositions faites par le conseil d'administration de la caisse nationale d'assurance maladie des professions indépendantes (CANAM). Elles permettront d'améliorer sensiblement la couverture sociale de ses professions en alignant le niveau des prestations en nature sur celles du régime général. Il y a donc désormais un socle commun entre le régime général, les régimes des exploitants agricoles et des salariés agricoles et ceux des professions indépendantes. L'amélioration des prestations maladie et maternité sera financée par un relèvement, à due concurrence, du taux de cotisation.

J'en viens à la fixation de l'ONDAM pour 2001

L'objectif pour 2001 doit être fixé en ayant pour but de renforcer l'efficacité de notre système de santé, de permettre aux acteurs du système de dispenser des soins de qualité tout en tenant compte à la fois de l'impact des politiques structurelles que nous avons lancées et du cadre économique et financier de la Nation.

Le gouvernement a retenu un objectif national des dépenses d'assurance maladie 2001 de 694,6 MdsF, en progression de 3,5 % par rapport à 2000.

Cet objectif permettra de répondre aux priorités de santé identifiées par les conférences et le Haut comité de la santé publique. Je pense également aux grandes politiques de santé qu'il faut poursuivre comme le plan Cancer ou le plan Greffes mais également à la nécessité de tenir compte des progrès de la connaissance médicale notamment en matière de réduction des risques sanitaires. Je pense en particulier à la maladie de Creutzfeld-Jacob et à son nouveau variant.

Un effort particulier sera fait, comme les années précédentes, en faveur des établissements médico-sociaux, pour accompagner le développement du nombre de place pour les personnes handicapées et la médicalisation des établissements pour personnes âgées dépendantes.

De plus le Gouvernement proposera pour 2001 un taux d'évolution des dépenses identique pour les hôpitaux et les cliniques privées.

Cet objectif, les caisses d'assurance maladie et les professionnels de santé devront le gérer de façon responsable en s'inscrivant dans la volonté d'infléchir durablement les tendances en matière de dépenses de ville. Les outils structurels de maîtrise des dépenses et d'amélioration de la qualité des soins existent, je l'ai dit. Il faut qu'ils s'en saisissent.

2. Associer les retraités aux fruits de la croissance et préparer l'avenir des régimes de retraite

Nous avons trouvé la branche vieillesse en déficit de 5 MdsF en 1997. Elle renoue dorénavant avec les excédents : 3,7 MdsF en 1999 et 3,4 MdsF en 2000 avant versement au fonds de réserve des retraites.

Ces excédents retrouvés permettent d'associer les retraités aux fruits de la croissance, tout en préparant l'avenir des régimes de retraite

4.1 Associer les retraités aux fruits de la croissance

Pour 2001, le Gouvernement propose de revaloriser les pensions de 2,2 %, alors que l'inflation prévisionnelle est de 1,2 %. Ce coup de pouce porte à 1,3 % le gain de pouvoir d'achat des retraités par rapport à l'inflation depuis 1997.

Par ailleurs, pour les retraités qui ne sont pas imposables à l'impôt sur le revenu, le Gouvernement souhaite leur accorder un gain de pouvoir d'achat supplémentaire grâce à la suppression de la CRDS (0,5%). Cette mesure devrait concerner près de 5 Millions de retraités.

4.2 Préparer l'avenir

Conformément à ce que le Premier ministre a annoncé lors de sa déclaration sur l'avenir des retraites le 21 mars dernier, le Gouvernement travaille pour préparer l'avenir, en abondant le fond de réserve et en engageant la concertation sur les réformes nécessaires de nos régimes de retraite.

- le fonds de réserve

Pour assurer les retraites des Français sur le long terme, le Gouvernement a créé le fonds de réserve en 1998 et y a affecté des ressources nouvelles dès 1999 : excédents de la CNAV et du fonds de solidarité vieillesse, la moitié du prélèvement de 2 % sur les revenus du patrimoine, contributions des Caisses d'Epargne et de la Caisse des Dépôts et Consignations, auxquels s'ajoute la majeure partie du produit de la vente des licences de téléphonie mobile de troisième génération.

Fin 2001, le fonds de réserve disposera de plus de 50 milliards de francs. Que de chemin parcouru depuis trois ans !

Avec les sources de financement actuelles, le fonds de réserve devrait disposer de 1.000 milliards de francs en 2020, dont 300 milliards proviendront des intérêts financiers. Cette somme correspond à la moitié des déficits prévisionnels des régimes de retraite entre 2020 et 2040.

Compte tenu des enjeux forts liés à la gestion du fonds de réserve et afin de lui donner plus de lisibilité, le Gouvernement propose d'en faire un établissement public séparé du FSV dont il faisait jusqu'à présent partie. Un conseil de surveillance aux pouvoirs renforcés, associant notamment des parlementaires et des représentants des partenaires sociaux, sera garant de la bonne gestion de ce fonds.

- - - - - - -

Nous pouvons nous réjouir de la poursuite de l'assainissement financier de la sécurité sociale. Après plus de 15 années de déficit, l'excédent des comptes se confirme et s'amplifie : 700 MdF en 1999, 3,4 MdF en 2000 et 4,4 MdF en 2001. Mais le redressement des comptes est aussi le fruit des réformes structurelles que nous avons patiemment engagées, et qui doivent se poursuivre. C'est ce qui nous permettra de continuer à faire progresser les acquis sociaux et, par la mise en réserve d'une partie de ces excédents, de garantir l'avenir de notre système de retraite et au-delà de notre protection sociale.

retour au sommaire

La politique du médicament

Discours de M. Jean-François MATTEI, le 17 juillet 2003

Je souhaite pouvoir aborder avec vous trois thèmes :

- la présentation des produits susceptibles de faire l'objet de la première vague de déremboursements,
- les grandes lignes de la réforme de la commission de la transparence
- et enfin les conséquences de l'arrêt récent du conseil d'Etat sur les vasodilatateurs.

Comme vous le savez, j'ai annoncé à l'automne, lors du projet de loi de financement de la sécurité sociale pour 2003, mon intention de procéder au déremboursement des médicaments n'ayant pas un service médical rendu suffisant pour justifier un remboursement. Cette décision est la conséquence directe de la réévaluation des 4.500 médicaments de la pharmacopée qui avait été commandée par Martine Aubry en 1999. Elle avait d'ailleurs publiquement annoncé son intention de procéder au déremboursement puis est revenue sur sa décision.

Dérembourser pour favoriser l'innovation

Je ne pouvais laisser la situation en l'état. Vous le savez, l'assurance maladie connaît un déficit important qui résulte d'une progression rapide des dépenses et d'une croissance ralentie des recettes conséquence du ralentissement actuel de la conjoncture économique. Pendant ce temps, nous devons admettre au remboursement de nouveaux produits dont les patients ont besoin. Depuis mon arrivée, nous avons notamment inscrit au remboursement des produits importants pour les malades tels que Ebixa, Prévenar, Lantus ou Keppra...

Ces décisions coûtent cher. Il est légitime d'essayer de les financer en partie au moins par le déremboursement de produits dont l'utilité est devenue moindre. C'est la concrétisation de ce qu'un ancien président du comité économique des produits de santé, Jean Marmot, qualifiait de "respiration de la liste des médicaments". En outre, ces produits pouvaient, juridiquement être déremboursés sur simple décision du ministre. Il n'était pas sain de laisser leurs laboratoires continuer à les commercialiser sans offrir la moindre visibilité.

Le plan que j'ai annoncé est étalé sur 3 ans afin de permettre tant aux médecins qu'aux industriels de se préparer à cette évolution. Ces déremboursements doivent intervenir en trois étapes correspondant chacune à une des catégories de médicaments suivantes : en 2003, les produits dont l'utilisation n'est médicalement pas souhaitable, en 2004 les produits qui relèvent d'un choix d'automédication et, enfin, en 2005, les produits médicalement peu efficaces mais, pour l'heure, sans alternative thérapeutique.

Dérembourser : une procédure longue

Nous avons donc procédé en fin d'année dernière à une relecture de la liste des produits à SMR insuffisant pour retenir ceux qui portaient la mention "n'a pas de place dans la stratégie thérapeutique". 95 spécialités ont alors été identifiées dont 2 n'étaient plus commercialisées à cette date. Restaient 93. En février, les laboratoires exploitant ces spécialités ont été informés individuellement de notre intention de procéder au déremboursement de leur spécialité. Ils ont été en même temps avertis qu'ils disposaient d'un mois pour faire valoir leurs observations à la commission de la transparence. Les laboratoires n'ont fait usage de ce droit que pour 10 produits. Les réexamens de la commission de la transparence ont eu lieu en mai et juin. A l'issue de cette phase, nous étions en mesure de procéder aux déremboursements pour le 1° juillet comme prévu.

Un délai supplémentaire nous a toutefois été imposé du fait de l'intervention récente de la décision du 20 juin du conseil d'Etat, qui, saisi par 2 laboratoires, a annulé les arrêtés pris par mon prédécesseur qui abaissaient de 65% à 35% le taux de remboursement de 2 médicaments vasodilatateurs. En effet, le Conseil d'Etat a mis en évidence l'insuffisante motivation des avis de la commission de la transparence sur lesquels le ministre s'appuie pour décider d'un déremboursement. J'ai donc demandé pour les produits concernés que la rédaction des avis motivés soit reprise de façon plus explicite et dans le sens d'une plus grande rigueur. Ce travail a mobilisé la commission de la transparence et son secrétariat jusqu'à ce jour. La commission de la transparence s'est réunie mercredi 16 pour adopter les nouveaux avis. Ceux-ci ont été transmis aux laboratoires qui disposent

de 8 jours pour faire part de leurs observations. A l'issue de ce délai, je serai en mesure de procéder au déremboursement.

Dérembourser : une procédure complexe

Toutefois, dans un souci de transparence et pour anticiper une annonce de déremboursements qui, juridiquement du fait des délais de procédure, ne pourra se faire qu'en août, j'ai souhaité vous communiquer dès maintenant les produits que j'ai demandés à la commission de réexaminer en vue d'un éventuel déremboursement. Vous trouverez la liste dans le dossier de presse. Cette liste précise pour chaque produit, ses indications, une brève description des raisons qui m'ont conduit à interroger la commission de la transparence une dernière fois sur l'opportunité d'un déremboursement et une présentation des alternatives thérapeutiques. Je ne doute pas que ce tableau devrait répondre à l'ensemble de vos interrogations.

Je profite de cette occasion pour faire le point sur 2 produits qui ne figurent pas dans cette liste alors qu'ils avaient été évoqués dans les journaux comme devant en faire partie. Le Toplexil est un sirop dont la commission de la transparence a estimé lors de la réévaluation qu'il rendait un service médical insuffisant car il associait un anti tussif et un expectorant. Chaque médecin sait que cette association est illogique. Suite à cette évaluation, l'entreprise a choisi de modifier la composition de ce produit. Comme pour tout médicament, elle a déposé un nouveau dossier d'autorisation de mise sur le marché ; ce nouveau sirop a été évalué en octobre 2002 par la commission de la transparence et a été crédité à cette occasion d'un "smr faible". Il n'est donc plus question de dérembourser ce produit. Nous n'avons pas de base légale pour le faire. Je vous rappelle que nous ne pouvons dérembourser que les médicaments susceptibles d'entraîner des dépenses injustifiées ou ceux qui ont un service médical rendu insuffisant. Dimetane, autre produit anti tussif, a choisi de procéder de la même manière.

Comme je vous l'ai dit, je ne pourrai procéder au déremboursement qu'au vu de l'avis définitif de la commission de la transparence. L'avis rendu mercredi n'est qu'un avis provisoire. Nous devrions donc être à même de publier l'arrêté officialisant la décision et la liste des produits concernés au début du mois d'août, une fois les avis devenus définitifs. La liste que je vous communique fournit toutefois une bonne indication des produits qui, sauf avis contraire de la commission, devraient être déremboursés.

Vous le voyez, un déremboursement nécessite une procédure longue et juridiquement complexe. Il ne saurait en être autrement. Il s'agit en effet d'une décision lourde de conséquences pour les médecins, leurs patients et l'industriel qui exploite ce médicament. La commission de la transparence a la charge de la majeure partie du travail d'instruction des dossiers de déremboursement. Je souhaite aujourd'hui lui rendre hommage pour le travail qu'elle a fourni. C'est un travail difficile, exigeant, technique. Il est légitime de remercier aujourd'hui tout spécialement les membres bénévoles et le tout premier d'entre eux son président, le professeur Bernard Dupuis.

Réformer la commission de la transparence

Il reste que cette commission doit évoluer pour assumer l'ensemble des charges que j'entends lui confier. La commission de la transparence doit en effet non seulement évaluer les nouveaux produits afin d'aider le politique à déterminer si le produit doit être admis au remboursement. Cette évaluation sert ensuite à la fixation des prix. Elle doit aussi le conseiller dans la gestion quotidienne de la liste des médicaments remboursés. Ces missions doivent être exercées dans le cadre d'un certain formalisme juridique. Cela implique des équipes et des savoir faire multiples, médicaux et juridiques. Elle a enfin un rôle à jouer capital dans l'information des professionnels de santé au quotidien. L'administration ne peut travailler dans son coin, elle doit informer et expliquer ses décisions auprès des praticiens et peut-être même auprès des patients. J'ai demandé au professeur Gilles Bouvenot (voir son C.V dans le dossier de presse) de me faire des propositions sur les évolutions souhaitables de cette commission. A partir de ses suggestions, j'ai décidé de faire évoluer la commission de la transparence dès maintenant selon trois axes : un changement de sa composition, une modification des procédures et un renforcement de son autonomie financière.

Cette évolution ne préjuge naturellement pas de la création de la commission du service médical rendu étendu à l'ensemble des conduites et procédés diagnostiques et thérapeutiques qui aura lieu dans l'année qui vient après une large concertation.

1 - La modification de sa composition vise à renforcer le caractère médical de cette commission. Je souhaite que ses avis soient, d'un point de vue médical, le plus incontestable possible. C'est pourquoi j'ai décidé d'augmenter le nombre de cliniciens qui y participent. Parallèlement, les représentants des administrations ou des caisses n'auront plus qu'une voix consultative. Il s'agit de mettre fin aux

soupçons, même injustifiés, qui pèsent actuellement sur le fonctionnement de cette commission. Les avis seront purement médicaux. Le mandat des actuels membres de la commission arrive à échéance fin juillet. La modification de la composition que je souhaite faire nécessite un décret en conseil d'Etat. Ce texte sera transmis au cours de l'été au Conseil d'Etat afin de le publier dès septembre pour assurer la continuité de cette commission essentielle au bon fonctionnement de notre dispositif d'admission au remboursement. Je peux d'ores et déjà vous annoncer que le professeur Gilles Bouvenot sera le président de cette commission de la transparence rénovée. C'est un choix logique. Il a une grande connaissance du médicament développée lors de ses nombreuses participations aux instances travaillant sur le médicament en France. Il était en outre cohérent de lui confier la charge de la commission après lui avoir demandé d'en tracer les évolutions.

2 - Nous devons aussi donner plus de clarté aux procédures qui régissent le fonctionnement de la commission de la transparence. Les modifications porteront sur la procédure telle qu'elle est décrite dans le code de la sécurité sociale. Le texte actuel est complexe, d'une interprétation délicate et source de contentieux. Le commissaire du gouvernement chargé du dossier vasodilatateur au conseil d'Etat le juge lui même difficile à appliquer. Les changement affecteront aussi le cheminement du dossier au sein de la commission. Nous devons être en mesure de mieux suivre les différentes étapes d'analyse d'un dossier. Cela permettra un travail plus approfondi et cela constituera un atout important dans le respect des délais qui nous sont fixés par l'Union Européenne. Les changements affecteront enfin le choix des experts qui peuvent être amenés à contribuer au travail de la commission. Les enjeux financiers qui découlent de cette commission sont considérables, la pression n'est pas absente. Les conditions de déontologie doivent donc être irréprochables. Cet axe de la réforme nécessite plus de temps, la réforme devrait pouvoir être mise en place à la fin de l'automne.

3 - Le troisième axe de la réforme de la transparence concerne le renforcement de la structure administrative sur laquelle est adossée cette commission. La Cour des Comptes a de nombreuses fois déploré le manque de moyens qui était accordé à la commission de la transparence. Le positionnement ambiguë de cette commission (elle est placée auprès du ministre mais rattachée à l'AFSSAPS) n'est pas de nature à faciliter la dotation en moyens administratifs de cet organisme. Il est temps de lui donner plus d'indépendance.

Il n'est pas raisonnable de confier à cette commission une tâche aussi lourde sans lui accorder les moyens nécessaires. J'ai obtenu du ministère de l'économie et des finances que nous indemnisions les experts libéraux. C'est un début, il faudra sans doute aller plus loin. Je souhaite aussi doter la commission d'un secrétaire général chargé du suivi de l'ensemble des taches administratives. Je souhaite enfin conférer une certaine autonomie budgétaire à cette commission. Les modalités ne sont pas encore fixées. La solution retenue pour le comité économique des produits de santé peut nous inspirer. Cette dimension devra aussi être considérée dans le cadre plus large de la mise en place de la commission du service médical rendu.

L'arrêt du conseil d'Etat sur les vasodilatateurs

Je faisais référence, il y a quelques instants à la nécessaire qualité juridique des avis. Vous le savez, le conseil d'Etat a annulé deux décisions prises par Madame Guigou en mettant en évidence le caractère insuffisant de la motivation des avis rendus par la commission de la transparence préalablement aux décisions du ministre de la santé.

Cette décision de justice fragilise l'ensemble des décisions de baisse de taux ou de déremboursement prises depuis 2001. Les enjeux financiers sont importants. Nous ne pouvons laisser un problème formel remettre en cause une politique dont aucun scientifique ne conteste le bien fondé.

Il fallait agir rapidement pour mettre fin à l'instabilité juridique née de cet arrêt. J'ai donc décidé de proposer au parlement une validation législative qui consolidera l'ensemble des décisions qui ont été prises et qui, à l'heure de leur annonce, n'avaient fait l'objet d'aucune contestation. Ce texte revêt la forme d'un amendement à un texte (voir fiche du dossier de presse) que le gouvernement fait actuellement discuter au parlement. J'espère qu'il pourra être promulgué dans les meilleurs délais.

Comme vous le voyez, malgré les imprévus qui font partie de tout quotidien, je maintiens le cap de la politique du médicament que j'avais définie à l'automne dernier.

Une politique du médicament au service des malades

J'avais souhaité faciliter l'accès de nos concitoyens aux innovations. Pour ce faire, j'ai mis en place une nouvelle procédure de dépôt de prix, et consacré 200 millions à l'innovation à l'hôpital.

J'ai souhaité pouvoir faire des économies sur les molécules plus anciennes, nous avons fait une campagne sur le générique, nous sommes en train de finaliser la mise en place des tarifs forfaitaires de remboursement et obtenu des laboratoires une baisse de prix conséquente sur le paracétamol équivalent à un prix générique.

Je désirais une gestion plus active de la liste des déremboursements : nous avons baissé la prise en charge de produits dont la prise en charge à 65% n'était pas justifiée, et nous allons procéder au déremboursement de la première phase du déremboursement des produits à SMR insuffisant. Il me semblait enfin nécessaire d'améliorer nos procédures : la modification de la commission de la transparence est en cours.

Les mesures que j'ai prises dès mon arrivée avec le soutien des professionnels de santé ont incontestablement concouru à ralentir la croissance des dépenses de médicaments en ville et à l'hôpital. Alors que le taux de croissance se situait à 7,7% par an en 2000 et 2001, il a été de 5,7% en 2002 et tout porte à croire que cet infléchissement se poursuivra en 2003.

C'est donc, avec constance et malgré les difficultés, que je trace un chemin pour assurer les meilleurs traitements aux coûts les plus justes pour les malades. C'est à eux seuls que je pense en définissant la politique du médicament car notre système de sécurité sociale doit rester ce qu'il a toujours été, juste et solidaire. Et tout le monde peut comprendre l'importance d'une prise en charge des meilleurs traitements, les plus innovants pour tous ceux qui en n'ont besoin lors des maladies graves. Le Ministre de la santé est d'abord le Ministre des malades et je veux que ceux-ci sachent ma détermination à leur assurer le meilleur, au meilleur coût pour nous tous. Ne l'oublions pas, nous payons tous pour que chacun soit pris en charge selon ses besoins.

La réévaluation mode d'emploi

1/ Pourquoi " réévaluer " les médicaments ?

L'objectif de la réévaluation, demandé en 1999 par le précédent gouvernement, était d'apprécier pour chaque médicament le bien fondé de son maintien au remboursement. En effet, avant cette date, il n'existait pas de procédure permettant de réviser périodiquement la liste des produits remboursés.

Pour ce faire, l'ensemble des médicaments remboursables par l'assurance maladie en ville s'est vu attribuer un service médical rendu (SMR).

Le SMR est un critère composite, défini à l'article R-163-3 du code de la sécurité sociale, qui prend en compte , d'une part la gravité de la pathologie dans laquelle le médicament est indiqué, d'autre part des données propres au médicament lui-même, dans l'indication considérée : efficacité, sécurité d'emploi, place dans la stratégie thérapeutique, et, le cas échéant, intérêt en termes de santé publique.

2/ Qui a réévalué les médicaments?

La commission de la transparence a été chargée de cette mission. Elle a pris en compte l'avis de groupes d'experts cliniciens dans chaque discipline thérapeutique. Elle s'est également appuyée sur les ressources de l'Agence française de sécurité sanitaire des produits de santé (Afssaps), qui assure le secrétariat de la commission.

3/ Comment s'est déroulée la procédure ?

La réévaluation comportait les phases suivantes :
- Regroupement des spécialités par classe pharmaco-thérapeutique
- Analyse des données et proposition de SMR par les groupes d'experts
- Examen des propositions par la Commission de la transparence et rédaction des avis
- Notification aux laboratoires concernés
- Examen par la commission des observations et des données déposées par les laboratoires qui le souhaitaient
- Nouvel avis de la commission
- Phase contradictoire avec possibilité pour la firme d'être entendue une nouvelle fois par la commission
- Avis définitif de la Commission de la transparence

4/ Les laboratoires ont-ils eu l'occasion de présenter leurs observations ?

Oui, les entreprises ont bénéficié de multiples occasions d'échanges avec la commission.

La réévaluation a fourni aux entreprises une première occasion de venir défendre le service médical rendu (SMR) par leur produit. Ensuite, chaque décision prise a donné lieu à une nouvelle possibilité d'échange.

Ainsi, lorsque le ministre a informé par courrier en février 2003 les entreprises de son intention de dérembourser certains médicaments en juillet 2003, il leur a offert la possibilité de présenter leurs observations. Sur les 95 présentations concernées par cette première phase de déremboursement, les laboratoires n'ont souhaité faire des observations que sur 10 d'entre elles. Ces observations orales ou écrites ont été examinées lors de réunions de la commission en mai et juin.

5/ Comment ont été classés les médicaments ?

Au terme de cette procédure, la Commission a qualifié le SMR de chacune des spécialités :
- SMR majeur ou important
- SMR modéré ou faible
- SMR insuffisant pour justifier d'une prise en charge par l'assurance maladie.

6/ Combien ont été concernés par cette réévaluation ?

Au 7 juin 2001, **4.490** spécialités avaient été réévaluées :
- **2.815** spécialités à SMR majeur ou important
- **840** spécialités à SMR modéré ou faible
- **835** spécialités à SMR insuffisant

7/ Si les médicaments à SMR insuffisant sont inefficaces, pourquoi maintenir leur autorisation de mise sur le marché ?

Pour qu'un médicament reçoive une autorisation de mise sur le marché (AMM) il est nécessaire que le bénéfice qu'il apporte (efficacité) soit supérieur au risque qu'il entraîne (effets indésirables). Cette évaluation du rapport bénéfice/risque se fait par indication, c'est à dire dans le cadre de la maladie auquel le médicament est destiné. L'AMM est accordée selon les standards scientifiques et médicaux en vigueur au moment où le laboratoire dépose sa demande. Elle peut être réévaluée, modifiée, ou retirée à tout moment si des données nouvelles laissent penser que le rapport bénéfice/risque n'est plus positif. Ceci est en particulier le cas s'il existe des effets indésirables nouveaux, ou plus graves que ce qui était attendu. Un problème de santé publique, comme le développement de la résistance aux antibiotiques, peut également justifier la révision ou le retrait d'une AMM.

Une réévaluation des AMM des médicaments contenant des antibiotiques pour usage local est ainsi en cours par l'Agence française de sécurité sanitaire des produits de santé, et s'est déjà traduit par le retrait récent du marché de médicaments contenant des antibiotiques pour administration par voie nasale.

Cependant, le fait qu'un médicament ait un SMR jugé insuffisant ne signifie pas pour autant qu'il existe un motif de santé publique justifiant son retrait du marché. Les médicaments les plus anciens ont été mis sur le marché à une époque où il n'était pas exigé du laboratoire d'apporter les preuves incontestables d'une efficacité clinique selon les standards actuels. Ces médicaments peuvent ainsi progressivement perdre leur place dans la stratégie thérapeutique, en raison de l'évolution des connaissances et de l'existence de nouvelles alternatives. Cependant, si le médicament en question est bien toléré (effets indésirables rares et bénins), il n'existe pas de motivation suffisante pour justifier un retrait de l'autorisation de mise sur le marché.

En revanche, il est légitime que, dans le cadre d'une politique de santé publique, les pouvoirs publics cherchent à réorienter les médecins et les patients vers des produits plus efficaces et mieux tolérés.

Les mesures prises à la suite de la réévaluation

1/ 2001 : baisse des taux de prise en charge des médicaments à SMR insuffisant

Le précédent gouvernement a baissé le taux de prise en charge des produits à SMR insuffisant et obtenu des baisses de prix de la part des laboratoires.

- **Les baisses de taux de prise en charge :** les baisses ont été organisées par un arrêté d'Août 2000 prévoyant la **baisse du taux de remboursement pour les vasodilatateurs périphériques et les nootropiques.** Ce texte a été abrogé en raison d'un vice de forme sanctionné par le Conseil d'Etat mais les baisses de taux ont été reprises par un arrêté du 14 septembre 2001. Un arrêté publié le 30 décembre 2001 a complété la baisse du taux de remboursement des autres médicaments dont

le SMR a été qualifié d'insuffisant et qui étaient encore remboursables à 65%.
- **Les baisses de prix** : L'Etat a demandé aux entreprises des baisses de prix sur les produits à SMR insuffisant selon un plan sur trois ans. Les baisses ont été obtenues en 2000, 2001 et 2002 respectivement de 7%, 8%, 7% en moyenne. Elles ont dans certains cas été remplacées par des déremboursements volontaires.

2/ Avril 2003 : 617 médicaments à SMR modéré ou faible font l'objet d'une baisse de taux de remboursement.

Les baisses de taux de remboursement de ces spécialités ont été mises en application en avril 2003, après que les laboratoires concernés ont été invités à présenter leurs observations à la commission de la transparence. La Commission a ainsi examiné des recours pour 68 spécialités. Pour 11 spécialités correspondant à 8 principes actifs, la commission a modifié son avis et considéré que le SMR était important.
L'arrêté de baisse de taux du 19 avril 2003 a concerné 617 présentations de médicaments correspondant 204 principes actifs.

3/ Juillet 2003 : présentation d'une liste préliminaire de médicaments à SMR insuffisant déremboursés

Jean-François Mattei a décidé de programmer le déremboursement des médicaments à SMR insuffisant en trois vagues (2003 à 2005). La première année concerne les médicaments dont la commission avait jugé, d'une part que le SMR était insuffisant, et d'autre part qu'ils n'avaient aujourd'hui pas de place dans la stratégie thérapeutique, d'autres moyens de prise en charge leur étant préférable (le plus souvent parce que ces derniers sont plus efficaces et mieux tolérés ou d'administration plus facile). En 2004 seront déremboursés les produits qui relèvent d'un choix d'automédication. Ils auront ainsi disposé d'environ 2 ans pour se préparer au passage à l'automédication. Enfin, en 2005, le déremboursement concernera des produits médicalement peu efficaces mais, pour l'heure, sans alternative thérapeutique.

4/ Combien de médicaments sont concernés ?

La liste initiale comptait 95 présentations.
- 2 produits ne sont plus commercialisés et ont déjà été radiés.
- 3 produits ont vu leur déremboursement reporté à une année ultérieure (2 formes de Sterlane et Covatine).
- 2 produits sont en attente d'un nouvel examen à la commission d'AMM (2 formes d'Isoprinosine)
- 4 produits sont maintenus au remboursement dont 3 suite à un changement de formule Toplexil et 2 formes de Dimetane et 1 suite à la réévaluation du SMR par la commission de la transparence (Orbenine).

Au total, 84 présentations seront déremboursées.

5/ Combien espérez-vous économiser avec cette mesure ?

Les déremboursements auxquels il est procédé cette année n'ont pas qu'un objectif financier. Ils répondent aussi à **un objectif de santé publique**. Ils visent des spécialités dont l'utilisation n'est plus souhaitable par les médecins et leurs patients. C'est pour cela que le tableau récapitulatif du dossier de presse indique les alternatives possibles. Il est possible que certains produits viennent se substituer aux produits que déremboursés.
Quelques repères financiers permettent toutefois d'apprécier l'ordre de grandeur de l'économie potentielle si l'on fait l'hypothèse que l'ensemble des produits de cette liste seront effectivement déremboursés. Le chiffre d'affaires TTC des spécialités déremboursées est de 82 millions d'€.

Une nouvelle politique du médicament : donner la priorité à l'innovation

1) État des lieux

Les dépenses de médicaments progressent à un rythme élevé : **depuis 1990**, elles ont plus que **doublé**. Les Français sont parmi les plus grands consommateurs mondiaux de médicaments (**3 milliards de boîtes consommés par an**, soit un peu moins d'une boîte par personne et par semaine).

Cependant, les patients souffrent d'un accès encore insuffisant à certaines innovations. Chaque année sont mis sur le marché des médicaments apportant des améliorations majeures. Ces produits sont de plus en plus coûteux : la recherche est longue et hasardeuse, les techniques employées de plus en plus sophistiquées, le nombre de patients en bénéficiant peut être faible. Le traitement par le Glivec revient à 30 000 €par an (pour la leucémie myeloïde chronique) par patient, Kineret utilisé dans la polyarthrite rhumatoïde se situe au même niveau de coût, le traitement par l'Herceptine pour certaines formes de cancer du sein coûte plus de 12 800 €...

La gestion du médicament se caractérisait jusqu'à présent par une absence de vision d'ensemble et par des opérations ponctuelle pour sortir de situations financières délicates.

2) Actions du gouvernement

Une politique du médicament lisible centrée sur l'innovation

Trois axes structurent la politique du médicament mise en place : le soutien à l'innovation, la recherche d'une efficience accrue pour les dépenses existantes et la simplification des dispositifs de régulation.

A - Garantir à tous l'accès aux médicaments les plus innovants :
- Fournir un effort supplémentaire pour le médicament innovant à l'hôpital. **200 M€** supplémentaires vont ainsi être consacrés à des médicaments particulièrement coûteux. **15 médicaments** sur les **4400 utilisés** représentent **25 % des dépenses** en médicaments à l'hôpital. Le Fabrazyme utilisé dans le traitement de la maladie de Fabri coûte **152 500 €**par an et par patient.
- Accélérer la mise sur le marché en pharmacie des médicaments les plus innovants. Le délai moyen actuel de mise sur le marché est de **240 jours**, il devrait pouvoir être réduit à environ **100 jours**.

B - Optimiser les dépenses sur les médicaments existants :
En réduisant les coûts supportés par l'assurance maladie sur des molécules existantes, il est possible de dégager des marges de manœuvre pour prendre en charge les innovations nécessaires à la santé des Français.

- Favoriser le développement du générique. Ces médicaments, copies fidèles de médicaments qui ne sont plus protégés par un brevet, sont de 30 à 40 % moins coûteux que les originaux. Ils n'occupent **qu'un peu plus de 6%** du marché français alors qu'ils dépassent plus de 20% chez certains de nos voisins. Quatre mesures ont été prises pour aider au développement des génériques.
a) L'accord du 5 juin entre les médecins et la caisse d'assurance maladie a permis d'impliquer le médecin dans la politique de promotion des génériques.
b) Une campagne de publicité grand public a été menée pour rappeler aux patients l'intérêt de ces produits.
c) La loi de financement pour la sécurité sociale pour 2003 a créé les forfaits de remboursement. Cette mesure vient en complément des politiques déjà déployées pour favoriser le développement du générique. Lorsque le forfait sera appliqué, le

patient sera libre du choix de la marque du médicament qu'il souhaite mais il ne sera remboursé qu'à hauteur du forfait.
d) La loi de financement pour la sécurité sociale pour 2003 prévoit enfin la possibilité de baisser les coûts supportés par l'assurance maladie pour des molécules anciennes comme le paracétamol ou l'aspirine.

La progression du générique a été spectaculaire ces derniers mois. Auparavant, lorsqu'un patient avait le choix d'un générique, il n'acceptait de le prendre que dans un cas sur trois. Désormais, il accepte une fois sur deux.

- Mener une politique de gestion active des produits remboursés. La réévaluation initiée en 1999 a permis de mettre en évidence 800 produits ne justifiant plus une prise en charge par les pouvoirs publics et 800 autres ne présentant pas un service médical rendu (SMR) suffisant pour une prise en charge à 65 %. En octobre 2002, le ministre a annoncé le déremboursement sur 3 ans de l'ensemble des produits à SMR insuffisants. Les produits à SMR modéré ou faible qui n'étaient pas pris en charge à 35 % viennent d'être ramenés à ce taux.

C - Simplifier et améliorer les dispositifs de régulation :
- **Évolution des taxes** dans le domaine pharmaceutique. Les assiettes varient d'une taxe à l'autre et sont contestées par les entreprises. La loi de financement pour la sécurité sociale 2003 a fait un premier pas dans le sens de la simplification en supprimant une des taxes, la taxe additionnelle sur les ventes directes. Elle a aussi été l'occasion de simplifier le calcul de l'assiette de la taxe sur la promotion.
- **Réforme de la commission de la transparence** : cette commission est chargée d'évaluer les médicaments qui pourraient être admis au remboursement. Malgré son rôle essentiel dans le dispositif, elle souffre d'un manque de moyens. Une première étape a consisté à rémunérer les experts qui participent activement au fonctionnement de cette commission. Une réforme plus globale aura lieu à l'occasion de son renouvellement.

3) Perspectives

La politique définie pour les médicaments sera poursuivie. D'autres économies sur les molécules anciennes peuvent être réalisées en accélérant le rythme d'apparition des génériques et en favorisant l'automédication.
Il faudra, avec l'aide de l'ensemble des acteurs du système de santé, trouver des solutions pour s'assurer que les Français n'utilisent que le strict nécessaire. La politique de développement de l'innovation sera poursuivie.

Présentation de la commission de la transparence

1/ Ses missions :

- donner un avis sur l'inscription, le renouvellement et la radiation des médicaments inscrits sur la liste d'admission au remboursement
- procéder aux réévaluations des listes de produits admis au remboursement lorsque nécessaire
- donner un avis sur les documents d'information à destination des praticiens et notamment les fiches d'information thérapeutiques ou les recommandations sur l'usage des médicaments.

2/ Sa composition : (article R.163-15 du code de la sécurité sociale)

- Un président et un vice-président
- Trois membres de droit : le directeur de la sécurité sociale ou son représentant ; le directeur général de la santé ou son représentant ; le directeur général de l'Agence

française de sécurité sanitaire des produits de santé ou son représentant ;
- Treize membres :
  - 7 représentants institutionnels: Un médecin au titre de l'ordre national des médecins ; un pharmacien choisi au titre de l'ordre national des pharmaciens ; deux représentants de la Caisse nationale de l'assurance maladie des travailleurs salariés ; un représentant de la Caisse nationale d'assurance maladie et maternité des travailleurs non salariés des professions non agricoles et un de la Caisse centrale de la mutualité sociale agricole ; un représentant de l'industrie pharmaceutique
  - Six membres choisis en raison de leur compétence médicale, scientifique ou économique dans le domaine du médicament.

Le président et le vice président et les membres (hors membres de droit) sont nommés par arrêté du ministre chargé de la sécurité sociale et du ministre chargé de la santé pour une durée de 3 ans renouvelable une fois.
La très grande majorité des membres de cette commission est soit médecin soit pharmacien. En dehors des représentants de l'administration, les membres de cette commission sont des bénévoles. Ils prennent sur leur temps de travail pour participer aux travaux de cette commission.

3/ Son fonctionnement :

La commission se réunit deux fois par mois pour une séance de 4 heures. Le secrétariat technique, administratif et scientifique de la commission est assuré par l'Agence Française de Sécurité Sanitaire des Produits de Santé.
La commission est assistée dans son travail, pour tous les dossiers qui le nécessitent, par des rapporteurs externes, notamment des médecins spécialistes du domaine pathologique concerné par le médicament évalué.
Elle se prononce en rendant des avis où elle détaille 2 critères :
- le service médical rendu : ce critère composite, (article R-163-3 du code de la sécurité sociale) prend en compte, d'une part la gravité de la pathologie dans laquelle le médicament est indiqué, d'autre part des données propres au médicament lui-même, dans l'indication considérée : efficacité, sécurité d'emploi, place dans la stratégie thérapeutique, et, le cas échéant, intérêt en termes de santé publique. Il permet une évaluation dans l'absolu de l'intérêt médical d'une spécialité au vu d'un éventuel remboursement. Il est aussi utilisé pour fixer le taux de prise en charge d'un produit. Cet indice est gradué de majeur à insuffisant.
- l'amélioration de service médical rendu (ASMR) évalue l'apport d'un nouveau médicament par rapport aux produits existants dans une indication. Ce critère est gradué de 1 (progrès majeur) à 5 (n'apporte rien par rapport aux produits existants). L'ASMR est utilisée par le Comité économique des produits de santé (CEPS) pour fixer le prix d'une spécialité.

Petit glossaire du médicament

Médicament
La définition réglementaire du médicament est la suivante :
(Art. L. 5111-1 du code de la santé publique)
"On entend par médicament toute substance ou composition présentée comme possédant des propriétés curatives ou préventives à l'égard des maladies humaines ou animales, ainsi que tout produit pouvant être administré à l'homme ou à l'animal, en vue d'établir un diagnostic médical ou de restaurer, corriger ou modifier leurs fonctions organiques."
Cette définition est assez générale, les autres termes utilisés ont des définitions plus précises.

Principe actif
Le principe actif est la substance responsable de l'action pharmacologique, ex : le paracétamol. Un même principe actif peut être présent dans de multiples spécialités et présentations.

Spécialité
La réglementation précise (Art. L. 5111-2 du code de la santé publique) :
"On entend par spécialité pharmaceutique, tout médicament préparé à l'avance, présenté sous un **conditionnement particulier et caractérisé par une dénomination spéciale**."
En pratique, les spécialités ont une autorisation de mise sur le marché.
Par exemple " Voltarène comprimés 50mg " et " Voltarène suppositoire 100 mg " et " Voltarène comprimés 25 mg " sont des spécialités différentes contenant un même médicament ou principe actif, le diclofénac.

Présentation
Une spécialité pharmaceutique peut être commercialisée sous différentes présentations, selon la taille ou la contenance du conditionnement.
Par exemple "ADVIL comprimés 400mg, Boîte de 20" et "ADVIL comprimés 400mg, Boîte de 30" sont des présentations différentes d'une même spécialité.

« 3ième vague de Médicaments Réévalués»

Mercredi 25 octobre 2006

CONTACT Service de Presse : 01 40 56 40 14 /12
www.sante.gouv.fr

Annexe 4-15

▪ Jeudi dernier, la Haute autorité de santé m'a recommandé de dérembourser 89 médicaments à service médical rendu insuffisant. **J'ai décidé de ne pas suivre l'avis de la HAS**. Je vais vous dire ce que j'ai décidé. Je veux vous dire pourquoi j'ai pris cette décision.

▪ Vous le savez, en 1999, le service médical rendu de l'ensemble des médicaments (soit 4 500) a été réévalué.
La prise en charge des médicaments doit s'apprécier en fonction du service médical rendu, et lui-même s'évalue et se réévalue en tenant compte notamment de l'évolution des connaissances scientifiques.

La prise en charge des médicaments nécessite donc **une gestion dynamique et rigoureuse**. Elle doit fournir à nos concitoyens l'ensemble **des médicaments dont ils ont besoin et seulement ceux là**. Elle doit aussi être capable de fournir des solutions pour l'ensemble des pathologies qui le nécessitent. Elle doit être en mesure d'assurer la prise en charge **des médicaments les plus innovants, même quand ce sont aussi les plus coûteux.**

• Je sais aussi que, **quand il n'y a rien, un médicament même faiblement efficace est un progrès pour les patients.**

• **Je souhaite donc qu'on ne parle plus de médicaments inefficaces ou inutiles.** C'est incompréhensible pour des patients qui prennent ces médicaments depuis des années. Ca l'est également pour les médecins qui ont prescrit ces médicaments. **Je préfère que l'on insiste sur le caractère prioritaire des médicaments remboursés** ; c'est pourquoi, je compte **modifier le décret sur la transparence prochainement.**

▪ La troisième et dernière vague de médicaments au service médical rendu jugé insuffisant vient d'être réévaluée par la Haute autorité de santé, autorité scientifique indépendante Elle porte sur des **médicaments à prescription obligatoire, c'est-à-dire sur des médicaments que seul un médecin peut vous autoriser à prendre**.

▪ La décision que je vais vous présenter prend compte plusieurs approches :
- la **recommandation scientifique** de la HAS
- l'existence d'**alternatives** thérapeutiques
- la capacité des patients concernés à **modifier leur comportement**
- **l'absence d'étude sur les reports** éventuels sur d'autres médicaments. Je demande d'ailleurs à l'Assurance maladie de procéder à ces études.
- **l'évolution des prix à la sortie du déremboursement**

Vous comprendrez qu'en tant que ministre de la santé, je dois non seulement fonder ma décision sur des recommandations scientifiques mais aussi **anticiper les conséquences d'un déremboursement sur les prix et voir très concrètement comment les patients et les professionnels de santé vont pratiquer ces changements.** La HAS est dans son rôle quand elle regarde l'appréciation scientifique, mon rôle c'est de tenir compte de la réalité sociale. Je suis convaincu que médical ne peut en aucun cas rimer avec brutal. Pour autant, je ne veux pas de statu quo.

▪ Sur la base d'éléments scientifiques **nouveaux**, la HAS a considéré que **5** des médicaments réévalués ont un service médical rendu suffisant pour être **pris en charge dans toutes leurs indications thérapeutiques** et **50 dans une partie de leurs indications**. Ces médicaments méritent donc d'être pris en charge, et continueront à l'être à hauteur de **65 ou 35 %, selon leur service médical rendu**.

▪ Pour 89 autres médicaments, la HAS a confirmé que le service médical rendu était insuffisant et a recommandé leur déremboursement selon des modalités adaptées à chaque type de médicament.

▪ Mais c'est aussi aux laboratoires, et non seulement aux patients, d'assumer les conséquences du service médical rendu insuffisant, je demande donc que soient appliqués à ces médicaments des **baisses de prix significatives. L'explosion des prix seraient incompréhensibles et inacceptables.**

Annexe 4-15

▪ Elle a en effet distingué **un premier groupe de 48 médicaments dit « vasodilatateurs »**, utilisés dans les troubles cognitifs des sujets âgés pour lesquels il n'existe **pas, à ce jour, d'alternative**. Et **un deuxième groupe de 41 médicaments** utilisés dans des pathologies diverses et souvent bénignes, pour lesquels **il existe**, en revanche, **d'autres traitements**.

▪ En ce qui concerne **le groupe dit des vasodilatateurs** pour lesquels il n'existe pas d'alternative, j'ai décidé de conserver leur prise en charge à hauteur de **35% tout en leur appliquant une baisse de prix allant jusqu'à 20%.** Je sais que des études importantes sont en cours sur certains de ses produits. Je souhaite que selon les vœux exprimés par le Collège de la Haute autorité de santé, **des nouveaux résultats cliniques** permettent de modifier comme cela a été fait pour d'autres médicaments l'évaluation de leur service médical rendu.

▪ En ce qui concerne **les 41 médicaments pour lesquels il existe une alternative**, j'ai décidé de conserver leur prise en charge, mais seulement **à 15%, et ce pendant un an avec une baisse de prix allant jusqu'à 15%.** Les patients qui le souhaitent pourront bénéficier d'une période de transition pendant laquelle la charge est répartie entre les patients, l'Assurance maladie et les laboratoires.

▪ Le maintien au remboursement, ne serait ce qu'à hauteur de 15%, permettra **aux patients de bénéficier d'un temps d'adaptation et aux professionnels de santé d'un temps de pédagogie**. Je suis par ailleurs très attaché à ce les prix ne flambent pas au moment du déremboursement. C'est pourquoi je souhaite aussi utiliser cette période **pour formaliser avec les industriels des accords de modération de prix à la sortie de leur déremboursement.**

▪ Je tiens à préciser que **les complémentaires santé vont également bénéficier de ces baisses de tarifs** et qu'elles n'auront donc aucune raison d'augmenter leurs tarifs, bien au contraire.

▪ **J'ai donc saisi le Comité des produits de santé pour que l'ensemble de mes décisions soient appliqués dès la fin du mois de janvier.**

▪ Enfin, je tiens à préciser que nous n'avons pas besoin de ce type de mesure pour réussir la réforme de l'Assurance maladie. Ce qui m'intéresse d'avantage, c'est l'évolution des comportements. Je suis fier qu'aujourd'hui un milliard d'euros soient consacrés chaque année à la prise en charge de médicaments nouveaux. Les 70 à 100 millions d'euros d'économie attendus sont bien loin de compte là.

Comité Economique du Médicament
Le Président

République Française

Le 17 février 2000

COURRIER ARRIVÉ LE : 22/02/2000
Le Conseiller
N° : 00001204O
Transmis à :
Le

NOTE

pour la ministre de l'emploi et de la solidarité

à l'attention d'Hervé Le Louët, conseiller technique

Objet : Conséquences de la réévaluation des médicaments.

Conformément à la demande de la ministre, j'ai consulté les entreprises pharmaceutiques les plus concernées par la réévaluation des médicaments afin d'examiner avec elles selon quelles modalités on pouvait envisager de donner suite aux avis rendus par la commission de la transparence. Parallèlement à ces discussions particulières, une concertation a été engagée avec le SNIP, comme cela avait été prévu dans l'accord sectoriel de juillet dernier.

La ministre trouvera ci-après successivement un compte rendu de ces consultations (A) et des propositions d'action (B).

A- Compte rendu de consultations

1- Outre la concertation avec le SNIP, des discussions approfondies ont eu lieu avec les 18 entreprises les plus concernées, représentant à elles seules plus de 90 % du chiffre d'affaires total des médicaments à SMR insuffisant (Aventis, Sanofi Synthélabo, Servier, Pierre Fabre, Beaufour Ipsen, Merck AG, Negma, Lafon, BASF, Chiesi, Innothéra, Expanscience, Mayoly, Médiolanum, Pharmapharm, Roche-Nicolas, Wyeth et Novartis.

2- Ni les entreprises consultées ni le SNIP ne se déclarent hostiles au principe même de la réévaluation. Beaucoup sont en revanche critiques sur certains aspects de la procédure suivie. Toutes dénoncent avec vigueur les fuites constatées et médiatisées depuis l'été, y compris sur les travaux préparatoires de la commission. Au-delà des questions de principe, nombreuses sont les entreprises à contester le traitement infligé à leurs propres produits, cette contestation m'ayant paru particulièrement forte pour les veinotoniques et ceux des vaso-dilatateurs qui détiennent une indication dans l'artérite des membres inférieurs. Il faut s'attendre à des contentieux sans doute assez nombreux.

8, avenue de Ségur - 75350 Paris 07 SP - Tél. : 01 42 56 73 76 - Télécopie : 01 43 06 30 02

3- La perspective d'un déremboursement immédiat est considérée comme difficilement soutenable, à des degrés divers selon ce que représentent ces produits dans leur chiffre d'affaires, par toutes les entreprises consultées sauf une (il s'agit d'Innothéra, qui produit des bas de contention, et qui estime qu'en cas de déremboursement des veinotoniques, la progression des ventes de bas pourrait rapidement compenser ce qu'elle perdrait à l'occasion du passage de son veinotonique en non-remboursable).

De fait, un déremboursement immédiat serait catastrophique pour Beaufour Ipsen (près d'un millier d'emplois), Negma, Lafon et un grand nombre de petites entreprises. Servier et Pierre Fabre s'en sortiraient, mais au prix d'un ralentissement sévère du développement de leurs futurs produits et sans doute, bien qu'ils ne l'aient pas évoqué devant moi, de réductions d'effectifs ou de non-création d'emplois. Aventis et Sanofi Synthélabo seraient fortement handicapées, en termes de ressources à consacrer au développement de leurs innovations, par rapport à leurs concurrents mondiaux.

Pour les filiales françaises de groupes étrangers, qui sont souvent d'anciennes PME indépendantes rachetées au fil du temps, les dégâts seraient importants en termes d'emplois (usines de fabrication et visiteurs médicaux). Je dois cependant signaler, pour sa valeur symbolique, l'exception de Mediolanum, petit groupe italien qui est menacé pour 70 % de son chiffre d'affaires, et qui m'a néanmoins indiqué que, quoiqu'il arrive en termes de déremboursement, il ne supprimerait aucun emploi en France.

4- Encore que sans enthousiasme, toutes les entreprises m'ont paru estimer qu'un déremboursement différé pouvait être géré par elles sans trop de dégâts pour autant que le délai soit suffisant.

5- Pour échapper à un déremboursement immédiat, et tant que le risque de déremboursement reste crédible, la plupart des entreprises seraient prêtes à accepter des baisses de prix, à l'exception notable de Beaufour.

6- Le SNIP ne serait pas opposé à des baisses de prix, tout en revendiquant qu'elles soient aussi modérées que possible et en rappelant que pour les médicaments remboursés à 35 %, compte tenu des dispositions de l'accord sectoriel, les ristournes sont plus avantageuses pour le sécurité sociale que les baisses de prix. Il estime que les déremboursements, différés ou non, devraient être sélectifs. Selon lui, un déremboursement peut être rapidement envisagé pour les magnésiums, pour peu que l'AFSSAPS leur confère une indication exploitable auprès du grand public, pour les bains de bouche ou pour certains produits d'ophtalmologie. Le SNIP juge, en revanche que le déremboursement est, même à terme, difficilement envisageable pour les vaso-dilatateurs à indication « artérite des membres inférieurs », pour lesquels il n'existe pas d'alternative thérapeutique et qui ne peuvent en aucun cas être exploités en automédication. Sa position est intermédiaire pour les veinotoniques pour lesquels, à s'en tenir au plan technique et commercial, un passage à l'automédication lui paraît concevable, dès lors qu'il serait laissé aux entreprises le temps de s'y préparer.

Le SNIP souhaite, de manière générale, qu'on privilégie les baisses de taux de remboursement en indiquant qu'elles ont un effet important de réduction des volumes prescrits.

B- Propositions d'action

1- **Annoncer un déremboursement à terme** (le 31 décembre 2003 ?) en indiquant que pourront y échapper les médicaments pour lesquels la commission de la transparence aurait avant cette date réévalué le SMR attribué sur la base d'un nouveau dossier d'essais cliniques. Pour pouvoir bénéficier de ce délai, les laboratoires devraient avoir accepté des baisses de prix conventionnelles (cf. 3 ci dessous).

Commentaire : c'est le nœud du dispositif. Il me paraît clair qu'on ne peut pas tout dérembourser tout de suite, ce qui serait dévastateur à tous égards, et pas seulement pour des raisons d'emplois ou de maintien du potentiel industriel français dans ce secteur, encore que ces raisons soient sérieuses.

Ce sont avant tout des raisons d'ordre sanitaire et social qui s'opposent à un déremboursement massif et brutal, étant rappelé que les médicaments contestés s'adressent, pour la plus grande part, aux personnes âgées (vaso-dilatateurs cérébraux) ou aux femmes qui souffrent des jambes (veinotoniques) et que, même si ces médicaments ne sont pas d'une grande efficacité, ils répondent incontestablement à une demande et à une douleur et on ne leur connaît pas d'alternative thérapeutique crédible. Il est vrai que l'usage, en cette quantité, de ces médicaments constitue une exception française et on peut sans doute légitimement soutenir, d'un point de vue rationaliste, que les gens ne se porteraient pas plus mal et, a fortiori, ne mourraient pas plus vite s'ils s'abstenaient d'en consommer, mais cette exception française constitue une donnée culturelle lourde, et je crois périlleux de prétendre en venir à bout sans délai ni pédagogie préalable.

Secondairement, on ignore tout des reports de prescription qui se produiraient en cas de déremboursement immédiat. Il faut cependant redouter, la maladie ou la plainte ne disparaissant pas avec le déremboursement du médicament, que ces reports ne se portent sur des produits plus coûteux et inutilement –voire dangereusement- plus actifs : anti-alzheimer et anti agrégants plaquettaires à la place des vaso-dilatateurs, anti-inflammatoires accompagnés d'antiulcéreux à la place des veinotoniques, benzodiazépines à la place des sédatifs à base de plantes, etc. Dans une stricte perspective d'équilibre des comptes de l'assurance maladie, il n'est pas certain que le déremboursement immédiat soit une bonne affaire.

En sens inverse, il ne me paraît pas non plus possible de ne rien faire en matière de déremboursement, ce qui décrédibiliserait durablement le processus de réévaluation et serait en opposition avec les orientations de la politique du médicament annoncées par la ministre et qui, je le répète, ne m'ont paru contestées par aucun de ceux que j'ai rencontrés.

On ne peut pas davantage, enfin, se contenter d'annoncer qu'on déremboursera plus tard, sans fixer précisément les conditions et les délais de ce déremboursement.

Les avantages de la formule proposée sont :

- Qu'elle ne discrédite ni les médecins ni les malades dans leurs usages respectifs de prescription et de consommation, tout en validant clairement l'avis de la commission de la transparence, qui ne peut se prononcer que sur des preuves scientifiques ;
- Qu'elle se traduit néanmoins par des mesures immédiates ou d'effet prochain, et permet de ne pas encourir le reproche d'avoir en pratique enterré un élément important de la politique du médicament.

On aurait pu imaginer de subordonner le différé de déremboursement au lancement de nouveaux essais cliniques mais, outre qu'un tel processus saturerait très rapidement les possibilités d'essais françaises, cela risquerait de créer un effet d'aubaine pour les plus grandes entreprises, qui bénéficieraient de l'inévitable renonciation des petites, et, paradoxalement, de relancer la promotion et la prescription de ces médicaments.

2- **Publier sans délai l'avis de la commission de la transparence et organiser l'information des professionnels de santé**, par exemple par une lettre de la ministre à l'ensemble des médecins et des pharmaciens (ci-joint en annexe, à toutes fins utiles, un projet de lettre).

Cette information devrait être relayée par l'assurance maladie qui pourrait à cette fin chercher à passer au niveau national ou régional des accords de bon usage du médicament avec les représentants des médecins.

Commentaire : On peut attendre de cette mesure trois effets :

- Une incidence directe sur la prescription en faisant appel à la responsabilité des médecins ;
- L'occasion d'expliquer clairement la différence entre un médicament dont le SMR ne justifie pas la prise en charge collective et un médicament inutile ;
- Une caution apportée au travail de la commission de la transparence, qui me paraît avoir grand besoin d'être soutenue dans cette affaire.

3- **Baisser les prix** en deux étapes à l'été 2000 et à l'été 2001, ce qui reviendra, pour les plus importantes des classes de médicaments concernées, à accélérer le processus de baisse engagé à l'été 1999. Je n'ai évidemment pas ouvert de négociation explicite sur ce point avec les entreprises, dans l'attente de la décision de la ministre sur le dispositif d'ensemble, mais il est raisonnable de penser que ces baisses, ou les déremboursements volontaires qui s'y substitueraient (cf. 4 ci-dessous) pourraient représenter 500 MF (en CA annuel) à l'été 2000 et autant à l'été 2001.

Commentaire : Comme prévu dans l'accord sectoriel, ces baisses feraient l'objet d'une compensation forfaitaire dans le calcul des remises quantitatives de fin d'année dues en cas de dépassement de l'ONDAM. Le rendement net immédiat serait donc considérablement plus faible (au mieux 200 MF) mais aurait son plein effet dès l'année suivante. Surtout, la mesure serait très visible pour les médecins et pour le public et constituerait une compensation pour l'assurance complémentaire pour les baisses de taux de remboursement (cf. 5 ci-dessous).

4- **Accepter, et même encourager les déremboursements, même isolés** et les accompagner en aménageant les règles de la publicité grand public. On peut espérer

aboutir rapidement à des déremboursements collectifs sur quelques classes, et notamment les magnésiums.

Commentaire : Les déremboursements isolés de médicaments substituables à des produits qui resteraient remboursés n'entraînent bien sûr que peu d'économies pour l'assurance maladie dans la mesure où les prescriptions sont massivement reportées. Je crois cependant qu'il y a intérêt à les encourager, pour leur portée symbolique lorsque ces médicaments sont impropres à une exploitation en non remboursable, et pour amorcer le mouvement de passage à l'automédication dans le cas contraire.

Le projet de loi de modernisation de la santé pourrait être l'occasion d'autoriser la publicité grand public au cours des quelques mois précédant un déremboursement décidé.

5- **Faire sans délai les passages de 65% à 35%** pour les produits actuellement pris en charge à 65 % et dont le SMR est faible ou modéré ainsi que, dans l'attente d'un éventuel déremboursement, pour ceux dont le SMR est insuffisant.

Commentaire : Dans le contexte du dispositif d'ensemble ci-dessus, cette mesure deviendrait parfaitement naturelle. Il ne pourrait en particulier pas être reproché à l'Etat de faire supporter aux seules mutuelles les conséquences de la réévaluation puisque celles-ci bénéficieraient directement des baisses de prix et, en perspective, des déremboursements annoncés. Du point de vue des comptes de l'assurance maladie, je rappelle que ces changements de taux devraient permettre une économie de plus de 1 milliard en année pleine.

*

Il y a à mon avis urgence à ce que la ministre fasse connaître sa décision, et ceci pour deux raisons essentielles :

D'abord parce que plus le temps passera, plus s'installera l'opinion que le gouvernement n'est en aucun cas prêt à dérembourser, ce qui rendra très difficile à mettre en œuvre toute autre mesure alternative. Spécifiquement, on ne peut espérer de baisses de prix significatives dans un cadre conventionnel que si le risque du déremboursement reste crédible.

En second lieu parce que le respect de l'ONDAM 2000 dépend très directement de la rapidité avec laquelle on aura tiré les conséquences de la réévaluation, sachant que, même hormis l'épidémie de grippe qui va coûter assez cher en dépenses remboursées de médicaments, la tendance actuelle du marché n'est pas à la décélération et qu'il va être difficile de maintenir durablement la croissance française des dépenses à un niveau aussi inférieur à celui constaté chez ses principaux voisins.

Pour ces motifs, il me semble en particulier qu'il n'y a pas intérêt à surseoir en annonçant que les conséquences de la première série d'avis de la commission de la transparence ne seront tirées qu'à l'achèvement du processus général de réévaluation. Je souligne à cet égard que, quoiqu'on entende parfois dire, il n'y a pas de réel enjeu d'égalité de traitement entre entreprises dans une décision immédiate portant sur la seule première phase

de réévaluation, car la concurrence dans le secteur du médicament s'exerce entre produits partageant les mêmes indications thérapeutiques. On sait, de surcroît, que les entreprises qui seront vraisemblablement touchées par les phases à venir seront pour l'essentiel les mêmes que celles de la première phase.

Fiche sur le Médiator établie à la demande de la mission de l'IGAS

P.J. copie des JO des 11 octobre 2000, 20 octobre 2001 et 12 octobre 2002

1) Prix

Sur la période antérieure à 1991, le CEPS ne dispose d'aucune information. A cette date, le prix du Médiator était de 26,70F en prix fabricant hors taxes.

A la suite de la réévaluation générale du SMR des médicaments remboursables de 1999, la ministre de l'époque (Martine Aubry), qui avait demandé cette réévaluation, a décidé de maintenir au remboursement l'ensemble des produits auxquels la commission de la transparence avait attribué un SMR insuffisant (dont le Médiator).
En contrepartie, il a été demandé au CEPS (alors comité économique du médicament) de baisser les prix de ces médicaments. L'orientation donnée au comité était d'obtenir, en moyenne, une baisse de 20% en trois ans.
Le comité a aussitôt engagé une négociation conventionnelle avec l'ensemble des entreprises concernées avec comme objectif d'obtenir pour l'année 2000 une première baisse équivalente, en moyenne, à 7% du chiffre d'affaires total de ces produits.
Les médicaments appartenant à des catégories homogènes, comme les veinotoniques, les mucolytiques ou les vasodilatateurs ont fait l'objet de demandes de baisses à des taux variables, et d'autant plus grands que leur coût de traitement journalier était élevé. Les autres, c'est-à-dire ceux qui étaient seuls de leur espèce, comme le Médiator se sont vu demander uniformément 7% de baisse.
Le comité a accepté des contrepropositions de la part des entreprises, soit sous la forme d'une modulation des baisses entre médicaments exploités par le même laboratoire, soit sous forme de déremboursements volontaires, dès lors que le résultat économique recherché était atteint.
Le prix du Médiator a ainsi été baissé de 10%, passant, en PFHT, de 26,70F à 24,03F. Par cette baisse plus élevée que celle qui lui était demandée, le laboratoire obtenait de moins baisser le prix d'un autre médicament, le Daflon (veinotonique).

Deuxième étape en 2001, et nouvelle baisse conventionnelle du Médiator, dont le prix fabricant passe de 24,03F à 22,35F (soit 7% de baisse).

Pour la troisième étape de 2002, le laboratoire Servier a refusé la baisse conventionnelle qui lui était proposée pour le Médiator comme pour tous les autres produits concernés qu'il exploitait. Afin de maintenir l'égalité de traitement entre entreprises, le comité, qui ne pouvait pas encore, à l'époque, prendre de décisions unilatérales, a demandé aux ministres (santé et finances) de prendre un arrêté de baisse. Cet arrêté, publié au JO du 12 octobre 2002, baissait le prix de Médiator de 5% (de 3,41€ à 3,24€) ainsi que ceux de 5 autres médicaments exploités par Servier. L'entreprise a fait un recours contre cet arrêté et l'a perdu.

2) Taux de remboursement

Le CEPS n'est pas compétent en matière de taux de remboursement et n'a pas été associé aux procédures. Il en a en revanche été tenu étroitement informé, mais je ne peux donc que rappeler les souvenirs que j'ai conservés de ces évènements.

La baisse (de 65% à 35%) du taux de remboursement des vasodilatateurs a été décidée la première au vu du caractère emblématique de cette classe de médicaments. Il faut se souvenir qu'à l'époque, les journaux qui se penchaient sur le sujet alternaient deux types d'articles. Ceux qui dénonçaient le gaspillage consistant à continuer à rembourser des médicaments « inutiles » ; ceux qui alarmaient patients et médecins sur l'éventualité d'un déremboursement de médicaments que, pour les uns, ils avaient durablement prescrits et qui, pour les autres, leur faisaient – pensaient-ils - depuis longtemps le plus grand bien.

La décision de passer les vasodilatateurs à 35% a été un compromis sur cette alternative : on ne causait aucun tort aux patients ni aux médecins puisque l'assurance complémentaire prenait le relais mais on réduisait la dépense injustifiée de l'assurance maladie obligatoire.

Il me semble que le train suivant de baisses de taux a été arrêté dans le même esprit, par classes de médicaments.

Le fait que le Médiator, et sans doute un ou deux autres produits, aient échappé à ces mesures tient, me semble-t-il, probablement à ce qu'il constituait une classe à lui tout seul. Ce qui est en revanche certain, c'est que son cas n'a à aucun moment été évoqué devant le CEPS au cours de ces procédures, ni sur le registre des économies à réaliser, ni a fortiori sur celui de la sécurité.

3) déremboursements

Là encore, le CEPS, juridiquement incompétent, n'a été qu'informé des mesures engagées. J'ai cependant, intuitu personae, été consulté par les ministres qui se sont successivement saisis de cette question dans la mesure où les déremboursements, à la différence des baisses de taux, ne sont évidemment pas sans conséquences sur la situation des entreprises concernées.

En 1999, j'avais indiqué à Mme Aubry que le comité pouvait faire son affaire, au plan industriel, des déremboursements recommandés par la commission de la transparence, pour peu qu'on accepte que cela soit très progressif. Il m'a paru clair que la décision qu'elle a prise de ne rien dérembourser a été exclusivement inspirée par le souci de ne pas priver les patients ni les médecins de médicaments auxquels, à tort ou à raison, ils étaient très majoritairement attachés.

Il faut noter que les déremboursements opérés à cette époque, et notamment ceux décidés par arrêté du 4 septembre 2001, l'ont été à l'initiative des laboratoires, en lieu et place des baisses de prix qui leur étaient demandées, et non à l'initiative de l'Etat.

La répartition en trois catégories des médicaments dont la commission de la transparence avait estimé le SMR insuffisant a été opérée, dans mon souvenir, à la demande de M. Mattéi lorsque celui-ci était ministre de la santé. Les critères de la répartition étaient les suivants :

Devaient être classés dans la catégorie 1 (médicaments à dérembourser sans délai) les spécialités qui disposaient d'indications communes avec des médicaments à SMR suffisant, et

Annexe 4-16

dont on pouvait donc considérer sans ambigüité que leur maintien au remboursement exposait les patients à une perte de chances. Ceux-ci risquaient en effet de se voir prescrire un médicament avec un rapport bénéfice risque moins bon que celui d'un autre médicament disponible pour la même indication. A ma connaissance, le cas du Médiator n'a pas été évoqué lors de ce travail de classement dans la mesure où ce médicament disposait d'une indication exclusive.

La catégorie 2 était constituée de ceux des médicaments non classés dans la catégorie 1 et non soumis à prescription obligatoire. Il s'agissait donc de médicaments dont le déremboursement pouvait être envisagé dans la perspective d'un passage à l'automédication.

La catégorie 3 était constituée des médicaments n'appartenant à aucune des deux premières. Elle incluait donc naturellement le Médiator, produit de prescription obligatoire. Le déremboursement de cette dernière catégorie était considéré comme plus difficile.

La catégorie 1 a été effectivement déremboursée à cette époque.

Après la réforme de l'assurance maladie de 2004, M. Bertrand, devenu ministre de la santé, a demandé à la nouvelle HAS de se prononcer sur les médicaments des catégories 2 et 3. Celle-ci a, pour l'essentiel, confirmé le caractère insuffisant du SMR de ces spécialités sans établir de distinction entre les catégories.

Les mesures prises à la suite de cet avis l'ont été sans considération pour leurs conséquences industrielles, mais exclusivement en fonction de leur acceptabilité par les patients. Il va de soi que, comme dans les épisodes précédents, la question de la dangerosité intrinsèque de produits, le Médiator ou un autre, n'a jamais émergé lors de la préparation des décisions.

Téléphone : 01 44 38 38 38
Télécopie : 01 44 38 20 10

NOTE

A l'attention de Madame la Ministre
S/C de Monsieur Dominique MARCEL
Directeur du Cabinet
et de Monsieur Pierre-Louis BRAS
Directeur-adjoint du Cabinet

OBJET : Réforme du remboursement/Conséquences à tirer de la réévaluation

I - RAPPEL

La réforme du remboursement prévoit que l'admission sur la liste des médicaments remboursables sera dorénavant fondée sur le service médical rendu. Celui-ci sera apprécié en tenant compte de l'efficacité et des effets indésirables du médicament, de sa place dans la stratégie thérapeutique, la gravité de l'affection à laquelle le médicament est destiné, ainsi que du caractère préventif, curatif ou symptomatique du traitement médicamenteux et de son intérêt pour la santé publique.

Le décret fixant les nouvelles conditions d'admission au remboursement a été publié le 27 Octobre 1999.

Parallèlement, une opération de réévaluation du service médical rendu de l'ensemble des médicaments remboursés a été initiée en mars 1999. Celle-ci se déroule en 3 phases. Les résultats définitifs de la première phase sont connus, de même pour les résultats préliminaires de la seconde phase.

Il faut noter que la troisième phase ne concerne que peu de médicaments ; ses résultats ne seront pas de nature à remettre en cause les décisions qui pourraient être prises au vu des résultats des deux premières phases.

Lors de la transmission des résultats définitifs de la première phase, vous avez souhaité que tous les acteurs concernés (syndicats des médecins et de pharmaciens, ordres professionnels, industriels, mutualité) soient consultés, afin de connaître leurs propositions sur les conséquences à tirer de cette réévaluation. Vous trouverez en annexe I les résultats de cette concertation.

Annexe 4-17

II – PROPOSITION D'ACTION

Vous trouverez en annexe :

- les données économiques concernant les déremboursements, les hausses de prix et les baisses de taux (annexe II)
- les données démographiques relatives aux principales classes de médicament concernées (annexe III)
- la position de la DGS (annexe IV)
- Les mesures à adopter sur les dispositifs médicaux (annexe V)

D'une façon générale, ne rien faire serait catastrophique puisqu'il s'agirait là d'une décrédibilisation durable d'un axe important de la politique du médicament, que vous avez initiée il y a maintenant 3 ans. De plus, hormis quelques exceptions, je vous rappelle que le principe même de cette démarche n'a été remise en question par personne.

Appliquer immédiatement les avis de la Commission de la Transparence serait à l'inverse suicidaire, tant l'impact d'une telle mesure serait catastrophique pour nombre d'entreprises d'une part, en terme d'emploi (pour les plus petites), mais également en terme de ressources à consacrer au développement de leurs innovations (pour les plus grandes.). D'autre part, parce que nous mettrions en péril l'organisation sanitaire et sociale en déstabilisant sans information les praticiens, et en s'exposant à un report de prescriptions massif coûteux et dangereux (anti-alzheimer et anti-agrégants à la place des vasodilatateurs, benzodiazépine à la place des sédatifs à base de plantes).

Bien évidemment, nous sommes à peu près certains que le fait de ne plus utiliser ces médicaments ne remettraient pas en cause les données de la morbi-mortalité dans notre pays, mais cette hyper consommation est une donnée culturelle de notre pays, qu'il nous faudra gérer à plus long terme grâce à des mesures de formation et d'information appropriées.

Quatre outils sont à notre disposition pour gérer de façon efficace et équilibrée ce dossier avec le minimum « d'effets secondaires » possibles. Il s'agit :

1°) d'un déremboursement à terme de 2 ou 3 ans
2°) des baisses de prix
3°) des baisses de taux
4°) d'une campagne de formation et d'information active

2 scénarios sont possibles :

Le premier consiste à :

- annoncer à terme de 2 ou 3 ans,

  • le déremboursement des spécialités dont le SMR a été jugé insuffisant,
  • la baisse du taux de remboursement (65 % → 75 %) pour les spécialités dont le SMR a été jugé faible ou modéré,

- effectuer immédiatement des baisses de prix d'environ 5 % par an sur les médicaments dont le SMR a été jugé insuffisant, et, ce jusqu'au déremboursement.

Ce scénario permet de tirer les conséquences de la réévaluation, sans impact immédiat sur les assurés, et sans prendre le risque d'un conflit majeur avec l'un des protagonistes. En revanche, le gain pour les comptes de l'exercice 2000 sera faible (environ 150 MF), et d'environ 500 MF pour 2001 (cf. annexe II). Ce gain faible pour l'année 2000 s'explique par le fait que la baisse des prix ne concernerait en pratique que le dernier trimestre de l'année. En effet, la loi nous impose que toute baisse de prix soit négociée dans le cadre conventionnel. Ce n'est qu'en cas d'échec éventuel de cette négociation que des arrêtés peuvent être pris. Cela prendra donc quelques mois.

Le 2ème scénario consiste à :

- Annoncer les déremboursements à terme de 2 à 3 ans des médicaments dont le SMR a été jugé insuffisant.

- Effectuer immédiatement

  • des baisses de taux pour les médicaments dont le SMR a été jugé insuffisant mais aussi pour ceux dont le SMR à été jugé mineur ou modéré,
  • des baisses de prix d'environ 5 % par an pour les médicaments dont le SMR a été jugé insuffisant.

Le risque de conflit notamment avec la mutualité est réel, toutefois les gains pour l'assurance maladie seront beaucoup plus significatifs puisque en sus des baisses de prix, cette mesure rapporterait 525 MF en 2000 et 2,1 MdF en 2001.

Commentaires

1°) Déremboursement à terme :

Cette annonce présente un triple avantage. Tout d'abord, c'est la seule mesure qui crédibilise l'ensemble du dispositif, et qui permettra d'inciter les différents partenaires -notamment les industriels-, à accepter les autres dispositions.

De plus, cette mesure, si elle est accompagnée d'une information intelligente des praticiens et du public, ne discréditera ni les malades, ni les médecins dans leurs usages respectifs de prescription et de consommation.

Enfin, cette solution pourrait être gérée sans trop de dégâts par les entreprises pour autant que le délai soit adapté. Bien évidemment, le terme du remboursement sera à évaluer au cas par cas. Il peut être rapide pour les magnésiums, dans la mesure où ceux-ci font l'objet d'un consensus scientifique très large et d'un consensus quasi total au niveau industriel, ainsi que pour les médicaments appartenant à des classes où il demeure des médicaments à SMR important. Dans ce dernier cas, il existe une meilleure alternative thérapeutique au sein de la classe (ex : hypnotiques). Le patient est donc mieux soigné .

Il peut être délayé à 2 ou 3 ans pour les médicaments appartenant à des classes thérapeutiques où l'ensemble des produits a un SMR insuffisant. Il n'y a donc pas d'alternative possible au sein de la classe (ex : les veinotoniques, les vasodilatateurs...), de façon à prendre en compte les données socio-culturelles et économiques.

Sur le plan financier, les déremboursements suivant les avis de la Commission de la Transparence génèreraient une économie brute (c'est-à-dire hormis l'effet report) de 9,6 MdF pour l'assurance maladie et de 5,5 MdF pour la mutualité.

A l'évidence, les effets du déremboursement seront différents selon qu'il s'agit d'un médicament appartenant à une classe où subsiste un nombre important de produits à SMR important, ou d'un médicament appartenant à une classe dont tous les médicaments ont vocation à être déremboursés.

Dans le premier cas, l'effet report serait de 100 % vers les autres médicaments de la même classe, mais le bilan en volume serait neutre.

Dans le second cas, l'attitude des prescripteurs et des patients est difficile à prévoir et dépendra de la capacité du produit à passer en automédication. Dans cette hypothèse, le gain brut du déremboursement ne serait plus que de 2,3 MdF.

L'aménagement du déremboursement nécessite que soient adoptées des mesures favorisant le passage en automédication. Sur le plan du statut même de l'automédication, un simple toilettage des AMM est nécessaire, mais aucune disposition législative n'est à envisager. A l'inverse, nous pourrions faire adopter lors de la loi santé une disposition visant à permettre aux produits ayant demandé le délistement de faire de la publicité deux mois avant la date effective du délistage.

2°) Baisses de prix

Les simulations qui vous sont proposées sont basées sur une baisse de prix globale de 5%. On peut discuter de l'opportunité d'annoncer une baisse de prix homogène sur l'ensemble des firmes. En effet, le nombre de produits soumis à une baisse de prix est très variable dans le CA total des entreprises. Ainsi, le taux de 5% pourrait être difficile à gérer pour les entreprises qui ont une forte proportion de produits à baisser, et ne pourrait être dépassé pour celles qui, au contraire, peuvent supporter une baisse plus élevée.

3°) Baisse des taux (de 65 à 35 % pour tous les produits à SMR insuffisant, modéré ou faible

Elle est évidement récusée par la mutualité puisque le coût supplémentaire assuré par celle-ci serait de 1,8 MdF (en année pleine). Cette somme pourrait être diminuée par le déremboursement de quelques classes et par les baisses de prix. Enfin, il s'agirait d'un surcoût transitoire puisque nombre des médicaments concernés s'inscrivent dans une procédure de déremboursement à terme.

Enfin, le transfert de charge des mutuelles à l'assurance maladie à l'occasion de la réforme de la marge des officines est estimé à 300 MF, et le surcoût dû à l'augmentation tendancielle du taux moyen de remboursement est estimé à 600 MF (soit près de 1 MdF).

Annexe 4-17

4°) Campagne d'information et de formation

Une campagne d'information et de formation, éventuellement relayée par l'assurance maladie, devra être conduite. Elle permettra d'avoir une incidence directe sur la prescription. La forme que celle-ci doit revêtir est à discuter. Cette information devrait permettre de réexpliquer la différence entre l'AMM et le SMR.

De façon immédiate, une synthèse des avis de la Commission de la Transparence en attente pourrait être diffusée sous une forme qui reste à déterminer. Vous trouverez en (annexe VI) ? un projet de lettre aux médecins et pharmaciens.

III - CONCLUSION

D'une façon générale, cette réforme doit avoir un habillage le plus « santé publique possible ». Elle permet essentiellement, d'une part, de mieux soigner les patients, d'autre part, de dégager des sommes qui seront immédiatement réinvesties dans la prise en charge des dispositifs médicaux (annexe V). Aucune économie n'est donc réalisée sur la santé de la population.

Je vous remercie de me donner vos instructions sur la démarche à adopter.

Hervé LE LOUËT

ANNEXE I

Annexe 4-17

ANNEXE I
RESULTAT DE LA CONCERTATION
(SYNTHESE)

De façon globale, les différents acteurs consultés réagissent de façon corporatiste. Vous trouverez, ci-joint, les comptes-rendus des différentes réunions.

1. Les syndicats de médecins

Les médecins ont peu d'idées sur les conséquences à tirer de la réévaluation. Ils se réfugient derrière une critique souvent non étayée de la procédure de réévaluation (c'est-à-dire du fonctionnement de la Commission de la Transparence). Bien évidemment, ils n'osent pas remettre en cause le principe même de réévaluation (hormis la CSMF qui considère qu'il s'agit là d'un simple habillage d'une politique uniquement budgétaire), mais l'on sent très clairement, bien que tout cela soit du domaine du non dit, que les médecins ont peur qu'on ne les prive du support de la relation thérapeutique avec les malades. Il s'agit là d'une attitude bien française où chaque consultation doit être sanctionnée d'une prescription médicamenteuse.

De plus, beaucoup de praticiens ne se voient pas expliquer à leurs patients qu'ils leur prescrivent depuis des années des médicaments « inutiles » (la confusion entre SMR et utilité est omniprésente chez les médecins).

2. Les pharmaciens

Si les pharmaciens ne remettent pas en cause le principe, les deux syndicats se livrent à une critique véhémente des procédures de la Commission de la Transparence, et agitent le spectre d'une médecine à deux vitesses.

En réalité, la grande peur des pharmaciens est qu'un déremboursement massif conduise à une sortie des produits concernés du pan pharmaceutique. Ceci représente, évidemment, une perte substantielle pour leur chiffre d'affaires (8 à 11 %).

3. Les ordres professionnels

- *L'Ordre national des Médecins* : le message essentiel de l'Ordre national des Médecins est que, quelles que soient les mesures adoptées, l'Ordre ne s'engagera pas dans un conflit sur la liberté de prescription. M. DETILLEUX a préféré placer le débat sur l'évolution du système de protection sociale. Lui aussi confond les procédures d'AMM et d'accès au remboursement.

- *L'Ordre national des Pharmaciens* : M. PARROT s'est livré à une critique des procédures de fonctionnement de la Commission de la Transparence. Il s'était déjà livré par voie de presse à ce type d'exercice dans sa « lettre à mes confrères ».

M. PARROT se prononce pour une baisse des taux de remboursement des médicaments à SMR insuffisant, et insiste sur la nécessité de mesures pédagogiques d'accompagnement dont le support pourrait être le réseau des pharmaciens

4. La Mutualité :

Les deux fédérations consultées (FNMF et FMF) ont souligné leur attachement à la réévaluation. Bien évidemment, ils manifestent l'un et l'autre une opposition farouche à toute baisse des taux ou à la création d'un taux intermédiaire soulignant qu'une telle mesure les mettraient en péril sur le plan financier, mais, surtout, n'aurait aucune influence sur le contenu de la prescription. Ils soutiennent en revanche les déremboursements

Annexe 4-17

COMPTE-RENDU DES REUNIONS AVEC LES SYNDICATS SUR LES CONCLUSIONS A TIRER DE LA REEVALUATION DES CLASSES THERAPEUTIQUES

MG-France (M. R BOUTON, Président)

M. BOUTON, à qui l'on demandait de réagir sur les conséquences à tirer du travail de réévaluation des classes thérapeutiques, a plaidé en faveur d'une « médicalisation de la prescription ».

Celui-ci pense qu'il faut éviter les déremboursements massifs, et redéfinir des sous-populations de patients susceptibles de bénéficier des thérapeutiques dont le SMR a été jugé insuffisant. Les questions sur les modalités selon lesquelles de telles populations seraient définies sont restées sans réponse. De plus, M. BOUTON dénonce la volonté des pouvoirs publiques d'imposer aux médecins, en plus de leur raisonnement sémiologique et thérapeutique, une prise en compte du « rapport qualité/prix ».

A l'évidence, la position adoptée par M. BOUTON est purement circonstancielle et dénote une mauvaise compréhension du processus et de la méthodologie de la réévaluation (mais ceci est sans doute de notre responsabilité).

En réalité, ces termes pour le moins équivoques sous-tendent l'angoisse des généralistes de devoir se passer de médicaments dont ils ne remettent pas en cause l'unique intérêt placebo, mais qui sont le support de leur relation thérapeutique avec le patient.

Toutefois M. BOUTON a soulevé 2 problèmes réels :

- Le premier problème concerne l'information thérapeutique dont disposent les médecins généralistes. Celle-ci est quasi-uniquement dispensée par l'industrie pharmaceutique, et il est évident que des mesures devront êtres prises pour remédier à cela. M. BOUTON

est cependant resté fort discret sur les formes que celle-ci pourrait revêtir.

- Le deuxième problème, plus difficile à régler, est qu'en ce qui concerne le tiers-payant, pour les généralistes, la prescription justifie l'acte.

En conclusion la position de M BOUTON manque de clarté. Hormis une opposition de principe, on ne relève pas de réelles contre-propositions.

U.C.C.S.F

Compte-tenu de la nature de l'exercice des praticiens représentés par ce syndicat, le Pr WINISDOEMFER n'a émis aucun avis sur le processus de réévaluation et fait confiance à la commission de la transparence.

Il a simplement fait remarquer que le déremboursement des veinotoniques, qu'il considère inutiles, inciteraient les patients à subir une intervention au niveau de leurs vamiles et de leurs hémorroïdes (et comme chirurgien, il s'en félicite !).

C.S.M.F.

La CSMF représentée, par son Président, M. MAFFIOLI, s'est montrée extrêmement virulente sur le processus de réévaluation.

M. MAFFIOLI considère qu'il n'a aucune proposition à faire sur les conséquences à tirer de la réévaluation, dans la mesure où il remet en cause les travaux de la commission de la transparence.

Les critiques alléguées sont :

- une mauvaise distinction entre l'utilité et le Service Médical Rendu par le médicament
- une commission comportant trop d'hospitalo-universitaires
- des experts partiaux et n'ayant aucun sens du vécu quotidien et de la relation thérapeutique
- une commission qui travaille trop vite et sur des critères non validés

Il propose donc que la commission soit réellement transparente tant au niveau de ses membres que de sa méthodologie et qu'elle associe un peu plus de praticiens de terrain.

Enfin, M. MAFFIOLI considère que cette opération n'est qu'un habile habillage d'une politique essentiellement guidée par l'impératif budgétaire.

Syndicat des Médecins Libéraux (SML - Dr CABRERA)

L'entretien avec M. CABRERA a été bref. Il souligne son attachement au principe de la réévaluation dans la mesure où il est convaincu que la société doit opérer des choix.

Il formule, cependant moins violemment, les mêmes critiques vis-à-vis de la commission de la transparence que C. MAFFIOLI. Le Dr CABRERA met en garde contre une politique de déremboursement rapide et mal conduite, ce qui génèrerait un effet de report de prescriptions vers des classes médicamenteuses plus coûteuses et plus dangereuses.

En terme de proposition, M. CABRERA est favorable à une baisse de taux pour certaines classes et à un déremboursement à terme.

Annexe 4-17

COMPTE-RENDU DE LA REUNION AVEC LES SYNDICATS DE PHARMACIENS SUR LES CONSEQUENCES A TIRER DE LA REEVALUATION DE L'ENSEMBLE DES CLASSES THERAPEUTIQUES

Personnes présentes :

- Messieurs BERAS et JAPHET, respectivement Président et Vice-président de l'Union nationale des pharmacies de France (UNPF).
- Monsieur CAPDEVILLE, Président de la Fédération syndicale des Pharmacies de France.

Monsieur BERAS à qui l'on demandait son avis sur les conséquences à tirer de la réévaluation de l'ensemble thérapeutique, nous a répondu qu'il s'agissait là d'un mauvais dossier.

Il a critiqué, de façon véhémente, la notion de service médical rendu, le fonctionnement de la commission de transparence et a souligné l'absence de représentation, au sein de cette même commission, de pharmaciens d'officine.

De façon générale, Monsieur BERAS s'est opposé à toute mesure de baisse de taux ou de déremboursement arguant du fait que l'on allait pénaliser les personnes les plus défavorisées.

Il s'est, en revanche, prononcé en faveur d'une baisse de prix progressive effectuée par le comité économique du médicament.

Cette appréciation générale a été confirmée par son Vice-président, Monsieur JAPHET qui, toutefois, ne s'est pas opposé à une baisse de taux de 65 à 35 % pour les vasodilatateurs. Monsieur JAPHET a également voulu nous mettre en garde contre le risque de transfert de prescription notamment en ce qui concerne les veinotoniques et les vasodilatateurs.

Il insiste sur la nécessité d'un vaste travail pédagogique avant que de prendre une quelconque mesure. En réalité, l'angoisse majeure de Monsieur JAPHET est que, selon lui, le déremboursement massif d'un certain nombre de classes thérapeutiques conduirait, comme cela a été le cas avec les vitamines, à une sortie de ces produits du pan pharmaceutique avec une perte financière substantielle.

Monsieur CAPDEVILLE a repris les critiques vis-à-vis de la Commission de transparence dénonçant : « un cénacle hospitalo-centriste ». Il a également regretté l'absence de pharmaciens au sein de cette Commission. Il se dit d'accord avec le président de l'ordre des pharmaciens qui dénonce une manipulation de la part de la Commission de transparence.

Toutefois, Monsieur CAPDEVILLE, conscient de la nécessité de réformer, nous a fait un certain nombre de propositions.

Monsieur CAPDEVILLE pense qu'un déremboursement brutal des spécialités telles que préconisées par la Commission de transparence, serait suicidaire et ouvrirait la porte aux assureurs privés type AXA. Cet avis est largement repris par ses confrères.

Ceci étant, Monsieur CAPDEVILLE se dit prêt à soutenir une démarche qui consisterait à opérer des baisses de prix progressives sur les produits dont le SMR a été estimé insuffisant, pour arriver à terme, à un déremboursement de ces spécialités.

Annexe 4-17

Compte-rendu de la réunion avec M. DUTILLEUX

Ordre National des Médecins

Monsieur DUTILLEUX ne remet en cause ni la démarche, ni la procédure de réévaluation. Il insiste sur l'importance du pouvoir discrétionnaire de la ministre.

Il craint toutefois un problème de lisibilité du message en évoquant une crainte diffuse parmi nos concitoyens d'une médecine à 2 vitesses.

Selon lui, il ne faut évidement pas tout médicaliser, et plutôt que d'agir sur l'accès au remboursement, retirer purement et simplement l'AMM aux médicaments à SMR insuffisant.

Toutefois M. DUTILLEUX souligne que les problèmes posés par la réévaluation dépassent largement le cadre du médicament, mais interrogent sur l'avenir de la protection sociale.

Il nous fait part de ses craintes de voir dans les années qui viennent se développer le recours aux assureurs privés, et s'interroge sur le rôle à jouer par la mutualité.

Enfin, M. DUTILLEUX nous informe que quelles que soient les mesures, l'Ordre ne s'engagera pas dans un conflit sur la liberté de prescription.

Annexe 4-17

Compte-rendu de la réunion avec

M. PARROT, Président de l'Ordre national des Pharmaciens

Interrogé sur les conséquences à tirer de la réévaluation, M. PARROT a essentiellement critiqué les procédures de fonctionnement de la Commission de la Transparence à laquelle il appartient depuis plusieurs années (à noter qu'il s'est déjà livré à ce type d'exercice par voie de presse dans sa « lettre à mes confrères »).

Ainsi, M. PARROT regrette ;

- la lourdeur de la rédaction des avis, qui selon lui ne mettent pas assez en évidence les données les plus pertinentes,

- la main mise d'une administration toute puissante conduisant à un manque d'indépendance de la commission,

- le rôle « délétère » des caisses qui ne raisonnent qu'en termes économiques (il remet en cause le droit de vote accordé aux caisses dans cette instance).

Enfin, il déplore que l'idéal scientifique de la Commission de la Transparence ne soit tourné que vers les produits majeurs, et dénonce les « maltraitances » dont sont victimes les petits médicaments.

Il propose d'enrichir la Commission de la Transparence des praticiens de terrain, et de faire participer plus souvent les sociétés savantes (il critique ainsi la médecine basée sur les faits).

Selon M. PARROT, les avis de la Commission de la Transparence ne sont pas applicables en l'état.

Il préconise une baisse de taux pour les médicaments à SMR insuffisant, et un passage progressif en automédication pour certaines classes comme les veinotoniques.

Il insiste sur la nécessité des mesures d'accompagnement pour expliquer cette démarche aux prescripteurs et aux publics, l'outil idéal étant pour lui d'utiliser le maillage du territoire du réalisé par le réseau officinal.

Annexe 4-17

Compte-rendu de la réunion avec LA FNMF

Mr DAVAN et le Pr. BERAS ont été reçus pour nous livrer leur réflexions sur les conséquences tirer de la réévaluation.

Ils ont souligné l'importance qu'ils attachaient à la redéfinition du panier de soins et ne contestent pas les travaux effectués par la Commission de la Transparence.

Ils regrettent toutefois de n'être associés à aucune commission, et donc de ne pouvoir peser dans la négociation.

A cet égard, une place pourrait être accordée à la mutualité au sein de l'Observatoire national de la Prescription.

Sur les outils disponibles pour mettre en œuvre les conclusions de la Commission de la Transparence, il ont émis les avis suivants :

- opposition farouche à toute baisse de taux ou à la création d'un petit taux. Ceci pour des raisons financières évidentes mais également parce que cette mesure ne modifie pas le contenu de la prescription.

- baisse de prix : avis favorable à des baisses de prix significatives et progressives pour les médicaments à SMR insuffisant. Ceci devait à terme conduire à un déremboursement.

Ces baisses doivent être associées à une homogénéisation des prix dans certaines classes thérapeutiques.

- déremboursement : nos interlocuteurs sont bien évidemment favorables à cette mesure. Celle-ci doit être progressive, et doit s'accompagner d'une large information des médecins et du grand public auquel ils sont prêts à s'associer.

Ils insistent sur le bien fondé de cette mesure qui permettra de renforcer la prise en charge sur le nécessaire (réparation, prévention).

A titre d'exemple, la mutualité se dit prête, en cas de déremboursement des veinotoniques, à réévaluer la prise en charge de la contention.

Pour étayer cette volonté, M. DAVANT évoque la possibilité pour la mutualité de se désengager de la prise en charge des veinotoniques.

Annexe 4-17

Compte-rendu de la réunion avec LA FMF

L'entretien avec M. ZAMICHIEI fut plus bref.

Celui-ci ne remet pas en cause le processus de réévaluation. Il s'oppose fermement à une éventuelle baisse de taux de remboursement qui, selon lui, conduirait à un conflit dur avec la mutualité.

M. ZAMICHIEI nous met en garde contre une mesure de déremboursement trop large et trop rapide qui ouvrirait la voie à une médecine à 2 vitesses, et à un effet de report de prescriptions incontrôlable.

Enfin, il évoque la nécessité d'une large information des prescripteurs et du grand public.

ANNEXE III

A l'attention de Hervé Le Louët (4 pages)

En ce qui concerne la première vague, un SMR **insuffisant** a été attribué pour les classes suivantes :

1- les veinotoniques
2- les vasodilatateurs
3- les magnésiums
4- les sédatifs à base de plantes

1- Concernant les veinotoniques, ces prescriptions représentent 3,8% des ventes des spécialités remboursables ce qui représente un coût d'environ 1,6 milliard de francs pour les régimes d'assurance maladie.
L'estimation du nombre d'utilisateurs de ces produits est de 6 millions de personnes pour 18 millions de prescriptions par an.
Deux tiers des utilisateurs sont âgés de plus de 50 ans dont 80% sont des femmes.

2- Concernant les vasodilatateurs, ces prescriptions représentent 2,6% des ventes des spécialités remboursables ce qui représente un coût d'environ 2,7 milliards de francs pour les régimes d'assurance maladie.
L'estimation du nombre d'utilisateurs de ces produits est de 1,3 million de personnes pour 14 millions de prescriptions par an.
Plus de 90% des utilisateurs sont âgés de plus de 60 ans dont 55% sont des femmes.

3- Concernant les magnésiums, ces prescriptions représentent 0,7 % des ventes des spécialités remboursables ce qui représente un coût d'environ 0,3 milliard de francs pour les régimes d'assurance maladie.
Le nombre de prescriptions de ces produits est de 5,5 millions par an.
La plupart des utilisateurs ont entre 20 et 55 ans , dont 70% sont des femmes.

4- Concernant les sédatifs, ces prescriptions représentent 0,3 % des ventes des spécialités remboursables ce qui représente un coût d'environ 0,2 milliard de francs pour les régimes d'assurance maladie.
Le nombre de prescriptions de ces produits est de 2,6 millions par an.
La moitié des utilisateurs ont entre 20 et 55 ans , dont 76% sont des femmes.

NB : Il ne peut être procédé à une addition du nombre de personnes consommant les médicaments des deux premières classes pour laquelle cette information est disponible puisqu'une même personne peut consommer plusieurs de ces médicaments à la fois.

Pour les autres classes, le nombre d'utilisateurs des produits concernés n'a pu être estimé fautes de données sur les durées effectives de traitements et sur les renouvellements de prescription. De plus, l'ensemble des informations concernent en général des classes thérapeutiques pour lesquelles les posologies et conditionnements de chaque produit doivent être considérés pour ces estimations.

Les seules informations rapidement disponibles sont le nombre de prescriptions par an et les données de vente.

annexe IV

ELEMENTS POUR UNE LETTRE DE LA MINISTRE AUX MEDECINS ET AUX PHARMACIENS

Pour les informer des résultats de la réévaluation des médicaments et leur expliquer les conséquences qui vont en être tirées.

Une orientation essentielle de la politique du médicament conduite par le Gouvernement consiste, comme vous le savez, à s'assurer que la prise en charge collective des spécialités et son montant sont, pour chacune d'elles, justifiés par le service médical qu'elle rend au regard de son efficacité, de ses effets indésirables, de sa place dans les stratégies thérapeutiques et de la gravité des maladies soignées ou prévenues. C'est en effet l'une des conditions pour que, par ailleurs, les médicaments innovants puissent continuer à être rapidement remboursés par la sécurité sociale et ainsi mis à la disposition de tous les malades.

A cette fin, j'ai demandé à la commission de la transparence de procéder à une évaluation de l'ensemble des médicaments actuellement remboursables par l'assurance maladie afin d'en déterminer le niveau de service médical rendu. Ce travail sera achevé avant la fin de cette année, mais la commission m'a d'ores et déjà transmis l'avis qu'elle a rendu à l'issue de la première phase de ses travaux, qui ont porté sur les classes de médicaments suivantes : système cardiovasculaire, rhumatologie, métabolisme-nutrition et, pour partie, psychiatrie.

J'ai décidé de diffuser cet avis et il m'a paru naturel que les premiers destinataires de cette diffusion soient les médecins et les pharmaciens, comme étant à la fois les mieux qualifiés pour recevoir cette information et susceptibles de la prendre en compte, s'ils l'estiment justifié, dans leurs pratiques de prescription, de délivrance ou de conseil, étant bien entendu qu'il ne s'agit encore que d'un avis, mais que cet avis émane d'une commission impartiale, composée d'experts reconnus, et dont les travaux ont été conduits en toute indépendance de jugement.

Vous constaterez dans le document ci-joint que la commission de la transparence a classé les médicaments évalués selon cinq niveaux de service médical rendu : majeur, important, modéré, faible et insuffisant. Les quatre premiers niveaux n'appellent pas de commentaire particulier, et il est probable que ce classement recoupe, pour l'essentiel, votre propre jugement sur les médicaments concernés si l'on se réfère aux critères du service médical rendu tels que je les rappelais au début de cette lettre. Ce classement fondera désormais le niveau de prise en charge des médicaments remboursables par l'assurance maladie obligatoire.

En revanche, l'attribution à certains médicaments d'un niveau de service médical rendu insuffisant nécessite des explications. Il faut rappeler avant tout que ce classement ne signifie pas, contrairement à ce qui a pu être dit ici ou là, que les médicaments en question sont inutiles. Il s'agit de médicaments au plein sens du terme, qui ont reçu à ce titre une

autorisation de mise sur le marché, et pour lesquels il a donc été établi qu'ils exerçaient une action sur l'organisme et que leur rapport bénéfice-risque était favorable. Il peut certes se faire que, pour tel ou tel d'entre eux, le progrès des connaissances et celui des techniques d'évaluation amène aujourd'hui à considérer que sa mise à la disposition des malades ne se justifie plus, ou seulement pour des indications plus restreintes. Mais ce n'était pas la question posée à la commission de la transparence, et ce n'est donc pas le sens qu'il faut donner à son avis.

La question posée à la commission de la transparence était celle du niveau de service médical rendu au dessous duquel la prise en charge collective, par l'assurance maladie obligatoire, d'un médicament pourrait n'être pas justifiée. L'avis qu'elle a rendu répond à cette question dans le registre scientifique et technique qui est le sien.

Il appartient désormais à l'Etat de prendre les décisions, sur la base de cet avis, mais en intégrant également d'autres considérations d'ordre sanitaire, économique ou social. J'ai donc procédé à une large concertation, en particulier avec vos représentants des ordres ou des syndicats ainsi qu'avec les industriels du médicament et leurs représentants.

Il apparaît clairement, au terme de cette concertation, qu'un déremboursement immédiat et donc sans préparation de l'ensemble des médicaments concernés aurait des conséquences très préjudiciables à un grand nombre de malades. C'est vrai en particulier dans les cas où ces produits, bien que leur efficacité démontrée soit faible ou très faible, constituent aujourd'hui la moins mauvaise des réponses médicamenteuses possibles à des souffrances qui, elles, sont bien réelles.

Il demeure cependant indispensable de traduire dans les faits le processus de réévaluation engagé, dont les objectifs conservent toute leur pertinence. J'ai donc décidé de donner suite aux avis rendus par la commission de la transparence, mais de façon progressive, éventuellement sélective et en tenant le plus grand compte des opinions et des suggestions formulées par les représentants de vos professions.

De manière générale, les déremboursements proposés par la commission de la transparence seront différés pour ne prendre effet qu'au 31 décembre 2003. Je souhaite que ce temps soit mis à profit – et ce ne peut être que par votre concours et dans l'exercice de votre responsabilité- pour que la prescription de ces médicaments, au vu de l'information nouvelle qui résulte de l'avis, soit progressivement réduite pour se limiter aux indications les mieux établies.

De leur côté, les laboratoires pharmaceutiques qui le souhaiteront et qui l'estimeront possible pourront utiliser ce délai pour obtenir, sur la base de preuves nouvelles, une nouvelle évaluation de la commission de la transparence et justifier ainsi, au terme du délai fixé, le maintien de la prise en charge de certains de ces médicaments.

Afin cependant qu'il soit sans attendre tiré les premières conséquences de l'avis de la commission, sans préjudice pour les malades, au plan de la répartition des ressources collectives consacrées au médicament, il sera demandé aux entreprises de baisser les prix de ceux de leurs produits dont le service médical rendu a été considéré comme insuffisant.

Enfin, l'opportunité de dérembourser plus rapidement telle ou telle catégorie de médicaments sera examinée au cas par cas, en tenant compte notamment des considérations

médicales, économiques ou sociales qui peuvent justifier le passage de ces médicaments sur le marché dit de la médecine familiale ou de « l'automédication ».

MINISTERE DE L'EMPLOI
ET DE LA SOLIDARITE

REPUBLIQUE FRANCAISE

PARIS, le mercredi 8 mars 2000

DIRECTION GENERALE DE LA SANTE

LE DIRECTEUR GÉNÉRAL

LA/DC

00. 255

NOTE

Pour

Madame la ministre de l'emploi et de la solidarité

A l'attention de Monsieur Hervé LE LOUET

OBJET : Réévaluation des spécialités pharmaceutiques

Après l'avis de la Commission de transparence sur les spécialités jugées comme ayant un "SMR" insuffisant, il me semble important que des décisions soient prises assez rapidement car : l'absence de décision pourrait entraîner une perte de crédibilité importante pour tout le processus de réévaluation, avec des conséquences potentiellement sérieuses dans un contexte où la "menace" de déremboursement est souvent brandie vis à vis des firmes qui ne respecteraient pas leurs engagements pour de nouveaux produits.

1- Remarque sur les éléments d'évaluation

Trois remarques doivent être faites en préalable.

La Commission de transparence a attribué le même SMR, jugé "insuffisant", à toutes ces spécialités ; elle s'est basée pour cela, à juste titre, sur la qualité des dossiers scientifiques fournis par les firmes. Ceci ne peut être remis en question.

Mais derrière cette même « côte », se retrouvent des réalités parfois assez différentes,qui font qu'une mesure unique pour toutes les spécialités me semble difficilement envisageable. Des différences importantes existent à plusieurs niveaux :

1) la pathologie-cible des traitements alors que certaines de ces molécules s'adressent à des entités cliniques mal définies (ex : perte cognitive) ou très bénignes (problèmes cutanés), voire indéfinies (« fatigue ») d'autres sont censées apporter une contribution à la prise en charge des pathologies graves (artérites des membres inférieurs).

2) pour certains produits il n' existe pas d'alternative thérapeutiques bien documentées (certains troubles des artérites) ; dans certains cas, les alternatives sont plus dangereuses (benzodiazépines à la place de sédatifs mineurs), ou beaucoup plus chères, avec une efficacité discutable (traitement de l'Alzheimer pour les pertes cognitives). Se pose alors la question du report de prescriptions.

3) Niveau de preuve : un SMR peut avoir été jugé insuffisant soit parce que, malgré des études adéquates, la molécule n'a pas d'effet notable sur la santé, soit parce qu'aucune étude n'a été réalisée qui aurait permis de mettre en évidence de façon incontestable l'existence d'un effet. Ceci est souvent une question de moyens.

Ces trois éléments (pathologie-cible, alternatives thérapeutiques et niveau de preuve) peuvent orienter une politique modulée vis à vis de l'ensemble de ces molécules. En effet, une politique drastique, uniforme et brutale pourrait avoir des conséquences délétères en termes de service médical rendu, de coût, pouvant aboutir ainsi à l'inverse de l'effet recherché.

2 – Mesures envisageables :

Trois mesures peuvent être envisagées :

- la réduction du taux de remboursement
- la baisse de prix
- le déremboursement (immédiat ou à terme)

La réduction du taux de remboursement des spécialités qui bénéficient encore d'un taux élevé, ne peut s'envisager qu'accompagnée d'au moins une baisse des prix ou une prévision de déremboursement à moyen terme, afin de ne pas faire supporter le fardeau de cette mesure entièrement par les assurances complémentaires (mutuelles). Si ceci était acquis, aucun produit ne devrait avoir un remboursement supérieur à 35 % par l'assurance maladie, afin de bien marquer l'insuffisance de "SMR" notée par la Commission de transparence pour ces spécialités.

Une baisse de prix de l'ordre de 25 à 30 % (7 à 8 % par an en moyenne) est sans doute acceptable pour une large gamme de produits. Cette baisse aboutirait sans doute au retrait (du remboursement) de molécules à faible marché, mais celles largement utilisées – et donc couvrant une vaste population – devraient la supporter.

Le déremboursement devrait être annoncé immédiatement et de façon claire, avec une application soit à court terme (1 an) soit dans un délai de 3 ans, selon les spécialités, en fonction des critères définis plus haut. Les molécules bénéficiant d'un délai, auraient ainsi une possibilité de recours en cas d'élément nouveau justifiant une réévaluation du SMR (au moins une nouvelle étude incontestable pour pouvoir prétendre à une réévaluation dans 3 ans). Ceci donnerait le temps aux molécules à SMR jugées insuffisantes par manque de preuve de faire appel de cette décision par la mise en place d'études appropriées. Le délai de 3 ans ne devrait s'adresser qu'aux molécules répondant à l'un des critères suivants : i) pathologie sérieuse ; ii) pas d'alternative ou report de prescription probable plus coûteux ou plus dangereux.

3 - **Mise en place**

La fixation du remboursement à 35 % devrait se faire après information des principales mutuelles, en montrant que la baisse de prix et le déremboursement à terme se traduit par un gain probable pour elles. Cela ne concerne que peu de molécules, la plupart des spécialités réévaluées étant déjà à ce niveau de remboursement.

La baisse de prix doit s'accompagner de la définition de critères simples :

- baisse modérée pour les produits les moins chers de la classe
- alignement des autres prix sur ceux des produits les moins chers de la classe
- volume

Le déremboursement à court terme (1 an) ou à moyen terme (3 ans) peut être décidé classe par classe ou par grande catégorie de produits, en appliquant les critères proposés plus haut. La DGS peut rapidement (1 mois) procéder à une proposition à cette classification avec quelques experts.

Il faut noter la nécessité de prévoir des mesures d'accompagnement pour le déremboursement éventuel :

- information des médecins et des patients (DGS/AFSSAPS/CFES)
- "toilettage" de certaines AMM pour permettre l'automédication dans certains cas
- éventuellement vérification de certains textes
- guides de bonnes pratiques (AFSSAPS/ANAES/DGS)

NOTE

A l'attention de Madame la Ministre
S/C de Monsieur Pierre-Louis BRAS
Directeur-adjoint du Cabinet

OBJET : Politique du médicament. Préparation de la réunion des Ministres et préparation de la réunion avec le SNIP.

Compte tenu du dépassement des dépenses consacrées au médicament par rapport à l'objectif fixé, des propositions ont été discutées en réunion interministérielle avec le Ministère de l'Economie, des Finances et de l'Industrie sur la base du document joint (annexe I).

I – CONSEQUENCES A TIRER DE LA REEVALUATION DE L'ENSEMBLE DES CLASSES THERAPEUTIQUES

Vous avez proposé que deux types de mesures soient prises :

➢ *des mesures à terme :*

- déremboursement à terme de 2 ou 3 ans des médicaments dont le SMR est insuffisant. Cette mesure aurait un impact sur environ 10 % du chiffre d'affaires de l'industrie pharmaceutique (9,16 MdF) ;

- passage de 65 % à 35 % des médicaments à SMR modéré ou faible (sauf les vasodilatateurs). Cette mesure pénalisante pour la mutualité et les assurés génèrera un gain de 2 MF.

➢ *des mesures immédiates :*

- baisse d'environ 7 % par an sur 3 ans (soit 20 % au total) pour les médicaments à SMR insuffisant. Le gain généré peut être estimé à 500 MF en année pleine. Une baisse de 10% par an est très largement négociable avec le SNIP ;

- passage de 65 % à 35 % de la classe des vasodilatateurs : gain généré 600 MF.

Le MEFI émet un avis favorable sur ces mesures, estimant que le coût industriel est tolérable. En effet, celui-ci considère que ces mesures ne feront qu'accélérer la recomposition nécessaire du tissu industriel dans le domaine pharmaceutique. Il évoque toutefois la possibilité de fermeture de quelques usines, dont les plus significatives sont celles de Beaufour à Dreux, et de Negma à Quimper (800 emplois au total). A cet égard vous trouverez, en annexe II, l'impact des déremboursements et des baisses de taux sur les principaux laboratoires ainsi que les sites d'implantations.

C'est en raison de ce risque que nous avions décidé de ne procéder à des déremboursements qu'au terme de 2 à 3 ans, et ce, afin de laisser aux entreprises concernées la possibilité de se reconvertir ou de préparer le passage à l'automédication.

Néanmoins, ceci n'exclut pas des situations difficiles, voire des fermetures de sites.

II – LE DURCISSEMENT DE LA CLAUSE DE SAUVEGARDE (annexe III)

Nous avons proposé une augmentation de barème de la clause de sauvegarde afin d'en augmenter le rendement. Du fait de l'effet seuil, la sécurité sociale récupère aujourd'hui, de manière aléatoire, entre 60 et 30 % du dépassement.

Le MEFI semble favorable au principe d'un tel durcissement.

Cette démarche comporte un risque réel vis-à-vis de la politique conventionnelle.

Si nous durcissons le barème de la clause de sauvegarde, nous pourrions donner instruction au président de CEM d'établir un système de remise, certes plus élevé que celui en vigueur, mais plus avantageux que la clause de sauvegarde. En effet, actuellement, les instructions données au président du CEM consistent à récupérer en remises conventionnelles au moins ce qu'aurait rapporté l'application de la cause de sauvegarde. Ainsi, si nous décidons d'établir un barème allant jusqu'à un taux de récupération de 80 % du dépassement, l'objectif à atteindre dans le cadre des remises conventionnelles pourrait s'établir à 70 %. Il y aurait donc intérêt pour les industriels à passer une convention.

Pour M. RENAUDIN, un tel objectif de 80 % est trop élevé (risque de rejet de toute politique conventionnelle, forte contestation des laboratoires

étrangers...). Il pense que le maximum que nous puissions imposer pour la clause de sauvegarde est 70 %, avec un écart de 20 % pour le dispositif conventionnel, soit 50 %.

Les diverses hypothèses sont décrites en annexe III

Il semble que dans un premier temps, nous pouvons maintenir une position dure vis-à-vis de l'industrie pharmaceutique pour donner des garanties à l'assurance maladie. Les Finances devraient jouer leur rôle d'avocat des laboratoires.

Pour apprécier la rigueur du mécanisme, si un taux de récupération de 80 % est élevé, il faut tenir compte du fait que les objectifs pour l'année n+1 sont rebasés, et que l'industrie pharmaceutique engrange en potentiel de chiffre d'affaires les dépassement de l'année n.

L'hypothèse de M.RENAUDIN est toutefois un point d'arrivée acceptable, le rendement pour la sécurité sociale est plus sûr (on obtient dans toutes les hypothèses 50 % de récupération). Les pertes par rapport au dispositif actuel sont limitées à quelques situations (cf. annexe III).

III – LA MAITRISE DES ACTIONS PROMOTIONNELLES ET LA MISE EN PLACE D'UN SYSTEME D'INFORMATION DESTINE AUX MEDECINS

Considérant que la politique du Gouvernement en matière de médicament est trop centrée sur l'offre et que nous atteignons les limites du faisable, le MEFI s'est prononcé positivement sur un renforcement de la maîtrise de la demande.

Ainsi, une modification de la loi anti-cadeau a été insérée dans le projet de loi de modernisation du système de santé. La nouveauté consiste à ne plus uniquement sanctionner les praticiens, comme cela est le cas actuellement mais de sanctionner également les industriels.

De plus, le principe d'une augmentation de la taxe promotionnelle a également fait l'objet d'un accord. Nous avons évoqué une augmentation de 30 % de la taxe actuelle, qui rapporte 1,2 MdF, soit 400 MF.

Enfin nous travaillons actuellement à définir une structure visant à informer les médecins sur le bon usage des soins et à concurrencer la promotion des laboratoires. Cette mission serait confiée à l'AFSSAPS. D'ores et déjà, et selon les premières concertations, un budget de 100 MF est à prévoir. Cette structure pourrait être financée par les recettes générées par l'augmentation de la taxe promotionnelle.

IV - DIVERS

Enfin, le MEFI a plaidé pour deux types de mesures supplémentaires :

- le conditionnement de l'évolution du revenu des praticiens au respect d'une enveloppe de prescription. Ceci reviendrait à remettre en cause les principes adoptés lors de la LFSS 2000 ;

- l'adoption d'un remboursement forfaitaire par classe thérapeutique. Sur ce dernier point, les exemples étrangers (allemand et hollandais) ne sont guère concluants, et en tout cas difficilement applicables en France. Nous avons reçu l'aval du cabinet du premier ministre sur le refus d'une telle démarche.

CONCLUSION

Les mesures qui vous sont proposées sont évidemment maximales. Ceci vous laisse ainsi toute marge de manœuvre dans la pondération que vous voudrez leur apporter lors de leur négociation avec le SNIP.

Hervé LE LOUËT

ANNEXE I

MEDICAMENT

I - Evolution des dépenses depuis 1997

	REGIME GENERAL (%)	TOUS REGIMES (%)
1997	5,1	4,7
1998	8,1	7,7
1999	6,3	5,9
1er trimestre 2000 *	11,5	11,1
Prévisions 2000	6 – 6,5	5,6 – 6,1

* Les résultats élevés du premier trimestre sont essentiellement liés à l'épidémie de grippe et de gastro-entérite ainsi qu'au 31 décembre 1999.

La croissance française des ventes de médicaments de prescription en officine, en 1999, reste la plus faible des grands pays industrialisés : 5 %. Elle est de 6 % en Allemagne, 9 % en Italie, 10 % au Royaume-Uni, 11 % en Espagne et 16 % en Amérique du Nord.

Une progression de 6 % des dépenses de médicaments par rapport à un objectif fixé à 2 % entraîne un dépassement d'environ 3 MdF. La clause de sauvegarde ou les remises conventionnelles permettent de récupérer environ 1 MdF de ce dépassement (1,2 MdF en 1999, 0,9 MdF en 2000). Mais les nouveaux objectifs étant fixés par rapport au réalisé, le dépassement est acquis pour l'industrie pharmaceutique les années ultérieures.

Cette croissance des dépenses correspond à une tendance de fond (innovation thérapeutique, produits plus coûteux), comme le démontre l'évolution des autres pays. Est-elle justifiée ? Mais il est vrai que nous consommons en France plus que nos voisins (antidépresseurs, antibiotiques...). Les veinotoniques, par exemple, sont une spécificité française puisque nous consommons 70 % du marché mondial. La part du médicament dans les dépenses de santé est élevée en France : 18 % contre 10 % aux Etats-Unis et 14 % en Allemagne.

Ainsi, un certain nombre de mesures correctrices doivent être adoptées.

II - Réévaluation

L'accès au remboursement des médicaments a été réformé par le décret du 27 octobre 1999. Les critères d'accès au remboursement ne sont plus fondés sur la seule gravité de la pathologie, mais sur le service médical rendu. Ce dernier prend en compte les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle le médicament est destiné, ainsi que le caractère préventif, curatif ou symptomatique du traitement médicamenteux et son intérêt pour la santé publique.

V - Réforme de la loi anti-cadeaux

Actuellement, la loi anti-cadeaux (article L.365.1 du code de la santé publique), qui limite la possibilité pour une firme d'agir directement et financièrement sur le prescripteur, s'applique essentiellement à l'encontre du professionnel de santé, l'entreprise pharmaceutique ne pouvant être poursuivie qu'indirectement à titre de complicité. Cet article ne permet pas de poursuivre directement l'entreprise et donc de regrouper l'ensemble des plaintes relatives à une même opération de promotion. Ainsi, un article visant à poursuivre directement le laboratoire en cause sera proposé dans le cadre de la loi sur la modernisation du système de santé.

VI - Dispositif d'information sur les prescriptions

Le développement d'une politique d'information publique est d'autant plus indispensable que l'on sait que tout contrôle de la promotion ne pourra jamais être que partiel. Il faut, dès lors, qu'une information objective puisse se substituer à l'information commerciale diffusée par les entreprises. Actuellement, deux outils sont en vigueur : la diffusion des fiches de transparence et le guide des équivalents thérapeutiques de la CNAMTS. Bien évidemment, la CNAMTS se doit de prendre ses responsabilités dans le domaine de l'information des prescripteurs. Toutefois, la possibilité de mettre en place un dispositif pour informer les prescripteurs d'une façon indépendante de toute promotion pharmaceutique est à l'étude.

Annexe 4-17

AB-VB-EN- 8/6/00

Mesures relatives au médicament

Propositions du MEFI en vue de la réunion interministérielle du 9 juin 2000

Le médicament figure régulièrement parmi les postes en plus forte croissance au sein des dépenses d'assurance maladie (+8,1 % en 1998 et +6,3 % en 1999 pour le régime général). Avec près de 90 MdsF, il représente 30 % des dépenses de soins de ville.

Certes, la croissance des dépenses de médicament est également forte dans les autres pays développés, du fait notamment de la mise sur le marché de médicaments innovants. Cependant, au-delà de l'effet des mesures prises depuis 1997 pour maîtriser la dépense de médicaments, l'augmentation récente moins forte en France que dans les pays comparables s'explique principalement par les facteurs intrinsèques suivants :

- importance du poste en volume absolu, ce qui limite la croissance relative, mais sans remettre en cause pour l'instant la position peu enviable de la France, deuxième derrière les Etats Unis pour ce qui est de la dépense de médicament par habitant ;
- diminution tendancielle des ventes de certains produits anciens (veinotoniques, vasodilatateurs), qui représentent en France des dépenses importantes, à la différence des autres pays, ce qui permet de peser sur l'évolution d'ensemble ;
- lenteur relative à l'entrée sur le marché de produits nouveaux, comparativement à nos partenaires.

Le poste médicament est caractérisé par un encadrement complet de l'offre par les pouvoirs publics : prix fixés administrativement, clauses de révision prix-volume par produits, clause de sauvegarde en cas de dépassement, encadrement et taxation spécifique de la promotion. Il demeure cependant en rapide évolution, ce qui appelle des mesures portant également sur la prescription.

La présente note passe en revue les principaux axes d'action envisageables, et en premier lieu la responsabilisation des prescripteurs (infra I). Elle examine ensuite les propositions du MES dans sa note du 29 mai 2000 (infra II et III), centrées pour l'essentiel sur un renforcement de l'encadrement de l'offre. Elle propose enfin d'agir sur la maîtrise des coûts de distribution (infra IV).

Par ailleurs, le MEFI considère toujours que la mise en œuvre de prix de référence (remboursement forfaitaire par classe thérapeutique) est une mesure structurante susceptible de générer des économies importantes grâce à une amélioration de la concurrence entre

laboratoires. Elle permettrait de limiter l'intervention critiquée des pouvoirs publics dans la fixation systématique des prix. A court terme, il est possible d'expérimenter la mise en œuvre de prix de référence sur certaines classes spécifiques (cf. fiche jointe). Dans un deuxième temps, une extension aux classes où existent des génériques est souhaitable. Cette extension devra intervenir une fois engrangés les effets de la substitution. Une troisième phase consistera à généraliser à l'ensemble des classes adaptées à ce mode de régulation.

I. Responsabilisation des prescripteurs

1 - Une maîtrise structurelle des dépenses de médicament ne peut se passer d'une action sur les prescripteurs

a) Une action portant uniquement sur l'industrie pharmaceutique ne permet pas d'agir efficacement sur le volume de la consommation, dont le niveau élevé caractérise la France

Le marché français se caractérise d'abord par le niveau élevé et la progression de la consommation *en volume*. Ainsi, si la France est le deuxième pays en matière de dépense par habitant, elle a connu une stagnation du niveau des prix relatifs des médicaments compensée par une forte progression de la dépense en volume (cf. annexe 1).

Or, si les laboratoires pharmaceutiques sont en mesure d'influencer le comportement des prescripteurs grâce aux actions de promotion, les politiques de régulation qui leur sont appliquées demeurent d'un effet limité sur le volume de la consommation. Elles se traduisent essentiellement par une réduction ou une limitation des prix, et par le versement de contributions qui compensent en recettes les dépassements observés mais sont sans impact sur le niveau des dépenses publiques.

b) Les exemples de nos partenaires étrangers tendent à montrer que la maîtrise des dépenses de médicament repose sur la combinaison de la régulation de l'offre et d'une responsabilisation des prescripteurs et des patients.

Ainsi, au Royaume-Uni comme en Allemagne, la responsabilisation des prescripteurs (médecins) a été recherchée par la fixation de cibles d'évolution des dépenses combinée à des outils de maîtrise médicalisée incitant à réduire le coût des prescriptions (lignes directrices, information des médecins…). La responsabilisation des patients a quant à elle pris la forme du remboursement forfaitaire en Allemagne et, dans ces deux pays, d'un relèvement significatif des franchises de remboursement (cf. annexe 2).

c) La révision de la liste des médicaments remboursables, réforme la plus porteuse d'économies à terme, doit être accompagnée d'actions de sensibilisation des prescripteurs et des patients afin d'éviter des reports de prescriptions vers des médicaments maintenus au remboursement et plus coûteux sans être nécessairement plus efficaces pour l'indication considérée.

2 – De nouvelles modalités de responsabilisation et de sensibilisation des médecins doivent donc être mises en place

a) La responsabilité première des médecins en matière de prescriptions devrait être réaffirmée par la mise en place d'enveloppes-cibles de prescriptions

La définition d'enveloppes opposables aux médecins en matière de prescriptions répond à la nécessité de réaffirmer que la responsabilité des médecins, mais également de la CNAMTS, ne se limite pas au respect des objectifs fixés en matière d'honoraires (qui ne représentent que 30% des dépenses générées par les médecins) mais porte également sur l'ensemble des prescriptions.

Elle vise ainsi à inciter les partenaires conventionnels à mettre en œuvre tous les moyens disponibles afin de limiter les prescriptions inutiles et de réduire le coût des prescriptions. Elle constitue en particulier un moyen puissant de favoriser, en même temps que d'encadrer, la conclusion des accords de « bon usage des soins », introduits par la loi de financement de la sécurité sociale pour 2000 et qui peuvent fixer des objectifs quantifiés d'évolution de certaines dépenses et prévoir les modalités selon lesquelles les médecins peuvent percevoir une partie du montant des dépenses évitées par la mise en œuvre de l'accord. Les dépenses de médicament constituent à l'évidence un champ d'action privilégié pour la mise en place de tels accords.

Concrètement, il pourrait s'agir soit d'établir un objectif de dépenses médicales englobant honoraires et prescriptions et se substituant à l'objectif de dépenses d'honoraires déjà prévu par la LFSS, soit d'un objectif portant uniquement sur les prescriptions et s'ajoutant à l'enveloppe d'honoraires. Cette seconde solution s'inscrit mieux dans la continuité du dispositif mis en place par la LFSS 2000.

L'objectif de dépenses de prescriptions serait déterminé annuellement dans les annexes aux conventions médicales ou à défaut dans les « mesures » des caisses, dans le respect de l'objectif prévisionnel des dépenses de soins de ville. Le suivi de ces dépenses serait effectué, comme pour l'objectif d'honoraires, tous les quatre mois et donnerait lieu, le cas échéant, à la mise en œuvre d'actions destinées à en assurer le respect (définition de RMO, de recommandations, actions d'évaluation, et conclusion d'accords de bon usage des soins).

Sans revenir à un dispositif de reversement en cas de dépassement, qui pénalise les médecins sur des dépenses qui ne constituent pas pour eux un revenu, les médecins seraient financièrement incités au respect de cet objectif par la conditionnalité des revalorisations d'honoraires au respect de cet objectif de prescriptions. Il s'agirait en quelque sorte d'une sanction positive. Une proposition en ce sens figure en annexe 3.

Le caractère collectif de cette « sanction », conforme à la logique qui sous-tend de manière générale le dispositif de régulation mis en place par la LFSS 2000, ne doit pas faire oublier qu'elle constitue d'abord une incitation à recourir à d'autres outils, qui peuvent être davantage ciblés sur certains types de dépenses ou certaines régions (accords de bon usage de soins notamment), voire sur certains individus (contrats de bonne pratique, sanctions en cas de non respect des références médicales opposables,...).

b) Le respect de ces objectifs devrait être facilité par le renforcement des outils de maîtrise médicalisée à la disposition des caisses et des médecins

Le développement de l'information sur les prescriptions à destination des médecins vise à les sensibiliser au rapport coût / efficacité de leurs prescriptions. La mise en place d'un dispositif d'information objective et indépendante sur les médicaments, envisagée par le ministère de l'emploi et de la solidarité, est souhaitable mais ne constitue qu'un des axes à envisager. Elle devrait être complétée par la transmission aux médecins, selon une périodicité régulière, d'informations individualisées sur leurs prescriptions de médicaments et de comparaisons de ces données individuelles avec un profil de prescription théorique en fonction de l'aire géographique ou des caractéristiques de leur clientèle. De ce point de vue, les informations aujourd'hui transmises aux médecins grâce aux RIAP (relevés individuels d'activité des praticiens) sont encore très incomplètes : elles restent très agrégées (médicaments non décomposés par classes, pas d'information sur les génériques...) et ne permettent la comparaison qu'avec une moyenne départementale. La mise en œuvre aujourd'hui effective du codage devrait permettre d'enrichir considérablement leur qualité.

La possibilité donnée aux médecins de prescrire en Dénomination Commune Internationale (DCI) favoriserait un développement plus rapide du marché des génériques. Elle pourrait être associée, pour les pharmaciens, à l'obligation de délivrer un générique en cas de prescription en DCI. La formation des médecins devrait être aménagée en ce sens.

Ultime recours à la disposition des caisses, les moyens de contrôle et de sanctions doivent être simplifiés et renforcés. En priorité, les sanctions en cas de non-respect des références médicales opposables (RMO), dont le dispositif a été annulé par le Conseil d'Etat en 1999, doivent être rétablies sur des bases juridiques plus solides. Au-delà, une réforme d'ensemble des procédures relatives aux contrôles et aux sanctions des professionnels devra être envisagée pour remédier aux blocages (comités médicaux régionaux) constatés aujourd'hui.

II. Réévaluation des spécialités

L'avis rendu par la Commission de la transparence sur les spécialités réévaluées a mis en lumière un service médical rendu (SMR) insuffisant pour justifier le remboursement, pour environ le quart des produits examinés. Ces avis ont été rendus publics et largement médiatisés. Le Gouvernement est donc en situation de prendre des mesures pour donner suite à ces avis.

La proposition du MES consiste à atteindre graduellement une situation où toutes les spécialités de SMR insuffisant seraient déremboursées, et les taux de remboursement portés à 35 % pour les spécialités de SMR faible ou moyen.

Il paraît souhaitable d'organiser cette évolution en deux temps, comme le propose le MES.

A. Une première étape consisterait à baisser en deux temps (été 2000 et été 2001) les prix des spécialités de SMR insuffisant et à porter les taux de remboursement à 35 % sur les seuls vaso-dilatateurs.

Cette disposition est rentable pour l'assurance-maladie et équilibrée pour les patients ou les organismes complémentaires, les baisses de prix compensant la baisse du niveau de remboursement. Cette dernière est d'autre part rendue moins délicate par la CMU pour les ménages les plus modestes.

L'impact de ce premier train de mesures sera concentré sur les laboratoires à capitaux français, de toute taille, dont il affectera la rentabilité. Affaiblissant principalement les laboratoires petits et moyens, il accélérera la concentration du secteur, où plusieurs rachats de laboratoires ont déjà eu lieu - Logeais, Théramex, Doms Adrian, Bouchara. Cette évolution du tissu industriel est naturelle, du fait du niveau très élevé des tickets d'entrée et de maintien sur le marché pharmaceutique.

Cette première étape serait donc politiquement peu sensible envers les patients et acceptable pour les laboratoires.

B. Une deuxième étape consisterait à dérembourser l'ensemble des spécialités de SMR insuffisant. Cette mesure pourrait être annoncée dès l'été 2000, pour prendre effet trois ans plus tard.

Il est souhaitable de s'engager dans cette voie afin d'initier une gestion plus dynamique que par le passé du panier de soins remboursables (sortie des produits inefficaces d'un point de vue thérapeutique, meilleur remboursement des soins dentaires ou des lunettes,...). Cependant, compte tenu de l'impact sur les patients (nombre important de consommateurs des produits appelés à être déremboursés) et de l'effet sur certains laboratoires français, cette deuxième étape est plus sensible que la précédente.

S'agissant de l'industrie pharmaceutique, il est souhaitable que la démarche soit annoncée au départ, donnant aux laboratoires la visibilité nécessaire pour gérer une transition difficile. En effet, ce deuxième train de mesures touchera fortement les laboratoires familiaux, mais certains d'entre eux peuvent y résister et ont un certain potentiel pour demeurer des acteurs significatifs de l'industrie pharmaceutique. Il conviendra donc, pendant la période qui précédera et suivra le déremboursement, de veiller à limiter les autres mesures susceptibles de toucher ces laboratoires, afin que leur affaiblissement ne soit que passager. Le déremboursement devrait conduire par ailleurs à la disparition de nombreux laboratoires français petits et moyens, qui n'auraient pas été auparavant rachetés par des laboratoires plus importants. Le déremboursement des produits issus de ces laboratoires n'incitera pas au maintien de leurs capacités de production par leurs éventuels acheteurs. Plusieurs fermetures d'usines sont donc à prévoir, les plus significatives étant celles de Beaufour à Dreux et de Negma à Quimper (environ 400 emplois chacune).

Afin de lisser quelque peu ces effets, il serait possible d'instaurer des forfaits de remboursement par classe pour certains de ces produits, à des niveaux relativement bas, en repoussant à une troisième étape le déremboursement définitif.

Le Gouvernement continuerait ainsi à prendre en charge ces pathologies, tout en affichant pour elles un budget limité de l'assurance maladie. Le marché se réorganiserait rapidement au profit des laboratoires capables de fournir les produits les moins chers. Il convient de noter que cette alternative devrait faire l'objet de dispositions législatives.

III. Les autres mesures ciblées sur l'industrie pharmaceutique

1 - Durcissement de la clause de sauvegarde

Le niveau de la clause de sauvegarde a un impact direct sur le conventionnement des laboratoires, le niveau de retour qu'elle fixe étant considéré comme le rendement à atteindre

par l'ensemble des conventions. En 1999, l'exercice conventionnel a pu être bouclé pour assurer un retour de 900 MF environ. La signature de conventions, outre sa cohérence avec l'orientation prise par le Gouvernement en 1998, simplifie les relations avec les laboratoires et permet des négociations assez libres, sans grand risque de harcèlement juridique de la part des laboratoires. Elle implique aussi l'adhésion des laboratoires au mécanisme de régulation par classes thérapeutiques, qui permet de répartir les retours selon les familles de produits et leur progression respective.

Le durcissement du barème de la clause de sauvegarde conduirait le Comité Economique à négocier des remises plus importantes avec les laboratoires pour respecter l'objectif de rendement égal qui lui a été donné. Les laboratoires pourraient alors s'interroger sur le bien fondé de signer une convention. Dans l'hypothèse où les quelques laboratoires en forte croissance qui assurent l'essentiel de la progression du marché signeraient des conventions, il s'avérerait beaucoup plus économique pour les autres entreprises d'être soumis au régime de la clause de sauvegarde. En effet, les ventes des autres laboratoires progressant peu, ce sont les taux les plus bas de la clause qui s'appliqueraient à cette population.

Outre qu'elle romprait l'équilibre souhaité par le Gouvernement en 1998, cette configuration conduirait à une perte financière importante pour l'assurance maladie. Comme en témoigne l'exemple de l'année 1999, ces comportements stratégiques n'apparaissent pas pour des remises de l'ordre de 20 à 30 millions de francs mais pourraient se produire si elles atteignaient 50 MF.

Dans l'hypothèse où les opérateurs anticiperaient des niveaux très élevés de remises et un échec du jeu conventionnel, il est à craindre que cela ne conduise les entreprises à stimuler leur effort de vente pour anticiper cette taxation, ce qui n'est souhaitable ni pour les patients, ni pour l'assurance maladie.

2 - Maîtrise des actions promotionnelles

L'impact effectif d'une augmentation de la taxe sur la promotion réalisée par les laboratoires n'est pas prouvé, notamment dès lors que certaines dépenses peuvent être transférées à l'étranger par les laboratoires internationaux.

Il s'agit d'une mesure peu structurante, qui ne peut être soutenue qu'en raison de son impact financier immédiat positif pour l'assurance maladie.

Par ailleurs, il est envisagé de modifier l'article L. 365-1 CSP pour permettre de poursuivre directement les laboratoires auteurs de pratiques répréhensibles au titre de cette disposition. Cette disposition peut modifier le comportement des parquets, qui hésitent actuellement à poursuivre les professionnels de santé à ce titre. On peut donc en attendre une modification des comportements. Une expertise complémentaire de la mesure serait toutefois souhaitable, afin d'anticiper de possibles contournements par les professionnels et les laboratoires.

IV. Maîtrise des coûts de distribution

Le circuit de distribution pharmaceutique intervient pour environ le tiers du poste médicament de l'assurance maladie. L'accord de stabilisation de la marge signé en 1999 avec les officinaux n'a pas été respecté, la marge des officines ayant cru de 900 MF. Le caractère structurellement dynamique de la marge des officines conduit à envisager des mesures de maîtrise des coûts de distribution.

En effet, la réforme de la marge des pharmaciens, décidée en 1999, était encadrée par un engagement ferme de stabilité en valeur absolue de la marge 1999 à son niveau constaté en 1998 : cet engagement, acté par le cabinet du Premier ministre, figure explicitement dans le protocole d'accord signé par les pharmaciens.

En réalité, en raison de l'accélération des dépenses de médicaments, et du caractère beaucoup plus dynamique de la nouvelle marge des pharmaciens, cette dernière a atteint 29,1 MdF en 1999, soit une augmentation de 900MF (dont 250 MF dus à la seule réforme de la marge, sur 4 mois).

Pour l'assurance-maladie, le surcoût de la dérive de la marge peut être évalué, pour 1999, à 780MF, avec un acquis sur 2000 de 810MF, compte tenu des effets de la déformation de la structure de remboursement des médicaments. Si l'on déduit l'impact lié au développement des génériques et à la réduction de la marge des grossistes, le surcoût net pour la sécurité sociale reste de 760 MF au titre de 1999 et 2000.

Par ailleurs, les enquêtes menées par la DGCCRF en 1999 ont permis de constater que les grossistes répartiteurs faisaient systématiquement bénéficier leurs clients pharmaciens de remises au moins égales au plafond légal de 2,5% du prix facturé aux pharmaciens, sans compter les remises supérieures pour les génériques (10,74% du prix fabricant) et les escomptes pour paiement comptant.

Compte tenu de ces éléments et de l'accord passé avec les pharmaciens, un montant de 900 MF pourrait être récupéré par l'une des mesures ci-après :

1. Réduction du forfait par unité de conditionnement de 30 centimes (2,7 Md d'unités remboursables vendues).

2. Diminution de la marge des grossistes de 1,1 point (soit l'équivalent de 900MF), qui devraient, au moins partiellement, être répercutés sur les remises que les grossistes accordent aux pharmaciens.

Le contexte (annonce d'un dispositif de maîtrise du poste médicament de l'assurance maladie) semble propice pour engager une telle mesure. En l'absence d'un bilan suffisant à ce jour de la substitution par les pharmaciens au profit des génériques, il est sans doute prématuré d'engager une action directe sur la marge des officinaux. C'est pourquoi une action immédiate doit de préférence porter sur une diminution de la marge des grossistes répartiteurs (proposition 2). Cette diminution, à hauteur de 1,1 point, représenterait moins de la moitié du niveau actuel des remises qu'ils accordent.

Le poids de cette réduction pèsera soit sur les seuls grossistes s'ils sont en mesure d'accroître leur productivité ou d'altérer leur rentabilité, soit sur les pharmaciens si les grossistes répercutent en tout ou partie la diminution de leur marge sur le niveau des remises qu'ils accordent. Ne visant pas directement les officines, cette mesure rendra plus difficile une réaction publique des pharmaciens.

Annexe 4-17

FICHE

SIMULATION DE REMBOURSEMENT FORFAITAIRE

Les exemples de remboursement forfaitaire présentés ici ont été établis à partir du coût de traitement journalier moyen des produits les moins chers inscrits dans la classe concernée et représentant une part significative des ventes en jours de traitement.

Les prix de vente fabricant sont libres, à la hausse ou à la baisse. En revanche, pour que les efforts consentis par les laboratoires pour rapprocher le prix de leur produit du forfait de remboursement ne soient pas compensés par une hausse corrélative des coûts de distribution, il n'est pas envisagé de libérer les marges des grossistes et des pharmaciens.

Sur chaque unité de conditionnement devra figurer le prix de vente au public ainsi que le forfait de remboursement, qui serait égal au coût de traitement journalier de la classe multipliée par le nombre de jours de traitement qui est fonction du dosage et du nombre d'unités contenus dans la présentation de la spécialité.

Sur les classes les plus anciennes, on peut escompter une limitation progressive du nombre de produits en concurrence, au bénéfice des moins chers. La baisse des prix de vente moyens ainsi que le nombre réduit de concurrents conduira à une diminution de la pression promotionnelle et à de là une baisse des prescription, facteur supplémentaire d'économie pour l'assurance maladie.

LES VEINOTONIQUES CO5C

Le coût de traitement journalier moyen des veinotoniques est actuellement de 2,11 F en prix PFHT avec des écarts maximum de 3,40 F (1,5 % des jours de traitement) à 1,15 (7,20 % des jours de traitement).

Sur la base d'un forfait de remboursement de 1,90 F par jour de traitement (les ventes en volume de produits dont le CTJ est égal ou inférieur à 1,90 F représentent 16,4 % des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 160 MF.

Sur la base d'un forfait de remboursement de 1,60 F par jour de traitement (les ventes en volume des produits dont le CTJ est égal ou inférieur à 1,60 F représentent 15 % des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 390 MF.

Sur la base de 1,30 F (11 % des jours de traitement) l'économie sécurité sociale est de 620 MF.

LES VASODILATATEURS

Le coût de traitement journalier moyen des VASODILATATEURS est actuellement de 2.40 F en prix PFHT avec des écarts maximum de 5.42 F (0.7 % des jours de traitement) à 0.3F (0.4 % des jours de traitement).

Sur la base d'un forfait de remboursement de 1,50 F par jour de traitement (les ventes en volume de produits dont le CTJ est égal ou inférieur à 1,50 F représentent 12% des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 515 MF.

CONTRACEPTIFS ORAUX

1/ SITUATION ACTUELLE

Seules les pilules de 1ère et 2ème génération sont actuellement prises en charge par l'assurance maladie. Le coût de traitement journalier (CTJ) de ces dispositifs est de 0,44 F en moyenne, en prix fabricant hors taxes (PFHT).

Les ventes des contraceptifs oraux, dont le CTJ est égal ou inférieur à 0,26 F, représentent, en jours de traitement, près de 17 % du marché des pilules remboursables.

Avant la hausse demandée aux pouvoirs publics par Wyeth Lederlé pour ADEPAL et MINIDRIL en 1998 et 1999, le CTJ moyen de la classe était de 0,33 F. Les ventes de spécialités à un CTJ égal ou inférieur à 0,26 F représentaient alors 60 % des jours de traitement.

2/ REMBOURSEMENT FORFAITAIRE

a) Hypothèse sans extension du champ de remboursement

En instaurant, dans cette classe, le remboursement forfaitaire sur la base d'un CTJ de 0,26 F, le coût pour l'assurance maladie des pilules de 1ère et 2ème génération passerait de 335 MF à 197 MF (soit une économie de près de 140 MF) (voir hypothèse H1 ci-joint).

b/ Hypothèse avec extension du remboursement aux pilules de 3ème génération

La mise en place du remboursement forfaitaire dans la classe des contraceptifs oraux pourrait être l'occasion d'ouvrir au remboursement les pilules de 3ème génération dont le CTJ moyen (prix PFHT) est actuellement de 1,27 F.

Le forfait de remboursement de l'ensemble des contraceptifs oraux pourrait, dans cette hypothèse, être fixé à 0,50 F : les ventes en volume de produits dont le CTJ est égal ou inférieur à 0,50 F représentent 92 % des ventes de spécialités remboursables et 58 % de l'ensemble des contraceptifs remboursables et contraceptifs de 3ème génération.

Le surcoût pour l'assurance maladie de cette opération serait limité à 270 MF alors que, dans les chiffrages actuels les plus optimistes, les propositions des différents laboratoires conduisent à un surcoût de plus de 500 MF pour la prise en charge complète de cette classe.

Même à prix fabricant hors taxe inchangés, les spécialités de 3ème génération bénéficieraient du plafonnement de la marge des intermédiaires, ainsi que d'un taux de TVA ramené de 5,5 % à 2,1%. La prise en charge de la pilule de 3ème génération induirait donc d'emblée une économie pour les consommatrices de plus de 40 %, à laquelle viendrait s'ajouter le remboursement du forfait.

ANNEXE 2

LA REGULATION DES DEPENSES PHARMACEUTIQUES

Allemagne, Royaume-Uni et France

	Allemagne	Royaume-Uni	France
Régulation de l'industrie pharmaceutique	- prix libres mais remboursement sur la base de prix de référence, couvrent 60% du marché	- contrôle des profits : taux de bénéfice autorisé négocié entre l'administration et l'industrie pour chaque entreprise ; remises ou baisse de prix en cas de dépassement. - fixation administrative du prix des génériques	- fixation des prix par voie conventionnelle (industrie, comité économique du médicament) ou à défaut administrative - clause de régulation : objectif annuel de chiffre d'affaires dont le dépassement déclenche l'application d'une taxation collective, ou la mise en œuvre de remises et de baisses de prix individualisées pour les laboratoires conventionnés
Responsabilisation des prescripteurs	- information des médecins sur leurs écarts de prescription par rapport à la moyenne. - lignes directrices encadrant la pratique, élaborées conjointement avec les médecins. - politique d'enveloppe : enveloppe médicaments dont le non-respect est sanctionné par des retenues sur honoraires de 93 à 97 (difficilement appliquée) ; réforme 2000 : enveloppes maintenues mais ajustements non automatiques.	- mécanisme de transmission d'informations sur les prescriptions mis en place en 1976 : relevé périodique adressé aux médecins comparant leurs prescriptions à celles d'un cabinet théorique ayant une clientèle comparable. - enveloppes-cibles de dépenses de médicaments (pas de sanction en cas de dépassement).	*- références médicales opposables (RMO) introduites en 1994 :* ***sanctions annulées*** *par le Conseil d'Etat* *- 1997-1998 : enveloppes opposables de prescriptions, dont le dépassement devait donner lieu à reversement ;* ***suppression en LFSS 2000.***
Responsabilisation des patients	- remboursement sur la base des prix de référence pour 60 % des médicaments. - franchise par boîte (relevée au cours des années 90 : de 4 à 8 DM par boîte selon le conditionnement) pour tous les médicaments. Exonération des populations en difficulté.	- franchise par boîte (£ 5,6 par boîte) ; 50% de la population exonérée (80% des médicaments prescrits)	*- ticket modérateur différencié (0%, 35%, 65%) selon les médicaments,* ***mais pris en charge par les mutuelles ou la CMU.***

Annexe 3

REGULATION DES DEPENSES DE SOINS DE VILLE

INTRODUCTION D'UN OBJECTIF DE PRESCRIPTIONS

1) Retrait du dispositif général des dispositions relatives aux médecins

A l'article L.162-15-2, supprimer au premier alinéa du I les mots « L.162-5 ».

Au 1° du I, supprimer les mots « un objectif étant fixé pour les médecins généralistes d'une part et pour les médecins spécialistes d'autre part »

Au 2°, supprimer les mots « les médecins et ».

2) Dispositif propre aux médecins : proposition de rédaction d'un article L.162-5-3 nouveau :

I – Chaque année, dans le respect de l'objectif prévisionnel des dépenses de soins de ville et de l'objectif de dépenses déléguées mentionnés au II de l'article L.227-1, une annexe à la ou aux conventions prévues à l'article L.162-5 fixe, pour les médecins généralistes d'une part et pour les médecins spécialistes d'autre part :

1° L'objectif de dépenses d'honoraires, incluant les dépenses d'honoraires, rémunérations et frais accessoires. Cet objectif s'applique à compter du 1er janvier de l'année civile concernée et porte sur les dépenses remboursables par les régimes d'assurance maladie, maternité, invalidité et accidents du travail ;

2° L'objectif de dépenses de prescriptions. Cet objectif s'applique à compter du 1er janvier de l'année civile concernée et porte sur les dépenses remboursables par les régimes d'assurance maladie, maternité, invalidité et accidents du travail ;

3° Les tarifs des honoraires, rémunérations et frais accessoires dus aux médecins par les assurés sociaux, en dehors des cas de dépassement autorisés par la convention.

4° Le cas échéant, les mesures de toute nature propres à garantir le respect des objectifs fixés et notamment :

a) Toute action visant à réduire le volume des actes **et prescriptions** non justifiés au plan médical et notamment les actions d'information, de promotion des références professionnelles opposables et des recommandations de bonne pratique ou d'évaluation des pratiques ;

b) Les modifications, dans la limite de 20% de la cotation des actes inscrits à la nomenclature établie pour les actes pris en charge par l'assurance maladie auxquelles les parties à la convention peuvent procéder.

A défaut de convention, et après consultation des syndicats représentatifs, ou à défaut d'annexe pour l'une des conventions, la Caisse nationale de l'assurance maladie des travailleurs salariés et au moins une autre caisse nationale signataire de la convention déterminent les éléments de l'annexe visés au 1°, 2°, 3° et 4°.

II – Les parties à la ou aux conventions effectuent le suivi des dépenses lors de la fixation des objectifs mentionnés au 1° et au 2° du I, et au moins deux fois dans l'année, une première fois au vu des résultats des quatre premiers mois de l'année, et une seconde fois au vu des résultats des huit premiers mois de l'année.

A défaut de convention, la Caisse nationale de l'assurance maladie des travailleurs salariés et au moins une autre caisse nationale d'assurance maladie assurent ce suivi et consultent les syndicats représentatifs.

1) Lorsqu'elles constatent que l'évolution des dépenses d'honoraires n'est pas compatible avec le respect de l'objectif fixé en application du 1° du I, les parties à la ou aux conventions déterminent, par une annexe modificative, les mesures de toute nature propres à garantir son respect et notamment celles prévues au 4° ainsi que, le cas échéant, les ajustements des tarifs prévus au 3°du I.

A défaut de mesures proposées par les parties conventionnelles ou en l'absence de convention, après consultation des syndicats représentatifs et lorsque le montant des dépenses réalisées n'est manifestement pas de nature à permettre le respect de l'objectif fixé, la Caisse nationale de l'assurance maladie des travailleurs salariés et au moins une autre caisse nationale signataire de la convention concernée déterminent les mesures prévues à l'alinéa précédent.

En cas de carence des caisses nationales ou lorsqu'il apparaît que les mesures proposées au titre des quatre alinéas précédents ne sont manifestement pas de nature à permettre le respect de l'objectif des dépenses, un arrêté interministériel fixe les tarifs et mesures mentionnés au 3° et 4°(b) du I.

2) Lorsqu'elles constatent que l'évolution des dépenses de prescriptions n'est pas compatible avec le respect de l'objectif fixé en application du 2° du I, les parties à la ou aux conventions déterminent les mesures de toute nature propres à favoriser son respect, et notamment celles prévues au a) du 4° du I et la conclusion d'accords de « bon usage des soins » prévus à l'article L.162-12-17.

Une revalorisation d'honoraires ne peut être accordée que si l'objectif d'évolution des dépenses de prescriptions de l'année précédente a été respecté.

3) Prise en compte de ces modifications dans l'article relatif à l'approbation des annexes annuelles

A l'article L.162-15-3, les références à l'article L.162-15-2 doivent être remplacées par des références aux articles L.162-5-3 et L.162-15-2.

4) Prise en compte de l'objectif de dépenses médicales pour la conclusion des ABUS

A la fin de la première phrase de l'article L. 162-12-17 (« un ou des accords de « bon usage de soins » peuvent être conclus… »), ajouter les mots **« dans le respect de l'objectif de dépenses de prescriptions mentionné au I de l'article L. 162-5-3 »**.

ANNEXE 2

Annexe 4-17

LA REGULATION DES DEPENSES PHARMACEUTIQUES

Allemagne, Royaume-Uni et France

	Allemagne	Royaume-Uni	France
Régulation de l'industrie pharmaceutique	- prix libres mais remboursement sur la base de prix de référence, couvrent 60% du marché	- contrôle des profits : taux de bénéfice autorisé négocié entre l'administration et l'industrie pour chaque entreprise ; remises ou baisse de prix en cas de dépassement. - fixation administrative du prix des génériques	- fixation des prix par voie conventionnelle (industrie, comité économique du médicament) ou à défaut administrative - clause de régulation : objectif annuel de chiffre d'affaires dont le dépassement déclenche l'application d'une taxation collective, ou la mise en œuvre de remises et de baisses de prix individualisées pour les laboratoires conventionnés
Responsabilisation des prescripteurs	- information des médecins sur leurs écarts de prescription par rapport à la moyenne. - lignes directrices encadrant la pratique, élaborées conjointement avec les médecins. - politique d'enveloppe : enveloppe médicaments dont le non-respect est sanctionné par des retenues sur honoraires de 93 à 97 (difficilement appliquée) ; réforme 2000 : enveloppes maintenues mais ajustements non automatiques.	- mécanisme de transmission d'informations sur les prescriptions mis en place en 1976 : relevé périodique adressé aux médecins comparant leurs prescriptions à celles d'un cabinet théorique ayant une clientèle comparable. - enveloppes-cibles de dépenses de médicaments (pas de sanction en cas de dépassement).	*- références médicales opposables (RMO) introduites en 1994 :* ***sanctions annulées*** *par le Conseil d'Etat* *- 1997-1998 : enveloppes opposables de prescriptions, dont le dépassement devait donner lieu à reversement ;* ***suppression en LFSS 2000.***
Responsabilisation des patients	- remboursement sur la base des prix de référence pour 60 % des médicaments. - franchise par boîte (relevée au cours des années 90 : de 4 à 8 DM par boîte selon le conditionnement) pour tous les médicaments. Exonération des populations en difficulté.	- franchise par boîte (£ 5,6 par boîte) ; 50% de la population exonérée (80% des médicaments prescrits)	*- ticket modérateur différencié (0%, 35%, 65%) selon les médicaments,* ***mais pris en charge par les mutuelles ou la CMU.***

Sur la base d'un forfait de remboursement de 1,50 F par jour de traitement (les ventes en volume de produits dont le CTJ est égal ou inférieur à 1,50 F représentent 12% des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 515 MF.

CONTRACEPTIFS ORAUX

1/ SITUATION ACTUELLE

Seules les pilules de 1ère et 2ème génération sont actuellement prises en charge par l'assurance maladie. Le coût de traitement journalier (CTJ) de ces dispositifs est de 0,44 F en moyenne, en prix fabricant hors taxes (PFHT).

Les ventes des contraceptifs oraux, dont le CTJ est égal ou inférieur à 0,26 F, représentent, en jours de traitement, près de 17 % du marché des pilules remboursables.

Avant la hausse demandée aux pouvoirs publics par Wyeth Lederlé pour ADEPAL et MINIDRIL en 1998 et 1999, le CTJ moyen de la classe était de 0,33 F. Les ventes de spécialités à un CTJ égal ou inférieur à 0,26 F représentaient alors 60 % des jours de traitement.

2/ REMBOURSEMENT FORFAITAIRE

a) Hypothèse sans extension du champ de remboursement

En instaurant, dans cette classe, le remboursement forfaitaire sur la base d'un CTJ de 0,26 F, le coût pour l'assurance maladie des pilules de 1ère et 2ème génération passerait de 335 MF à 197 MF (soit une économie de près de 140 MF) (voir hypothèse H1 ci-joint).

b/ Hypothèse avec extension du remboursement aux pilules de 3ème génération

La mise en place du remboursement forfaitaire dans la classe des contraceptifs oraux pourrait être l'occasion d'ouvrir au remboursement les pilules de 3ème génération dont le CTJ moyen (prix PFHT) est actuellement de 1,27 F.

Le forfait de remboursement de l'ensemble des contraceptifs oraux pourrait, dans cette hypothèse, être fixé à 0,50 F : les ventes en volume de produits dont le CTJ est égal ou inférieur à 0,50 F représentent 92 % des ventes de spécialités remboursables et 58 % de l'ensemble des contraceptifs remboursables et contraceptifs de 3ème génération.

Le surcoût pour l'assurance maladie de cette opération serait limité à 270 MF alors que, dans les chiffrages actuels les plus optimistes, les propositions des différents laboratoires conduisent à un surcoût de plus de 500 MF pour la prise en charge complète de cette classe.

Même à prix fabricant hors taxe inchangés, les spécialités de 3ème génération bénéficieraient du plafonnement de la marge des intermédiaires, ainsi que d'un taux de TVA ramené de 5,5 % à 2,1%. La prise en charge de la pilule de 3ème génération induirait donc d'emblée une économie pour les consommatrices de plus de 40 %, à laquelle viendrait s'ajouter le remboursement du forfait.

Annexe 4-17

FICHE

SIMULATION DE REMBOURSEMENT FORFAITAIRE

Les exemples de remboursement forfaitaire présentés ici ont été établis à partir du coût de traitement journalier moyen des produits les moins chers inscrits dans la classe concernée et représentant une part significative des ventes en jours de traitement.

Les prix de vente fabricant sont libres, à la hausse ou à la baisse. En revanche, pour que les efforts consentis par les laboratoires pour rapprocher le prix de leur produit du forfait de remboursement ne soient pas compensés par une hausse corrélative des coûts de distribution, il n'est pas envisagé de libérer les marges des grossistes et des pharmaciens.

Sur chaque unité de conditionnement devra figurer le prix de vente au public ainsi que le forfait de remboursement, qui serait égal au coût de traitement journalier de la classe multipliée par le nombre de jours de traitement qui est fonction du dosage et du nombre d'unités contenus dans la présentation de la spécialité.

Sur les classes les plus anciennes, on peut escompter une limitation progressive du nombre de produits en concurrence, au bénéfice des moins chers. La baisse des prix de vente moyens ainsi que le nombre réduit de concurrents conduira à une diminution de la pression promotionnelle et à de là une baisse des prescription, facteur supplémentaire d'économie pour l'assurance maladie.

LES VEINOTONIQUES CO5C

Le coût de traitement journalier moyen des veinotoniques est actuellement de 2,11 F en prix PFHT avec des écarts maximum de 3,40 F (1,5 % des jours de traitement) à 1,15 (7,20 % des jours de traitement).

Sur la base d'un forfait de remboursement de 1,90 F par jour de traitement (les ventes en volume de produits dont le CTJ est égal ou inférieur à 1,90 F représentent 16,4 % des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 160 MF.

Sur la base d'un forfait de remboursement de 1,60 F par jour de traitement (les ventes en volume des produits dont le CTJ est égal ou inférieur à 1,60 F représentent 15 % des jours de traitement dans la classe) l'économie pour la sécurité sociale est de 390 MF.

Sur la base de 1,30 F (11 % des jours de traitement) l'économie sécurité sociale est de 620 MF.

LES VASODILATATEURS

Le coût de traitement journalier moyen des VASODILATATEURS est actuellement de 2.40 F en prix PFHT avec des écarts maximum de 5.42 F (0.7 % des jours de traitement) à 0.3F (0.4 % des jours de traitement).

En effet, la réforme de la marge des pharmaciens, décidée en 1999, était encadrée par un engagement ferme de stabilité en valeur absolue de la marge 1999 à son niveau constaté en 1998 : cet engagement, acté par le cabinet du Premier ministre, figure explicitement dans le protocole d'accord signé par les pharmaciens.

En réalité, en raison de l'accélération des dépenses de médicaments, et du caractère beaucoup plus dynamique de la nouvelle marge des pharmaciens, cette dernière a atteint 29,1 MdF en 1999, soit une augmentation de 900MF (dont 250 MF dus à la seule réforme de la marge, sur 4 mois).

Pour l'assurance-maladie, le surcoût de la dérive de la marge peut être évalué, pour 1999, à 780MF, avec un acquis sur 2000 de 810MF, compte tenu des effets de la déformation de la structure de remboursement des médicaments. Si l'on déduit l'impact lié au développement des génériques et à la réduction de la marge des grossistes, le surcoût net pour la sécurité sociale reste de 760 MF au titre de 1999 et 2000.

Par ailleurs, les enquêtes menées par la DGCCRF en 1999 ont permis de constater que les grossistes répartiteurs faisaient systématiquement bénéficier leurs clients pharmaciens de remises au moins égales au plafond légal de 2,5% du prix facturé aux pharmaciens, sans compter les remises supérieures pour les génériques (10,74% du prix fabricant) et les escomptes pour paiement comptant.

Compte tenu de ces éléments et de l'accord passé avec les pharmaciens, un montant de 900 MF pourrait être récupéré par l'une des mesures ci-après :

1. Réduction du forfait par unité de conditionnement de 30 centimes (2,7 Md d'unités remboursables vendues).

2. Diminution de la marge des grossistes de 1,1 point (soit l'équivalent de 900MF), qui devraient, au moins partiellement, être répercutés sur les remises que les grossistes accordent aux pharmaciens.

Le contexte (annonce d'un dispositif de maîtrise du poste médicament de l'assurance maladie) semble propice pour engager une telle mesure. En l'absence d'un bilan suffisant à ce jour de la substitution par les pharmaciens au profit des génériques, il est sans doute prématuré d'engager une action directe sur la marge des officinaux. C'est pourquoi une action immédiate doit de préférence porter sur une diminution de la marge des grossistes répartiteurs (proposition 2). Cette diminution, à hauteur de 1,1 point, représenterait moins de la moitié du niveau actuel des remises qu'ils accordent.

Le poids de cette réduction pèsera soit sur les seuls grossistes s'ils sont en mesure d'accroître leur productivité ou d'altérer leur rentabilité, soit sur les pharmaciens si les grossistes répercutent en tout ou partie la diminution de leur marge sur le niveau des remises qu'ils accordent. Ne visant pas directement les officines, cette mesure rendra plus difficile une réaction publique des pharmaciens.

Le Monde

Le gouvernement renonce à supprimer le remboursement des médicaments « inutiles »

LES DIFFÉRENTS MINISTÈRES chargés de la politique du médicament procédaient, dans la matinée de jeudi 7 juin, aux derniers ajustements concernant le « plan médicament » qu'Elisabeth Guigou, ministre de l'emploi et de la solidarité, et Bernard Kouchner, ministre délégué à la santé, devaient rendre public le même jour en fin d'après-midi, à l'issue de la réunion de la commission des comptes de la Sécurité sociale. Les mesures présentées devraient permettre d'obtenir, d'emblée, des économies annuelles comprises entre 2,2 et 2,5 milliards de francs pour un secteur correspondant à des remboursements de 95 milliards par les régimes d'assurance-maladie. Au vu des arbitrages rendus ces derniers jours, et dont les milieux pharmaceutiques ont pu prendre connaissance, il apparaît que le gouvernement a, en définitive, renoncé à prendre une mesure drastique et spectaculaire concernant les médicaments dont les experts estiment qu'ils ne fournissent pas la preuve d'une efficacité – un « *service médical rendu* » (SMR) – suffisante pour pouvoir être pris en charge par la collectivité.

Travaillant depuis plus de deux ans, à la demande du gouvernement, les experts de la commission de transparence de l'Agence de sécurité sanitaire des produits de santé avaient établi une liste de 835 spécialités pharmaceutiques pour lesquelles le SMR était, à leurs yeux, notoirement insuffisant (*Le Monde* du 2 juin). Ces médicaments, souvent qualifiés d'« *inutiles* », remboursés à hauteur de 65 % ou de 35 % par les caisses génèrent un chiffre d'affaires de l'ordre de 10 milliards de francs. Ils ne devraient faire l'objet que de mesures de baisses de prix qui devraient conduire à une économie globale, en année pleine, entre 800 millions et 1 milliard de francs. Contrairement à la volonté affichée par Martine Aubry lorsqu'elle était à la tête du ministère de la solidarité, le gouvernement n'a pas choisi de mettre en œuvre une réelle et profonde réforme du système de remboursement des spécialités pharmaceutiques.

L'objectif de cette réforme visait en effet à obtenir que les taux de remboursement des médicaments ne soient, à l'avenir, explicitement fondés que sur la qualité du SMR, ce qui, en toute logique sanitaire, conduisait à ne pas faire supporter à la collectivité le coût des médicaments dont les fabricants ne pouvaient apporter aux experts la démonstration scientifique de leur efficacité. Le chantage à l'emploi exercé auprès du gouvernement par les laboratoires directement concernés – souvent de petites tailles et indépendants des multinationales pharmaceutiques –, ainsi que l'impact négatif présumé qu'aurait eu une mesure radicale de déremboursement des 835 spécialités visées, expliquent la décision prudente du gouvernement.

Pour autant, sans remettre en question la politique conventionnelle, le plan annoncé par Mme Guigou et M. Kouchner comporte un certain nombre d'innovations qui devraient permettre d'obtenir un encadrement des dépenses caractérisées par une rapide progression (+ 10,7 % en 2000 et + 9 % pour les quatre premiers mois de 2001). Des mesures devraient être prises visant à faciliter la prescription et la délivrance de médicaments génériques, spécialités pharmaceutiques correspondant en tout point aux molécules d'origine n'étant plus protégées par brevet. Elles visent à une économie de l'ordre de 500 millions de francs. Une autre source d'économie devrait être obtenue par une réduction des prix des spécialités les plus innovantes, mais dont les volumes de consommation, comme c'est fréquemment le cas, dépassent les prévisions initiales. Une quinzaine de spécialités seraient concernées et la baisse de leur prix devrait être négociée avec les fabricants dans le cadre du comité économique des spécialités pharmaceutiques. L'objectif est une économie de l'ordre du milliard de francs.

Défendues M. Kouchner, diverses initiatives devraient être prises concernant l'incitation à la bonne prescription et à un bon usage du médicament. En liaison avec l'Agence française de sécurité sanitaire des produits de santé et l'Agence nationale d'accréditation et d'évaluation en santé, une structure serait créée pour permettre aux pouvoirs publics de mieux suivre l'évolution et les tendances des consommations médicamenteuses. La Caisse nationale d'assurance-maladie pourrait, de son côté, être mise à contribution pour, en liaison avec les syndicats de médecins, établir une charte du bon usage du médicament. Cet ensemble devrait être complété par une série de dispositifs comptables concernant les marges des pharmaciens d'officine et des grossistes répartiteurs, le gouvernement espérant parvenir à terme à des économies globales à hauteur d'environ 4 milliards de francs par an.

Avis de la Commission

21 juillet 1999

MEDIATOR, comprimé enrobé,
Boîte de 30

benfluorex

LES LABORATOIRES SERVIER (BIOPHARMA)

Indication (s) :
- Adjuvant du régime adapté dans les hypertriglycéridémies.
La poursuite du régime est toujours indispensable.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Après avoir étudié l'ensemble des indications, la Commission a retenu pour cette spécialité, les indications ci-dessous.

INDICATION : Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale. Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Caractère habituel de gravité de l'affeetion traitée :

L'affection concernée par cette spécialité engage le pronostic vital du patient immédiatement ou par suite de complications.

Efficacité/Sécurité d'emploi de la spécialité :

Cette spécialité entre dans le cadre d'un traitement curatif.

L'efficacité de cette spécialité dans cette indication est faible

Place dans la stratégie thérapeutique :

Cette spécialité est un médicament d'appoint.

Il existe des alternatives thérapeutiques médicamenteuses ou non médicamenteuses à cette spécialité.

Intérêt en termes de santé publique :

Sans objet.

Annexe 4-20

INDICATION :
- Adjuvant du régime adapté dans les hypertriglycéridémies.
La poursuite du régime est toujours indispensable.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Caractère habituel de gravité de l'affection traitée :

L'affection concernée par cette spécialité n'engage pas le pronostic vital du patient, n'entraîne pas de complications graves , ni de handicap, ni de dégradation marquée de la qualité de vie.

Efficacité/Sécurité d'emploi de la spécialité :

Cette spécialité entre dans le cadre d'un traitement préventif.

L'efficacité de cette spécialité dans cette indication est moyenne.

Place dans la stratégie thérapeutique :

Cette spécialité est un médicament d'appoint.

Il existe des alternatives thérapeutiques médicamenteuses ou non médicamenteuses à cette spécialité.

Intérêt en termes de santé publique :

Sans objet.

Annexe 4-20

Conclusion de la Commission de la Transparence

La Commission constate, compte tenu des données dont elle dispose, qu'aucun niveau de SMR ne peut être attribué pour cette spécialité.

LES LABORATOIRES SERVIER

RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

AUDITION DE RECOURS AUPRES DE LA COMMISSION DE LA TRANSPARENCE
- 19 NOVEMBRE 1999 -

Nom de la spécialité : **MEDIATOR® 150 mg**

Dénomination commune internationale : **Benfluorex**

Nom du Laboratoire Titulaire de l'AMM : **LES LABORATOIRES SERVIER**

Indication : **Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.**

Le niveau de SMR de MEDIATOR® est *IMPORTANT*, car :

1) **Le diabète engage le pronostic vital du patient.**
2) **L'efficacité antidiabétique de MEDIATOR® est démontrée versus placebo. Cette efficacité est comparable à celle d'autres antidiabétiques, notamment la metformine, classée par la Commission en niveau de SMR *important*. Sa sécurité d'emploi est bien documentée.**
3) **MEDIATOR® est un antidiabétique de la classe des insulino-sensibilisateurs indiqué en 1ère intention quand le régime diététique ne suffit plus à lui seul pour rétablir l'équilibre glycémique.**
4) **MEDIATOR® présente un intérêt en termes de santé publique compte tenu de son efficacité dans le traitement du diabète, de la fréquence, de la gravité et du coût de cette pathologie.**

Nous contestons les points sur lesquels la Commission de la Transparence s'est appuyée pour proposer pour MEDIATOR® un niveau de SMR *insuffisant*, à savoir :

1) L'efficacité qualifiée de faible
2) Le qualificatif de médicament d'appoint
3) Le terme «sans objet» concernant l'intérêt en termes de santé publique.

SERVIER

annexe 4-21

I **<u>L'efficacité antidiabétique et la sécurité d'emploi de MEDIATOR® sont démontrées</u> :**

1. ***L'efficacité de MEDIATOR® est démontrée en comparaison au placebo*** à tous les stades du diabète de type 2 : en monothérapie dans les stades initiaux de la maladie, et en association chez les patients présentant un diabète plus sévère, déjà traités par d'autres antidiabétiques.

Populations	N	Durée de traitement	HbA_{1c} (%) initiale		Δ HbA_{1c} finale vs placebo
			Med.	Pl	
Régime seul *(Velussi)*	32	3 mois	6.7	6.8	0.9 (p=0.024)
Régime seul *(Leutenegger)*	435	6 mois	7.6*	7.4*	0.9 (p<0.001)
Insuline *(Erkelens)*	19	3 mois	7.1	8.7	0.9 (p<0.001)
Sulfonylurées *(Tomasi)*	58	3 mois	8.7	8.1	0.8 (p=0.007)
Sulfonylurées *(Louvet)*	24	3 mois	8.5	8.0	1.7 (p=0.023)

*après deux mois de régime strict

La différence d'évolution de l'hémoglobine glyquée (en valeur absolue) entre MEDIATOR® et placebo varie entre 0,8% et 1,7 %, ce qui est cliniquement et statistiquement significatif et concordant dans toutes les études. Dans les deux études en monothérapie, une différence proche de 1% est observée, alors même que l'état diabétique avait été préalablement amélioré par un régime diététique bien conduit abaissant l'hémoglobine glyquée d'inclusion à une valeur proche de 7%. Enfin, comme pour d'autres antidiabétiques oraux, l'efficacité de MEDIATOR® est d'autant plus importante que le diabète est sévère.

MEDIATOR® est listé parmi les antidiabétiques dans la classification ACP 1998 :Métabolisme Nutrition - Diabète sucré -P1-4.

annexe 4-21

2. ***L'efficacité de MEDIATOR® est comparable à celle d'autres antidiabétiques oraux :***

- **La metformine,** qui est l'antidiabétique insulino-sensibilisateur de référence. Dans une étude ayant inclus 722 patients diabétiques de type 2 insuffisamment équilibrés après 2 mois de régime intensif, MEDIATOR® est significativement non-inférieur à la metformine (traitement pendant 29 semaines) : différence d'évolution de l'HbA1c dans la population en intention de traiter 0,28 ± 0,12 % (IC 90% [-0,07 ; 0,48]) et dans la population per protocole, comme recommandé par ICH 9 pour les analyses de non-infériorité, 0,08 ± 0,17 %, (IC 90% [-0,12 ; 0,29]).
  La metformine a été classée par la Commission en niveau **SMR *important***.

- D'après les données de la littérature, l'efficacité antidiabétique de MEDIATOR® en monothérapie peut être comparée à celle **d'autres antidiabétiques** testés dans les mêmes conditions (HbA1c autour de 7% après régime).

  Elle est comparable à celle de la Rosiglitazone (*BARMAN-BALFOUR*, Drug 1999; *CHARBONNEL* et al., Poster ADA meeting 1999).

  Elle est supérieure à celle de l'Acarbose qui conduit à une différence finale d'HbA1c d'environ 0,6 % versus placebo (*CONIFF* et al., AJM 1995 ; *CONIFF* et al., Arch Intern Med 1994).
  L'acarbose a été classée initialement par la Commission en niveau **SMR *modéré.***

3. ***La sécurité d'emploi est confirmée et bien documentée :***

- MEDIATOR® n'entraîne ni acidose lactique ni prise de poids.

- Les événements indésirables sont peu nombreux et mineurs. Ils touchent essentiellement la sphère digestive. Les troubles gastrointestinaux sont moins fréquents sous MEDIATOR® que sous metformine (13% vs 25% dans l'étude 6 mois).

- Il n'existe aucune contre-indication ni précaution d'emploi particulière (cf RCP) notamment chez le sujet âgé.

Après 25 ans d'utilisation correspondant à un volume de prescriptions de plus de 25 millions de mois de traitement, les rapports annuels de pharmacovigilance regroupant toutes les notifications reçues par le laboratoire de la part des prescripteurs et des Autorités de santé, n'ont décelé aucun événement remarquable.

Le dernier en date a été transmis à l'AFSSAPS le 22 juin 1999.

annexe 4-21

II La place de MEDIATOR® dans la stratégie thérapeutique du diabète de type 2 est celle d'un traitement de 1ère intention :

MEDIATOR® est un insulino-sensibilisateur, tel que démontré par des études de clamp hyperinsulinémique euglycémique (*DE FEO* et al. Diabetes/Metabolism Review 1993 ; *BIANCHI* et al. Diabetes Care 1993).

Le mécanisme d'action est décrit dans le RCP.

Comme tous les antidiabétiques oraux insulino-sensibilisateurs, MEDIATOR® est indiqué en traitement de 1ère intention quand le traitement diététique ne suffit plus. En effet, l'efficacité de MEDIATOR® en monothérapie a bien été démontrée en comparaison au placebo et à la metformine chez des diabétiques de type 2 qui n'étaient pas suffisamment contrôlés par un régime intensif.

III MEDIATOR® présente un intérêt indéniable en termes de santé publique :

MEDIATOR® présente un intérêt en termes de santé publique compte tenu d'une part de son efficacité dans le traitement du diabète, d'autre part de la fréquence, de la gravité et du coût du diabète.

La diversité des alternatives thérapeutiques est une des clés pour combattre avec succès le diabète de type 2.

En conclusion, MEDIATOR® a une efficacité comparable à celle des insulino-sensibilisateurs. Le niveau de SMR pour MEDIATOR® doit donc être équivalent à celui de la metformine.

L'ordre du jour de la Commission de la Transparence du 19 novembre 1999 est l'audition des Laboratoires dans le cadre de la réévaluation du service médical rendu (SMR) des spécialités remboursables en ville. Ces auditions constituent la deuxième et dernière étape de la phase contradictoire prévue par la procédure de réévaluation.

Les auditions reçues ce jour portent sur trois des quatre disciplines constituant la première vague de la réévaluation soit Métabolisme-Nutrition, Psychiatrie et Rhumatologie.

Au total, 20 laboratoires ont été auditionnés pour un total de 33 spécialités soit en Métabolisme-Nutrition = 10, Psychiatrie = 15 Rhumatologie = 8 (un Laboratoire s'est désisté). La liste de ces spécialités est jointe en annexe 1.

Au cours de cette Commission, 11 votes ont eu lieu sur 33 spécialités ayant effectué une demande d'audition :

1. ART 50 , gélule, boîte de 30 et ZONDAR 50 mg, gélule, boîte 30
2. CHONDROSULF, gélule, boîte de 8,
CHONDROSULF, granulé pour suspension buvable, sachets, boîte de 84
3. EUPHYTOSE comprimé enrobé, tubes de 40 et 20,
EUPHYTOSE solution buvable, flacon de 82ml
4. JONCTUM 200 mg gélule, boîte de 45
5. KETUM gel à 2,5 %, tube de 60 g (2 dossiers)
6. LITHIUM OLIGOSOL sol buv amp de 2ml, boîte de 14,
MAGNESIUM OLIGOSOL sol buv amp 2ml, boîte de 14

Pour toutes les autres spécialités concernées par les auditions, un consensus ayant été obtenu, le niveau de SMR de ces spécialités n'a pas été modifié. Les éléments repris lors des délibérations sont les suivants :

- Les affections ou symptômes visés par les médicaments classés comme « sédatifs divers » n'ont pas de caractère habituel de gravité (états neurotoniques, irritabilité, nervosisme, manifestations mineures de l'anxiété, troubles légers du sommeil). Dans les dossiers de demande de réexamen déposés, l'efficacité n'a pas été jugée cliniquement significative. La prise en charge de ce type de trouble repose sur la qualité de la relation médecin-patient (dialogue avec le patient, rappel des règles d'hygiène de vie). Une prise en charge psychologique peut être proposée au patient selon des modalités dépendantes de chaque cas. Le risque d'un transfert de prescription vers des médicaments psychotropes (anxiolytiques, voire antidépresseurs) n'est pas documenté actuellement. De plus, les psychotropes ne sont pas indiqués dans le traitement de ces affections bénignes et leur prescription dans ces situations cliniques serait selon les experts contraire à leur bon usage. Si néanmoins, le médecin souhaite prescrire un médicament à visée sédative en raison du profil psychologique de son patient ou de l'impact attendu d'une prescription de courte durée, la prescription peut se faire indépendamment du statut de prise en charge.

- Les affections ou symptômes visés par les médicaments à base de magnésium et destinés à la voie orale n'ont pas de caractère habituel de gravité (spasmophilie). L'efficacité n'a pas été jugée cliniquement significative. La prise en charge de ce type de trouble repose sur la qualité de la relation médecin-patient (dialogue avec le patient, rappel des règles d'hygiène de vie). Le risque d'un transfert de prescription vers des médicaments psychotropes (anxiolytiques, voire antidépresseurs) n'est pas documenté actuellement. De plus les psychotropes ne sont pas indiqués dans le traitement de ces affections bénignes et leur prescription dans ces situations cliniques serait selon les experts contraire à leur bon usage. Si néanmoins, le médecin souhaite prescrire un médicament à base de magnésium (administration par voie orale) en raison du profil psychologique de son patient ou de l'impact attendu d'une prescription de courte durée, la prescription peut se faire indépendamment du statut de prise en charge.

- Le rapport efficacité/sécurité de COVATINE comprimé (captodiame), utilisé dans le traitement de l'anxiété et de ses manifestations psychosomatiques, est faible. En particulier le captodiame se distingue des benzodiazépines ou des spécialités apparentées par une efficacité nettement moins bien établie. De ce fait, il ne possède pas de place dans la stratégie thérapeutique. Si un traitement médicamenteux de courte durée s'avère nécessaire, il fera appel de préférence à une benzodiazépine, à la buspirone ou à l'hydroxyzine. Une prise en charge psychologique peut être aussi proposée.

- MEDIATOR comprimé est indiqué comme adjuvant du régime dans le « diabète asymptomatique » avec surcharge pondérale. L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée (comme indiqué dans le R.C.P.). L'étude UKPDS a montré l'intérêt d'un contrôle strict de la glycémie en cas de diabète de type II par la metformine (réduction de la mortalité chez les sujets obèses) et des complications microangiopathiques (sulfamide hypoglycémiant). MEDIATOR ne figure pas dans les recommandations de bonne pratique de l'AFSSAPS de février 1999 intitulées : « traitement médicamenteux du diabète de type 2 ».

- MODIODAL 100 mg comprimé est indiqué dans le traitement de la narcolepsie avec ou sans cataplexie. Le rapport efficacité/sécurité est important dans cette indication et cette spécialité peut être utilisée en 1ère intention.

- L'efficacité de OLIGOSOL ZINC NICKEL COBALT solution buvable prescrit en cas de régime amaigrissant (utilisé comme « modificateur du terrain » en particulier en cas de régime amaigrissant) n'a pas été jugée cliniquement significative. Il s'agit d'un traitement symptomatique dans une affection sans caractère habituel de gravité. La prise en charge d'un surpoids repose notamment sur le suivi d'un régime alimentaire adapté au patient, le respect de règles d'hygiène de vie, voire un soutien psychologique. Si néanmoins, le médecin souhaite prescrire ce médicament en raison du profil psychologique de son patient ou de l'impact attendu d'une prescription de courte durée, la prescription peut se faire indépendamment du statut de prise en charge.

- Les spécialités indiquées dans le traitement des dorsalgies « essentielles » ainsi que les topiques utilisés dans le traitement local des douleurs d'origine musculaire et tendino-ligamentaire ont une efficacité faible. Il s'agit de traitement d'appoint visant des affections dont le caractère habituel de gravité est mineur et pour lesquelles il existe des alternatives non médicamenteuses ou médicamenteuses si

nécessaire (kinésithérapie, hygiène de vie, traitement par des antalgiques voire des anti-inflammatoires non stéroïdiens).

- Pour les spécialités indiquées dans le traitement symptomatique des manifestations fonctionnelles de l'arthrose, un SMR faible est attribué aux spécialités pour lesquelles des essais (de méthodologie parfois discutable) ont montré une diminution de la consommation d'antalgiques et d'anti-inflammatoires non stéroïdiens qui sont les traitements utilisés dans cette indication. Les résultats ont établi que cette diminution était légère. Un SMR insuffisant est attribué aux spécialités n'ayant pu apporter la même démonstration (parmi lesquelles le JONCTUM, spécialité ayant fait l'objet d'une audition).

En annexe 2 de ce document sont repris les spécialités, leur niveau de service médical rendu et la date d'attribution de ce niveau.

Sont également listées les spécialités n'ayant pas eu de SMR le 21 juillet 1999 :

- pour lesquelles aucun dossier de demande de réexamen n'a été déposé,
- Et dont aucune autre spécialité ayant des indications similaires n'a déposé de dossier de demande de réexamen.

LES LABORATOIRES SERVIER (BIOPHARMA)

Indication (s) :
- Adjuvant du régime adapté dans les hypertriglycéridémies.
La poursuite du régime est toujours indispensable.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Après avoir étudié l'ensemble des indications, la Commission a retenu pour cette spécialité, les indications ci-dessous.

INDICATION : Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale. Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Caractère habituel de gravité de l'affection traitée :

L'affection concernée par cette spécialité engage le pronostic vital du patient immédiatement ou par suite de complications.

Efficacité/Sécurité d'emploi de la spécialité :

Cette spécialité entre dans le cadre d'un traitement curatif.

L'efficacité de cette spécialité dans cette indication est faible

Place dans la stratégie thérapeutique :

Cette spécialité est un médicament d'appoint.

Il existe des alternatives thérapeutiques médicamenteuses ou non médicamenteuses à cette spécialité.

Intérêt en termes de santé publique :

Sans objet.

Annexe 4-23

INDICATION :
- Adjuvant du régime adapté dans les hypertriglycéridémies.
La poursuite du régime est toujours indispensable.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

Caractère habituel de gravité de l'affection traitée :

L'affection concernée par cette spécialité n'engage pas le pronostic vital du patient, n'entraîne pas de complications graves , ni de handicap, ni de dégradation marquée de la qualité de vie.

Efficacité/Sécurité d'emploi de la spécialité :

Cette spécialité entre dans le cadre d'un traitement préventif.

L'efficacité de cette spécialité dans cette indication est moyenne.

Place dans la stratégie thérapeutique :

Cette spécialité est un médicament d'appoint.

Il existe des alternatives thérapeutiques médicamenteuses ou non médicamenteuses à cette spécialité.

Intérêt en termes de santé publique :

Sans objet.

Annexe 4-23.

Conclusion de la Commission de la Transparence

Le service médical rendu de cette spécialité a été apprécié en prenant en compte l'efficacité et les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle il est destiné, le caractère préventif, curatif ou symptomatique du traitement médicamenteux et son intérêt pour la santé publique.
Le niveau de service médical rendu est insuffisant au regard des autres médicaments ou thérapies disponibles pour justifier sa prise en charge.

médecin inspecteur régional et examen du tableau général de garde de l'établissement, autoriser, par période maximum d'un an, des dépassements de plafond dans certaines disciplines.

C. – Quel que soit l'établissement où elles ont été effectuées, les participations au service de garde sont exclusivement mandatées par l'établissement où le praticien effectue son service normal de jour.

D. – Pour les activités de service continu institué à titre dérogatoire en application de l'article 8 ci-dessus, les plages de travail effectuées au delà des obligations statutaires sont indemnisées sur la base du montant d'une garde ou d'une demi-garde, selon leur durée.

Art. 18. – Les appels faits aux praticiens à plein temps au bénéfice de leurs malades personnels admis dans les établissements dans le cadre de l'activité libérale qu'un praticien peut exercer à l'hôpital ne donnent pas lieu au remboursement de frais de transport ni à l'octroi d'indemnités kilométriques.

Les déplacements effectués pour assurer le service de garde ne donnent pas lieu au remboursement de frais de transport ni à l'octroi d'indemnités kilométriques. Toutefois, si le service de garde est organisé entre plusieurs hôpitaux conformément aux dispositions de l'avant-dernier alinéa de l'article 4 ci-dessus, les frais de déplacement des praticiens à temps plein ou à temps partiel appelés à se rendre dans un établissement autre que celui dans lequel ils exercent leurs fonctions sont remboursés sur la base d'indemnités kilométriques dans les conditions et limites prévues pour les membres du personnel hospitalier visés au titre IV du statut général des fonctionnaires.

Art. 19. – Les dispositions des articles 17 et 18 ci-dessus ne sont pas applicables aux praticiens hospitaliers logés par nécessité ou utilité de service.

CHAPITRE IV

Dispositions d'ordre comptable

Art. 20. – Chaque praticien effectuant une garde à domicile note sur un carnet à double feuillet, unique pour l'établissement et déposé au service des urgences :

- le nombre et l'heure des appels reçus au cours de la nuit ;
- ses heures d'arrivée et de départ de l'hôpital ;
- le nom des malades soignés et, par référence à la nomenclature des actes médicaux, l'indication des soins dispensés.

Art. 21. – Au plus tard le 10 de chaque mois, le directeur de l'établissement ou le directeur responsable du service de garde arrête l'état récapitulatif des participations au service de garde effectuées au cours du mois précédent. Cet état décompte pour chaque praticien le nombre de permanences à l'hôpital, effectuées sous déduction, le cas échéant, de celles incluses dans le service normal, conformément aux dispositions de l'article 16 ci-dessus, et celui des gardes par astreinte à domicile, avec l'indication du nombre des appels et heures de présence consécutifs à chaque garde. L'extrait qui le concerne est adressé à chaque praticien.

Lorsque cet état récapitulatif est arrêté par le directeur responsable d'un secteur de garde, il en est transmis copie à chaque directeur d'établissement concerné.

Art. 22. – Au vu de l'état récapitulatif visé à l'article précédent, le directeur liquide le montant des indemnités dues aux praticiens extérieurs rattachés en appliquant aux services faits le barème fixé à l'article 17 ci-dessus.

Les mandatements sont présentés au comptable sous forme d'état collectif pour chaque mois et sont accompagnés du tableau mensuel de service visé à l'article 15 ci-dessus, préalablement annoté des modifications qui lui auraient été apportées et arrêté par le directeur de l'établissement comme état des services faits.

CHAPITRE V

Champ d'application et calendrier

Art. 23. – Pour l'application des dispositions du présent arrêté :

- les fractions d'heures sont négligées ou comptées pour une heure selon qu'elles sont inférieures ou supérieures à la demi-heure ;
- la période hebdomadaire commence le lundi matin à 8 h 30 et s'achève le lundi suivant à la même heure ;
- la période mensuelle commence le premier lundi de chaque mois à 8 h 30 et s'achève le premier lundi du mois suivant à la même heure, chaque période mensuelle comportant ainsi quatre ou cinq semaines entières.

Art. 24. – Les dispositions des articles 16 et 17 du présent arrêté sont applicables aux gardes médicales effectuées dans les services de réanimation des hôpitaux publics par les praticiens et les internes autorisés à participer au service de garde de réanimation en application de l'article 3 de l'arrêté du 21 janvier 1976.

En outre, les permanences à l'hôpital pendant l'après-midi sont indemnisées sur la base de la demi-garde. Elles ne peuvent faire l'objet de récupération.

Art. 25. – Le bénéfice du repos de sécurité, dans les conditions fixées par l'article 1er du présent arrêté, est ouvert à tous les praticiens visés au premier alinéa de l'article 9 à compter du 1er octobre 2003.

Dans les établissements ayant organisé leurs secteurs de garde conformément aux dispositions de l'avant-dernier alinéa de l'article 3 ci-dessus, le bénéfice du repos de sécurité peut, à titre dérogatoire, être ouvert avant la date fixée au premier alinéa du présent article, à compter de la mise en place d'une organisation des soins le permettant.

Art. 26. – L'arrêté du 15 février 1973 relatif à l'organisation et à l'indemnisation des services de garde dans les hôpitaux publics autres que les hôpitaux locaux est abrogé.

Art. 27. – Le directeur de l'hospitalisation et de l'organisation des soins au ministère de l'emploi et de la solidarité est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 14 septembre 2001.

La ministre de l'emploi et de la solidarité,
Pour la ministre et par délégation :
Par empêchement du directeur
de l'hospitalisation
et de l'organisation des soins :
Le sous-directeur des professions médicales
et des personnels médicaux hospitaliers,
P. BLÉMONT

Le ministre de l'économie,
des finances et de l'industrie,
Pour le ministre et par délégation :
Par empêchement de la directrice du budget :
La sous-directrice,
C. BUHL

Le ministre de l'éducation nationale,
Pour le ministre et par délégation :
Par empêchement du directeur
des personnels enseignants :
La sous-directrice,
J. COLLET-SASSÈRE

Arrêté du 14 septembre 2001 modifiant la liste des spécialités pharmaceutiques remboursables aux assurés sociaux

NOR : *MESS0123370A*

La ministre de l'emploi et de la solidarité et le ministre délégué à la santé,

Vu le code de la sécurité sociale, notamment les articles L. 162-17, L. 162-17-1, R. 161-50, R. 163-2 à R. 163-7 et R. 322-1 ;

Vu le code de la santé publique, notamment les articles L. 5123-1, L. 5121-8, L. 5121-13 et L. 5121-15 ;

Vu les avis de la Commission de la transparence,

Arrêtent :

Art. 1er. – La liste des spécialités pharmaceutiques remboursables aux assurés sociaux est modifiée conformément aux dispositions qui figurent en annexe.

Art. 2. – L'arrêté du 1er août 2000 est retiré en tant qu'il concerne les différentes formes figurant dans ce texte des spécialités : Tanakan, Piribedil, Olmifon, Gevatran, Praxilène, Cervoxan, Trivastal, Duxil, Nootropyl, Tramisal, Ginkogink et Geram.

Art. 3. – L'arrêté du 1er août 2000 est abrogé en tant qu'il concerne les différentes formes des autres spécialités que celles mentionnées à l'article 2 du présent arrêté.

Art. 4. – Le directeur général de la santé et le directeur de la sécurité sociale sont chargés, chacun en ce qui le concerne, de l'exécution du présent arrêté, qui sera publié ainsi que son annexe au *Journal officiel* de la République française.

Fait à Paris, le 14 septembre 2001.

La ministre de l'emploi et de la solidarité,
ÉLISABETH GUIGOU

Le ministre délégué à la santé,
BERNARD KOUCHNER

ANNEXE

MODIFICATION DU TAUX DE REMBOURSEMENT

Le taux de participation de l'assuré est celui prévu au 5° du deuxième alinéa de l'article R. 322-1 du code de la sécurité sociale pour les spécialités ci-dessous à compter de la date de publication du présent arrêté.

Les fabricants doivent apposer sur les spécialités concernées des vignettes avec la mention du taux de participation fixé à l'alinéa ci-dessus à compter de la même date.

Les stocks détenus à cette date des différentes formes de la spécialité Fonzylane comportant des vignettes avec la mention du taux prévu au 6° du deuxième alinéa de l'article R. 322-1 peuvent être écoulés et pris en charge au taux de participation figurant sur la vignette jusqu'au 1er octobre 2001.

A compter du 1er octobre 2001, les stocks détenus à cette date des différentes formes de la spécialité Fonzylane comportant des vignettes avec la mention du taux prévu au 6° du deuxième alinéa de l'article R. 322-1 ne peuvent être écoulés et pris en charge qu'au taux de participation prévu au premier alinéa ci-dessus.

328 442-3 Adlone (exifone), comprimés sécables (B/30) (laboratoires Pharmascience).

331 498-6 Axonyl 1 g/5 ml (piracétam), solution buvable Gé, 125 ml en flacon (laboratoires Parke-Davis).

325 761-0 GEVATRAN 200 mg (oxalate de naftidrofuryl), gélules (B/20) (laboratoires Lipha Santé).

328 457-0 GINKOGINK 40 mg/ml (ginkgo biloba), solution buvable en flacon de 30 ml (laboratoires Urpac-Astier).

328 459-3 GINKOGINK 40 mg/ml (ginkgo biloba), solution buvable en flacon de 90 ml (laboratoires Urpac-Astier).

335 700-4 Hatial LP 400 mg (pentoxifylline), comprimés à libération prolongée Gé (B/30) (société Wyeth Lederlé).

305 122-2 Hydergine 1 mg/ml (mésilate de dihydroergotoxine), solution buvable en gouttes, 1 flacon de 50 ml avec mesurette graduée (société Novartis Pharma SA).

325 280-2 Hydergine 4,5 mg dose quotidienne unique (mésilate de dihydroergotoxine), comprimés (B/30) (société Novartis Pharma SA).

322 183-6 Iskedyl (mésilate de dihydroergocristine, raubasine), comprimés (B/100) (laboratoires Pierre Fabre Médicament).

314 183-0 Iskedyl (mésilate de dihydroergocristine, raubasine) soluté injectable en ampoule (B/6) (laboratoires Pierre Fabre Médicament).

305 425-5 Iskedyl (raubasine, méthanesulfonate de dihydroergocristine), gouttes en flacon de 30 ml (laboratoires Pierre Fabre Médicament).

333 995-7 Iskedyl (raubasine, méthanesulfonate de dihydroergocristine), solution buvable en flacon de 140 ml avec mesurette graduée (laboratoires Pierre Fabre Médicament).

333 523-8 Iskedyl (raubasine, méthanesulfonate de dihydroergocristine), solution buvable en flacon de 70 ml avec mesurette graduée (laboratoires Pierre Fabre Médicament).

330 077-7 Iskedyl Fort (mésilate de dihydroergocristine, raubasine), comprimés (B/112) (laboratoires Pierre Fabre Médicament).

330 076-0 Iskedyl Fort (mésilate de dihydroergocristine, raubasine), comprimés (B/56) (laboratoires Pierre Fabre Médicament).

341 238-7 Iskedyl Fort (raubasine, mélisate de dihydroergocristine), comprimés (B/56) (laboratoires Pierre Fabre Médicament).

341 237-0 Iskedyl Fort (raubasine, mésilate de dihydroergocristine), comprimés (B/28) (laboratoires Pierre Fabre Médicament).

346 597-5 Loftyl 150 mg (chlorhydrate de buflomédil), comprimés pelliculés Gé (B/20) (laboratoires Abbott).

346 442-1 Naftidrofuryl Merck 100 mg, gélules (B/20) (laboratoires Merck Génériques).

346 443-8 Naftidrofuryl Merck 200 mg, comprimés pelliculés (B/20) (laboratoires Merck Génériques).
343 741-8 Naftidrofuryl RPG 100 mg, gélules (B/20) (laboratoires Biogalénique).
325 765-6 Naftilux 200 mg (naftidrofuryl), gélules (B/20) (laboratoires Thérabel Lucien Pharma).
352 528-1 Nicergoline Biogaran 10 mg, gélules (B/30) (laboratoires Biogaran).
352 529-8 Nicergoline Biogaran 10 mg, gélules (B/90) (laboratoires Biogaran).
352 526-9 Nicergoline Biogaran 5 mg, gélules (B/30) (laboratoires Biogaran).
353 435-7 Nicergoline EG 10 mg, gélules (B/90) (EG Labo-laboratoires EuroGenerics).
353 434-0 Nicergoline EG 10 mg, gélules (B/30) (EG Labo-laboratoires EuroGenerics).
353 837-8 Nicergoline EG 5 mg, gélules (B/30) (EG Labo-laboratoires EuroGenerics).
345 817-1 Nicergoline RPG 10 mg, gélules (B/90) (laboratoires Biogalénique).
338 106-6 Nicergoline RPG 10 mg, gélules (B/30) (laboratoires Biogalénique).
337 387-1 Nicergoline RPG 5 mg, gélules (B/30) (laboratoires Biogalénique).
313 056-5 Nootropyl (piracétam), gélules (B/60) (laboratoires UCB Pharma).
313 057-1 Nootropyl (piracétam), soluté injectable, 5 ml en ampoule (B/12) (laboratoires UCB Pharma).
331 441-4 Nootropyl 1,2 g/6 ml (piracétam), solution buvable en ampoules (B/30) (laboratoires UCB Pharma).
320 955-1 Nootropyl 20 % (piracétam), soluté buvable en flacon de 125 ml (laboratoires UCB Pharma).
326 861-9 Nootropyl 800 mg (piracétam), comprimés pelliculés (B/90) (laboratoires UCB Pharma).
326 637-1 Nootropyl 800 mg (piracétam), comprimés pelliculés (B/45) (laboratoires UCB Pharma).
324 824-9 Novodil (cyclandélate), gélules Gé (B/50) (laboratoires Augot).
324 876-9 Olmifon (adrafinil), comprimés pelliculés sécables (B/40) (laboratoires Lafon).
324 875-2 Olmifon (adrafinil), comprimés pelliculés (B/20) (laboratoires Lafon).
317 169-9 Optamine 1 mg/ml (mésilate de dihydroergotoxine), solution buvable en gouttes Gé, 50 ml en flacon + mesurette graduée (laboratoires Théraplix).
329 509-4 Oxadilène (chlorhydrate de butalamine, chlorhydrate de papavérine), gélules (B/30) (institut de recherche Corbière).
335 522-9 Oxyphar (mésilate de dihydroergotoxine), solution buvable en flacon Gé, 50 ml (laboratoires Diophar).
334 873-2 Pentoflux LP 400 mg (pentoxifylline), comprimés enrobés à libération prolongée Gé (B/30) (laboratoires du docteur E. Bouchara).
349 850-3 Pentoxifylline Bayer LP 400 mg, comprimés pelliculés à libération prolongée (B/30) (laboratoires Bayer Classics).
335 922-7 Pentoxifylline BGR LP 400 mg, comprimés à libération prolongée (B/30) (laboratoires Biogaran).
351 284-1 Pentoxifylline Biogaran LP 400 mg, comprimés pelliculés à libération prolongée (B/30) (laboratoires Biogaran).
335 467-8 Pentoxifylline GNR LP 400 mg, comprimés pelliculés à libération prolongée (B/30) (laboratoires GNR-pharma).
349 767-9 Pentoxifylline Merck LP 400 mg, comprimés pelliculés à libération prolongée (B/30) (laboratoires Merck Génériques).
323 301-2 Perenan, gélules (B/30) (laboratoires Sanofi Winthrop).
325 113-9 Perenan, solution buvable en gouttes, 50 ml en flacon (laboratoires Sanofi Winthrop).
349 727-7 Piracetam Biogaran 400 mg, comprimés pelliculés (B/90) (laboratoires Biogaran).
349 734-3 Piracetam Biogaran 800 mg, comprimés pelliculés sécables (B/90) (laboratoires Biogaran).
349 732-0 Piracetam Biogaran 800 mg, comprimés pelliculés sécables (B/45) (laboratoires Biogaran).
349 715-9 Piracetam EG 400 mg, comprimés pelliculés (B/90) (EG Labo-laboratoires EuroGenerics).
349 719-4 Piracetam EG 800 mg, comprimés pelliculés sécables (B/45) (EG Labo-laboratoires EuroGenerics).
353 277-2 Piracetam G GAM 800 mg, comprimés pelliculés sécables (B/45) (laboratoires G GAM).
347 383-9 Piracetam GNR 20 %, solution buvable, 125 ml en flacon avec pipette doseuse (laboratoires GNR-pharma).
351 261-1 Piracetam RPG 400 mg, comprimés pelliculés (B/90) (laboratoires Biogalénique).
351 265-7 Piracetam RPG 800 mg, comprimés pelliculés sécables (B/45) (laboratoires Biogalénique).
330 823-0 Piribedil Biogaran 20 mg, comprimés enrobés (B/30) (laboratoires Biogaran).
330 880-4 Piribedil Biogaran 3 mg/ml, solution injectable, 1 ml en ampoule (B/12) (laboratoires Biogaran).
330 829-9 Piribedil Biogaran 50 mg LP, comprimés enrobés à libération prolongée (B/30) (laboratoires Biogaran).
332 879-3 Praxilène 100 mg, gélules sous plaquettes thermoformées (B/20) (laboratoires Lipha Santé).
324 264-3 Praxilène 200 mg (oxalate acide de naftidrofuryl), comprimés pelliculés (B/20) (laboratoires Lipha Santé).
342 055-3 Praxilène 200 mg (oxalate acide de naftidrofuryl), comprimés pelliculés (B/90) (laboratoires Lipha Santé).
317 873-8 Rheobral (vincamine, troxérutine), gélules (B/60) (laboratoires Niverpharm).
317 872-1 Rheobral (vincamine, troxérutine), gélules (B/30) (laboratoires Niverpharm).
320 911-4 Rutovincine (vincamine, troxérutine, acide ascorbique), comprimés enrobés (B/60) (laboratoires Pamex SARL).
315 039-0 Segolan (dihydroergotoxine), gouttes, 75 ml en flacon (laboratoires Wyeth Byla).
337 257-0 Sermion 10 mg (nicergoline), gélules (B/90) (laboratoires Rhône-Poulenc Rorer).
335 638-7 Sermion 10 mg (nicergoline), gélules (B/30) (laboratoires Spécia).
337 390-2 Sermion 5 mg (nicergoline), gélules sous plaquettes thermoformées (B/30) (laboratoires Spécia).
317 613-6 Sermion injectable (nicergoline), préparation injectable, 1 flacon + 1 ampoule de solvant de 2,5 ml (laboratoires Spécia).
332 621-6 Sermion Lyoc 10 mg (nicergoline), lyophilisats oraux (B/30) (laboratoires Aventis).
317 064-2 Sermion Lyoc, lyophilisat oral dosé à 5 mg, 30 doses unitaires (laboratoires Spécia).
315 495-6 Stratene 100 mg (citrate monohydraté de cétiédil), gélules (B/24) (laboratoires Gerda).
310 219-0 Sureptil (cinnarizine, acéfylline heptaminol), comprimés (B/50) (laboratoires Synthélabo France).
312 370-8 Sureptil (cinnarizine, acéfylline heptaminol), solution buvable, gouttes en flacon de 100 ml (laboratoires Synthélabo France).
329 906-3 Tanakan 40 mg (extrait de ginkgo biloba), comprimés enrobés (B/90) (société Beaufour Ipsen Pharma).
329 904-0 Tanakan 40 mg (extrait de ginkgo biloba), comprimés enrobés (B/30) (société Beaufour Ipsen Pharma).
330 279-9 Tanakan 40 mg/ml (extrait de ginkgo biloba), solution buvable, 90 ml en flacon avec mesurette graduée (société Beaufour Ipsen Pharma).
316 324-0 Tanakan 40 mg/ml (extrait de ginkgo biloba), solution buvable, 30 ml en flacon avec mesurette graduée (société Beaufour Ipsen Pharma).
317 696-9 Torental 100 mg/5 ml (pentoxifylline), solution injectable en ampoule (B/6) (laboratoires Hoechst Houdé).
322 757-2 Torental LP 400 mg (pentoxifylline), comprimés enrobés à libération prolongée (B/20) (laboratoires Hoechst Houdé).
328 779-8 Tramisal (ginkgo biloba), solution buvable, 30 ml en flacon (laboratoires Urpac-Astier).
310 860-8 Trivastal 20 mg (piribédil), comprimés enrobés (B/30) (laboratoires Servier).
318 906-7 Trivastal 50 mg LP (piribédil), comprimés enrobés à libération prolongée (B/30) (laboratoires Servier).
316 990-0 Trivastal injectable 3 mg (monométhane sulfonate de piribédil), soluté injectable, 1 ml en ampoule (B/12) (laboratoires Servier).
315 698-4 Vadilex 10, soluté injectable, 2 ml en ampoule (B/10) (laboratoires Synthélabo France).
322 867-2 Vadilex 20, comprimés dragéifiés (B/30) (laboratoires Synthélabo France).
311 151-0 Vasculat, ampoules injectables (B/6) (laboratoires Boehringer Ingelheim France).
311 152-7 Vasculat, comprimés (B/40) (laboratoires Boehringer Ingelheim France).

311 153-3 Vasculat, gouttes, 30 ml en flacon (laboratoires Boehringer Ingelheim France).
314 792-7 Vasculogene (vincamine), comprimés enrobés à 10 mg (B/60) (laboratoires Pharma 2000).
317 377-0 Vasculogene Fort (vincamine), comprimés (B/60) (laboratoires Pharma 2000).
325 566-3 Vascunormyl 200 mg (cyclandélate), comprimés enrobés (B/50) (laboratoires Alcon).
343 183-5 Vasobral (mésilate de dihydroergocryptine A, caféine), comprimés sécables (B/60) (laboratoires Chiesi SA).
339 209-3 Vasobral (mésilate de dihydroergocryptine A, caféine), comprimés sécables (B/30) (laboratoires Chiesi SA).
318 250-4 Vasobral, soluté buvable, 50 ml en flacon (laboratoires Chiesi SA).
319 815-5 Vinca 20 mg (vincamine), comprimés pelliculés (B/45) (laboratoires Substipharm).
322 265-2 Vinca 30 mg retard (vincamine), gélules (B/60) (laboratoires Substipharm).
319 495-0 Vincafor Retard 30 mg (vincamine), gélules (B/30) (laboratoires Pharmafarm).
319 850-5 Vincarutine (vincamine, rutoside), gélules (B/45) (laboratoires Labomed).
330 822-4 Zenium 4,5 mg (mésilate de dihydroergotoxine), gélules Gé (B/30) (laboratoires Jumer).

Arrêté du 17 septembre 2001 modifiant l'arrêté du 2 août 2001 autorisant au titre de l'année 2001 l'ouverture de concours pour le recrutement d'éducateurs spécialisés des instituts nationaux de jeunes sourds et de l'Institut national des jeunes aveugles (femmes et hommes)

NOR : *MESG0123235A*

Par arrêté de la ministre de l'emploi et de la solidarité et du ministre de la fonction publique et de la réforme de l'Etat en date du 17 septembre 2001, les dispositions de l'arrêté du 2 août 2001 autorisant au titre de l'année 2001 l'ouverture de concours pour le recrutement d'éducateurs spécialisés des instituts nationaux de jeunes sourds et de l'Institut national des jeunes aveugles (femmes et hommes) sont modifiées ainsi qu'il suit :

Les épreuves écrites auront lieu le 6 décembre 2001.

La date de clôture des inscriptions est fixée au 31 octobre 2001.

Le dossier complet de candidature doit être adressé, uniquement par voie postale, au ministère de l'emploi et de la solidarité (DAGPB, bureau du recrutement, pièce 217), 10, place des Cinq-Martyrs-du-Lycée-Buffon, 75015 Paris, au plus tard le 31 octobre 2001 (le cachet de la poste faisant foi).

(Le reste sans changement.)

MINISTÈRE DE L'INTÉRIEUR

Décret n° 2001-847 du 11 septembre 2001 relatif à la durée de validité des passeports délivrés en Nouvelle-Calédonie, en Polynésie française, dans les îles Wallis et Futuna, à Mayotte et à Saint-Pierre-et-Miquelon

NOR : *INTM0100036D*

Le Premier ministre,

Sur le rapport du ministre de l'intérieur,

Vu le décret de la Convention nationale du 7 décembre 1792 relatif aux passeports à accorder à ceux qui seraient dans le cas de sortir du territoire français pour leurs affaires ;

Vu le décret n° 2001-185 du 26 février 2001 relatif aux conditions de délivrance et de renouvellement des passeports ;

Vu l'avis du gouvernement de la Nouvelle-Calédonie en date du 2 août 2001 ;

Vu l'avis du gouvernement de la Polynésie française en date du 11 juillet 2001,

Décrète :

Art. 1er. – La durée de validité des passeports délivrés en Nouvelle-Calédonie, en Polynésie française, dans les îles Wallis et Futuna, à Mayotte et à Saint-Pierre-et-Miquelon est de dix ans sous réserve des dispositions des articles 2 et 3 ci-après.

Art. 2. – La durée de validité des passeports délivrés dans les collectivités d'outre-mer visées à l'article 1er à un mineur ou portant inscription d'un mineur de moins de quinze ans est de cinq ans.

Art. 3. – La durée de validité des passeports délivrés dans les collectivités d'outre-mer visées à l'article 1er à titre exceptionnel et pour un motif d'urgence dûment justifié ou délivrés par une autorité qui n'est pas celle du lieu de résidence ou de domicile du demandeur est de six mois.

Art. 4. – Le ministre de l'intérieur et le secrétaire d'Etat à l'outre-mer sont chargés, chacun en ce qui le concerne, de l'exécution du présent décret, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 11 septembre 2001.

LIONEL JOSPIN

Par le Premier ministre :

Le ministre de l'intérieur,
DANIEL VAILLANT

Le secrétaire d'Etat à l'outre-mer,
CHRISTIAN PAUL

Décret du 11 septembre 2001 approuvant des modifications apportées aux statuts d'une congrégation

NOR : *INTA0100240D*

Par décret en date du 11 septembre 2001, sont approuvés les nouveaux statuts de la congrégation dite « Province de France de la mission ouvrière Saint-Pierre et Saint-Paul », reconnue légalement par le décret du 22 juin 1992 et dont le siège est transféré à Montfermeil (Seine-Saint-Denis), 10, rue Grange.

Décret du 11 septembre 2001 approuvant des modifications apportées aux statuts d'une congrégation

NOR : *INTA0100241D*

Par décret en date du 11 septembre 2001, sont approuvés les nouveaux statuts de l'établissement particulier de la congrégation des sœurs du Sacré-Cœur de Montigny-lès-Metz, autorisé légalement par le décret du 6 décembre 1860, dont le siège est 9 et 11, rue des Couvents, à Montigny-lès-Metz (Moselle).

Arrêté du 20 juillet 2001 relatif aux pièces et informations à transmettre en vue de l'agrément et du versement de la prime à la création d'emplois

NOR : *INTM0100031A*

La ministre de l'emploi et de la solidarité et le secrétaire d'Etat à l'outre-mer,

Vu le code du travail, notamment les articles L. 421-2, L. 832-7, R. 831-20 et R. 831-21 et D. 831-5 ;

Vu la loi n° 2000-1207 du 13 décembre 2000 d'orientation pour l'outre-mer, et notamment ses articles 7 et 63 ;

Vu le décret n° 2001-499 du 11 juin 2001 portant application de l'article 7 de la loi n° 2000-1207 du 13 décembre 2000 d'orientation pour l'outre-mer et modifiant le code du travail (deuxième partie : Décrets en Conseil d'Etat) ;

Vu le décret n° 2001-502 du 11 juin 2001 portant application de l'article 7 de la loi n° 2000-1207 du 13 décembre 2000 d'orientation pour l'outre-mer,

Arrêtent :

Art. 1er. – La demande d'agrément de la prime à la création d'emploi signée est adressée au représentant de l'Etat dans le département ou dans la collectivité territoriale. A la demande est annexé un dossier qui doit comporter les pièces et informations suivantes :

DEUXIÈME PARTIE

Modifications du taux de remboursement

Pour les spécialités ci-dessous, le taux de participation de l'assuré prévu au premier alinéa et au 6° du deuxième alinéa de l'article R. 322-1 du code de la sécurité sociale est abrogé et remplacé par celui prévu au 5° du deuxième alinéa de l'article R. 322-1 du code de la sécurité sociale, à compter du 1er janvier 2002.

Les fabricants doivent apposer sur les spécialités concernées des vignettes avec la mention du taux de participation fixé à l'alinéa ci-dessus à compter de la même date.

Les stocks détenus à cette date comportant des vignettes avec la mention de l'ancien taux peuvent être écoulés et pris en charge au taux de participation figurant sur la vignette jusqu'au 2 mars 2002.

A compter du 3 mars 2002, les stocks détenus à cette date comportant des vignettes avec la mention de l'ancien taux de participation ne peuvent être écoulés et pris en charge qu'au nouveau taux de participation.

MINISTERE DE L'EMPLOI
ET DE LA SOLIDARITE

REPUBLIQUE FRANCAISE

PARIS, le 10 OCT. 2001

DIRECTION DE LA SECURITE SOCIALE
DIRECTION GENERALE DE LA SANTE

Monsieur le Président,

La commission de la transparence, dans le cadre de la procédure de réévaluation décidée par la ministre de l'emploi et de la solidarité en 1998, a considéré notamment que le service médical rendu des spécialités dont la liste est fixée en annexe était insuffisant pour justifier une prise en charge par l'assurance maladie. La ministre de l'emploi et de la solidarité a décidé de tirer les conséquences de ces avis en prenant plusieurs mesures dont notamment une baisse du taux de remboursement.

Nous vous informons donc que nous envisageons de porter à 65% la participation de l'assuré et, en conséquence, de baisser à 35% le taux de prise en charge par l'assurance maladie de ces spécialités.

Votre laboratoire étant concerné par cette mesure, nous vous informons que vous avez la possibilité de présenter des observations écrites ou demander à être entendu par la commission de la transparence dans le mois suivant la réception de la présente lettre, conformément aux dispositions de l'article R. 163-13 du CSS.

Vos observations écrites éventuelles et vos demandes d'audition devront être adressées au ministère de l'emploi et de la solidarité, 8, avenue de Ségur 75007 PARIS, Direction de la sécurité sociale, bureau 1C (pièce 5129) avec copie à l'Agence française de sécurité sanitaire des produits de santé.

Nous vous indiquons également que cette mesure serait appliquée au 1er janvier 2002 afin qu'elle coïncide avec les opérations de revignettage nécessitées par le passage à l'Euro.

Nous vous prions d'agréer, Monsieur le Président, l'expression de notre considération distinguée.

Le Directeur Général

Objet : **Notre spécialité :**
MEDIATOR,® comprimés enrobés
V/Courrier du 10.10.2001

Messieurs les Directeurs,

Par votre courrier du 10.10.2001 (reçu le 12.10.2001), vous nous informez que vous envisagez de baisser à 35% le taux de prise en charge par l'assurance maladie de notre spécialité :

MEDIATOR,® comprimés enrobés,

dans la mesure où la Commission de la Transparence, dans le cadre de la procédure de réévaluation décidée en 1998, a considéré que le service médical rendu par cette spécialité était insuffisant ; cette appréciation reposant sur l'avis rendu à propos de l'indication principale de notre spécialité à la date 19.11.1999 : "*Adjuvant du régime adapté dans le diabète asymptomatique avec surcharge pondérale*".

Or il s'avère que, depuis (cf. notre courrier en date du 11.09.01), l'indication de MEDIATOR® dans le diabète a été validée selon le nouveau libellé suivant :

"Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale". (cf. modification de l'A.M.M. du 12.06.01).

SERVIER

Annexe 4-27

Cette indication a été agréée sur la base d'un dossier synthétisant les principales études pharmacologiques et cliniques disponibles, qui permet de positionner MEDIATOR® comme une alternative utile à la metformine.

En effet, l'action principale de MEDIATOR® chez les diabétiques de type 2 est **un effet insulino-sensibilisateur**, qui a été démontré par trois études de clamp hyperinsulinémique eu- (1,2) ou iso-glycémique (3), réalisées en double aveugle contre placebo.

Son mode d'action in vitro est différent de celui de la metformine et des thiazolidinediones : il s'exerce via un effet direct sur le foie (modifications de l'activité et de l'expression génique d'enzymes clés du métabolisme hépatique du glucose et des acides gras) et un effet indirect sur le muscle par la diminution des flux de triglycérides (4-11).

MEDIATOR® est utilisé depuis de nombreuses années dans le traitement du diabète de type 2, mais la démonstration de son efficacité reposait essentiellement sur des études réalisées en double aveugle versus placebo, aux effectifs relativement limités, qui ont montré néanmoins un effet cliniquement significatif avec une différence d'évolution de l'HbA1c de l'ordre de 1% au terme de 3 mois de traitement, à différents stades de la maladie :

- en monothérapie chez des patients nouvellement diagnostiqués insuffisamment contrôlés par régime seul (12),
- en association aux sulfonylurées (13) ou à la metformine (14) chez des patients insuffisamment contrôlés sous sulfonylurées ou metformine en monothérapie,
- et en association à l'insuline chez des patients insulino-requérants (15-17).

Une étude à plus large échelle a été récemment réalisée, comparant en double aveugle l'efficacité et la sécurité d'emploi de MEDIATOR®, de la metformine et d'un placebo au cours de 6 mois de traitement (18).
Cette étude a inclus 722 patients à un stade relativement précoce de la maladie, afin de permettre l'inclusion d'un groupe placebo suivi 8 mois (2 mois de pré-inclusion et 6 mois de traitement). Cette population était assez similaire aux 1704 patients éligibles pour le traitement par la metformine dans l'étude UKPDS (valeurs moyennes à l'inclusion : IMC 31 kg/m^2, HbA_{1c} 7,2%, glycémie à jeun 8,1 mmol/L dans UKPDS, et respectivement 30 kg/m^2, 7,6% et 10 mmol/L dans cette étude).

Annexe 4-27

L'effet sur le contrôle glycémique au terme de 6 mois de traitement dans cette étude a confirmé celui observé dans les précédentes études, avec une différence d'évolution de l'HbA_{1c} de près de 1% entre MEDIATOR® et le placebo chez les patients dont l'HbA_{1c} était comprise entre 6% et 8,5% au terme de 2 mois de régime intensif. L'effet a été plus prononcé chez les patients dont l'hyperglycémie était plus sévère à l'inclusion (HbA_{1c} > 8%), avec une diminution en valeur absolue de 1,5%, et une différence de 1,7% avec le groupe placebo. Dans cette étude, la différence finale d'HbA_{1c} entre MEDIATOR® et metformine était de 0,28 ± 0,12% (test de non-infériorité : p = 0,037, avec une limite supérieure de l'I.C. à 90 % au-dessous de la limite d'équivalence clinique fixée à 0,5 %). Cliniquement, cette différence pourrait traduire une puissance de MEDIATOR® légèrement inférieure à la metformine, probablement due à l'utilisation d'un dosage (moyenne 2,65 comprimés par jour), inférieur au dosage recommandé (3 comprimés par jour).

Un **programme d'études complémentaires** répondant aux standards qui seraient actuellement requis pour tout nouveau traitement du diabète a été envisagé, afin de mieux préciser la place de MEDIATOR® par rapport à la metformine dans la stratégie thérapeutique telle que définie par les recommandations de l'A.F.S.S.A.P.S. (02.99) et de l'ANAES (03.00), y compris chez des patients à un stade plus avancé de la maladie :

Deux études incluant près de 700 patients sont d'ores et déjà en cours de mise en place :

1 - Une étude comparant MEDIATOR® au placebo chez des patients insuffisamment contrôlés sous sulfonylurées en monothérapie, et présentant des contre-indications relatives ou absolues à l'usage de la metformine (produit d'association de première intention dans les recommandations de l'A.F.S.S.A.P.S. - Février 1999 pour la prise en charge du patient diabétique de type 2).
La durée du suivi sera de 7 mois (6 mois de maintenance après une période de titration initiale). Cette étude permettra de confirmer les données préalablement obtenues avec des effectifs plus faibles, et le positionnement de MEDIATOR® en tant qu'alternative thérapeutique à l'usage de la metformine, quand cette dernière ne peut être utilisée compte tenu de ses précautions d'emploi ou contre-indications.

2 - Une étude comparant MEDIATOR® au placebo chez des patients insuffisamment contrôlés sous metformine en monothérapie. En effet, il apparaît aujourd'hui intéressant, au vu des études réalisées sur l'association de la metformine et des thiazolidinediones, de prescrire une association de deux insulino-sensibilisateurs.

Annexe 4-27

Or, le mode d'action de MEDIATOR® et de la metformine sur la sensibilité à l'insuline est complémentaire. MEDIATOR® constitue donc une alternative thérapeutique utile aux thiazolidinediones, puisqu'il présente très peu de contre-indications (pancréatites chroniques avérées et hypersensibilité au benfluorex ou à l'un de ses excipients), et ne nécessite pas de surveillance biologique particulière. La durée du suivi sera également de 7 mois.

Au total et en résumé :

- La place de MEDIATOR® chez le diabétique vient d'être confirmée (A.M.M. validée en date du 12.06.01).
- L'évaluation de son Service Médical Rendu est antérieure, tout comme la publication des «*Recommandations pour le traitement médicamenteux du diabète de type 2*» (AFSSAPS - février 1999) et la «*Stratégie de prise en charge du patient diabétique de type 2, à l'exclusion de la prise en charge des complications*» (ANAES - mars 2000), documents qui ne pouvaient, par conséquent, en faire état.
- Nous sommes prêts à nous engager, y compris par voie conventionnelle, sur la réalisation d'un programme d'études visant à confirmer et préciser la place de MEDIATOR® dans la stratégie thérapeutique du diabète. Nous nous tenons à votre disposition pour vous en exposer les synopsis. La mise en place des deux études ci-dessus mentionnées est en cours, en vue de résultats escomptés pour début 2004.

Dans ce cadre et compte tenu de ces nouveaux éléments, comme vous nous en offrez la possibilité, nous vous demandons de présenter ces observations à la Commission de la Transparence, en vue de la réévaluation du Service Médical Rendu par notre spécialité MEDIATOR®.

Dans l'attente, nous vous prions donc de bien vouloir surseoir à votre décision.

Nous vous prions d'agréer, Messieurs les Directeurs, l'expression de notre considération distinguée.

NOTE
pour la Ministre et pour le Ministre délégué

A l'attention de M.Romaneix et Mme Wargon, conseillers techniques

Objet : Baisse du taux de remboursement de certains médicaments

Réf : Ma note en date du 28 novembre.

Comme je vous l'indiquais dans ma note susvisée, il n'a pas été possible de procéder à l'élaboration d'un arrêté unique portant à 35% le taux de remboursement de l'ensemble des médicaments dont le service médical rendu a été jugé insuffisant par la commission de la transparence dans le cadre de la procédure de réévaluation.

En effet, un certain nombre de laboratoires ont formulé des observations, suite au courrier du 10 octobre 2001 les informant de l'intention des pouvoirs publics de procéder à la baisse de taux des spécialités concernées qu'ils exploitent.

Le premier arrêté qui ne concerne donc que les médicaments pour lesquels les laboratoires n'ont pas formulé d'observations est en cours de publication.
Le 2ème arrêté concerne les médicaments pour lesquels les laboratoires nous ont fait parvenir des observations. Leurs génériques figureraient également dans ce second texte.
Les points suivants sont à noter :

1. Trois spécialités (hydracort, mediator, pepsane) ayant un niveau de Service Médical Rendu (SMR) insuffisant dans toutes leurs indications ont fait l'objet d'un nouvel examen de la commission de la transparence. Pour ces 3 produits l'avis de la commission de la transparence a été confirmé. Nous vous proposons de porter leur taux de remboursement à 35%.

Copie : Hélène Sainte- Marie, DGS

2. Le laboratoire Alpharma conteste la baisse du taux de la spécialité Galirène au motif que cette mesure [illegible] pour effet [illegible] un report de prescription vers des [illegible]

3. La spécialité Méthotrexate [illegible] a reçu un niveau de SMR insuffisant dans les indications de son AMM. Or ce produit est principalement utilisé depuis des années dans une indication hors AMM : la polyarthrite rhumatoïde. Il convient de noter que le laboratoire Aventis (anciennement Roger Bellon) n'a jamais déposé de demande de modification de son AMM afin d'obtenir cette indication. Il existe depuis 1995, un médicament ayant exactement la même composition : le Novatrex (Wyeth-Léderlé) qui lui a l'AMM dans l'indication de la polyarthrite rhumatoïde, est remboursable et a obtenu un niveau de SMR important. Le laboratoire Aventis nous a signalé que dans l'hypothèse où le taux de remboursement de Methotrexate serait ramené à 35% il en arrêterait la commercialisation. Cependant et compte tenu du fait que cette spécialité a été utilisée et remboursée dans une indication hors AMM pendant des années sans que le laboratoire ne fasse la moindre démarche pour régulariser cette situation. Je vous propose d'adresser un courrier au laboratoire en lui indiquant que s'il ne demande pas la modification de son AMM afin de régulariser sa situation dans un délai de 6 mois, le taux de remboursement de cette spécialité sera porté à 35%.

4. Le laboratoire Aventis nous a également saisi de la situation de la spécialité colimycine injectable qui a obtenu un niveau de SMR insuffisant dans les indications de son AMM mais qui est utilisé hors AMM dans une indication pédiatrique pour les enfants souffrant de mucoviscidose. Je vous propose de tenir le même raisonnement que pour Méthotréxate et de saisir le laboratoire d'une demande de régularisation de ses indications de l'AMM dans un délai de 6 mois en lui précisant qu'en l'absence de cette démarche le taux de remboursement de cette spécialité sera porté à 35%.

5. La spécialité Cognex utilisée dans le traitement de la maladie d'Alzheimer ne fait à l'heure actuelle plus l'objet d'initialisation de nouveaux traitements mais concerne des patients anciennement traités et qui supportent bien ce produit. S'agissant d'un médicament qui n'étant plus prescrit dans de nouveaux traitements va progressivement quitter le marché et compte-tenu de la gravité de la pathologie en cause, je vous propose de maintenir son taux de remboursement à 65%. De plus, la pathologie étant prise en charge à 100%, cette baisse de taux ne conduirait à aucune économie pour l'assurance maladie.

6. Les autres spécialités[1] pour lesquelles des observations ont été formulées présentent toutes la caractéristique d'avoir obtenu un niveau de SMR modéré ou faible dans certaines de leurs indications et insuffisant dans d'autres. La commission de la transparence a confirmé ses avis sans définir les indications prévalentes. Dans ces conditions, et à l'appui des documents dont nous disposons (analyse de la prescription médicale de la société IMS) et qui ont montré que les prescriptions les plus importantes pour ces spécialités étaient effectuées dans les indications ayant un niveau de service médical rendu modéré ou faible, je vous propose de maintenir le taux de remboursement de ces spécialités à 65%, à l'exception de Vitamine A faure pour laquelle les données sur la prescription indiquent que l'indication la plus prescrite est celle qui a un niveau de SMR insuffisant. La même décision sera appliquée à leurs génériques

[1] il s'agit de : Vastarel, Centrofène, Ikaran, Seglor, Prazinil et Vitamine A Faure, collyre.

Annexe 4-28

7. J'attire néanmoins votre attention sur la situation de la spécialité Vastarel (laboratoires Servier). En effet, si l'on considère uniquement les indications de son AMM (« traitement de l'angine de poitrine et vertiges) Vastarel est effectivement prescrit majoritairement dans l'indication : « traitement de l'angine de poitrine » pour laquelle ce médicament a eu un niveau de SMR modéré.

En revanche, il convient de noter que cette spécialité est **prescrite à plus de 50% dans des indications hors AMM sans justification de santé publique.**
En effet, les données sur la prescription dont nous disposons nous indiquent que VASTAREL est prescrit dans de multiples indications telles que les maladies hypertensives, les troubles mentaux organiques, l'infarctus du myocarde aigu et même pour 8,2% dans des indications non déterminées. L'utilisation de VASTAREL dans ces indications n'est validée, à ce jour, par aucune donnée scientifique. Je vous précise que les montants remboursés pour Vastarel étaient de 648 MF en 2000 pour des dépenses présentées au remboursement de 821 MF (source CNAMTS). Ces montants ne concernent que le régime général qui représente environ 70% de la dépense totale. On peut donc estimer la dépense totale à 925 MF pour l'ensemble des régimes en ce qui concerne les remboursements et à 1173 MF les dépenses présentées au remboursement. Le chiffre d'affaires TTC de la spécialité est de 1221 MF en 2000 (source GERS). On peut donc estimer que seulement 4% des achats de Vastarel ne sont pas remboursés alors que 51% des prescriptions sont réalisées en dehors des indications de l'AMM.
Une telle dérive me semble inacceptable.

Les solutions suivantes sont envisageables :

- Baisse du taux de remboursement de Vastarel à 35%

Cette décision serait fondée sur le fait que les indications dans lesquelles Vastarel est prescrit font généralement l'objet de traitement par des spécialités dont le niveau de smr a été jugé insuffisant (notamment en ce qui concerne les prescriptions dans les indications de vaso-dilatateur périphérique).
Toutefois cette option est extrêmement fragile juridiquement.
En effet, seule la commission de la transparence est habilitée à évaluer le niveau de smr d'un médicament. Toutefois, elle ne pourra pas donner un avis sur des indications hors AMM dans la mesure où une telle démarche reviendrait à se prononcer sur la validité même de ces indications ce qui n'entre pas dans son champ de compétence. Les ministres ne peuvent pas non plus porter une telle appréciation sans les avis des commissions compétentes (AMM et transparence).

- En revanche, il semble juridiquement possible de procéder à la radiation de la liste des spécialités remboursables de cette spécialité. En effet, le 3° de l'article R 163-5 du code de la sécurité sociale précise que les médicaments susceptibles d'entraîner des dépenses injustifiées ne peuvent faire l'objet d'une inscription sur la liste des spécialités remboursables. L'article R 163-7 d même code indique que les médicaments mentionnés au 3° de l'article R 163-5 peuvent faire l'objet d'une radiation de la liste des spécialités remboursables. Dans le cas d'espèce, le caractère injustifié des dépenses entraînées par les prescriptions hors AMM de Vastarel n'est pas contestable. De ce fait, la décision de radiation serait juridiquement fondée. Aussi, je vous propose de saisir le laboratoire Servier de mon intention de radier Vastarel de la liste des spécialités remboursables dés lors qu'il n'y aurait pas eu de régularisation de sa situation vis à vis de l'AMM. Le laboratoire aura alors un mois pour formuler des observations. Cette saisine suppose l'accord de la DGS sur ce scénario dans la mesure où ce type de courrier doit être signé conjointement par nos deux directions.
- En tout état de cause, ce courrier présentera l'avantage de mettre le laboratoire dans une position où il sera contraint, s'il veut éviter la radiation, de nous fournir des éléments

Annexe 4-28

justifiant les prescriptions hors AMM de son produit voire de demander une régularisation de ces indications à la commission d'AMM, ce qui permettra par la suite à la commission de la transparence de se prononcer sur le niveau de smr de cette nouvelle indication et donc d'aboutir très probablement à une baisse du taux de remboursement.

- Si toutefois cette proposition ne recueillait pas votre accord, il conviendrait de demander au Comité Economique des Produits de Santé de bien vouloir examiner la possibilité d'une baisse de prix de ce produits.

8. Concernant la spécialité Succiminide Pharbiol (laboratoire Labomed), le niveau de SMR retenu par la commission de la transparence est insuffisant mais le laboratoire fait valoir que dans l'indication : lithiases oxaliques il n'existe aucune alternative thérapeutique médicamenteuse, la seule alternative est l'hospitalisation. Pour cette raison, l'an dernier, les pouvoirs publics ont demandé au laboratoire Labomed de maintenir ce produit sur le marché en lui accordant une hausse de prix pour l'y inciter. Dans ces conditions et par cohérence avec les décisions prises l'an dernier sur cette spécialité, il semble inopportun un an après et alors qu'il n'y a toujours pas d'alternative thérapeutique médicamenteuse de procéder à la baisse du taux de remboursement de ce produit.

9. Trois spécialités ont fait l'objet d'une notification complémentaire postérieure à celle du 10 octobre : Nopron, Vita-3 et Asthmasédine. A ce jour, seul le laboratoire NOVARTIS (Vita 3) a fait part de son accord sur la baisse du taux.et Vita-3 a pu être intégré dans le 1er arrêté.

Cette mesure devait prendre effet le 1er janvier 200, mais il est désormais impossible de respecter ce calendrier.
Je vous informe que j'ai donc indiqué aux laboratoires concernés que la décision de baisse de taux pour leurs spécialités n'étaient pas encore arrêtée.
Toutefois, il va de soi que je souhaiterais que cette mesure puisse être effective rapidement. Elle pourrait, par exemple, prendre place en même temps que la baisse de la marge des pharmaciens qui est envisagée. Aussi, je vous serais obligé de bien vouloir me faire parvenir votre avis sur les propositions contenues dans la présente note dans les meilleurs délais possibles

Paris - 8 AOUT 2002

NOTE POUR LE MINISTRE DE LA SANTE, DE LA FAMILLE ET DES PERSONNES HANDICAPEES

A l'attention de Monsieur Ph.Georges, directeur-adjoint de cabinet, MM.D.Eyssartier et J.de-Tournemire, conseillers techniques
Copie à M.P.Mayeur, conseiller technique au cabinet du ministre des Affaires sociales, du travail et de la solidarité.

Objet : Baisse du taux de remboursement des médicaments à service médical rendu insuffisant – mesures complémentaires à celles prises en 2001

La réévaluation du service médical rendu des médicaments par la commission de la transparence a conduit dans un premier temps, en août 2000, à baisser de 65% à 35% le taux de remboursement des vasodilatateurs.
Cet arrêté ayant fait l'objet d'une annulation par le Conseil d'Etat pour vice de forme, un deuxième arrêté a été pris pour ces produits en septembre 2001.
Pour la quasi-totalité des médicaments à service médical rendu insuffisant appartenant à d'autres classes thérapeutiques, le taux de remboursement a été porté à 35% par arrêté de décembre 2001.

Quelques produits bénéficient encore d'un taux de 65%.

Un certain nombre d'entreprises ont formulé des observations suite au courrier qui leur avait adressé en octobre 2001, les informant de l'intention des pouvoirs publics de procéder à la baisse des taux de remboursement des spécialités à SMR insuffisant qu'ils exploitaient.
Ces observations ont donné lieu à un nouvel examen par la commission de la transparence qui a confirmé ses avis précédents. La mise en place de cette procédure n'a toutefois pas permis que certains de ces produits puissent être rattachés à l'arrêté publié en décembre 2001.

Copie DGS (Hélène Sainte-Marie)

Annexe 4-29

Le cabinet précédent a été sollicité par la DSS en décembre 2001 ainsi que par la DGS en janvier 2002, pour accord sur la suite à donner aux propositions faites par les deux directions. Pour certains des médicaments concernés, ces propositions divergeaient. Le cabinet n'a pas fait part de sa position.

Il subsiste donc sur le marché quelques produits pour lesquels il serait nécessaire de prendre un arrêté ramenant leur taux de prise en charge de 65% à 35%, même si la décision était prise de dérembourser ultérieurement ces produits.

Une fiche jointe en annexe détaille les différents cas individuels en précisant la position de la DSS ainsi que celle de la DGS sur la base des observations faites par cette direction en janvier 2002. Il en ressort que pour six spécialités[1], la baisse de taux pourrait être immédiate. Elle est particulièrement nécessaire pour le Médiator(laboratoires Servier) dont les dépenses présentées au remboursement du régime général s'élevaient à 30 ME en 2001. Pour deux produits [2]des négociations devraient être menées avec les entreprises afin de les amener à déposer un dossier d'extension d'indication de leur autorisation de mise sur le marché ; ces produits sont en effet essentiellement prescrits hors AMM et le service médical rendu apprécié par la commission ne concerne bien entendu que les indications reconnues. Cinq produits [3]devraient être maintenus à 65% (ainsi que les médicaments faisant le cas échéant partie du même groupe générique).

J'appelle en particulier votre attention sur le cas du Vastarel des laboratoires Servier. En effet ce produit a eu un niveau de SMR modéré pour deux de ses indications qui représentent l'essentiel des prescriptions dans les indications de son AMM, le SMR pour ces autres indications étant insuffisnt. Par contre il est prescrit à plus de 50% dans des indications en dehors de celles de son AMM.La solution envisageable serait un passage à 35% justifié par le SMR modéré dans les indications prévalentes de l'AMM, assorti d'une menace de radiation si l'entreprise ne régularise pas la situation de son produit. L'enjeu est important car ce produit occupe en 2001 la 10ème place des produits remboursés.

Je vous remercie de me faire part de votre position sur chacun des cas évoqués.

Le chef de service,
oint au directeur de la sécurité sociale

Dominique LIP[illegible]

DSS/FSS/1C

BAISSE DU TAUX DE REMBOURSEMENT DES MEDICAMENTS A SMR INSUFFISANT

I – Dossiers faisant l'objet d'une position commune DSS/DGS et n'ayant pas fait l'objet de remarques de la part de l'AFSSAPS

1 – Trois spécialités (Hydracort, Mediator, Pepsane) ayant un niveau de service médical rendu (SMR) insuffisant dans toutes leurs indications ont fait l'objet d'un nouvel examen de la commission de la transparence. Pour ces trois produits l'avis de la commission de la transparence a été confirmé. Nous vous proposons de porter leur taux de remboursement à 35%.

2 – Le laboratoire Alpharma conteste la baisse du taux de la spécialité **Galirène** au motif que cette mesure aura pour effet d'entraîner un report de prescription vers des anxiolytiques plus puissants. Cette remarque ne semble pas recevable aussi je vous propose de **ramener le taux de remboursement de cette spécialité à 35 %**, d'autres spécialités comparables ayant vu leur taux ramené à 35% en décembre 2001 .

3 – La spécialité **Cognex** utilisée dans le traitement de la maladie d'Alzheimer ne fait à l'heure actuelle plus l'objet d'initialisation de nouveaux traitements mais concerne des patients anciennement traités et qui supportent bien ce produit. S'agissant d'un médicament qui n'étant plus prescrit dans de nouveaux traitements va progressivement quitter le marché et compte tenu de la gravité de la pathologie en cause, je vous propose de **maintenir son taux de remboursement à 65 %** De plus, la pathologie étant prise en charge à 100 %, cette baisse de taux ne conduirait à aucune économie pour l'assurance maladie.

4– La spécialité **Methotrexate** (laboratoire Aventis) a eu un niveau de SMR insuffisant dans les indications de son AMM. Or, ce produit est principalement utilisé depuis des années dans une indication hors AMM : la polyarthrite rhumatoïde. Il convient de noter que le laboratoire Aventis (anciennement Roger Bellon) n'a jamais déposé de demande de modification de son AMM afin d'obtenir cette indication. Il existe depuis 1995, un médicament ayant exactement la même composition : le Novatrex (Wyeth-Léderlé) qui lui a l'AMM dans l'indication de la polyarthrite rhumatoïde, est remboursable et a obtenu un niveau de SMR important. Le laboratoire Aventis a signalé que dans l'hypothèse où le taux de remboursement de Méthotréxate serait ramené à 35 % il en arrêterait la commercialisation. Cependant et compte tenu du fait que cette spécialité a été utilisée et remboursée dans une indication hors AMM pendant des années sans que le laboratoire ne fasse la moindre démarche pour régulariser cette situation, je vous propose **d'adresser un courrier au laboratoire en lui indiquant que s'il ne demande pas la modification de son AMM afin de régulariser sa situation dans un délai de 6 mois, le taux de remboursement de cette spécialité sera porté à 35 %.** La DGS, soucieuse de ne pas créer une situation de monopole au profit de Wyeth-Lederle, estime également nécessaire de négocier avec Aventis pour lui demander de déposer une demande d'extension d'AMM et de maintenir son produit sur le marché. L'AFSSAPS estime correct le délai de 6 mois proposé ci-dessus.

5 – Concernant la spécialité **Succinimide Pharbiol** (laboratoire Labomed), le niveau de SMR retenu par la commission de la transparence est insuffisant mais le laboratoire fait valoir que dans l'indication « lithiases oxaliques » il n'existe aucune alternative thérapeutique médicamenteuse,

Annexe 4-29

eule alternative est l'hospitalisation. Pour cette raison, en 2000, les pouvoirs publics ont andé au laboratoire Labomed de maintenir ce produit sur le marché en lui accordant une se de prix pour l'y inciter. Dans ces conditions et par cohérence avec les décisions prises érieurement sur cette spécialité, il semble inopportun alors qu'il n'y a toujours pas alternative thérapeutique médicamenteuse de procéder à la baisse du taux de remboursement de ce produit. L'AFSSAPS mentionne toutefois que la place de ce médicament par rapport à d'autres alternatives thérapeutiques tels que la litotrypsie paraît limitée.

6 – Le laboratoire Aventis nous a saisi de la situation de la spécialité **Colimycine injectable** qui a obtenu un niveau de SMR insuffisant dans les indications de son AMM mais qui est utilisée hors AMM pour les enfants souffrant de mucoviscidose. La DSS propose de tenir un **raisonnement analogue à celui du Méthotréxate** . Toutefois, au vu des observations formulées par l'AFSSAPS, l'engagement à demander au laboratoire concernerait le dépôt dans un délai de 6 mois d'un programme de développement préalable à une demande d'extension d'AMM en lui précisant qu'en l'absence de cette démarche le taux de remboursement de cette spécialité sera porté à 35 %. La DGS estime pour sa part inopportun, dans le contexte de la politique d'encouragement des pouvoirs publics aux médicaments pédiatriques, de fixer un ultimatum au laboratoire alors qu'il n'aurait semble t'il maintenu son produit sur le marché que pour répondre à un besoin de santé publique à la demande des prescripteurs. Il semble toutefois difficile de maintenir la situation actuelle. Si l'utilisation de la Colimycine correspond à une pratique, une régularisation de l'AMM doit être demandée. Une négociation est à conduire avec l'entreprise .

7 –Certaines spécialités pour lesquelles des observations ont été formulées présentent la caractéristique d'avoir obtenu un niveau de SMR modéré ou faible dans certaines de leurs indications et insuffisant dans d'autres. La commission de la transparence a confirmé ses avis sans définir les indications prévalentes. Dans ces conditions, et à l'appui des documents dont nous disposons (analyse de la prescription médicale de la société IMS) et qui ont montré que les prescriptions les plus importantes pour ces spécialités étaient effectuées dans les indications ayant un niveau de SMR modéré ou faible, je vous propose de maintenir le taux de remboursement à 65 % pour Prazinil, Ikaran , et Seglor, (ainsi que pour les spécialités des mêmes groupes génériques, s'il y a lieu) tant que les décisions de baisse de taux ne seront pas prises pour les autres spécialités à SMR modéré ou faible .

8- Deux spécialités qui ont font l'objet d'une notification complémentaire postérieure à celle du 10 octobre (**Nopron**[4] et **Asthmasédine**) n'ont pas fait part d'observations et donc acceptent implicitement la baisse du taux.

II – Dossier faisant l'objet d'un désaccord entre DSS et DGS

Parmi les spécialités visées au point 7 ci-dessus, figure également la Vitamine A Faure collyre pour laquelle les données sur la prescription indiquent que l'indication la plus prescrite est celle qui a un niveau de SMR insuffisant, justifiant une baisse de taux de remboursement. La DGS n'est pas d'accord avec cette proposition car cette spécialité a un SMR modéré dans l'indication « xérosis conjonctival et cornéen » . Toutefois elle ne justifie pas que cette indication représente une part substantielle du volume prescrit et l'AFSSAPS mentionne qu'il s'agit d'une indication rare. Le passage à 35% est donc justifié au regard des règles adoptées par la commission de transparence pour attribuer les niveaux de service médical rendu.

[4] Nopron est en cours de négociation avec le CEPS en vue d'un déremboursement

Annexe 4-29

III - Spécialité Vastarel (laboratoires Servier).

Si l'on considère uniquement les indications de l'AMM (traitement prophylactique de la crise d'angine de poitrine ; traitement symptomatique d'appoint des vertiges et des acouphènes ; traitement d'appoint des baisses d'acuité et des troubles du champ visuel présumés d'origine vasculaire) Vastarel est effectivement prescrit majoritairement (données sur la prescription médicale d'IMS) dans l'indication : « traitement de l'angine de poitrine » pour laquelle ce médicament a eu un niveau de SMR modéré.

En revanche, il convient de noter que cette spécialité est **prescrite à plus de 50% dans des indications hors AMM**.
En effet, les données sur la prescription dont nous disposons nous indiquent que VASTAREL est prescrit dans de multiples indications telles que les maladies hypertensives, les troubles mentaux organiques, l'infarctus du myocarde aigu et même pour 8,2 % dans des indications non déterminées. L'utilisation de VASTAREL dans ces indications n'est validée, à ce jour, par aucune donnée scientifique. Je vous précise que les montants remboursés pour Vastarel étaient de 83 ME en 2001 pour des dépenses présentées au remboursement de 104 ME (source CNAMTS). Ces montants ne concernent que le régime général qui représente environ 70 % de la dépense totale. On peut donc estimer la dépense totale à 118 ME pour l'ensemble des régimes en ce qui concerne les remboursements et à 149 ME les dépenses présentées au remboursement. Le chiffre d'affaires en prix public de la spécialité est environ de 155 ME en 2001 (source GERS). On peut en conclure que toutes les prescriptions, y compris celles qui sont réalisées en dehors des indications de l'AMM, sont prises en charge par l'assurance maladie.

- Il est possible juridiquement de procéder à une baisse de taux car la spécialité a un SMR modéré dans les indications de l'AMM où le produit est majoritairement prescrit. Cette baisse pourrait donc intervenir soit immédiatement, soit conjointement avec celles des autres spécialités de SMR modéré. Par ailleurs, je vous propose de menacer l'entreprise d'une radiation de son produit s'il ne régularise pas sa situation au regard des indications de l'AMM. Ce courrier présentera l'avantage de mettre le laboratoire dans une position où il sera contraint, s'il veut éviter la radiation, de nous fournir des éléments justifiant les prescriptions hors AMM de son produit voire de demander une régularisation de ces indications à la commission d'AMM, ce qui permettra par la suite à la commission de la transparence de se prononcer sur le niveau de SMR de cette nouvelle indication. S'il peut paraître difficilement envisageable de procéder, in fine, à la radiation de cette spécialité, il me semble que la menace de radiation est la seule voie possible pour responsabiliser le laboratoire Servier et l'engager à régulariser la situation de Vastarel vis à vis du remboursement ; Les génériques de cette spécialité (notamment Centrophène) se trouvant dans une situation comparable, je vous propose de leur appliquer la même procédure.

- Si toutefois, cette proposition ne recueillait pas votre accord, il conviendrait de demander au Comité Economique des Produits de Santé de bien vouloir examiner la possibilité d'une baisse de prix de ces produits. La DGS est favorable à une saisine du CEPS afin qu'il utilise les moyens en sa possession pour inciter la firme à déposer un dossier de demande d'extension d'AMM.

Note
pour le ministre

A l'attention de M. de Tournemire, conseiller technique
Copie : M.Eyssartier

Objet : Baisse de 65% à 35% des médicaments de SMR modéré ou faible
PJ : 2 lettres-type

Suite à vos instructions concernant le calendrier de mise en œuvre de la baisse du taux de remboursement des médicaments dont le niveau de service médical rendu a été jugé faible ou modéré par la commission de transparence, vous voudrez bien trouver ci-joint deux projets de lettres-type pour les industriels, leur faisant part de l'intention du Ministre de procéder à cette baisse et visant à recueillir leurs éventuelles observations ou demandes d'audition auprès de la commission de la transparence.
Le premier projet est destiné aux entreprises dont les médicaments ont un niveau de service médical rendu, pour l'ensemble de leurs indications, apprécié comme faible ou modéré par la commission de la transparence.
Le second projet sera adressé aux quelques entreprises dont les produits ont un niveau de service médical rendu faible ou modéré pour certaines indications et insuffisant pour d'autres. La plupart de ces produits ont été écartés en 2001 de la baisse de taux pour SMR insuffisant compte tenu de leur caractère particulier[1]. Ils doivent donc désormais faire l'objet de cette nouvelle notification, cette fois en raison de leurs indications à SMR faible ou modéré. Je vous avais d'ailleurs proposé, par note en date du 8 août 2002, de porter à 35% le taux de prise en charge de ces spécialités.
Par ailleurs, comme le prévoyait la même note, il conviendra de porter également à 35%, après information des entreprises, et sous réserve que ces spécialités ne figurent pas dans la première liste de médicaments à dérembourser, le taux de prise en charge de 6 produits à SMR insuffisant pour l'ensemble de leurs indications[2] mais n'ayant pas fait l'objet de baisse en décembre 2001.
Vous trouverez ci-joint une liste des produits concernés, qui est en cours de validation définitive. Le cas de quelques produits à niveau de SMR faible ou modéré pour certaines indications et important pour d'autres indications est également en cours d'examen.

Le chef de service
adjoint au directeur de la sécurité sociale

Dominique LIBAULT

Copie : M. MAYEUR

[1] Il s'agit des spécialités : DHE Sandoz et ses génériques (Seglor, Ikaran,Tamik) ainsi que de Vastarel et les produits contenant de la trimetazidine ou du chlorhydrate de trimetazidine et partageant les mêmes indications, de Prazinil , et de Vitamine A Faure.
[2] Il s'agit des spécialités Hydracort, Mediator, Pepsane, Galirène, Nopron et Asthmasédine.

Médicament	Niveau de SMR dans les indications de l'AMM	Niveau de SMR dans les indications hors AMM	Taux actuel de prise en charge	Proposition DSS 8/08/2002	position DGS au 8/08/2002	Mesure de déremboursement ou de baisse de taux	Proposition DSS février 2003

Note
pour le Ministre

A l'attention de M. de Tournemire, conseiller technique

Objet : Baisse du taux de remboursement des médicaments à service médical rendu insuffisant.

PJ : - notes du 8/08/2002 et du 11/12/2002.
- tableau

Suite à votre demande, je vous prie de bien vouloir trouver ci-joint la note du 8 août 2002 sur la baisse du taux de remboursement des médicaments à service médical rendu insuffisant.

Dans cette note, je vous proposais de baisser le taux de remboursement des quelques produits à service médical rendu insuffisant bénéficiant encore d'un taux de prise en charge à 65%, même si la décision était prise de les dérembourser ultérieurement.

Je vous indiquais que pour six de ces spécialités, la baisse de taux pouvait être immédiate. Sur ces six spécialités, deux ont fait l'objet d'une annonce de déremboursement par lettre du 3 février dernier[1] et une spécialité est radiée depuis le 31 décembre 2002[2]. Il subsiste donc trois produits[3] dont il conviendrait de baisser le taux à 35% dans l'attente d'un futur déremboursement. Je vous propose de notifier cette baisse aux entreprises concernées en même temps que celle envisagée pour les vasodilatateurs.

Par ailleurs, je vous rappelle que pour deux produits[4] des négociations devraient être menées avec les entreprises afin de les amener à déposer un dossier d'extension d'indication de leur autorisation de mise sur le marché.

Je vous remercie de me faire part de votre position sur chacun des points évoqués.

Le Directeur de la Sécurité Sociale

Dominique LIBAULT

1 Hydracort, Galirène
2 Nopron
3 Mediator, Pepsane, Asthmasedine.
4 Methotrexate et Colymicine injectable

Médicament	Niveau de SMR dans les indications de l'AMM	indications hors AMM	Taux actuel de prise en charge	Proposition DSS 3/08/2002	position DGS au 8/08/2002	Mesure de déremboursement ou de baisse de taux	Proposition DSS février 2003
Hydracort	insuffisant		65%	35%		déremboursement (lettre envoyée le 3/02)	clos
Mediator	insuffisant		65%	35%			3e vague de déremboursement en attendant, baisse de taux à 35% proposée
Pepsane	insuffisant		65%	35%			2e vague de déremboursement en attendant, baisse de taux à 35% proposée
Galirène	insuffisant		65%	35%		déremboursement (lettre envoyée le 3/02)	clos
Nopron	insuffisant		radié au 31/12/2002				clos
Asthmasedine	insuffisant		65%	35%			2e ou 3e vague de déremboursement en attendant, baisse de taux à 35% proposée

Colymicine injectable	insuffisant	oui - pour les enfants atteints de mucoviscidose	65%	contacter le labo pour demander le dépôt d'un programme de développement préalable à la demande d'extension d'AMM, dans un délai de 6 mois - sinon, baisse à 35%	contacter le labo mais sans fixer d'ultimatum		idem proposition 8/08/2002 - attente décision cabinet
Cognex	insuffisant		65%	maintien à 65% car pas d'économie potentielle + patients anciennement traités + pathologie grave prise en charge à 100%			idem proposition 8/08/2002

Annexe 4-32

Rapport pour la commission de transparence du 12/04/06.

Réevaluation du Service Médical Rendu

Nom du produit : Mediator 150 mg
Principe actif : Benfluorex
Laboratoire : Servier

Dr P. GIRAL
Unités de Prévention Cardio-vasculaire
Groupe hospitalier Pitié-Salpétrière - PARIS 13

Le benfluorex est un très ancien produit qui est commercialisé depuis 30 ans avec des indications larges et imprécises à la lumière des données récentes et un mode d'action inconnu.
Du fait des indications imprécises, la prescription du produit l'est aussi et il est nécessaire de préciser les indications et le service médical rendu dans le cadre de ces indications

Le présent rapport ne traite que de l'indication « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale. »
On considère que la précédente réévaluation des autres indications (adjuvant du régime adapté dans les hypertriglycéridémies) a considéré le SMR comme insuffisant (commission de transparence du 19/11/1999).
Les complications du diabète sont nombreuses et graves. La microangiopathie diabétique qui atteint essentiellement le rein et la rétine est directement en rapport avec l'hyperglycémie dont le niveau moyen est reflété par l'hémoglobine glyquée. L'étude majeure UKPDS a montré que l'abaissement de l'hémoglobine glyquée chez les diabétiques était associé avec un développement moindre de la microangiopathie. De ce fait, l'abaissement de l'hémoglobine glyquée représente un marqueur validé de l'amélioration de l'équilibre du diabète et d'une diminution de la survenue des complications spécifiques.

En fait 2 études récemment publiées modifient certainement l'approche du produit dans l'indication du diabète.
Il s'agit de 2 études réalisées en Europe et dans le monde hors US publiés en 2003 et 2006.
La plus importante vient d'être publié dans Diabetes Care qui est une des meilleures revues internationale consacré au diabète (Impact factor 2004 : 7).
Il s'agit d'une étude majoritairement européenne (85% des patients inclus) d'une durée globale de 15 mois, terminé en 2004, communiqué en congrès international en 2005 et publié en 2006. L'investigateur principal qui est aussi le premier signataire de l'article est le chef du service d'endocrinologie de l'hopital cardiovasculaire de Lyon. Ce service et ses publications font autorité dans le domaine de la diabétologie, la lipidologie et la prise en charge du risque CV.
Cette étude a inclus 325 (ou 327 dans le rapport d'étude ?) patients de type 2 non insulinotraités intolérant à la metformine, traité par sulfamide hypoglycémiant et dont le diabète n'est pas équilibré sous ce dernier traitement. (HBA1c à l'entrée = 8.32 % dans les 2 groupes, glycémie à jeun 9.87 mmol/l groupe benfluorex ; 9.67 dans le groupe placebo).
IL s'agit d'une étude en double insu benfluorex versus placebo d'une durée de 18 semaines. Une période d'extension (non publiée) a été effectuée et 95% des patients (n=282) ont participé à cette période d'extension).

Annexe 4-32

Cette étude satisfait aux standards actuels des études comparatives vs placebo et les résultats peuvent être considérés comme fiables.
Les 2 groupes de patients sont comparables pour toutes les variables étudiées.
Le résultat principal est dans le groups traité par benfluorex, une baisse de 1% de l'hémoglobine glyquée par rapport au groupe placebo (groupe benfluorex de 8.34 à 7.52% ; groupe placebo 8.33 à 8.52%). Presque 3 fois plus de patients (34% vs 12%) atteigne les objectifs d'hémoglobine glyquée (7%) dans le groupe traité vs groupe contrôle. D'autres paramètres en rapport avec le métabolisme glucidique sont améliorés de façon similaire glycémie a jeun, indice de HOMA.

	Benfluorex

Annexe 4-32

Annexe 4-32

Le rapport présenté par le laboratoire apporte des informations intéressantes complémentaires sur la période d'extension en ouvert. Les patients du groupe placebo ont donc reçu le benfluorex dans la suite de l'étude suivant un période d'extension de 16 semaines avec la possibilité après 8 semaines de rajouter de l'arcabose chez les patients considérés comme mal équilibrés. Sur les 160 patients initiaux de ce groupe, 149 ont basculé du placebo au benfluorex. A noter que 23 patients de ce groupe avec un diabète déséquilibré ont reçu de l'arcabose à partir de la 26éme semaine soit donc 8 semaines après le début de la prise du benfluorex. Globalement, dans ce groupe, l'HbA1C a diminué de 8.53 à 7.49 %, ce qui représente une baisse similaire à ce qui a été constatée dans la première période Pour les 140 patients du groupe benfluorex de la première période, le niveau d'HbA1C est resté stable (de 7.52% à 7.53%). La glycémie et l'indice de HOMA montrent des modifications similaires.

La deuxième étude est une étude Européenne (France très majoritaire, Italie et Hollande) d'une durée globale de 21 mois, terminé en 1998, et publié en 2003 (Acta diabetologica IF 0.3). Alors que cette étude comprend 3 bras, le laboratoire annonce qu'il n'a été autorisé à ne communiquer que les résultats sur 2 bras : benfluorex versus placebo ; par contre le troisième bras qui comportait la metformine dans un design de non infériorité n'est pas commenté dans le mémoire du laboratoire.
Comme cette étude est publiée, l'ensemble de ses résultats sera commenté. Le premier signataire (Del Prato S) est un des professeurs d'un des plus célèbre service de diabétologie d'Europe situé à Pise (Italie).
La durée de l'étude était de 6 mois et concernait des patients présentant un diabète de type 2 mal équilibré traité uniquement par régime.
Il s'agit donc d'une étude multicentrique, comportant 3 bras : placebo, benfluorex, metformine avec des effectifs suivant un rapport 1/2/2. 722 patients ont été inclus et la durée du traitement est de 6 mois. 573 patients ont terminé l'étude soit 149 (21%) patients qui ont arrêté prématurément l'essai ou qui ont été perdu de vue (9). La répartition des patients entre les groupes est la suivante (ITT/PP) : Placebo 144/105, benfluorex 294/232, metformine 284/284.
Après 6 mois de traitement Le critère principal l'HbA1C est significativement abaissé dans le groupe benfluorex et le groupe metformine par rapport au groupe placebo dans lequel il augmente (cf tableau).

Fasting serum insulin, pmol/l			
Benfluorex (n=237)	78.6 (82.60)	61.1 (77.90)	2.10 (5.64) [-7.19; 11.39]
Metformin (n=237)	79.7 (84.80)	59.0 (39.30)	

La baisse de l'HbA1C est de 0.86 % dans le groupe benfluorex et de la différence est de 1.01% par comparaison à l'évolution de l'HbA1C dans le groupe placebo ($p< 0.001$).
Une étude en non infériorité vs metformine a été effectuée avec un seuil de non infériorité fixé à 0.5% pour l'HbA1C. Comme il existait une différence de 0.28% (CI 0.07-0.48) entre benfluorex et metformine, il a été conclu à l'absence d'infériorité entre baisse de l'HBA1C induite par la metformine et le benfluorex.

Globalement ces 2 études montrent des résultats similaires avec une baisse significative de l'HbA1C induite par le benfluorex autour de 1% par rapport au groupe placebo. Clairement, ces 2 études réalisées dans des populations européennes diabétiques représentatives montrent des résultats favorables pour le benfluorex qui suggère que la baisse de l'HbA1C devrait entraîner une diminution des complications du diabète.

Paramètres lipidiques : il faut noter même si cela ne faisait pas l'objet du présent rapport que dans ces populations diabétiques présentant des dyslipidémies, la modification des paramètres lipidiques est très modeste, voire non significative dans l'étude de Del Prato. Cela pose la question des indications du produit dans les dyslipidémies surtout si l'on compare les résultats obtenus avec les autres classes d'hypolipémiants que ce soit en terme d'effet biologique (fibrate, statine, acide nicotinique) ou en terme clinique (statine ou gemfibrozil). A la lumière de ces résultats, il n'est pas acceptable que le benfluorex conserve cette indication dans les hypertriglycéridémies ce d'autant que le DOREMA

Annexe 4-32

montre que le benfluorex est prescrit dans 46.3% pour une dyslipidémie. Cela pourrait être considéré comme un perte de chance pour les patients redevable d'un traitement par un hypolipémiant cliniquement efficace !

Effets secondaires : la fréquence des diarrhées qui est un des effets secondaires les plus fréquents avec la metformine est significativement plus faible avec le benfluorex (2 fois moins dans les 2 études commentées) . Par contre, il existe une symptomatologie mal étiquetée (vertiges, hypoglycémie, asthénie ...) qui semble plus fréquente dans le groupe benfluorex que dans le groupe placebo voire même vs metformine dans l'étude de Del Prato.

Conclusion :
Au vu de ces 2 études de bonne qualité, le service médical rendu du benfluorex dans le diabète est validé car il entraîne une baisse similaire aux autres antidiabétiques oraux du principal marqueur biologique de complications qui est l'hémoglobine glyquée.
Mais il ne faut pas que le dossier s'arrête là et les indications du produit doivent être revue à la lumière de ces études car il existe plusieurs problèmes
1/ Quel est la place du benfluorex dans la stratégie de prise en charge du diabète de type 2 ?.
Il revient aux sociétés savantes et aux commissions chargées des recommandations de préciser exactement la place du benfluorex.
2/ Quelle est la place du benfluorex par rapport à la metformine ?
. Soit seconde intention, à réserver aux intolérants si on considère que le benfluorex n'est qu'un me too de la metformine avec peut être une meilleure tolérance digestive.
. Soit en addition, mais il faut que des essais montrent l'effet additif du benfluorex par rapport à la metformine et aux autres antidiabétique oraux
Ces questions sont d'ailleurs posées en conclusion de l'article du Pr Moulin
3/ Par contre les propriétés hypolipémiantes sont très modestes et les indications doivent être revues en précisant au minimum une seconde intention sous réserve que les études d'association avec les statines montrent un gain biologique.

HAS

HAUTE AUTORITÉ DE SANTÉ

COMMISSION DE LA TRANSPARENCE

DOCUMENT PREPARATOIRE

12 avril 2006

Suite à la demande du ministre chargé de la Santé et de la Sécurité Sociale, la commission réexamine la spécialité suivante :

MEDIATOR 150 mg, comprimé enrobé
B/30 (CIP : 317 557-9)
B/100 (CIP : 317 559-1)

Laboratoire SERVIER

Benfluorex (chlorhydrate de)

liste I

Date de l'AMM : 22/04/1987

Conditions actuelles de prise en charge : Sécurité sociale (35%) ; Collectivités

Motif de la demande :Réévaluation du service médical rendu par la spécialité

Note : Le benfluorex est un dérivé de la fenfluramine (ex–PONDERAL) et de la dexfenfluramine (ex-ISOMERIDE), deux anorexigènes amphétaminiques retirés du marché du fait d'effets indésirables graves : hypertensions artérielles pulmonaires et valvulopathies cardiaques. (ces effets secondaires sévères connus peuvent se manifester plus de 10 ans après la dernière prise)
Le benfluorex est classé par l'OMS parmi les anorexigènes. Il est utilisé en France, hors AMM, comme traitement à visée amaigrissante.
En Espagne, la survenue sous benfluorex de troubles cardiaques graves, semblables à ceux observés avec la fenfluramine et la dexfenfluramine, est à l'origine du retrait du marché des spécialités pharmaceutiques contenant du benfluorex en mars 2003. En juin 2005, l'agence espagnole du médicament a annoncé l'interdiction des préparations magistrales à base de divers produits amaigrissants, dont le benfluorex, suite à la survenue d'effets indésirables graves.
La Commission Nationale de Pharmacovigilance (PV du 29 novembre 2005 ci joint) a souhaité une réévaluation du rapport bénéfice/risque du produit.

Chef de projet :

Direction de l'évaluation des actes et produits de santé

1 CARACTERISTIQUES DU MEDICAMENT

1.1. Principe actif

benfluorex (chlorhydrate de)

1.2. Indications remboursables

- Adjuvant du régime adapté dans les hypertriglycéridémies ;
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

1.3. Posologie

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante :

- 1ère semaine : 1 comprimé par jour, au cours du dîner ;
- 2ème semaine : 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner ;
- à partir de la 3ème semaine : 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.
En association à un régime adapté, Médiator constitue un traitement adjuvant : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

2 ANALYSE DES DONNEES DISPONIBLES

2.1. Efficacité

en attente d'éventuelles données de la firme

2.2. Effets indésirables (données RCP)

Les effets indésirables suivants ont été observés :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée) ;
- asthénie ;
- somnolence ;
- état vertigineux.

Toutefois, ces effets s'observent plus particulièrement à des posologies élevées. Une susceptibilité individuelle a également été observée.

3 SERVICE MEDICAL RENDU

3.1. Caractère habituel de gravité des affections traitées

La prise en charge des hypertriglycéridémies et du diabète ne se conçoit que dans le cadre d'une prise en charge globale des facteurs de risque (tabac, hypertension artérielle, obésité...)

Les hypertriglycéridémies sont souvent associées à un risque de maladie coronarienne. Les personnes avec des taux de triglycérides très élevés présentent un risque accru de développer une pancréatite. Les hypertriglycéridémies peuvent être isolées ou associées à une augmentation du taux de LDL-cholestérol.
En dehors de l'hypertriglycéridémie sévère, associée à un risque de survenue de pancréatite aiguë, il n'y a aucune urgence pour la prise en charge thérapeutique d'une anomalie isolée des triglycérides. Si le taux de triglycérides est le seul perturbé (taux de LDL-cholestérol en dessous des valeurs usuelles), il faut rechercher une cause associée : obésité ou surpoids, diabète, consommation excessive d'alcool.
Les complications les plus fréquentes et les plus graves du diabète sont cardiovasculaires, micro et macroangiopathiques.

3.2. Rapport efficacité/effets indésirables en attente d'éventuelles données de la firme

3.3. Place dans la stratégie thérapeutique

La prise en charge recommandée de la surcharge pondérale, déterminée par l'IMC, repose sur :
-la recherche de complications ou de facteurs de risques associés (HTA, dyslipidémie, diabète...)
- les mesures hygiéno-diététiques : activité physique, régime alimentaire, voire une psychothérapie de soutien.
Le traitement médicamenteux est indiqué en cas d'échec des mesures hygiéno-diététiques poursuivies pendant 3 mois. Mais ces dernières doivent être maintenues et associées au traitement médicamenteux.

La thérapeutique de première intention de l'hypertriglycéridémie inclut une thérapeutique diététique ainsi que la perte de poids, l'activité physique, la diminution des apports caloriques et de la consommation des graisses saturées et la restriction d'alcool. Lorsque l' hypertriglycéridémie est associée à une hypercholestérolémie, cette dyslipidémie mixte étant fortement athérosclérosante, un traitement médicamenteux doit être envisagé. Les médicaments de choix pour réduire les taux de triglycérides sont habituellement les fibrates. Dans le cas de dyslipidémie mixte, les statines associées aux fibrates sont recommandées.
Le mécanisme d'action du benfluorex comme hypolipémiant est indéterminé. Les données actuellement disponibles sont insuffisantes pour justifier son utilisation.[1]

Le programme alimentaire et une activité physique régulière constituent le traitement initial du diabète de type 2. Ils doivent être mis en oeuvre dès que le diagnostic de diabète de type 2 est confirmé et poursuivis indéfiniment.
Le régime diabétique est normoglucidique et hypolipidique. En cas de surpoids, il convient de mettre en place un régime hypocalorique.
Lorsque les mesures hygiéno-diététiques se révèlent insuffisantes, on prescrit un hypoglycémiant oral. En cas de surpoids important, la metformine en monothérapie a démontré son efficacité dans l'étude UKPDS. En cas de surpoids modéré, on peut choisir en première intention la metformine ou un inhibiteur des alphaglucosidases.

Une diminution significative du poids par rapport au placebo a été observée chez des patients obèses avec un diabète de type 2, ayant reçu de l'orlistat (diminuant l'absorption des TG alimentaires) ou de la sibutramine (utilisée pour stimuler la satiété).[2] Une méta-analyse[3] a évalué l'efficacité de certains médicaments (fluoxetine, orlistat, sibutramine) pour la perte de poids chez des patients obèses avec un diabète de type 2. Ces médicaments ont

[1] Prise en charge thérapeutique du patient dyslipidémique – recommandations Afssaps Mars 2005
[2] NICE – National Clinical Guidelines for Type 2 Diabetes - 2005
[3] Pharmacotherapy for weight loss in adults with type 2 diabetes mellitus – Review Cochrane 2006

permis une perte de poids significative mais modeste. De plus, le profil de sécurité de la sibutramine est discutable.

Le benfluorex n'est cité dans aucune recommandation, il n'a donc pas de place reconnue dans la stratégie thérapeutique des traitements adjuvants du régime dans les hypertriglycéridémies et chez les diabétiques avec surcharge pondérale.

3.4. Intérêt en termes de santé publique

Compte tenu :

- d'un rapport efficacité/effets indésirables mal établi ;
- de l'absence de place dans la stratégie thérapeutique,

cette spécialité ne présente pas d'intérêt en termes de santé publique.

3.5. Recommandations de la commission de la transparence

Annexe 4-34

REEVALUATION DU SERVICE MEDICAL RENDU (SMR)
CONCERNANT LE MEDIATOR 150 mg

1. **Gravité des pathologies visées par les indications du Résumé des Caractéristiques du Produits de l'AMM**

Le Mediator a, actuellement, deux indications thérapeutiques :
- Le diabète avec surcharge pondérale,
- Les hypertriglycéridémies.

Le diabète avec surcharge pondérale est une pathologie fréquente et grave, dont la progression s'accélère dans les pays développés parallèlement à celle de l'excès pondéral.

Les hypertriglycéridémies sont plus rares et moins pathogènes. Leur association à une élévation du risque athérogène paraît essentiellement liée à la baisse du cholestérol HDL qui les accompagne habituellement.

2. **En fonction des données fournies par les laboratoires, analyse critique des études et des données comparatives, en particulier :**

La principale étude présentée par les laboratoires Servier dans ce dossier de réévaluation du SMR est celle publiée par Moulin en 2006 dans Diabetes Care.
Cette étude me semble :
- Concerner des sujets respectant le RCP de l'AMM,
- Avoir été conçue et réalisée selon une méthodologie correcte (avis complémentaire d'un expert statisticien indispensable),
- Concerner des sujets représentatifs d'une large population de malades vus en pratique, mais elle ne concerne ni les patients traités par la Metformine, ni ceux âgés de moins de 50 ans,
- Avoir adopté des critères diagnostiques adaptés à la pratique, des critères de jugement cliniquement adaptés et un comparateur (le placebo) acceptable.

Pour résumer, cette étude trouve que, par rapport au placebo, le Benfluorex :
- Améliore l'équilibre glycémique, avec une baisse moyenne de l'HbA1c de l'ordre de 1 % et de la glycémie de 1,65 mmol/l,
- Abaisse le LDL cholestérol (de l'ordre de 6%), les triglycérides et l'index HOMA-IR, reflet de l'insulinorésistance,
- Augmente le risque d'épisodes suggestifs d'hypoglycémie (8,5 % contre 3,8 % avec le placebo).

Les études antérieures montrent une efficacité proche de celle retrouvée par Moulin.
Les différences observées sont cliniquement pertinentes en ce qui concerne l'équilibre glycémique et le LDL cholestérol, mais cette étude ne permet pas de conclure sur un effet

vasculoprotecteur de ces effets liés au Benfluorex.
En revanche, la baisse des triglycérides est modeste (- 0,16 mmol/l par rapport au placebo) et n'a que peu de signification clinique.

3. Apport du médicament dans la stratégie thérapeutique

La prise en charge habituelle du « diabète avec surcharge pondérale » passe par plusieurs étapes :

- Avant tout, une prise en charge hygiéno-diététique associant activité physique et conseils nutritionnels destinés à favoriser une perte pondérale même partielle et à normaliser la glycémie.
- Le premier traitement médicamenteux reste la Metformine, qui a démontré une efficacité en termes d'événements cardiovasculaires et de mortalité,
- En cas d'échec partiel de la Metformine, association à un sulfamide hypoglycémiant ou à une glitazone, voire à l'acarbose,
- Ces trois classes thérapeutiques peuvent, par ailleurs, être utilisées en cas d'intolérance ou de contre-indication à la Metformine.

· Par rapport à la Metformine et aux glitazones, le Benfluorex agit également en tant qu'insulino-sensibilisateur, possède une efficacité voisine ou légèrement inférieure selon les études et, à l'inverse de ces deux molécules, n'a pas démontré jusqu'à présent posséder un effet bénéfique sur la morbidité cardiovasculaire.

· Point positif pour le Benfluorex : il n'est contre-indiqué ni en cas d'insuffisance cardiaque (alors que les glitazones le sont), ni en cas d'insuffisance rénale, cardiaque ou respiratoire (alors que la Metformine l'est). Dans ces populations, il peut donc avoir des indications privilégiées.

4. Conclusion

En pratique quotidienne, le Benfluorex me paraît, d'après ces études, avoir un intérêt en association aux sulfamides hypoglycémiants en cas d'intolérance ou de contre-indication à la Metformine et aux glitazones.
Concernant l'effet du Benfluorex sur les triglycérides, il n'a que peu de signification clinique et on pourrait discuter la pertinence de cette indication.

Le Benfluorex a un coût moyen de prescription largement inférieur aux glitazones (voir tableau 6 page 24 du volume 1/3) et une souplesse d'utilisation potentiellement utile dans le cadre de la médecine générale ; il manque cependant une démonstration d'efficacité en termes de morbidité/mortalité.

Benfluorex = Médiator ® 150 mg

Réévaluation du service médical rendu

Avril 2006

Dr H. Narbonne

Introduction

Le diabète est une maladie chronique qui touche plus de 2 millions de Français (et certainement beaucoup plus si on inclut ceux chez qui le diagnostic n'a pas encore été posé).
Le diabète est une maladie gravissime au vue des complications qu'elle entraine : première cause de cécité chez l'adulte, première cause d'amputation non traumatique, une des causes principales de mise en dialyse et de maladie coronarienne. 51% des patents ont une hypercholestérolémie, 54% une HTA.
Le cout de la prise en charge du diabète est majeur car il existe des dépenses médicamenteuses, des dépenses en relations avec les professionnels de santé mais aussi par un nombre important d'hospitalisation (28% ont été hospitalisés au moins une fois en 2001), et également par un nombre important de mise en invalidité (11% en 2001). Au total, la prise en charge d'un patient diabétique en 2001 revient 1,9 fois plus chère qu'un non diabétique (Entred 2001).
Afin d'éviter l'apparition de complication, l'ANAES recommande d'obtenir un taux d'HbA1c < 6,5% dans le diabète de type 2 (ANAES 2000). Or, dans la population française, > 1/3 des diabétiques ont une HbA1c > 8% (Detournay 2005). Il est donc important de connaître et d'évaluer parfaitement l'ensemble des molécules pouvant y participer, dont le benfluorex.

I - Mécanismes d'action

L'effet du benfluorex s'exerce sur les lipides par 2 effets : un direct par action sur certains enzymes du métabolisme lipidique (Geelen 1983, Arnaud,1990, Sommariva 1986), un indirect par diminution de l'insulinorésistance. En effet, le benfluorex agit au niveau hépatique en diminuant la glycogénolyse hépatique (Bailey 1992) et au niveau périphérique en augmentant la captation et l'oxydation du glucose (Bailey 1992, Storlien 1993).
Néanmoins, sur le plan clinique, peu d'études convaincantes ont montré une baisse significative de l'insulinémie.

II - Efficacité

A – Effet sur la glycémie

1 – Efficacité de la molécule

Le tableau 1 résume les études qui semblent les plus intéressantes. Il faut noter d'emblée le très faible nombre de patients dans les études (seules 3 études ont plus de 100 patients), de la très faible durée des études (entre 3 et 6 mois) même s'il ne semble pas que l'effet de la molécule diminue avec le temps.
Concernant les critères d'efficacité, l'HbA1c diminue de 0,35 à 1,01% dans les groupes traités par le benfluorex (cette variation peut aller de 0,35 à 1,68% en calcul de variation inter groupe en sachant que dans cette dernière étude où le delta est si important, on note une forte augmentation de l'HbA1c dans le groupe contrôle).
La glycémie à jeun baisse elle aussi significativement dans toutes les études de 0,7 à 1,6 mmol/l allant jusqu'à 1,68 mmol/l en delta inter groupe (mais avec la même restriction que pour l'HbA1c).
Enfin, je trouve plus que surprenant de référencer une étude (celle de Louvet) qui porte sur un nombre ridicule de patients (25), dont l'HbA1c du groupe contrôle augmente de façon majeure et qui n'a pas été publiée de surcroit.

2 – Comparaison par rapport aux autres antidiabétiques oraux de même mode d'action

La comparaison doit se faire essentiellement avec les autres molécules efficaces sur l'insulinorésistance, c'est-à-dire la metformine et les glitazones.

Concernant la metformine, les essais en monothérapie montrent une baisse autour de 1,5% de l'HbA1c (DeFronzo 1995, Campbell 2004). Cette amélioration de la glycémie s'accompagne d'une perte de poids modeste qui ne devient vraiment significative qu'en comparaison de la prise de poids des sulfamides. On note également très peu d'hypoglycémies et une amélioration du profil lipidique, notamment des triglycérides quand ils sont élevés (Defronzo 1991, Schneider 1990).
Enfin et surtout, le metformine a montré une baisse de la mortalité significative lors de l'étude de l'UKPDS (UKPDS 1998). Si on compare le benfluorex et la metformine, sur la seule étude que nous avons (Del Prato 2003), l'effet sur le poids et les triglycérides est équivalent, il n'y a pas d'infériorité du benfluorex sur l'HbA1c mais celle-ci semble nettement plus basse sous metformine (cf tableau 1).
Le mode d'action de ses 2 molécules est proche, jouant sur la sensibilité à l'insuline. Leurs effets secondaires les plus fréquents sont digestifs, dont la fréquence, est à peu près similaires, même peu être supérieurs pour la metformine. Par contre, la metformine a des contre indications (toute défaillance viscérale pouvant entrainer une acidose lactique) que n'a pas le benfluorex.

Concernant les glitazones, aucune étude comparative n'a été réalisée. Les glitazones, que ce soient la pio ou la rosiglitazone entrainent une baisse de l'HbA1c autour de 1,4% en monothérapie (Campbell 2004, Lebovitz 2001). La pioglitazone a un effet intéressant sur les triglycérides avec une baisse dc 19% et une augmentation du HDL de 14% (Campbell 2004). Par contre, un des effets secondaires important de cette gamme de médicament est une prise de poids certaine et non négligeable, entrainant une surcharge hydrique et une augmentation du risque d'insuffisance cardiaque (Dormandy 2005). Il est clair que le benfluorex n'a pas ces effets secondaires, mais également semble moins efficace.

B - Effet sur les triglycérides

Les triglycérides baissent dans la majorité des études, de façon pas toujours significative (tableau 1). Mais, il est certains que le taux de triglycérides dans ces études est peu élevé. La baisse devient plus importante dans les sous groupes où les triglycérides sont plus hauts.
Par ailleurs, chez les sujets non diabétiques hypertriglycéridémiques, le benfluorex semble abaisser les triglycérides mais ici encore très peu d'études et très peu de patients : 22 patients sur 80 jours (Ranquin 1987) avec une baisse des triglycérides de plus de 20% par rapport au placébo. Enfin, les études comparant le benfluorex aux fibrates ont été très largement critiquées pour des problèmes méthodologiques (Prescrire 1998).

C – Effet sur le poids

Le poids baisse très faiblement de 0,5 à 1,96 Kg, le plus souvent non significativement. Il n'y a donc absolument pas lieu de le prescrire dans un but d'amaigrissement.

III – Effets secondaires et contres indications

Les effets secondaires sont essentiellement digestifs, à type de diarrhée, de douleurs abdominales ou de nausées. La fréquence est autour de 13% ce qui reste 2 fois moins fréquents que sous Metformine (25%) (Del Prato2003).
A noter un cas rapporté de défaillance avec fibrose sévère trivalvulaire cardiaque, identique à celle décrite avec la fenfluramine et la dexfenfluramine (Ribera 2003).
Enfin, dans les contre indications figurent l'hypersensibilité à la molécule. Plus surprenante est la contre indication en cas de pancréatite chronique.

IV – Place dans l'arsenal thérapeutique

Du fait de son mode d'action, il pourrait avoir sa place en tant qu'insulinosensibilisateur à la place de la metformine en cas de contre indication ou d'intolérance de celle-ci, ou même en association avec la metformine. N'ayant pas d'effet secondaire grave dans une population de patients fragiles, il pourrait être utilisé en monothérapie ou en association. Actuellement, dans ce cas de figure, les glitazones peuvent être utilisées. Il est certains que les effets secondaires à type d'insuffisance cardiaque, de prise de poids conséquente et d'œdèmes de membres inférieurs engendrés par les glitazones en limitent la prescription. Néanmoins, l'efficacité du benfluorex en termes de baisse de l'HbA1c est moindre que les glitazones. Il manque donc une étude, avec un grand nombre de patients et sur une période d'étude minimum de 6 mois, comparant le benfluorex à une glitazone.
Sur le plan santé publique, l'effet maximal du benfluorex sur l'HbA1c étant autour de 1% de l'HbA1c, son utilisation permettrait une baisse de 20% de la mortalité cardiovasculaire (UKPDS). La récente étude PROACTIVE avec la pioglitazone a été partiellement négative (Dormandy 2005). Néanmoins, aucune étude de morbimortalité n'est disponible pour le benfluorex. Enfin, le prix du traitement par benfluorex est 1/3 moins cher que celui par une glitzone.

V – Conclusion

Le benfluorex est une molécule ayant une activité insulinosensibilisatrice certaine permettant une amélioration des glycémies et des triglycérides. L'importance de son action sur ces 2 paramètres reste à affirmer par de grandes études sur des périodes de plus de 6 mois, avec un panel important de patients, et surtout en se comparant non pas à un placébo mais à un compétiteur actif type glitazone. Il serait également intéressant d'avoir des études de morbimortalité. Ceci permettrait d'intégrer éventuellement le benfluorex dans l'arbre décisionnel de la prise en charge du diabète. Il pourrait s'intégrer en association avec la metformine, ou à sa place, ou à la place des glitazones. Néanmoins, actuellement, les glitazones ont fourni des études comparatives versus metformine très convainquantes, avec cependant un doute quant à l'efficacité en termes de mortalité pour la pioglitazone.
Actuellement, le benfluorex ne bénéficiant pas d'étude de ce type, il est difficile de lui trouver une place certaine.
Concernant le traitement de l'hypertriglycéridémie, le flou est encore plus grand, les études de très faible qualité. Cela ne veut pas dire que la molécule ne serait pas active, mais les études recouvrent un trop faible nombre de patients pour se prononcer.
Enfin, il est bien certains que son effet sur la perte pondérale est minime et il n'a aucune indication dans la prise en charge du surpoids ou de l'obésité.

Etudes	Nombre patients	Modalités	Durée (semaines)	Efficacité				Commentaires

HAUTE AUTORITÉ DE SANTÉ

COMMISSION DE LA TRANSPARENCE

AVIS

10 mai 2006

Suite à la demande du ministre chargé de la Santé et de la Sécurité Sociale, la commission réexamine la spécialité suivante :

MEDIATOR 150 mg, comprimé enrobé
B/30 (CIP : 317 557-9)
B/100 (CIP : 317 559-1)

Laboratoire SERVIER

Benfluorex (chlorhydrate de)

liste I

Date de l'AMM : 22/04/1987

Conditions actuelles de prise en charge : Sécurité sociale (65%) ; Collectivités

Motif de la demande :Réévaluation du service médical rendu par la spécialité

Direction de l'évaluation des actes et produits de santé

Annexe 4-37

1 CARACTERISTIQUES DU MEDICAMENT

1.1. Principe actif

benfluorex (chlorhydrate de)

1.2. Indications remboursables

- Adjuvant du régime adapté dans les hypertriglycéridémies ;
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

1.3. Posologie

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante :

- 1ère semaine : 1 comprimé par jour, au cours du dîner ;
- 2ème semaine : 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner ;
- à partir de la 3ème semaine : 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.
En association à un régime adapté, Médiator constitue un traitement adjuvant : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

2 RAPPEL DES AVIS DE LA COMMISSION

Avis de la Commission du 19 novembre 1999

Le service médical rendu de cette spécialité a été apprécié en prenant en compte l'efficacité et les effets indésirables du médicament, sa place dans la stratégie thérapeutique, notamment au regard des autres thérapies disponibles, la gravité de l'affection à laquelle il est destiné, le caractère préventif, curatif ou symptomatique du traitement médicamenteux et son intérêt pour la santé publique.
Le niveau de service médical rendu est insuffisant au regard des autres médicaments ou thérapies disponibles pour justifier sa prise en charge.

3 ANALYSE DES DONNEES DISPONIBLES

3.1. Efficacité

3.1.1. Dans l'indication : adjuvant du régime adapté dans les hypertriglycéridémies
Aucune donnée clinique n'a été fournie par le laboratoire.

3.1.2. Dans l'indication : adjuvant du régime adapté chez les diabétiques avec surcharge pondérale

1/ Etudes anciennes

L'étude VELUSSI[1] de phase IV randomisée en double aveugle a évalué l'efficacité de MEDIATOR versus placebo sur l'insulinémie et sur le métabolisme glucidique chez 30 patients diabétiques de type 2, hyperinsulinémiques et en surpoids.
La durée de l'étude a été de 3 mois.
L'évaluation a porté sur des critères multiples (glycémie à jeun, HbA1c, fructosamine, test de tolérance au glucose, insulinémie...)
Aucun critère principal de jugement n'est précisé.

L'étude LOUVET de phase IV (non publiée) randomisée en double aveugle a évalué l'efficacité de MEDIATOR versus placebo sur le contrôle métabolique de 25 patients diabétiques de type 2 insuffisamment contrôlés par un régime et par sulfonylurés.
La durée de l'étude a été de 3 mois.
L'évaluation a porté sur des critères multiples (glycémie à jeun, HbA1c, fructosamine, test de tolérance au glucose, insulinémie...)
Aucun critère principal de jugement n'est précisé.

L'étude TOMASI[2] de phase IV randomisée en double aveugle a évalué l'efficacité de MEDIATOR versus placebo sur le contrôle métabolique de 68 patients diabétiques de type 2 insuffisamment contrôlés par sulfonylurés.
La durée de l'étude a été de 12 semaines.
L'évaluation a porté sur des critères multiples (glycémie à jeun, HbA1c, fructosamine, test de tolérance au glucose, insulinémie...)
Aucun critère principal de jugement n'est précisé.

Conclusion
Compte tenu de l'absence de détermination d'un critère principal et du nombre important des critères d'évaluation, les résultats de ces études anciennes ne permettent pas de préciser une éventuelle quantité d'effet du benfluorex dans l'indication « en adjuvant du régime adapté chez les diabétiques avec surcharge pondérale».

2/ Etudes récentes

Le laboratoire a fourni les résultats de 2 études récentes dans l'indication : adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Etude MOULIN[3]
Cette étude randomisée en double aveugle a évalué l'efficacité et la tolérance de MEDIATOR versus placebo chez 325 patients diabétiques de type 2 en surcharge pondérale (IMC compris entre 25 et 40 kg/m^2), insuffisamment contrôlés par les sulfamides hypoglycémiants et ayant une intolérance ou une contre-indication à la metformine.
La durée de l'étude a été de 18 semaines.
L'étude a ensuite été poursuivie en ouvert pendant 16 semaines. L'ensemble des patients étaient traités par MEDIATOR. Les résultats du suivi en ouvert ne sont pas publiés.

---

[1] Velussi M, De Monte A, Cernigoi AM. Therapeutic effect of benfluorex in type II diabetic patients on diet regimen alone. Journal of Diabetes and Its Complications 1996;10:261-266.
[2] Therapeutic benefit of benfluorex in type II diabetic patients. J Diab Complic 1996; 10 : 267-273
[3] Moulin Ph. et al. Efficacity of benfluorex in combination with sulfonylurea in type 2 diabetic patients. An 18-week, randomized, double-bind study. Diabetes Care 2006; 65 (3) : 515-520

Le critère principal d'efficacité a été le taux d'hémoglobine glyquée HbA1c.
A l'inclusion, les populations étaient comparables dans les 2 groupes.

	Groupe MEDIATOR (n=161)	Groupe placebo (n=156)
Taux d'HbA1c à l'inclusion (%)	8,34 ± 0,83	8,33 ± 0,87
Taux d'HbA1c à 18 semaines (%)	7,52 ± 1,04	8,52 ± 1,36
Variation du taux d'HbA1c	- 0,82	+0,19

Il a donc été observé une diminution de 1,01% du taux d'HbA1c (IC 95% [-1,26 ; -0 ,76], p<0,001) dans le groupe traité par MEDIATOR par rapport au groupe placebo.

En fin de traitement, un taux d'HbA1c ≤ 7% a été atteint chez 34,2% des patients du groupe MEDIATOR versus 11,5% des patients du groupe placebo (p<0,001).

Les effets indésirables les plus fréquents ont été gastro-intestinaux (15% dans le groupe MEDIATOR, 10% dans le groupe placebo).

Etude DEL PRATO[4]
Cette étude randomisée en double aveugle a évalué l'efficacité et la tolérance de MEDIATOR versus placebo chez 722 patients diabétiques de type 2 en surpoids (IMC compris entre 25 et 40 kg/m^2), insuffisamment contrôlés par un régime seul.
Cette étude a également comporté un bras metformine (n=250), afin de démontrer la non infériorité de MEDIATOR.
Le seuil de non infériorité a été fixé à 0,5% pour le taux d'HbA1c. Une différence de 0,28% (IC 95% [0,07 ; 0,48]) a été observée entre le benfluorex et la metformine. Le benfluorex n'a pas été inférieur à la metformine sur la diminution du taux d' HbA1c.
La durée de l'étude a été de 6 mois.

Le critère principal d'efficacité a été le taux d'hémoglobine glyquée HbA1c.

	Groupe MEDIATOR (n=258)	Groupe placebo (n=127)
Taux d'HbA1c à l'inclusion (%)	7,65 ± 1,58	7,43 ± 1,48
Taux d'HbA1c à 6 mois (%)	7,05 ± 1,46	7,91 ± 1,86
Variation du taux d'HbA1c	-0,60	+0,48

Une différence moyenne de 0,86% (IC 95% [-1,20 ; -0 ,52], p<0,001) entre les taux d'HbA1c a été observée entre les 2 groupes de traitement.

Les effets indésirables les plus fréquents ont été gastro-intestinaux (6,8% dans le groupe MEDIATOR, 2,8% dans le groupe placebo).

3.2. Effets indésirables

Selon le RCP, les effets indésirables suivants ont été observés :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée) ;
- asthénie ;
- somnolence ;
- état vertigineux.

[4] Del Prato S, Erkelens DW, Leutenegger M. Six month efficacy of benfluorex vs placebo or metformin in diet-failed type 2 diabetic patients. Acta Diabetol 2003; 40 : 20-27

Toutefois, ces effets s'observent plus particulièrement à des posologies élevées. Une susceptibilité individuelle a également été observée.

4 SERVICE MEDICAL RENDU

4.1. Dans l'indication : adjuvant du régime adapté dans les hypertriglycéridémies :

4.1.1. Caractère habituel de gravité des affections traitées

La prise en charge des hypertriglycéridémies ne se conçoit que dans le cadre d'une prise en charge globale des facteurs de risque (tabac, hypertension artérielle, obésité...)
Les hypertriglycéridémies sont souvent associées à un risque de maladie coronarienne. Les personnes avec des taux de triglycérides très élevés présentent un risque accru de développer une pancréatite. Les hypertriglycéridémies peuvent être isolées ou associées à une augmentation du taux de LDL-cholestérol.
En dehors de l'hypertriglycéridémie sévère, associée à un risque de survenue de pancréatite aiguë, il n'y a aucune urgence à la prise en charge thérapeutique d'une hypertriglycéridémie isolée. Si le taux de triglycérides est le seul perturbé (taux de LDL-cholestérol en dessous des valeurs usuelles), il faut rechercher une cause associée : obésité ou surpoids, diabète, consommation excessive d'alcool.

4.1.2. Rapport efficacité/effets indésirables

Cette spécialité entre dans le cadre d'un traitement à visée symptomatique.
En l'absence de données cliniques, l'efficacité de cette spécialité n'est pas établie.
La tolérance est acceptable.
Le rapport efficacité / effets indésirables de cette spécialité est mal établi.

4.1.3. Place dans la stratégie thérapeutique

La prise en charge recommandée de la surcharge pondérale, déterminée par l'IMC, repose sur :
-la recherche de complications ou de facteurs de risques associés (HTA, dyslipidémie, diabète...)
-les mesures hygiéno-diététiques : activité physique, régime alimentaire, voire une psychothérapie de soutien.

Le traitement médicamenteux est indiqué en cas d'échec des mesures hygiéno-diététiques poursuivies pendant 3 mois. Mais ces dernières doivent être maintenues et associées au traitement médicamenteux.

La thérapeutique de première intention de l'hypertriglycéridémie inclut une thérapeutique diététique ainsi que la perte de poids, l'activité physique, la diminution des apports caloriques et de la consommation des graisses saturées et la restriction d'alcool. Lorsque l' hypertriglycéridémie est associée à une hypercholestérolémie, cette dyslipidémie mixte étant fortement athérosclérosante, un traitement médicamenteux doit être envisagé. Les médicaments de choix pour réduire les taux de triglycérides sont habituellement les fibrates. Dans le cas de dyslipidémie mixte, les statines associées aux fibrates sont recommandées.

Le mécanisme d'action du benfluorex comme hypolipémiant est indéterminé. Les données actuellement disponibles sont insuffisantes pour justifier son utilisation.[5]

Le benfluorex n'est cité dans aucune recommandation, il n'a pas de place reconnue dans la stratégie thérapeutique des traitements adjuvants du régime dans les hypertriglycéridémies.

[5] Prise en charge thérapeutique du patient dyslipidémique – recommandations Afssaps Mars 2005

Annexe 4-37

4.1.4. Intérêt en termes de santé publique

Compte tenu :

- d'un rapport efficacité/effets indésirables mal établi,
- de l'absence de place dans la stratégie thérapeutique,

cette spécialité ne présente pas d'intérêt en termes de santé publique.

4.1.5. Recommandations de la commission de la transparence

Le service médical rendu par cette spécialité est insuffisant dans l'indication adjuvant du régime adapté dans les hypertriglycéridémies.

4.2 Dans l'indication : adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Dans la mesure où la Commission de la transparence dispose de nouvelles données par rapport à l'avis de 1999 concernant l'indication « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » dont un essai publié (étude Moulin), dans la mesure où une réévaluation du rapport bénéfice / risque est en cours à l'Afssaps, la Commission de la transparence ne réévaluera le service médical rendu de MEDIATOR dans l'indication diabète qu'après avis de la Commission d'AMM et prise en compte de la réévaluation du rapport bénéfice / risque de ce produit par l'Afssaps.

HAUTE AUTORITÉ DE SANTÉ

Le président de la commission de la transparence,
Membre du collège de la Haute Autorité de Santé

Saint-Denis, le 13 JUIL. 2006

à

Monsieur Xavier BERTRAND
Ministre de la santé et des solidarités

Objet : Réévaluation des spécialités à SMR insuffisant – Etape 3

Monsieur le Ministre,

La commission de la transparence vient d'achever la réévaluation des spécialités à service médical rendu insuffisant et principalement de prescription médicale obligatoire (étape 3).

Je vous prie donc de trouver ci-joint :

- un tableau récapitulatif par spécialité des résultats de cette réévaluation,
- les avis de la commission portant sur l'ensemble des 127 médicaments concernés.

Ces avis résultent d'une expertise de caractère exclusivement scientifique et vous sont adressés sans préjuger de la teneur des recommandations que le Collège de la Haute Autorité de santé vous fera parvenir à leur propos courant septembre. Dans cette attente, nous prenons toutes les dispositions nécessaires pour conserver le caractère confidentiel de ces avis.

Je vous remercie de la confiance témoignée et vous prie d'agréer, Monsieur le Ministre, l'assurance de ma très haute considération.

Professeur Gilles BOUVENOT

SANTé-MéDICAMENT-DIABèTE-OBéSITé
Médiator: la Haute autorité de Santé se défend
01/12/2010 19:42:24 GMT+01:00
#747766 DVBP 4360 GXZ83 (4) AFP (457)

PARIS, 1 déc 2010 (AFP) - La Haute Autorité de Santé (HAS) rappelle mercredi qu'elle s'est prononcée contre le remboursement par la sécurité sociale du Mediator, jugeant qu'il ne présentait pas d'intérêt, en mettant en ligne les avis concernés ainsi qu'un document préparatoire sujet à controverse.

La HAS, qui héberge la Commission de transparence du médicament, souligne à ce propos que son travail se limite à dire si l'efficacité d'un médicament justifie son remboursement, la décision revenant au ministère de la Santé.

A la suite d'informations parues dans la presse concernant l'évaluation de Mediator par la Commission de transparence, la HAS rappelle qu'elle s'est "déclarée défavorable au remboursement de ce produit dans un avis du 10 mai 2006, publié sur son site".

La Commission avait déjà rendu un avis défavorable au remboursement (avis du 17 novembre 1999), qui n'avait pas non plus été suivi d'une décision de déremboursement par le ministère.

La note incluse dans le document préparatoire du 12 avril 2006, reproduite en partie par le Canard Enchaîné fait état, selon l'HAS "d'informations qui étaient déjà publiques à l'époque" et dont certaines ont été reprises par la presse professionnelle. Cette note précisait aussi que la Commission Nationale de Pharmacovigilance (Afssaps) souhaitait une réévaluation du rapport bénéfice/risque de ce médicament, souligne la HAS.

Selon cette note en ligne, "le benfluorex (ndlr Médiator) est un dérivé de la fenfluramine (ex-Pondéral) et de la dexfenfluramine (ex-Isoméride), deux anorexigènes amphétaminiques retirés du marché du fait d'effets indésirables graves : hypertensions artérielles pulmonaires et valvulopathies cardiaques. (ces effets secondaires sévères connus peuvent se manifester plus de 10 ans après la dernière prise)".

La note relève que le Mediator "classé par l'OMS parmi les anorexigènes" est "utilisé en France, hors AMM (hors indications diabète), comme traitement à visée amaigrissante".

"En Espagne, la survenue sous benfluorex de troubles cardiaques graves, semblables à ceux observés avec la fenfluramine et la dexfenfluramine, est à l'origine du retrait du marché des spécialités pharmaceutiques contenant du benfluorex en mars 2003. En juin 2005, l'agence espagnole du médicament a annoncé l'interdiction des préparations magistrales à base de divers produits amaigrissants, dont le benfluorex, suite à la survenue d'effets indésirables graves".

"La Commission Nationale de Pharmacovigilance (PV du 29 novembre 2005 ci joint) a souhaité une réévaluation du rapport bénéfice/risque du produit", conclut cette note en forme d'encadré.

Le document préparatoire conclut que le Médiator "ne présente pas d'intérêt en termes de santé publique".

Note pour le Ministre
(A l'attention de M. de TOURNEMIRE)

Objet : Fiches juridiques sur les différentes étapes de la procédure de radiation des spécialités à SMR insuffisant.
P.J : 7 fiches

Je vous prie de trouver ci-joint 7 fiches attirant votre attention sur les difficultés juridiques pouvant surgir à l'occasion des différentes étapes de la procédure contradictoire à engager avec les laboratoires en application de l'article R. 163-13 du code de la sécurité sociale.

Ces risques sont tirés de la connaissance que nous avons des arguments le plus souvent soulevés par les laboratoires à l'occasion des contentieux sur la baisse du taux des vasodilatateurs. Ces risques ne sont pas tous de nature à entraîner une annulation en cas de contentieux. Toutefois, il ne semble pas inutile de les prendre en compte.

S'agissant des contentieux sur les vasodilatateurs, les requêtes seront jugées par le CE probablement avant la fin de l'année. Nous ne savons donc pas à ce jour si les griefs utilisés par les requérants et repris dans la présente note entraîneront ou pas l'annulation de l'arrêté du 14 septembre 2001.

Il pourrait être utile que l'ensemble des intervenants de la procédure côté pouvoirs publics, et tout particulièrement l'AFSSAPS et le président de la commission de la transparence, aient conscience de ces différents aspects. Les fiches ci-jointes pourraient leur être transmises ou communiquées à l'occasion d'une prochaine réunion

Le Directeur de la Sécurité Sociale

Dominique LIBAULT

Annexe 4-40

Procédure : faire-apparaître ces questions comme des informations complémentaires et non

Annexe 4-40

Fiche n°1 : Elaboration des listes de médicaments à SMR insuffisant dont le déremboursement est envisagé

[redacted]

- La première phase doit intéresser les médicaments à SMR insuffisant qui n'ont plus leur place dans la stratégie thérapeutique. L'idée serait que la procédure débute en décembre 2002 pour aboutir à un déremboursement en juillet 2003.
- La deuxième phase concernerait les médicaments à SMR insuffisant susceptibles de trouver leur place sur le marché de l'automédication : début de la procédure en juillet 2003 avec un arrêté en janvier 2004.
- Enfin, la dernière phase concernerait les autres médicaments à SMR insuffisant : début de la procédure en juillet 2004 avec un arrêté en janvier 2005.

1/ la succession dans le temps des déremboursements suppose d'être très vigilant sur le champ de chaque liste afin d'éviter toute inégalité de traitement. Ainsi, s'agissant de la première liste :

- il faudra veiller à ce que tous les médicaments à SMR insuffisant n'ayant plus de place dans la stratégie thérapeutique **d'une même classe thérapeutique (même visée thérapeutique)** fassent l'objet d'un déremboursement en même temps sauf à générer des atteintes à la concurrence ;
- dans la même logique, veiller à exclure du remboursement les indications des médicaments qui ont, par ailleurs, un SMR qui n'est pas insuffisant mais dont ces indications correspondent à celles des médicaments, qui n'ont pas d'autres indications et dont le déremboursement est envisagé.

2/ Pour les médicaments à SMR insuffisant mais ayant plusieurs indications : il faudra faire une analyse indications par indications car le décret précise que les spécialités pharmaceutiques sont inscrites indications par indications (Voir fiche 2) et adapter, le cas échéant, la rédaction des arrêtés de déremboursement en conséquence (Voir fiche 7) ;

3/ définir clairement si le déremboursement vise la seule liste ville ou les deux listes (ville et collectivités). L'article R. 163-13 autorise les ministres à radier des spécialités sur l'une et/ou l'autre. En revanche, la mission confiée à la commission de la transparence sur la réévaluation ne concernait que les médicaments sur la liste ville. Toutefois, s'agissant de la première phase de déremboursement, la radiation sur la liste ville doit entraîner d'office la radiation sur la liste des collectivités car ces médicaments n'ont plus de place dans la stratégie thérapeutique. Pour les deux autres phases la réponse est moins évidente.

4/ enfin, dans l'hypothèse où les textes réglementaires définissant les critères du SMR seraient modifiés entre les différentes phases, il faut garder à l'esprit que les laboratoires redemanderont une évaluation selon les nouveaux critères. Tant que l'on reste avec les mêmes critères, le ministre peut prendre une décision se fondant sur les avis de 1999 concernant la réévaluation. Après changement, il sera plus difficile au ministre de prendre une décision sur la base d'un avis de 1999. Si la composition de la commission venait à être modifiée de manière importante, on s'expose à des demandes similaires de la part des entreprises, mais le risque est moindre.

Annexe 4-40

Fiche n° 2 : Cas des médicaments à plusieurs indications

Dans ce cas, il convient :

- de veiller à ce que toutes les indications soient évaluées dans l'avis de la CT ;
- si toutes les indications ont un SMR insuffisant : faire attention à ne pas dérembourser des indications qui ne devraient faire l'objet d'un déremboursement que dans la deuxième ou troisième phase sauf, bien sûr, en cas d'accord du laboratoire. En l'absence d'accord, les laboratoires pourraient également invoquer une rupture d'égalité de traitement ;
- si les indications n'ont pas toutes le même niveau de SMR :

La pratique actuelle veut que la spécialité soit prise en charge pour l'ensemble des indications dans le SMR le plus élevé à condition que cette indication représente une part substantielle des indications (lettre de l'afssaps du 16 septembre 1999). Les textes ne précisent pas ce point, l'article R. 163-3 précise simplement que la spécialité est inscrite au vu de son SMR indication par indication. Il n'est pas possible d'inscrire une spécialité avec plusieurs taux de remboursement car il n'est pas possible pour les caisses de connaître exactement l'indication dans laquelle la spécialité a été prescrite. D'où la pratique de retenir l'indication où le SMR est le plus élevé. Pour la DSS, la part substantielle est la part prépondérante[1]. Les laboratoires contestent cette position aujourd'hui[2], car ils estiment que même en présence d'une indication orpheline pour laquelle le SMR est supérieur mais qui représente une part de prescription non négligeable (mais non forcément majoritaire) on devrait retenir le SMR le plus important. Il conviendra donc d'avoir une position claire et transposable à tous les laboratoires sur l'indication qui est retenue pour l'admission au remboursement.

Mais lorsque l'on parle de déremboursement, on n'est plus tenu par la divergence de taux soulevé précédemment, il semble possible de dérembourser la spécialité dans une ou plusieurs indications et en revanche de garder au remboursement une indication remboursable. Mais attention dans ce cas, en principe, les médecins doivent inscrire NR sur l'ordonnance lorsqu'ils prescrivent le médicament en dehors de l'indication remboursable. En réalité les médecins ne remplissent pas cette obligation et les caisses n'ont pas les moyens de contrôler, ce qui rend le système largement inefficace. En termes d'efficacité, il est préférable de soutenir la position soutenue jusqu'à maintenant par la DSS. Le cas échéant, s'agissant d'indications « orphelines » dont le SMR justifierait le maintien au remboursement, on pourrait, à la limite, recourir à la procédure du médicament d'exception.

En tout état de cause, ces médicaments méritent qu'on s'interroge sur leur traitement dés le tout début de la procédure.

[1] C'est à dire la part pour laquelle les prescriptions sont le plus importantes en volume (ex : Pour Trivastal, afin de déterminer la part prépondérante, l'administration s'est référée aux statistiques du Doréma qui précisent que 22,2% des prescriptions concernent l'indication dans la maladie de Parkinson où le SMR est important et le reste des prescriptions se font dans des indications pour lesquelles le SMR est insuffisant.).

[2] Ils ne l'ont pas contesté après le courrier du 19 juin 1999, et n'ont commencé à contester cette interprétation qu'au moment des contentieux sur les vasodilatateurs.

Annexe 4-40

Fiche n°3 : Engagement de la procédure contradictoire ;

L'article R. 163-15 précise : « Le ministre chargé de la sécurité sociale et le ministre chargé de la santé informent l'entreprise qui exploite le médicament de leur intention soit de modifier le classement d'un médicament inscrit sur la liste prévue à l'article L. 162-17 au regard de la participation des assurés aux frais d'acquisition des médicaments, soit de radier un médicament des listes prévues aux articles L. 162-17 du présent code et L. 5123-2 du code de la santé publique.

L'entreprise qui exploite le médicament peut présenter des observations écrites ou demander à être entendue par la commission prévue à l'article R. 163-15, dans le mois suivant réception de cette information ».

L'absence de consultation préalable des entreprises préalablement à une baisse de taux ou de déremboursement entraîne inévitablement l'annulation de l'arrêté pris : **cette consultation est un préalable obligatoire.**

1/ La notification doit comporter les motifs de la décision des ministres. En l'espèce, il s'agit de l'avis de la CT qui conclut à un SMR insuffisant.

2/ Indiquer le délai laissé au laboratoire pour faire valoir ses observations. En l'espèce, un mois.

3/ Indiquer le lieu de centralisation de ses observations (en principe le ministère avec copie au secrétariat de la commission à l'AFSSAPS) ;

4/ La notification par les ministres doit avoir une date certaine car elle fait partir le délai de réponse d'un mois de l'entreprise. Le moyen le plus sûr est d'envoyer ce courrier avec un AR car en retour on a ainsi de façon incontestable, la preuve que le laboratoire a bien été informé et ce à une date précise.

L'administration serait fondée à refuser des observations qui parviennent au-delà du délai d'un mois mais en revanche, elle peut décider de les accepter si le mois est dépassé dans un délai qu'elle estime acceptable.

5/ Il faut une coordination parfaite entre les services du ministère qui centralisent les observations des laboratoires et l'AFSSAPS afin que toutes les observations fassent l'objet d'un traitement dont l'issue sera soit une audition par la CT à la demande de l'entreprise (art R. 163-13) où à la demande des ministres si le laboratoire n'a pas sollicité d'audition (6° de l'article R. 163-19) soit un traitement en interne au service du ministère ;

6/ Toutes les demandes d'audition ne sont pas forcément suivies d'une audition effective. En effet, le texte précise « le laboratoire peut demander à être entendu par la commission ». Ainsi, rien n'empêche la commission de refuser une nouvelle audition si par exemple elle considère que le dossier transmis par le laboratoire est complètement vide ou n'apporte aucun élément nouveau par rapport à l'audition précédente.

7/ le temps que prend l'administration et l'AFSSAPS pour répondre aux observations des laboratoires n'est pas prévu par les textes. Dès lors, la règle de droit commun pourrait trouver à s'appliquer, à savoir l'absence de réponse de l'administration dans un délai de deux mois vaut décision implicite de rejet (mais en l'espèce cette règle n'a qu'un intérêt relatif) ;

Annexe 4-40

Fiche n° 4 : Audition par la Commission de la transparence ou examen des observations écrites des entreprises

[redacted]

Dans les précédents contentieux sur la baisse de taux des vasodilatateurs, les requérants ont tous évoqués des vices dans la procédure de consultation de la commission

1/ veiller à un strict respect des règles de convocation, cf article R. 163-17 du CSS ; envoi de l'ordre du jour et des documents aux membres au plus tard 8 jours avant la date de la réunion (article 1-1-6 du règlement intérieur plus favorable que l'art 11 du décret du 28 novembre 1983 qui prévoyait 5 jours) ;

2/ **veiller au respect du quorum, à l'occasion de chaque vote.** La règle est fixée à l'article R. 163-16 I et II : les délibérations de la commission ne sont valables que si au moins douze membres de la commission sont présents. Les avis sont pris à la majorité des suffrages, le président ayant voix prépondérante en cas de partage égal des voix.

- Douze membres de la commission doivent être présents c'est à dire douze membres ayant le droit de vote. Si le membre titulaire et son suppléant sont tous deux présents, seul le membre titulaire a le droit de voter et cela compte pour 1 personne dans le quorum ;

- A l'occasion de chaque vote, les membres qui ont un droit de vote mais qui pourraient avoir un conflit d'intérêt avec le dossier étudié doivent sortir de la salle ou, en tout état de cause, ne pas prendre part au vote et ne pas être comptés dans le quorum (cf. dernière phrase de l'article R. 163-17) ;

- Les membres de droit de la commission peuvent se faire accompagner d'une personne de leurs services mais cette personne doit au préalable adresser au secrétariat de la commission de la transparence une déclaration mentionnant les liens directs ou indirects qu'elle peut avoir avec les titulaires d'autorisation de mise sur le marché et les entreprises dont les produits sont susceptibles de faire l'objet d'un examen par la commission (cf. 3) ;

- Le nombre de personnes de l'AFSSAPS assistant à la séance au titre du sécrétariat de la commission doit être raisonnable. En effet, dans les contentieux en cours la forte représentation des services de l'afssaps est fortement critiquée par les requérants. Ainsi, on a pu constater la présence de 12 ou 13 personnes[3] de l'AFSSAPS pour un quorum de 12 personnes. C'est manifestement disproportionné, il serait sans doute souhaitable de restreindre à 2 ou 3 le nombre de personnes assistant aux réunions de la commission de la tranparence au titre du secrétariat administratif.

[3] On ne sait pas très bien parmi ces personnes, quelles sont celles qui sont présentes au titre du secrétariat de la commission et qui en conséquence ne prennent pas la parole et n'ont pas à fournir de déclarations d'intérêt et celles qui sont là en qualité d'évaluateur interne qui elles peuvent prendre la parole et devraient être soumises à DI (cf. point 3).

Annexe 4-40

3/ Clarifier le rôle des évaluateurs internes :

L'article R. 163-15 du CSS précise que le président de la commission peut faire appel à des rapporteurs extérieurs à la commission. Ces derniers sont soumis à diverses obligations : un rapporteur ne peut intervenir pour un médicament comme expert devant la commission d'AMM et comme rapporteur de l'entreprise devant la CT ; il doit déposer une déclaration d'intérêt et il ne peut pas prendre part aux délibérations ni aux votes (CT I-3 du règlement intérieur).

Le CSS ne parle pas des évaluateurs internes. Ces derniers apparaissent dans le règlement intérieur de la commission (§ 1-2). Le rôle de ces évaluateurs internes est important : ils effectuent une synthèse du dossier et des données disponibles sur le dossier, ils présentent le dossier à la commission en réalisant une analyse critique du dossier, les membres de la commission peuvent attirer leur attention sur un point précis à tout moment, ils instruisent l'intégralité du dossier (pas de rapporteur externe) dans le cas des procédures simplifiées, ils assistent aux délibérations[4] puisqu'ils sont chargés de rédiger l'avis.

Ce rôle fondamental excède manifestement le simple secrétariat qui suppose une non participation aux débats. Certes ces évaluateurs internes, comme tous les membres de l'Agence conformément aux dispositions de l'article L. 1323-9 du CSP, sont tenus au secret et à la discrétion professionnelle et ne peuvent avoir, par eux-mêmes ou par personne interposée, aucun intérêt de nature à compromettre leur indépendance, mais il n'en reste pas moins que l'absence de conflits d'intérêt n'est pas vérifiée pour chaque dossier. On constate donc une plus grande rigueur vis à vis des rapporteurs externes que des évaluateurs internes. Peut-être faudrait-il assurer une plus grande transparence sur ce point et en tout cas faire apparaître les évaluateurs internes en tant que tel sur le P.V.

A noter que ce point n'a jamais été soulevé dans un contentieux jusqu'à aujourd'hui. Mais devant le caractère de plus en plus procédurier des laboratoires, il est probable qu'un jour ils contestent la présence de l'évaluateur interne et surtout le fait qu'il n'est pas soumis aux mêmes obligations que le rapporteur externe alors même que son rôle est tout aussi important. Il semble donc prudent d'essayer de clarifier la pratique sur ce point.

4/ veiller à la publication des déclarations mentionnant les liens directs ou indirects des personnes participant aux travaux de la commission de la transparence (membres de la commission, personnes des services accompagnant les membres de droit, rapporteurs ou experts externes et évaluateurs internes) au bulletin officiel du ministère chargé de la sécurité sociale. Aujourd'hui, seules les déclarations d'intérêt des membres de la commission ont été publiées au BO. La publication des déclarations d'intérêt des rapporteurs va être faite très prochainement dans un BOMES hebdomadaire. La jurisprudence accepte que la publication se fasse postérieurement à la réunion de la commission de la transparence mais elle doit se faire en tout état de cause dans un délai raisonnable.

4/ veiller à établir un procès verbal en bonne et due forme à chaque séance : **article 14 du décret du 28 novembre 1983 qui précise que le PV indique le nom et la qualité des membres présents, les questions traitées au cours de la séance et le sens de chacune des délibérations. Tout membre de l'organisme consultatif peut demander qu'il soit fait mention de son désaccord. Le PV doit être transmis à l'autorité compétente pour prendre la décision. Lorsque la décision doit être motivée, la notification de la décision doit être accompagnée des mentions du PV se rapportant à la question sur laquelle il est statué par cette décision.** Ce document n'a pas à être transmis au laboratoire sauf si ce dernier en fait la demande. Les PV sont des documents administratifs communicables sur demande (art 7 de la loi du 12 avril 2000).

[4] Contrairement aux rapporteurs externes qui ne participent ni aux délibérations ni aux votes (§ 1.3.1 du règlement intérieur de la CT)

Annexe 4-40

La loi du 12 avril nous autorise à ne communiquer ces PV que dés lors que la décision des ministres est prise soit postérieurement à l'arrêté (en l'espèce donc la règle est la même que pour les avis de recevabilité qui n'ont pas été publiés sur internet sauf l'AFSSAPS – voir fiche 6).

Lorsque le PV n'existe pas, cela peut constituer un vice de procédure substantiel car alors on n'a pas d'indication sur le nom des membres présents. En pratique, on constate que l'AFSSAPS est pour toutes les commissions en mesure de fournir la liste des membres présents avec les votes. En revanche, aucune précision supplémentaire n'existe dans le PV par rapport à la motivation qui existe dans l'avis. Cela n'est pas en soi critiquable, surtout si on considère que les avis sont correctement motivés. Mais lorsque l'avis est motivé succinctement, le fait de ne rien trouver dans le PV affaiblit la position des ministres qui prennent la décision vis à vis de l'inscription car ils ne peuvent puiser dans les PV la motivation qui ne figurent pas toujours dans les avis (Voir fiche 5 sur la motivation). En outre, en cas de contentieux, le PV est un outil précieux car il facilite la rédaction du mémoire environ 6 mois après les faits et donc à un moment où les personnes présentes lors de la séance de la commission n'ont plus un souvenir très précis de ce qui s'est réellement passé.

[5] Seules les conclusions ont été diffusées sur le site de l'AFSSAPS mais pas les avis proprement dits.

[6] De plus en plus, les laboratoires demandent communication du PV car ils savent avoir droit à la communication de ce document. Toutefois, très souvent en pratique le PV se résume à la feuille de présence et au sens des votes plus les avis de la CT. Ainsi, l'aspect «questions traitées au cours de la séance » ne fait pas l'objet de précisions supplémentaire par rapport à l'avis lui-même.

Annexe 4-40

Fiche n° 5 : Motivation des avis de la Commission de la transparence

[redacted]

L'a motivation doit exister :

[redacted]

- les requérants estiment qu'une motivation stéréotypée ne répond pas à l'exigence de motivation imposée par les textes car elle ne permet pas au laboratoire d'avoir la certitude que la commission s'est réellement prononcée sur chacun des critères dans le cas particulier de la spécialité qui lui était soumise ;

- les requérants estiment que l'exigence de motivation ne peut être remplie que si dans l'avis on retrouve la position de la CT sur tous les critères visés à l'article R. 163-18. Cet article précise que l'avis de la CT doit comporter notamment l'appréciation du SMR dans chaque indication, une comparaison du médicament avec ceux de la classe pharmaco-thérapeutique de référence, l'ASMR, l'estimation du nombre de patients relevant des indications thérapeutiques pour lesquelles la commission estime fondée l'inscription..... La rédaction des avis de réévaluation de la CT ne répond pas aux exigences du R. 163-18[7]. Notre défense consiste donc à soutenir que l'article R. 163-18 ne s'applique pas aux avis de réévaluation. **Que concernant ces avis, seul l'article R. 163-3 s'applique**, faisant uniquement obligation à la commission d'apprécier le service médical rendu. De toute façon, certains critères du R. 163-18 sont inapplicables comme par exemple l'appréciation de l'ASMR et les populations cibles qui sont clairement hors du champ de la réévaluation du SMR. Notre défense semble solide mais il faut attendre la position du CE pour savoir vraiment si cet argument est valable ou pas. **Si le CE nous donne tort, cela signifie que tous les avis de la CT sur la réévaluation ne sont pas suffisamment motivés.**

2/ L'avis de la CT doit porter sur toutes les indications thérapeutiques. Ainsi, si certaines indications n'ont pas été réévaluées par la CT et que le laboratoire demande une nouvelle audition, sans doute serait-il opportun d'évaluer les indications manquantes.

3/ La motivation doit permettre au laboratoire de comprendre les éléments justifiant l'appréciation par la commission. La rédaction actuelle de certaines rubriques ne semble pas correspondre à cette exigence. Ainsi,

- La mention « sans objet pour l'évaluation du SMR » sous la rubrique « intérêt en santé publique » doit être proscrite. L'intérêt en santé publique est l'un des critères du SMR visé à l'article R. 163-3 et la commission doit l'évaluer. Dans les contentieux en cours, nous avons expliqué cette mention en précisant au CE qu'il convenait d'interpréter la mention « sans objet » comme l'indication que le médicament en cause n'avait pas d'effets en termes de santé publique distincts de ceux, appréciés à partir d'autres critères du SMR, qui caractérisent son SMR auprès

[7] Article R. 163-18 du CSS : l'avis mentionné au premier alinéa de l'article R. 163-4 (avis pour inscription, renouvellement et modification des conditions d'inscription)...comporte notamment 1° : l'appréciation du SMR sur chacune des indications thérapeutiques, 2° une comparaison du médicament, en termes de SMR, avec ceux de la classe pharmaco-thérapeutique de référence...3° lors du renouvellement, la réévaluation du SMR, 4° une appréciation sur les modalités d'utilisation du médicament et notamment durées de traitement et posologie, 5° estimation du nombre de patients relevant des indications pour lesquelles la commission estime fondée l'inscription, 6° pour la liste ville, leur classement au regard de la participation de l'assuré en fonction de l'importance de leur SMR, 7° l'appréciation du conditionnement approprié au regard des indications thérapeutiques.

Annexe 4-40

des patients effectivement traités. En tout état de cause, si de nouvelles auditions ont lieu mais que l'avis précédemment émis n'est pas modifié il faudra trouver une autre rédaction ;

Par suite, sous la rubrique « place dans la stratégie thérapeutique » est précisé « il existe des alternatives thérapeutiques médicamenteuses ou non médicamenteuses à cette spécialité » les requérants font valoir que l'absence de précision sur les alternatives existantes ne lui permet pas de savoir quelles sont ces alternatives et surtout ne lui permet pas de contester ces références.

La motivation utilisée pour les autres critères semble moins contestable.

4/ l'élaboration d'un procès verbal complet peut être utile ici car dans le PV peuvent figurer des explications plus longues que dans le corps même de l'avis, reprenant, le cas échéant, des échanges avec le laboratoire dans lesquels la commission lui a expliqué les raisons pour lesquelles elle prenait cette position. En l'absence de PV nous sommes (AFSSAPS et DSS) assez démunis pour expliquer dans le cadre d'un contentieux les éléments pris en compte par la commission et les raisons pour lesquelles elle les a écartés.

Annexe 4-40

Fiche n°6 : Fin de la procédure contradictoire devant la commission de la transparence et devenir des avis définitifs

1/ A l'issue de l'audition demandée par le laboratoire, ou de l'examen par la CT de ses observations écrites, délai dans lequel l'avis devient définitif

- Si la commission confirme sans aucune modification son avis précédent, nous considérons que **l'avis est définitif immédiatement**. En effet, dans ce cas, l'avis de la commission est une simple confirmation de l'avis définitif précédent. Le laboratoire a eu un mois pour faire valoir ses observations et si la commission n'a pas modifié son avis c'est qu'elle considère que les éléments fournis par le laboratoire ne sont pas de nature à modifier son appréciation précédente du SMR.

Dans les contentieux sur les vasodilatateurs, les requérants ont fait valoir que l'administration n'avait pas respecté la procédure contradictoire en ne donnant pas les 8 jours supplémentaires au laboratoire alors même que l'avis définitif de la CT n'avait pas été modifié. Nous avons défendu devant le juge la position logique qui est de considérer que lorsque le laboratoire a été entendu à plusieurs reprises et que l'avis de la CT n'a jamais été modifié, il faut stopper la procédure car sinon le laboratoire pourrait par des manœuvres dilatoires demander indéfiniment une audition devant la CT et ce, même en l'absence de tout élément nouveau dans le seul but de retarder la décision qu'il sait par ailleurs inévitable. Ce moyen a peu de chance de prospérer mais il reste que la rédaction des textes est ambiguë.

- Si la commission prend un nouvel avis : la procédure prévue au III de l'article R. 163-16 doit trouver à s'appliquer. Cet article précise que lorsque l'avis **porte sur l'inscription, la modification des conditions d'inscription ou le renouvellement de l'inscription d'un médicament** sur la liste du L. 162-17 du CSS ou du L. 5123-2 du CSP, l'avis est immédiatement communiqué à l'entreprise qui a 8 jours à compter de la réception de l'avis pour présenter des observations écrites ou demander à être entendue par la commission. Nous considérons que s'agissant d'avis de réévaluation, ils ne sont pas expressément visés par cet article et que par conséquent, leur régime est indépendant. Toutefois, force est de reconnaître que ces avis de réévaluation conduisent les ministres à modifier les conditions d'inscription. Dès lors, il nous semble que lorsque la commission, à la suite de l'audition de l'entreprise, est amenée à modifier ou à prendre un nouvel avis, et afin d'éviter toute contestation ultérieure, il est préférable d'envoyer le nouvel avis à l'entreprise en lui laissant 8 jours pour réagir.

2/ Les droits de l'entreprise pendant ces 8 jours : l'article R. 163-16 précise que l'entreprise a 8 jours pour demander à être entendue par la commission de la transparence ou pour présenter des observations écrites. L'intention des pouvoirs publics dans cet article était clairement de cantonner les observations de l'entreprise à des observations purement formelles ou alors à des erreurs manifestes mais ne devait pas être l'occasion de contester à nouveau l'appréciation de chaque critère par la commission sauf bien sûr en cas d'apparition d'un élément nouveau absolument fondamental qui modifierait complètement l'appréciation du SMR. Mais en pratique, la procédure contradictoire de fond se déroule préalablement à l'envoi de cet avis par la CT et ce délai n'a d'autre ambition que de demander à l'entreprise une dernière relecture. Cette logique semble d'ailleurs confirmée par les dispositions de l'article R. 163-13 qui laissent 1 mois à l'entreprise pour demander une audition ou présenter des observations écrites mais c'est clairement pour laisser le temps à l'entreprise de trouver des arguments pour contester l'appréciation précédente portée par la CT sur le SMR de la spécialité.

Annexe 4-40

En tout état de cause, si nous laissons 8 jours au laboratoire pour relire l'avis, il faut clairement lui signifier qu'il s'agit d'une relecture « formelle » ne pouvant donner lieu à des observations de fond ou à une nouvelle demande d'audition, en l'absence d'éléments nouveaux portant sur l'appréciation du SMR.

Cette mention, ainsi que la mention du délai de 8 jours, doivent sans doute être mentionnées en clair dans le courrier qui adresse l'AFSSAPS aux laboratoires pour leur transmettre l'avis de la CT.

3/ Lorsque l'avis est sollicité par les pouvoirs publics (6° de l'article R. 163-19), l'avis ne devrait pas être transmis à l'entreprise mais seulement aux pouvoirs publics. Dans cette hypothèse, ce n'est pas cet avis qui servira de base à un éventuel arrêté de déremboursement mais bien l'avis définitif antérieur qui a été soumis à l'entreprise.

4/ L'obligation de publier les avis de la commission de la transparence ne porte que sur les avis relatifs à l'inscription, la modification des conditions d'inscription ou le renouvellement de l'inscription. Il n'y a aucune obligation de publier les avis de réévaluation.

En outre, les avis de la CT étant des actes préparatoires nous aurions pu ne les publier qu'une fois la décision des ministres prise et publiée. Toutefois, dans un souci de plus grande transparence la décision de publier non pas l'avis in extenso mais seulement le niveau de SMR a été prise et donc figurent sur le site de l'AFSSAPS les résultats de la réévaluation.

5/ Une publication de l'avis de la commission préalablement à la décision des ministres ne change pas les règles juridiques de ce document qui reste un acte préparatoire insusceptible de recours pour excès de pouvoir. Cet avis ne pourra être contesté qu'à l'occasion de la contestation de la décision finale des ministres.

Annexe 4-40

Fiche n°7 : Publication de l'arrêté et notification des déremboursements

L'article R. 163-14 du CSS précise les décisions portant refus d'inscription sur les listes prévues à l'article L. 162-17 et L. 162-22 refus de renouvellement d'inscription, radiation de ces listes ou refus de modification du prix doivent dans la notification à l'entreprise exploitant le médicament être motivées et mentionner les voies et délais de recours qui leur sont applicables.

1/ L'arrêté qui portera à la connaissance des tiers et des caisses le déremboursement des médicaments à SMR insuffisant devra être doublé d'une procédure de notification individuelle à chaque laboratoire concerné.

2/ Pour les spécialités dont certaines indications seront exclues des indications ouvrant droit à prise en charge ou remboursement, l'arrêté sera plus complexe à rédiger dans la mesure où il devra mentionner les indications « déremboursées ».

Annexe 4-41

HAUTE AUTORITÉ DE SANTÉ

Direction de l'Evaluation Médicale, Economique et de Santé Publique

Service Evaluation des Médicaments

Le chef de service

Madame, Monsieur le Pharmacien Responsable
Laboratoires SERVIER
22, rue Garnier
92578 NEUILLY-SUR-SEINE CEDEX

Lettre recommandée A/R

Saint-Denis, le

19 OCT. 2009

Objet : MEDIATOR 150 mg, comprimé enrobé

N/Réf : AA/SD

Madame, Monsieur le Pharmacien Responsable,

En application de l'article R.163-21 du code de la sécurité sociale, la Commission de la transparence souhaite réexaminer le service médical rendu par la spécialité MEDIATOR dont votre laboratoire est l'exploitant.

La Commission de la transparence a eu connaissance de nouvelles données relatives notamment à la tolérance cardiovasculaire du benfluorex (risque de survenue d'hypertension artérielle pulmonaire et de valvulopathies).

A ce titre, vous voudrez bien nous faire parvenir, dans un délai de 3 mois à dater de la réception de ce courrier, l'ensemble des données cliniques permettant de réévaluer le service médical rendu par la spécialité mentionnée en objet en 50 exemplaires (10 exemplaires papier et 40 CDRom).

Je vous prie d'agréer, Madame, Monsieur le pharmacien responsable, l'expression de ma considération distinguée.

Docteur Anne D'ANDON

☒ AUCUNE

CONTEXTE/TYPE DE DEMANDE

MEDIATOR a été une nouvelle fois présenté en Commission Nationale de Pharmacovigilance (CNPV) ; en effet, un signal relatif aux anomalies des valves cardiaques soupçonné depuis plusieurs mois par les données de pharmacovigilance se trouve confirmé par :

1. les données d'une étude cas /témoins brestoise rétrospective menée par le CHU de Brest.

2. les résultats d'une étude clinique (Etude REGULATE) dans laquelle en parallèle de l'analyse des données d'efficacité du benfluorex en association à un sulphonylurée (SU), une exploration de la tolérance cardiaque/impact du traitement sur les valves cardiaques a été explorée.

Les données de l'étude cas /témoins, ainsi que les résultats préliminaires de l'étude REGULATE ont été présentés en CNPV le 09 09 2009.

A l'issu de cette présentation, les membres de la CNPV ont considéré (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex, ceci malgré certaines limites méthodologiques soulevées par l'étude Cas/témoins. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

La CNPV souhaite que l'ensemble des données soient transmises à la Commission d'AMM afin qu'elle se qu'elle puisse se prononcer – au vu de l'ensemble des données de bénéfice et

de risque dans les conditions d'utilisation actuelles du produit - sur la balance bénéfice-risque du produit.

La programmation en COM d'AMM est prévue le 23 10 2009. A cet effet, il a été demandé à la firme de déposer l'ensemble des données cliniques en vue de cette Commission, notamment les **résultats de l'étude REGULATE.**

Le Groupe DEUG est de ce fait sollicité avant cette Commission afin d'évaluer :i) les données d'efficacité de cette étude REGULATE et ii) plus généralement la place de cette molécule dans la prise en charge thérapeutique du diabète à partir des données existantes (bénéfice).

Historique/Rappel des données de Pharmacovigilance (mise à jour lors de la CNPV du 09 09 2009)

Données de la pharmacovigilance :

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon. 11 nouveaux cas de valvulopathie associés au benfluorex sont rapportés dont 3 issus de la notification spontanée et 8 de des notifications sollicitées et provenant d'Amiens. L'analyse de ces 11 nouveaux cas montre une prédominance féminine, une durée moyenne de traitement de 3 ans et un âge de survenue le plus fréquemment identifié de 55 ans. Dans 9/11 cas une association à une hypertension artérielle pulmonaire est rapportée, une atteinte de type insuffisance mitrale et aortique dans 6 cas et une atteinte mitrale+aortique+tricuspide dans 2 cas. Malgré des échocardiographies documentées, les données anatomopathologiques restent peu informatives.

Certains membres ont souligné qu'en cas de notification sollicitée dans d'autres bassins de population, de nombreux autres cas de valvulopathie associés au benfluorex pourraient être mis en évidence.

Données de l'étude Brestoise :

L'étude cas-témoin rétrospective menée par le CHU de Brest, a pour objectif la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait le diagnostic de diabète ou l'Index de Masse Corporelle (IMC). L'exposition au benfluorex est recherchée auprès du patient, de sa famille et de ses médecins, par téléphone, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio = 40,4 (9,7 – 168,3, IC à 95%)). L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas la significativité du résultat.

CONTENU DU DOSSIER

Le dossier soumis ne comporte que quelques éléments de l'étude REGULATE.

Cette étude s'est achevée en 15 janvier 2009. Des analyses complémentaires sont actuellement en cours. Seul **un projet de résumé du rapport final de cette étude est disponible**. A noter, il état prévu initialement que le rapport de cette étude soit soumis début/courant du 1er semestre 2010.

Seules les données d'efficacité de cette étude sont analysées/expertisées par le Groupe DEUG ; les données de sécurité d'emploi dont les données valvulaires sont examinées en parallèle par le Département de Pharmacovigilance de l'Afssaps.

Les conclusions du Groupe DEUG ainsi que celles sur la sécurité d'emploi de cette étude seront présentées le 23 10 2009 en Commission d'AMM.

Analyse des données d'efficacité de l'Etude REGULATE

Titre de l'étude :

A one-year multicentre, international, randomised, doubleblind study with comparison of benfluorex (150 mg bid or 150 mg tid) *versus* pioglitazone (30 mg od or 45 mg od) in combination with sulfonylurea administered orally for the treatment of type 2 diabetes.

Méthodologie :

Il s'agit d'une multicentrique, randomisées, en double aveugle, contrôlée *versus* pioglitazone, d'une durée de 52 semaines, comparant chez 847 patients diabétiques de type 2, insuffisamment contrôlés par sulfamides hypoglycémiants (SU) l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR à la dose maximale recommandée (450 mg /jour, 1 comprimé pendant le repas), à un traitement par pioglitazone à la dose maximale recommandée (45 mg/jour, 1 comprimé au petit déjeuner)

Objectifs :

Le but de cette nouvelle étude était de comparer l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR versus un traitement par pioglitazone, en association à un SU, sur le contrôle glycémique et le profil lipidique.

L'objectif principal est de démontrer la non-infériorité de la combinaison SU + Benfluorex comparé à la combinaison SU + Pioglitazone sur l'évolution de l'HbA1c.

L'objectif secondaire est de démontrer la supériorité du benfluorex combiné aux SU comparativement à la Pioglitazone combiné aux SU sur le taux de cholestérol.

Les autres objectifs secondaires sont d'évaluer et de comparer ces combinaisons après 1 an de traitement sur : glycémie à jeun, l'insulinémie à jeun, le risque cardiovasculaire, la sécurité d'emploi et le coût de ces deux traitements.

Critères d'évaluation :

Critère principal : HbA1c mesuré à chaque visite (inclusion, 4, 8, 16, 28, 40 et 52 semaines)

Critères secondaires :

Paramètres lipidiques : LDL-cholestérol, cholestérol total, HDL-cholestérol, triglycérides à chaque visite.

Autres paramètres : glycémie à jeun (FPG), insulinémie à jeun (HOMA-IR), C-réactive protéine, mesure du tour de taille, poids.

Paramètres de sécurité d'emploi : événements indésirables, hypoglycémies, paramètres biologiques, examen cardiaque (ECG, échographie cardiaque à l'inclusion et à 12 mois)

Analyse statistique :

La borne de non-infériorité entre les deux traitements a été fixée à 0.4% d'HbA1c.

Résultats :

1. Caractéristiques de la population

Annexe 4-42

Tableau 7 REGULATE Caractéristiques de la population randomisée

	benfluorex (n = 423)	pioglitazone (n = 423)

	p-value (3)	0.19	

END = last value; (1): Estimate (Standard Error) of the difference (benfluorex minus pioglitazone)between adjusted group means (2): 95% Confidence Interval of the estimate (3): For a non-inferiority one-sided test (alpha = 2.5%) obtained from an analysis of covariance with baseline and country (fixed effects) as covariates and a 0.4% margin of clinical relevance

Au total, **la non-infériorité de benfluorex par rapport à la pioglitazone n'a pas été démontrée** (limite supérieure de l'intervalle de confiance à 0.49 pour une limite de non infériorité fixée à 0.40 (E (SE) = 0,33 (0,08) %, 95 % CI = [0,17; 0,49], p = 0,19).

3. Critères secondaires

Annexe 4-42

Tableau 8 -REGULATE Evolution des principaux paramètres biologiques dans la population FAS

	Benfluorex			Pioglitazone			différence entre les groupes
	N	valeur initiale moyenne (SD)	différence pré-post (SD)	n	valeur initiale moyenne (SD)	différence pré-post (SD)	Δ (ES) IC 95%
Glycémie à jeun mmol/L	392	*9.9 (± 2.71)*	-1.20 (0.15)	396	*9.9 (± 2.51)*	-1.73 (0.23)	**0.56**** (0.18) [0.21;0.90]
HOMA- IR Index	332	*6.36 (± 5.30)*	-1.23 (0.38)	315	*6.83 (±7.34°*	-2.52 (0.35)	1.04 (0.41) [0.23;1.85]
Total Cholestérol mmol/L	396	*5.01 (± 0.99)*	-0.16 (0.04)	396	*5.02 (± 0.92)*	0.08 (0.05)	**-0.25**** (0.057) [-0.357;-0.134]
LDL cholestérol mmol/L	396	*3.11 0.83)*	-0.24 (0.03)	396	*3.15 (0.81)*	-0.12 (0.04)	**-0.13**** (0.05) **[-0.22;-0.04]**
Triglycérides mmol/L	397	*1.92 (± 0.97)*	-0.14 (0.05)	397	*1.96 (± 0.90)*	-0.21 (0.05)	0.058 (0.06) [-0.07 ;0.18]

****p < 0.001 **p< 0.01 *p< 0.05 °test non paramétrique*

On observe :

- une diminution du LDL-cholestérol moyen (-0,24) dans le groupe benfluorex plus importante que celle observée dans le groupe pioglitazone (-0.12).

- une diminution du cholestérol total moyen (-0.16) dans le groupe benfluorex comparativement à une augmentation dans le groupe pioglitazone (+0.08)

- une stabilité du HDL-cholestérol (0.01) dans le groupe benfluorex et une légère augmentation sous pioglitazone (+0.06)

- une diminution des concentrations de triglycérides comparable dans les 2 groupes.

Enfin, il y a une diminution du poids sous benfluorex (-1.6 kg) et une augmentation sous pioglitazone (3.3 kg).

Sécurité

La fréquence des effets indésirables est comparable entre les deux groupes (63,7% dans le groupe benfluorex versus 62,9% dans le groupe pioglitazone). Les effets indésirables les plus fréquents sont les infections et infestations (24,9% versus 28,6%), les troubles gastro-digestifs (14,7% versus 11,8%), et les troubles musculosqueletiques (13,1% versus 15,6%).

Les effets indésirables émergents dans le groupe benfluorex sont les hypoglycémies (9% versus 13,2% dans le groupe pioglitazone) et les diarrhées (4.3% versus 1,9%).

Au niveau cardiaque, 2 patients du groupe benfluorex versus 3 dans le groupe pioglitazone ont fait un infarctus du myocarde, 0 versus 1 pour les angines de poitrine, 1 versus 0 pour l'insuffisance cardiaque congestive, 0 versus 1 pour l'ischémie, 0 versus 1 pour le syndrome coronarien aigu et 1 versus 0 pour la cardiomyopathie congestive.

Enfin, il y a eu deux décès dans le groupe benfluorex contre 4 dans le groupe pioglitazone, ces décès n'étant pas reliés aux traitements.

CONCLUSIONS PRELIMINAIRES DE LA FIRME :

En conclusion, chez des patients diabétiques de type 2 insuffisamment contrôlés par SU, l'ajout d'un traitement par benfluorex pendant 12 mois permet/entraîne une diminution statistiquement significative de l'HbA1c.

L'effet antidiabétique du benfluorex est confirmé dans cette étude (diminution de -0,54% de l'HbA1c), bien que la non infériorité du benfluorex versus la pioglitazone ne soit pas démontrée.

La supériorité du benflurorex versus la pioglitazone sur la diminution du LDL-cholestérol est démontrée.

De plus, le benfluorex diminue significativement le cholestérol total contrairement à la pioglitazone.

Les deux traitements diminuent significativement les taux de triglycérides, la glycémie à jeun et améliore l'insulinorésistance.

Après un an de traitement, le poids ainsi que le tour de taille ont augmenté sous pioglitazone mais pas sous benfluorex.

Le profile de sécurité d'emploi est en ligne avec ce qui figure déjà dans le RCP

En ce qui concerne le profile de sécurité cardiaque (échographies cardiaques), aucune modification de la fraction d'éjection du ventricule gauche (FEGP) n'a été détectée dans les deux groupes de traitement.

Des régurgitations des valves cardiaques ont été observées plus fréquemment sous benfluorex que sous pioglitazone, mais sans retentissement clinique délétère (significatif).

La différence morphologique en termes d'anomalies des valves cardiaques dont les régurgitations (au dessus d'un grade 1) ne sont pas significatives.

Les anomalies émergentes (nouvelles) des valves cardiaques dans cette étude n'étaient pas associées à des signes ou symptômes cliniques.

Des analyses complémentaires visant à expliciter les anomalies valvulaires observées sont en cours.

Note d'évaluation :

Le Groupe DEUG est sollicité avant la Commission d'AMM afin d'évaluer :i) les données d'efficacité de cette étude REGULATE et ii) plus généralement la place de cette molécule dans la prise en charge thérapeutique du diabète à partir des données existantes (bénéfice).

Les points suivants ont été discutés au cours du groupe DEUG:

Au niveau efficacité :

- La non-infériorité du benfluorex versus la pioglitazone n'est pas démontrée sur le critère principal de jugement, l'HbA1c. On observe néanmoins une diminution de -0.54% sous benfluorex et de -0.88% sous pioglitazone. Les valeurs de la glycémie à jeun évoluent en cohérence avec celles de l'HbA1c (baisse de -1.2 ±2.9 mmol/L sous benfluorex et de – 1.7 ±2.9 mmol/L sous pioglitazone. Cette efficacité, même modeste, est à souligner et permet de confirmer les résultats de l'étude Moulin dans laquelle une diminution de -0.8% d'HbA1c était observée chez les patients sous benfluorex en add-on des sulphonylurées.

- une diminution de poids est observée dans le groupe benfluorex (- 1.6 kg) alors qu'une augmentation de poids est observée dans le groupe pioglitazone (+ 3.3 kg).

- Au niveau lipidique : un effet peu important est observé sur le cholestérol total (-0.16 mmol/L), sur le LDL cholestérol (-0.24 mmol/L) et encore plus faible sur les triglycérides (-0.14 mmol/L). Cet effet mimine du benfluorex sur les triglycérides confirme le bien-fondé du retrait de l'indication « adjuvant du régime adapté dans les hypertriglycéridémies » en 2007, d'autant que d'autres hypolipidémiants très supérieurs existent actuellement sur le marché.

Au niveau de la sécurité d'emploi :

La fréquence des effets indésirables est comparable entre les deux groupes : 63.7% sous benfluorex versus 62.9% sous pioglitazone. Il s'agit essentiellement de :

- Troubles gastro-intestinaux : 14.7% versus 11.8% dont les diarrhées (4.3% versus 1.9%)

- Troubles musculo-squelettiques : 11.4% versus 15.6%

- Hypoglycémies : 9% versus 13.2%

Au niveau des valvulopathies, 614 patients, 309 dans le groupe benfluorex et 305 dans le groupe pioglitazone ont eu une échocardiographie à l'inclusion et à 52 semaines, après une exposition aux traitements d'une durée moyenne de 328 jours.

Cette étude a mis en évidence dans le groupe traité par benfluorex versus le groupe pioglitazone :

- l'émergence d'anomalies valvulaires fonctionnelles statistiquement significatives, 26,5% versus 10,9%, (p<0,0001),

- des anomalies valvulaires morphologiques non statistiquement significatives (2,6% versus 1,3% respectivement, p=0,264).

Il est à noter que i) la durée d'exposition moyenne au benfluorex est limitée à 328 jours, ii) les anomalies émergentes fonctionnelles sont estimées "triviales" (selon les critères cardiologiques), sans traduction clinique et iii) la lecture des échocardiographies s'est faite par couple mais avec connaissance des dates des échographies.

Conclusion du groupe DEUG :

Le benfluorex a une efficacité modérée sur les paramètres glucidiques (baisse 0.5-0.8% sur l'HbA1c). Il présente l'avantage de ne pas entraîner de prise de poids voire d'entraîner une légère baisse, ce qui peut être intéressant dans le cadre de patients obèses. D'autre part, peu d'hypoglycémies sont constatées sous benfluorex, ce qui est pourrait avoir un éventuel intérêt dans le cadre d'une prescription sur le sujet âgé, bien qu'aucune étude spécifique n'ait été menée. Il semble avoir une efficacité similaire aux gliptines et à l'acarbose bien qu'aucune étude comparative de non-infériorité n'ait été réalisée.

Il n'a pour l'instant aucune place dans la stratégie de prise en charge du diabète, dans la mesure où le benfluorex ne fait pas partie des recommandations françaises et internationales de la prise en charge du diabète de type 2 car il est considéré uniquement comme un adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Le benfluorex est essentiellement prescrit par des médecins généralistes, les diabétologues ne le prescrivant très peu voire pas du tout. Il est bien souvent prescrit hors AMM, chez des patients obèses non diabétiques mais également chez des patients présentant une dyslipidémie.
Dans l'état actuel du dossier, les données préliminaires de l'étude REGULATE ne permettent pas de modifier le RCP comme demandé par la firme car :
- la non-infériorité de benfluorex n'est pas établie versus pioglitazone. Des alternatives thérapeutiques sont disponibles en add-on des SU et ont montré un profil de sécurité très supérieur au benfluorex.
- les données de l'étude REGULATE sont préliminaires et nécessitent une expertise approfondie. Une modification de l'indication doit d'autre part tenir compte des résultats de sécurité, très défavorables au regard des dysfonctionnements valvulaires apparues au cours de l'étude.
- Le groupe DEUG s'interroge sur la proposition de la firme de suivi échographique des patients avant et pendant un traitement par benfluorex, ainsi que sur la pertinence et la faisabilité d'une telle démarche.

AVIS DU GROUPE DEUG N°24 DU 22 OCTOBRE 2009:

Le Groupe DEUG a été sollicité avant la Commission d'AMM du 23 octobre afin d'évaluer :

i) les données d'efficacité de l'étude REGULATE et

ii) plus généralement la place de cette molécule dans la prise en charge thérapeutique du diabète à partir des données existantes (bénéfice).

L'analyse des données préliminaires d'efficacité de l'étude REGULATE

PERMET :

- de confirmer l'efficacité modérée du benfluorex sur l'HbA1c en association aux sulphonylurées : de – 0.5% (dans l'étude REGULATE) à – 0.8% (Etude MOULIN)

- de confirmer l'effet peu important du benfluorex sur le métabolisme lipidique.

NE PERMET PAS :

- de recommander le benfluorex en association aux SU ; dans cette étude, la non–infériorité versus pioglitazone n'est pas établie (limite supérieure de l'intervalle de confiance à 0.49 pour une limite de non infériorité fixée à 0.40 (E (SE) = 0,33 (0,08) %, 95 % CI = [0,17; 0,49], p = 0,19).

De plus, des alternatives thérapeutiques en association sont par ailleurs disponibles pour lesquelles le rapport bénéfice risque est favorable.

- de modifier l'indication du benfluorex comme proposé par la firme. En effet, seule une expertise partielle des résultats a été effectuée en l'absence de rapport final. D'autre part, une modification de l'indication doit tenir compte des données de sécurité d'emploi, notamment des cas de valvulopathies observées dans l'étude.

- tel que proposé par la firme, de positionner le benfluorex dans la stratégie thérapeutique de prise en charge du diabète de type 2 ; en effet, le benfluorex est actuellement uniquement considéré comme un adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Les conclusions du Groupe DEUG sur l'évaluation des données de l'étude REGULATE ainsi que l'ensemble des données d'efficacité dans les indications actuelles de l'AMM seront présentées à la Commission d'AMM du 23 octobre pour discussion et décision finale sur le rapport Bénéfice/Risque de cette molécule. En parallèle, et en vue de cette discussion seront

Annexe 4-42

présentées par le Département de Pharmacovigilance et les experts mandatés les conclusions sur les données relatives à la sécurité d'emploi du benfluorex

COMMISSION D'AMM N° 469 DU 23 OCTOBRE 2009

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoire SERVIER

Demande déposée le

Principe actif:	Benfluorex
Caractère d'originalité	Réévaluation des données de Bénéfice et de Risque
Classe ATC:	Système cardio-vasculaire/Hypolipémiants (Code ATC à mettre)

CONTEXTE DE LA PRESENTATION en COM D'AMM

MEDIATOR a été une nouvelle fois présenté en Commission Nationale de Pharmacovigilance (CNPV) ; en effet, un signal relatif aux anomalies des valves cardiaques soupçonné depuis plusieurs mois par les données de pharmacovigilance se trouve confirmé par :
1. les données d'une étude cas /témoins brestoise rétrospective menée par le CHU de Brest.
2. les résultats d'une étude clinique (Etude REGULATE) dans laquelle en parallèle de l'analyse des données d'efficacité du benfluorex en association à un sulphonylurée (SU), une exploration de la tolérance cardiaque/impact du traitement sur les valves cardiaques a été explorée.
Les données de l'étude cas /témoins, ainsi que les résultats préliminaires de l'étude REGULATE ont été présentés en CNPV le 09 09 2009.

A l'issue de cette présentation, les membres de la CNPV ont considéré (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex, ceci malgré certaines limites méthodologiques soulevées par l'étude Cas/témoins. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

La CNPV souhaite que l'ensemble des données soient transmises à la Commission d'AMM afin qu'elle se qu'elle puisse se prononcer – au vu de l'ensemble des données de bénéfice et de risque dans les conditions d'utilisation actuelles du produit - sur la balance bénéfice- risque du produit.
Il a été demandé à la firme de déposer l'ensemble des données cliniques en vue de cette Commission, notamment les résultats de l'étude REGULATE.

Annexe 4-43

RESUME DES DONNEES DE BENEFICE

Historique de l'évaluation des données d'efficacité : de 2000 à 2009-10-13

- **Date d'AMM** : 16-07-1976 avec une indication en tant qu'hypolipidémiant

- **1995. Inscription sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes.** Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le CTPV a craint une dérive de l'utilisation du benfluorex comme anorexigène.

- **1987**: validation de la 1ère tranche dans l'indication « hypertriglycéridémies »

- **1990** : dépôt du dossier de la 8ème tranche de validation dans l'indication en « diabétologie » ; nombreux échanges entre l'Afssaps et la firme entre 1990 et 1995 sur la nature des données à soumettre afin de valider cette indication (type d'étude, population cible, etc.), aboutissant finalement en 1998 au dépôt de l'étude Del Prato (étude de l'efficacité du benfluorex versus placebo et metformine sur les paramètres glucidiques (voir ci-dessous données cliniques). En attente de cette étude, l'indication telle que libellée lors de l'octroi de l'AMM a été maintenue.

- **Septembre 2000:** demande d'extension d'indication au «*Diabète de type II insulino-dépendant, en association au régime adapté, lorsque ce régime n'est pas suffisamment suffisant pour rétablir à lui seul l'équilibre glycémique* ». Une seule étude de phase III **(Etude Del Prato)**, randomisée, en double insu, benfluorex versus placebo et metformine a été soumise à l'appui de cette demande (A noter, cette étude a été réalisée à la demande de l'Afssaps; protocole revu en concertation avec l'Afssaps). Un avis défavorable a été émis par le Groupe de Travail PTC2 ainsi que par la COM d'AMM. Après recours de la firme de cette décision, cet avis a été maintenu par la COM d'AMM. En effet, compte tenu des défauts de la qualité méthodologique de cet essai (ayant l'objet par ailleurs d'une inspection), aucune conclusion n'a pu être formulée sur la taille de l'effet: i) du benfluorex versus placebo; ii) du benfluorex versus metformine (non-infériorité non démontrée : déséquilibre des taux d'HbA1c entre les groupes à l'inclusion, 68% seulement inclus dans l'analyse per protocole, 25% de patients inclus à tort). A noter également, aucune efficacité sur les paramètres lipidiques n'a été mise en évidence dans cette étude. En conclusion, la COM d'AMM (20-09-2002) a demandé qu'une étude évaluant l'efficacité du benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux soit effectuée; l'association devant être également étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisants rénaux, sujets âgés)

- 2007=> Réévaluation du rapport bénéfice Risque / Modification du code ATC

Conclusions de la réévaluation du bénéfice /risque demandé par la CNPV (AVIS DE LA COM d'AMM 419 DU 5 AVRIL 2007) (Extrait) faisant suite au Groupe de Travail DEUG N°6 du 21 10 2006 :

Après présentation et discussion des conclusions du Groupe de Travail DEUG sur les données d'efficacité et des conclusions de la CNPV sur les données de sécurité d'emploi, les conclusions suivantes ont été émises :

1. La COM d'AMM suit l'avis DEFAVORABLE émis par le Groupe DEUG au maintien de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée*», les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante dans les études soumises sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol.

2. La COM d'AMM suit également l'avis du Groupe DEUG pour le maintien de l'indication : « *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* » dans son libellé actuel. En l'attente de données plus complètes sur l'efficacité du benfluorex en association aux autres antidiabétiques oraux, la COM d'AMM n'a pas souhaité modifier le libellé actuel. A ce jour, seule l'étude MOULIN a permis de montrer une efficacité du benfluorex sur l'HbA1c en association à un sulfamide

L'étude Moulin (publiée dans Diabetes Care en 2006) est une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par SU et intolérants ou ayant une contre indication à la metformine. Le critère principal était l'HbA1c ; les critères secondaires : insulinémie, glycémie à jeun, paramètres lipidiques, index d'insulino résistance HOMA. Trois sous-groupes ont été analysés : HbA1c > 8%, âge > 65 ans et clairance de la créatininémie < 80ml/mn. Etude de supériorité avec un différence de 06% entre les groupes sur l'HbA1c.

Résultats :

Après 18 semaines de traitement, les résultats d'efficacité sur les paramètres glucidiques de cette étude montrent que :

- l'HbA1c est diminuée de -0.82% dans le groupe benfluorex (versus baseline) et de 1% versus le groupe placebo. 34.2% et 19% arrivent à une HbA1c ≤ 7% et > 6.5% contre 11% et 5% respectivement sous placebo. Baisse de l'HbA1c significative dès la 4ème semaine ; d'après la firme, l'effet est du même ordre entre les trois sous groupes pré définis ;
- l'insulinorésistance s'améliore significativement sous benfluorex ; la glycémie à jeun baisse significativement dès la 4ème semaine sous benfluorex.

La perte de poids était de 1.3 kg sous benfluorex et de 0.7kg sous placebo

3. La COM d'AMM souhaite que les modifications d'ajout d'effets indésirables suivants tels que décidés par la CNPV soient mentionnées au sein de la rubrique 4.8. du RCP : « *troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations)* » et de la rubrique correspondante de la Notice.

4. Une inspection de l'étude MOULIN, seule étude à ce jour ayant montré une efficacité sur les paramètres glucidiques a été proposée et acceptée par les membres de la COM d'AMM. Une saisine sera adressée en ce sens à la DIE (Direction de l'Inspection des Etablissements).

5. Enfin, les membres de la COM d'AMM souhaitent qu'une communication soit faite sur l'usage hors AMM de cette spécialité ainsi que sur la seule indication retenue après réévaluation des bénéfice/risque de cette spécialité.

Au total, le libellé de l'indication retenu est le suivant : «Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».

Code ATC

1) Avis Afssaps (Groupe DEUG du 13 09 2009

AVIS FAVORABLE à la modification du Code ATC ; le Code ATC retenu est le suivant : **DIVERS MEDICAMENTS DES VOIES DIGESTIVES ET DU METABOLISME/Code ATC A16X**

En effet, compte-tenu de la modification de l'indication avec suppression de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours nécessaire* », le code ATC actuel : HYPOCHOLESTEROLEMIANT ET HYPOTRIGLYCERIDEMIANT/Code ATC : C10AX04 n'est donc plus d'actualité.

Dans l'attente du reclassement du benfluorex selon la classification ATC par l'Organisation Mondiale de la Santé (OMS), sur proposition des laboratoires SERVIER auprès de l'OMS, le code ATC proposé par la firme soit : AUTRES MEDICAMENTS DU DIABETE/Code ATC : A10X n'est pas acceptable. En effet, selon les experts ce code ne peut être accepté compte tenu du fait que cette spécialité n'a pas à ce jour d'indication reconnue dans le diabète de type 2.

2) Code ATC octroyé par l'OMS => Code ATC : A10X : AUTRES MEDICAMENTS DU DIABETE

Année 2009 => Nouvelles données d'efficacité : Etude REGULATE

Analyse des données d'efficacité de l'Etude REGULATE

Titre de l'étude :

A one-year multicentre, international, randomised, doubleblind study with comparison of benfluorex (150 mg bid or 150 mg tid) *versus* pioglitazone (30 mg od or 45 mg od) in combination with sulfonylurea administered orally for the treatment of type 2 diabetes.

Méthodologie :

Il s'agit d'une multicentrique, randomisées, en double aveugle, contrôlée *versus* pioglitazone, d'une durée de 52 semaines, comparant chez 847 patients diabétiques de type 2, insuffisamment contrôlés par sulfamides hypoglycémiants (SU) l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR à la dose maximale recommandée (450 mg /jour, 1 comprimé pendant le repas), à un traitement par pioglitazone à la dose maximale recommandée (45 mg/jour, 1 comprimé au petit déjeuner)

Objectifs :

Le but de cette nouvelle étude était de comparer l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR versus un traitement par pioglitazone, en association à un SU, sur le contrôle glycémique et le profil lipidique.

L'objectif principal est de démontrer la non-infériorité de la combinaison SU + Benfluorex comparé à la combinaison SU + Pioglitazone sur l'évolution de l'HbA1c.

L'objectif secondaire est de démontrer la supériorité du benfluorex combiné aux SU comparativement à la Pioglitazone combiné aux SU sur le taux de cholestérol.

Les autres objectifs secondaires sont d'évaluer et de comparer ces combinaisons après 1 an de traitement sur : glycémie à jeun, l'insulinémie à jeun, le risque cardiovasculaire, la sécurité d'emploi et le coût de ces deux traitements.

Critères d'évaluation :

Critère principal : HbA1c mesuré à chaque visite (inclusion, 4, 8, 16, 28, 40 et 52 semaines)

Critères secondaires :

Paramètres lipidiques : LDL-cholestérol, cholestérol total, HDL-cholestérol, triglycérides à chaque visite.

Autres paramètres : glycémie à jeun (FPG), insulinémie à jeun (HOMA-IR), C-réactive protéine, mesure du tour de taille, poids.

Paramètres de sécurité d'emploi : événements indésirables, hypoglycémies, paramètres biologiques, examen cardiaque (ECG, échographie cardiaque à l'inclusion et à 12 mois)

Analyse statistique :

La borne de non-infériorité entre les deux traitements a été fixée à 0.4% d'HbA1c.

Résultats :

1. Caractéristiques de la population

Tableau 7 REGULATE Caractéristiques de la population randomisée

	benfluorex (n = 423)	pioglitazone (n = 423)

Au total, **la non-infériorité de benfluorex par rapport à la pioglitazone n'a pas été démontrée** (limite supérieure de l'intervalle de confiance à 0.49 pour une limite de non infériorité fixée à 0.40 (E (SE) = 0,33 (0,08) %, 95 % CI = [0,17; 0,49], p = 0,19).

3. Critères secondaires

Tableau 8 -REGULATE Evolution des principaux paramètres biologiques dans la population FAS

	Benfluorex			Pioglitazone			différence entre les groupes
	N	valeur initiale moyenne (SD)	différence pré-post (SD)	n	valeur initiale moyenne (SD)	différence pré-post (SD)	Δ (ES) IC 95%
Glycémie à jeun mmol/L	392	9.9 (± 2.71)	-1.20 (0.15)	396	9.9 (± 2.51)	-1.73 (0.23)	0.56** (0.18) [0.21;0.90]
HOMA- IR Index	332	9.36 (± 5.30)	-1.23 (0.38)	315	9.83 (±5.34*)	-2.52 (0.35)	1.04 (0.41) [0.23;1.85]
Total Cholestérol mmol/L	396	5.01 (± 0.99)	-0.16 (0.04)	396	5.02 (± 0.92)	0.08 (0.05)	-0.25** (0.057) [-0.357;-0.134]
LDL cholestérol mmol/L	396	3.13 (0.83)	-0.24 (0.03)	396	3.15 (0.81)	-0.12 (0.04)	-0.13** (0.05) [-0.22;-0.04]
Triglycérides mmol/L	397	1.92 (± 0.97)	-0.14 (0.05)	397	1.96 (± 0.90)	-0.21 (0.05)	0.058 (0.06) [-0.07 ;0.18]

***p : 0.001 **p : 0.01 *p : 0.05 *test non paramétrique*

On observe :

- une diminution du LDL-cholestérol moyen (-0,24) dans le groupe benfluorex plus importante que celle observée dans le groupe pioglitazone (-0.12).

- une diminution du cholestérol total moyen (-0.16) dans le groupe benfluorex comparativement à une augmentation dans le groupe pioglitazone (+0.08)

- une stabilité du HDL-cholestérol (0.01) dans le groupe benfluorex et une légère augmentation sous pioglitazone (+0.06)

- une diminution des concentrations de triglycérides comparable dans les 2 groupes.

Enfin, il y a une diminution du poids sous benfluorex (-1.6 kg) et une augmentation sous pioglitazone (3.3 kg).

Sécurité

La fréquence des effets indésirables est comparable entre les deux groupes (63,7% dans le groupe benfluorex versus 62,9% dans le groupe pioglitazone). Les effets indésirables les plus fréquents sont les infections et infestations (24,9% versus 28,6%), les troubles gastro-digestifs (14,7% versus 11,8%), et les troubles musculosqueletiques (13,1% versus 15,6%).

Les effets indésirables émergents dans le groupe benfluorex sont les hypoglycémies (9% versus 13,2% dans le groupe pioglitazone) et les diarrhées (4.3% versus 1,9%).

Au niveau cardiaque, 2 patients du groupe benfluorex versus 3 dans le groupe pioglitazone ont fait un infarctus du myocarde, 0 versus 1 pour les angines de poitrine, 1 versus 0 pour l'insuffisance cardiaque congestive, 0 versus 1 pour l'ischémie, 0 versus 1 pour le syndrome coronarien aigu et 1 versus 0 pour la cardiomyopathie congestive.

Enfin, il y a eu deux décès dans le groupe benfluorex contre 4 dans le groupe pioglitazone, ces décès n'étant pas reliés aux traitements.

CONCLUSIONS PRELIMINAIRES DE LA FIRME :

En conclusion, chez des patients diabétiques de type 2 insuffisamment contrôlés par SU, l'ajout d'un traitement par benfluorex pendant 12 mois permet/entraîne une diminution statistiquement significative de l'HbA1c.

L'effet antidiabétique du benfluorex est confirmé dans cette étude (diminution de -0,54% de l'HbA1c), bien que la non infériorité du benfluorex versus la pioglitazone ne soit pas démontrée.

La supériorité du benflurorex versus la pioglitazone sur la diminution du LDL-cholestérol est démontrée.

De plus, le benfluorex diminue significativement le cholestérol total contrairement à la pioglitazone.

Les deux traitements diminuent significativement les taux de triglycérides, la glycémie à jeun et améliore l'insulinorésistance.

Après un an de traitement, le poids ainsi que le tour de taille ont augmenté sous pioglitazone mais pas sous benfluorex.

Le profile de sécurité d'emploi est en ligne avec ce qui figure déjà dans le RCP

En ce qui concerne le profile de sécurité cardiaque (échographies cardiaques), aucune modification de la fraction d'éjection du ventricule gauche (FEGP) n'a été détectée dans les deux groupes de traitement.

Des régurgitations des valves cardiaques ont été observées plus fréquemment sous benfluorex que sous pioglitazone, mais sans retentissement clinique délétère (significatif).

La différence morphologique en termes d'anomalies des valves cardiaques dont les régurgitations (au dessus d'un grade 1) ne sont pas significatives.

Les anomalies émergentes (nouvelles) des valves cardiaques dans cette étude n'étaient pas associées à des signes ou symptômes cliniques.

Des analyses complémentaires visant à expliciter les anomalies valvulaires observées sont en cours.

Annexe 4-43

RESUME DES DONNEES DE SECURITE D'EMPLOI

- 1998: 1ère enquête de Pharmacovigilance. Présentation des effets indésirables en CTPV (plusieurs séances) en 1998 ainsi qu'au groupe Européen de PV le 30-11-2000, entraînant des modifications de la rubrique 4.8. du RCP (ajout de « confusion » comme effet indésirable».

- 2004-2005/Seconde enquête de Pharmacovigilance

Cette 2nd enquête fait suite à plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique, rapportés avec le benfluorex. De ce fait, une actualisation des données relatives aux troubles neuropsychiatriques observés avec cette spécialité a été décidée.

L'enquête a ensuite été étendue aux hypertensions artérielles pulmonaires du fait de la notification d'un cas d'HTAP associé à la prise de benfluorex. Les conclusions de la CNPV sont les suivantes:

1. en ce qui concerne les troubles neuropsychiatriques: « *cette enquête confirme la réalité du risque de survenue de « confusions » en présence de Médiator. Il est proposé que cet effet, déjà mentionné dans le RCP, soit détaillé comme suit :* ***« troubles des fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) ».***
2. en ce qui concerne l'HTAP: « *compte tenu de l'incidence des HTAP idiopathiques (1 à 2 par millions et par an), le nombre de cas d'HTAP idiopathique rapportés dans l'enquête ne constitue pas un signal significatif de toxicité du Médiator dans la classe organe cardio-vasculaire ».*

La discussion en CNPV (29-11-2005, adoptée le 16-06-2006) a par ailleurs, porté sur les éléments suivants (extrait):

- Les ventes de Médiator en Europe sont réalisées en quasi totalité en France. Les données DOREMA d'avril 2005 montrent une utilisation dans 46,3% dans les dyslipidémies et dans 8,3% dans d'autres indications. L'effet anorexigène du benfluorex n'a pas été démontré. Toutefois, les membres de la CNPV craignent un mésusage, en particulier dans l'obésité. Dans ce contexte, une étude d'utilisation de prescription serait utile.
Il est à noter que le renouvellement quinquennal du produit intervient dans 2 ans en France et que des données d'efficacité dans le diabète existent mais restent limitées et mériteraient d'être réévaluées.

- Le bilan de pharmacovigilance confirme les données de sécurité d'emploi du Médiator déjà connues. Les effets neuropsychiatriques décrits actuellement dans le RCP sous le terme « confusion » doivent être détaillés. Il n'y a pas actuellement assez de données pour affirmer l'existence de syndrome de sevrage. Le faible nombre de cas décrits d'HTAP idiopathique associés au Médiator doit être relativisé par rapport à la sous-notification habituelle en pharmacovigilance. Afin d'évaluer au mieux les risques potentiels de l'utilisation de Médiator, il conviendrait de réaliser:
i) une étude d'utilisation/prescription de Médiator;
ii) une étude expérimentale sur un modèle animal permettant d'évaluer le potentiel de Médiator à engendrer des HTAP;
iii) une étude au niveau des Centres d'Evaluation et d'Information sur la Pharmacodépendance (CEIP) afin d'évaluer un éventuel problème de pharmacodépendance. A ce titre, une saisine de la Commission Nationale des stupéfiants et psychotropes sera effectuée.

Enfin, il a été proposé d'étudier la possibilité d'interroger les registres d'HTAP existant dans 17 centres, afin de rechercher, dans une étude rétrospective cas-témoins, le rôle éventuel du benfluorex.

- Année 2009

En mai 2009, le Comité technique de Pharmacovigilance a examiné les résultats actualisés de l'enquête de PV, notamment les données relatives au risque d'HTAP et de valvulopathie cardiaque sous MEDIATOR® ainsi que les données d'une publication[1] récente sur ce sujet.

Annexe 4-43

Ce dossier a été successivement présenté :

- en CTPV le 05 05 2009
- en CNPV le 07 07 2009
- en CNPV le 29 09 2009
-

- CNPV du 7 juillet 2009

=> Point sur les données relatives à l'HTAP en CNPV du 07 07 2009

Depuis le dernier passage en Commission Nationale de Pharmacovigilance du 27 mars 2007, 8 nouveaux cas d'HTAP ont été notifiés, soit un total de 28 cas, parmi lesquels le nombre d'HTAP d'allure idiopathique sous MEDIATOR® non associés à un autre anorexigène, est passé de 3 à 4. Le taux de notification des HTAP imputables au MEDIATOR® reste donc stable par rapport à 2007 (1 cas sur 34 954 169 boîtes vendues, soit 1 cas pour 14 372 602 mois de traitement). De même, la fréquence des cas d'HTAP idiopathiques sous MEDIATOR® est stable par rapport aux données présentées en mars 2007.

Compte tenu de l'incidence des HTAP d'allure idiopathique dans la population générale (1 à 2 cas par millions et par an), le Comité Technique a considéré que le nombre de cas d'HTAP d'allure idiopathique associés à l'utilisation de MEDIATOR® ne semblait pas constituer un signal significatif de la toxicité pulmonaire du Médiator®. Les membres du Comité Technique ont recommandé la poursuite d'une surveillance des notifications spontanées des cas d'HTAP dans la population générale.

=> Point sur les données relatives aux valvulopathies 07.07.2009

Actualisation de l'enquête sur les valvulopathies => CNPV du 07 07 2009

Concernant les valvulopathies, 30 cas sont observés entre 1998 et 2009 sous MEDIATOR® ce qui constitue un signal. L'ensemble de ces résultats a fait l'objet d'une présentation en groupe pharmaco-épidémiologie de l'Afssaps afin de définir un modèle d'étude permettant d'explorer le signal relatif aux valvulopathies. Une étude rétrospective cas-témoins des cas de valvulopathies issus du PMSI a été proposée.

En France, 30 cas de valvulopathies cardiaques sont rapportés entre 1998 et 2009 :

- 19 cas issus de la notification spontanée (NS) dont 3 cas concernant également les HTAP post-capillaires
- 11 cas identifiés par le CRPV de Brest à la suite de l'interrogation du PMSI (Programme de médicalisation des systèmes d'information).

Annexe 4-43

Caractéristiques des patients :

	NS : 19	PMSI : 11
Sexe	Femmes : 24, hommes : 6	
Age moyen de survenue (ans)		
Femmes : 54,6	53,7	56,4
Hommes : 62,2	54,6	69,7
BMI (kg/m²)		
18,5 à 24,9 : 5 cas	3	3-2
25 à 29,9 : 7 cas	5	2
≥ 30 : 8 cas	4	4
Durée moyenne de traitement (ans)		
5,3	5,6	4,6
Antécédents / Terrain (nombre)		
Tabac : 13	10	3
Hypothyroïdie : 9	7	2
Diabète : 9	5	4
Dyslipidémie : 12	10	2
Polyarthrite rhumatoïde : 2	1	1
Antécédent/Terrain cardiaque (nombre)	15	
Médicaments associés (nombre)		
Levothyroxine	9	
Antidépresseur IRS	7	

Type et localisation des valvulopathies :

Les 30 valvulopathie rapportées sont monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Concernant la localisation de ces valvulopathies, 28 cas sont des insuffisances mitrales (sévères dans 17 cas), 24 cas sont des insuffisances aortiques et 11 cas sont des insuffisances tricuspides (sévères dans 4 cas).

Aspects anatomo-pathologiques des valvulopathies opérées

Des diagnostics anatomo-pathologiques sont effectués chez 6 patients opérés : 5 patients français et un cas espagnol rapporté dans une publication (Rafel Ribera J.).

a) **4 cas dont l'aspect anatomo-pathologique serait compatible avec celui décrit sous anorexigène :**

TO060355 (Noize[1] 2006) : une femme de 48 ans, avec un BMI=25 kg/m², sous MEDIATOR® pendant 7 ans pour intolérance aux glucides.

BR20080051 (Boutet[2], cas n°6) : une femme de 50 ans ayant un diabète de type 2, avec un BMI=34 kg/m², sous MEDIATOR® de 2001 à 2007 et sous ISOMERIDE® pendant 1 à 3 mois 20 ans auparavant.

BR20090080 (Brest PMSI) : une femme de 54 ans, avec un BMI=30 kg/m², sous MEDIATOR® de septembre 2007 à décembre 2008, ayant pris des amphétamines 7 à 8 ans jusqu'en 1986.

S03000422 (R. Riber[3] J. 2003) : une femme de 50 ans, sous MEDIATOR® pendant 12 mois par intermittence.

b) **Autres cas**

Dans 2 cas, l'anatomopathologie n'est pas spécifique.

Dans les autres cas, seules les données échographiques sont disponibles.

Annexe 4-43

Conclusions du rapporteur (CRPV de Besançon) :

Le CRPV de Besançon, rapporteur de cette enquête, a conclu à l'existence d'un signal de cardiotoxicité détecté par la notification spontanée et les données du PMSI. Il convient alors de confirmer ce signal par une étude épidémiologique (cas-témoin).

Le rapporteur souligne que la pharmacologie du benfluorex et de son métabolite, la norfenfluramine, devra être prise en compte dans l'analyse du mécanisme de la cardiotoxicité.

Compte tenu de ces nouvelles données de sécurité, le rapporteur propose une réévaluation du bénéfice/risque de benfluorex.

Présentation du Dr. Frachon (praticien, CHU de Brest):

Lors de cette réunion, le Docteur Frachon, du groupe HTAP de Bretagne Occidentale (CHU de Brest) a présenté la méthodologie appliquée à Brest pour l'identification des cas de valvulopathies associées au benfluorex.

L'identification des cas de valvulopathies a reposé sur :

i) le signalement spontané de 4 cas par des médecins brestois,
ii) l'interrogation du PMSI en utilisant le codage « valvulopathies et diabète » qui a mis en évidence 240 dossiers dont 3 cas compatibles et le codage « valvulopathies et Médiator® » qui a rapporté 23 dossiers dont 11 compatibles,
iii) une surveillance prospective avec 3 nouveaux cas.

Sur les 15 patients identifiés « compatibles » (dont 11 rapportés par le CRPV de Besançon et 4 très récents à l'étude), 12 étaient des femmes et 3 des hommes. L'âge moyen est de 58 ans (49-78). 6 patients sur 12 étaient diabétiques. La durée moyenne d'exposition est de 53 mois (12-144) avec un délai entre la première prise du médicament et le diagnostic de 97 mois (13-384). L'échographie cardiaque antérieure est normale dans 5 cas sur 7. L'exposition à d'autres anorexigènes concerne 5 patients sur 12, et à un antidépresseur de type inhibiteur de recapture de la sérotonine (IRSI) concerne 8 patients sur 10.
Les valves atteintes sont la valve mitrale et la valve aortique dans 100% des cas, avec une atteinte de la valve tricuspide dans 7 cas et de la valve pulmonaire dans un cas. Une chirurgie de remplacement valvulaire a été effectuée dans 8 cas.

Une analyse systématique de toutes les insuffisances mitrales (IM), isolées ou associées, examinées au CHU de Brest depuis 2003, est actuellement en cours. Plus de 600 dossiers d'IM sont classés en 3 groupes: 1) IM dans un contexte étiologique bien identifié 2) IM inexpliquées 3) IM non classables.
Une recherche de l'exposition au benfluorex sur un modèle de cas témoins est réalisée pour les cas identifiés par le PMSI et par une enquête téléphonique auprès du médecin et du patient.

Les résultats de cette étude sont attendus pour fin juillet 2009.

Présentation du laboratoire :

A l'issu de la présentation des données, les représentants des laboratoires Servier ont proposé deux modèles d'études :

i) une étude anatomopathologique sur un modèle exposé/non-exposé (ce modèle d'étude a été récusé par la commission),

ii) une étude cas-témoin ayant pour objectif de quantifier un éventuel sur-risque de valvulopathie associé au MEDIATOR® chez des patients atteints de valvulopathie idiopathique comparativement à des patients indemnes de valvulopathie. Cette étude se ferait sur une population de patients diabétiques ayant une échographie cardiaque.

Le protocole de cette étude serait disponible début Septembre2009 et permettrait dans le meilleur des cas d'avoir des résultats dans un an.

Par ailleurs, la firme a informé la CNPV que l'étude REGULATE, (MEDIATOR® + SU versus pioglitazone + SU) est actuellement en cours d'analyse. Cette étude incluant 840 patients dont 420 dans chaque bras, comporte une échographie cardiaque à T0 et à la 52ème semaine de traitement. Les résultats d'efficacité et de tolérance sont attendus pour la fin du 1er trimestre 2010.

Conclusions de la CNPV du 07 07 2009

Le responsable du CRPV de Brest, présent à la réunion de la CNPV, a informé les membres que les résultats de l'étude brestoise cas-témoin seront disponibles fin Juillet 2009. Les membres de la commission nationale avaient alors souhaité disposer des résultats de l'étude cas-témoin brestoise afin de se prononcer sur les mesures éventuelles à entreprendre.

Les membres de la CNPV ont également discuté de l'importance des utilisations hors AMM de ce produit, notamment dans la perte de poids, malgré la restriction d'indication.

La commission s'est prononcée en faveur (16 voix pour, 2 voix contre et 2 abstentions) de l'attente des résultats de l'ensemble des études en cours ou planifiées (laboratoires Servier et CRPV de Brest) avant de proposer d'éventuelles mesures.

Elle a toutefois souhaité qu'une communication soit effectuée auprès des professionnels de santé pour leur rappeler le bon usage du Benfluorex dans le cadre de l'AMM.

• CNPV du 29 septembre

=> Actualisation des données relatives aux valvulopathies présentées en CNPV du 07.07 2009 :

1- *Données de la pharmacovigilance :*

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon. 11 nouveaux cas de valvulopathie associés au benfluorex sont rapportés dont 3 issus de la notification spontanée et 8 de des notifications sollicitées et provenant d'Amiens. L'analyse de ces 11 nouveaux cas montre une prédominance féminine, une durée moyenne de traitement de 3 ans et un âge de survenue le plus fréquemment identifié de 55 ans. Dans 9/11 cas une association à une hypertension artérielle pulmonaire est rapportée, une atteinte de type insuffisance mitrale et aortique dans 6 cas et une atteinte mitrale+aortique+tricuspide dans 2 cas. Malgré des échocardiographies documentées, les données anatomopathologiques restent peu informatives.

Certains membres ont souligné qu'en cas de notification sollicitée dans d'autres bassins de population, de nombreux autres cas de valvulopathie associés au benfluorex pourraient être mis en évidence.

2- Données de l'étude Brestoise :

L'étude cas-témoin rétrospective menée par le CHU de Brest, a pour objectif la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait le diagnostic de diabète ou l'Index de Masse Corporelle (IMC). L'exposition au benfluorex est recherchée auprès du patient, de sa famille et de ses médecins, par téléphone, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio = 40,4 (9,7 – 168,3, IC à 95%)). L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas la significativité du résultat.

Annexe 4-43

3- Données de l'étude « REGULATE » :

Les résultats préliminaires de l'étude REGULATE ont été présentés par le laboratoire Servier. Il s'agit d'une étude multicentrique, en double aveugle, comparant pendant 52 semaines chez 840 diabétiques l'efficacité et la sécurité de 2 traitements, benfluorex et SU versus pioglitazone et sulphonylurée (SU). Deux échographies cardiaques ont été réalisées : avant exposition (T0) et à la 52ème semaine. La non-infériorité de l'association benfluorex + SU par rapport à l'association pioglitazone + SU sur la réduction de l'hémoglobine glycosylée n'a pas été démontrée. L'effet a été plus important sur la baisse du LDL-cholestérol

Concernant le profil de tolérance, cette étude a mis en évidence dans le groupe traité par benfluorex, l'émergence d'anomalies valvulaires fonctionnelles statistiquement significatives (26,5% versus 10,9% respectivement, p<0,0001) ainsi que des anomalies valvulaires morphologiques non statistiquement significatives (2,6% versus 1,3% respectivement, p=0,264). Il est à souligner que les anomalies fonctionnelles apparues sous benfluorex n'ont pas de traduction clinique.

A l'issue de cette présentation, le laboratoire Servier a proposé des modifications du Résumé des Caractéristiques du Produit de Médiator®:

- rubrique 4.2 « Indication » : *Restriction aux diabétiques en échec de traitement après les anti-diabétiques oraux*

- conditions de prescription et de délivrance : *Prescription réservée aux spécialistes tels que diabétologues/endocrinologues.*

- *contre-indication aux patients présentant une anomalie valvulaire*

- *mise en place d'une surveillance échocardiographique.*

=> Discussion :

Les résultats de l'étude cas-témoin de Brest ont été largement débattus par les experts de l'Afssaps, les membres de la commission, les investigateurs et le laboratoire.

Les experts ont déploré ne pas disposer du protocole de l'étude. Plusieurs biais ont cependant été identifiés:

- le choix des témoins : si la question posée est de savoir si le benfluorex peut ou non être responsable de valvulopathies, les témoins ne devraient alors pas présenter de valvulopathie,
- le choix des valvulopathies inexpliquées : il est difficile d'être absolument sûr que le diagnostic ne soit pas biaisé,
- les cas et les témoins ont des caractéristiques très différentes. Une confusion par indication (lien entre caractéristiques des patients témoins et l'absence de traitement par benfluorex) ne peut être exclue. Les témoins ont très peu de chance d'être exposés au benfluorex,
- le faible nombre de patients exposés,
- le choix de l'anomalie valvulaire (limité à la valve mitrale).

Toutefois, malgré certaines limites méthodologiques de cette l'étude, les experts et les membres de la commission considèrent que le signal d'une relation entre l'exposition au benfluorex et la survenue de valvulopathies se confirme. Ce signal est d'autant plus préoccupant que l'étude « REGULATE » met en évidence une émergence d'anomalies morphologiques et fonctionnelles valvulaires à la suite d'une exposition d'environ un an au benfluorex (328 jours en moyenne). De plus, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne peut être exclue, notamment en raison des données d'utilisation du produit qui montrent une durée moyenne d'exposition d'environ 3 ans.

Annexe 4-43

=> Conclusions de la CNPV du 29 septembre 2009 :

Les membres de la CNPV considèrent (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex, et ce malgré certaines limites méthodologiques. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

Il est à noter que le dépôt par le laboratoire du protocole de l'étude cas-témoin, prévu initialement pour début septembre 2009 n'a pas encore été effectué.

La CNPV a été informée de la transmission de ces données à la Commission d'AMM au plus tard le 23 octobre 2009, afin qu'elle puisse se prononcer sur la balance bénéfice- risque du produit.

2000 => demande d'extension (2nd dépôt Etude Del Prato) => *"diabète de type 2 insulinodépendant, en association au régime adapté, lorsque ce regime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique"*

Jusqu'en 2007, deux indications:

- ***Adjuvant au régime adapté dans les hypertriglycéridémies.***
- ***Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.***

2007 => Réévaluation du bénéfice-risque (COM AMM 05-04-07)

=> Retrait indication "*adjuvant au régime adapté dans les hypertriglycéridémies*"

Réévaluation du Bénéfice Risque (2007)

afssaps

Conclusions de la COM d'AMM 5 avril 2007:

1. Suppression de l'indication "*Adjuvant du régime adapté dans les hypertriglycéridémies*"

   Les données soumises ne montrent qu'une efficacité très modeste sur les triglycérides et non démontrée sur les autres paramètres lipidiques

2. Maintien de l'indication "*Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*"

   Les données soumises, en particulier celles de l'étude Moulin, semblent montrer une efficacité sur les paramètres glucidiques.

=> Demande de la COM de dépôt rapide d'une étude clinique évaluant l'efficacité du benfluorex en association aux autres antidiabétiques oraux (Etude REGULATE démarrée)

Etude DEL PRATO (1998)

Efficacité du benfluorex vs placebo et metformine

afssaps

Méthodologie:

Etude multicentrique, randomisée en double aveugle de 6 mois évaluant l'efficacité et la sécurité d'emploi de benfluorex vs placebo et vs metformine, chez 438 patients diabétiques de type 2 non équilibrés par régime seul (7,5% < HbA1c < 10%).

Etude déposée dans le cadre de la validation de l'AMM (en 1990) + extension d'indication (2000)

Résultats:

Taulle de l'effet difficile à estimer : i) vs placebo; ii) vs metformine (non infériorité non démontrée : déséquilibre del'HbA1c entre les groupes à l'inclusion; 68% seulement des patients inclus dans l'analyse PP. A noter : absence d'efficacité sur les paarmètres lipidiques.

Au total, seul le bras versus placebo avait été in fine retenu

INSPECTION DE L'ESSAI

Conclusions de la COM d'AMM du 09/12/99 (reprises en 2002)

"Il est noté une efficacité du benfluorex vs placebo **(-0,86% d'HbA1c),** néanmoins aucune conclusion ne peut être formulée sur la taille de l'effet compte tenu des défauts de la qualité méthodologique de cet essai."

Modification de l'indication rejetée (COM AMM 20-09-2002) => Indication *"Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale"* maintenue

afssaps

METHODOLOGIE:

Etude multicentrique, randomisée en double aveugle de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex vs placebo, chez 325 patients diabétiques de type 2 mal équilibrés (7% < HbA1c < 10%) **par SU, ou intolérants ou ayant une CI à la metformine.**

Deux phases :

- **Phase I de 18 semaines en double aveugle : supériorité du benfluorex vs placebo sur l'HbA1c** (différence attendue de 0.6%)

- **Phase II de 16 semaines en ouvert :** données de **sécurité d'emploi à long-terme** en association à un SU ou à l'acarbose

Critère principal: HbA1c

Critères secondaires: glycémie à jeun, insulinémie à jeun, paramètres lipidiques, sécurité d'emploi

Etude MOULIN (2006)

Conclusions

afssaps

Bénéfice sur le métabolisme glucidique:

- **Sur l'HbA1c => supériorité du benfluorex vs placebo démontrée à 4 mois;** maintien de l'efficacité obtenue à 8 mois.
- Efficacité très modeste voire inexistante sur les TG (- 7%). Efficacité sur les autres paramètres lipidiques dont LDL-cholestérol (-6%) non démontrée.
- Variation du poids: - 1.3 kg sous benfluorex et - 0.7 kg sous placebo

Sécurité d'emploi => tolérance acceptable

- Troubles digestifs mineurs (diarrhée) : 15.2% vs 15.3%
- Pas de modification significative de la PA, FC, à l'ECG et des autres paramètres biologiques
- Troubles neurologiques plus fréquents sous benfluorex (9% vs 6.3%)
- Hypoglycémies: 20 patients rapportent 37 épisodes => fréquence plus importante sous sous benfluorex (> 65 and, ClCr < 80 ml/mn)

L'efficacité en seconde intention en association à un SU semble démontrée MAIS réserves méthodologiques soulevées par les experts => Nécessité d'une étude complémentaire pour confirmer cette efficacité pour les paramètres glucidiques

Etude REGULATE (2009)
Méthodologie – Objectifs

afssaps

Objectifs: comparaison de l'efficacité et de la sécurité d'emploi à un an d'un traitement par MEDIATOR vs pioglitazone, chez les patients insuffisamment contrôlés par un sulphonylurée (SU)

Objectif principal: **non-infériorité de la combinaison SU + benfluorex vs SU + pioglitazone sur l'évolution de l'HbA1c à un an** (borne fixée à 0,4%).

Objectifs secondaires:

Supériorité du benfluorex + SU vs pioglitazone + SU sur le taux de cholestérol.

Autres objectifs secondaires: glycémie à jeun, insulinémie à jeun, **risque cardiovasculaire (Echographie ++)**, sécurité d'emploi et coût de ces deux traitements.

CONCLUSIONS sur les données d'efficacité

afssaps

Bénéfice sur le métabolisme glucidique:

- **Sur l'HbA1c => non infériorité vs pioglitazone non établie. Diminution de l'HbA1C de – 0.54% sous benfluorex vs - 0.88% sous pioglitazone à 12 mois**
- **Evolution des autres paramètres glucidiques dans le même sens.**
- **Evolution des paramètres lipidiques similaire à celle observée dans l'étude Moulin: cholestérol total (-0.16 mmol/l).**
- **Variation du poids: - 1.6 kg sous benfluorex et + 3.3 mg sous pioglitazone**

Sécurité d'emploi => fréquence des effets indésirables comparable dans les 2 groupes : 63.7% vs 62.9%

- **Troubles gastro-intestinaux : 14.7 % vs 11.8% dont diarrhées (4.3% vs 1.9%)**
- **Pas de modification significative de la PA, FC et des autres paramètres biologiques**
- **Troubles musculosquelettiques (11.4 vs 15.6%)**
- **Hypoglycémies plus fréquentes sous benfluorex : 9% vs 13.2%**

=> NON INFERIORITE du BENFLUOREX versus la PIOGLITAZONE non démontrée (en seconde intention)

Modifications du RCP demandées par la firme suite aux Etudes MOULIN et REGULATE

afssaps

Modification de l'Indication (rubrique 4.1.) avec ajout d'une Restriction des prescriptions aux spécialistes :

- **Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale, intolérants à la metformine et/ou insuffisamment contrôlés par un insulinosécréteur sulfamidé ou non.**
- **Le traitement doit être instauré par un médecin spécialiste en diabétologie, en endocrinologie ou en médecine interne**

Autres modifications demandées (rubriques 4.2., 4.3., 4.4. et 4.8.) intégrant les nouvelles données de sécurité d'emploi sur les valvulopathies (suivi échographique)

AVIS DU GROUPE DEUG DU 22 Octobre 2009

afssaps

L'analyse des données d'efficacité de l'étude REGULATE

PERMET :

- de confirmer l'efficacité modérée du benfluorex sur l'HbA1c en association aux SU : de -0.5 % (Regulate) à -0.8% (Moulin)

- de confirmer l'effet peu important sur les lipides (retrait de l'AMM en 2007)

NE PERMET PAS:

- de recommander le benfluorex en add-on d'un SU (NI non établie vs pioglitazone dans REGULATE, alternatives thérapeutiques en add-on établies)

- de modifier l'indication du MEDIATOR (proposition de la firme rejetée) : expertise partielle en l'absence de rapport final, modification devant tenir compte de la partie safety de l'étude Regulate (valvulopathies)

- de situer le benfluorex dans la stratégie thérapeutique de prise en charge du diabète de type 2 (voir Recos actuelles)

BENEFICE-RISQUE MEDIATOR

afssaps

Bénéfices :

Efficacité modérée sur les paramètres glucidiques mais absence de bénéfice sur les paramètres lipidiques – effet sur l'HbA1c +/- similaire à celle des gliptines/acarbose mais doutes méthodologiques (Etude Moulin)

Absence d'hypoglycémies (intéressante chez le sujet âgé)

Pas de prise de poids voire légère baisse pondérale (intéressante chez les obèses)

Risques

HTPP signal

Emergence d'effet d'atteintes valvulaires = Signal ++

Utilisation hors AMM (obèses, dyslipidémiques)

Direction de l'Evaluation des Médicaments et des Produits Biologiques

Saint-Denis, le 24 NOV. 2009

Madame le Pharmacien responsable
Les Laboratoires SERVIER
22 rue Garnier
92200 NEUILLY-SUR-SEINE

Lettre recommandée avec avis de réception
1A 036 504 922 49

Dossier suivi par : BP/SO/DBM/CRQ/DR

Réf. : NL 10008 (CIS 6 242 648 7)
COM AMM 469 et 470

Madame,

Je vous prie de bien vouloir trouver ci-joint la décision de suspension de l'autorisation de mise sur le marché de la spécialité pharmaceutique :

MEDIATOR 150 mg, comprimé enrobé,

dont la date d'effet est fixée au 30 novembre 2009.

A cet égard, je vous indique que cette décision est prise dans le contexte procédural de l'article 107 paragraphe 2 de la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire relatif aux médicaments à usage humain. Néanmoins, conformément aux dispositions du 1er paragraphe de ce même article, je vous informe que, au vu l'évaluation des données disponibles et en l'état actuel du dossier, je considère que le retrait de l'autorisation de votre spécialité apparaîtrait fondé.

La présente décision peut faire l'objet d'un recours contentieux devant le Conseil d'Etat dans un délai de deux mois à compter de la date de réception.

Par ailleurs, je vous indique que la procédure de rappel des lots de votre spécialité dans les pharmacies sera mise en œuvre à la date d'effet de la présente décision.

Je vous prie d'agréer, Madame, l'expression de ma considération distinguée.

Le Directeur Général

Jean MARIMBERT

DECISION

du..... 24 NOV. 2009

portant suspension de l'autorisation de mise sur le marché du médicament :

MEDIATOR 150 mg, comprimé enrobé

LE DIRECTEUR GENERAL DE L'AGENCE FRANCAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE

Vu la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire relatif aux médicaments à usage humain, notamment l'article 107 ;

Vu le code de la santé publique, cinquième partie, notamment les articles L. 5121-9, L. 5121-20, R. 5121-21 et suivants, ainsi que l'article R.5121-158 ;

Vu l'avis de la Commission d'autorisation de mise sur le marché (AMM) prévu à l'article R. 5121-50 du code de la santé publique, en date du 12 novembre 2009, par lequel elle se prononce, suite à la réévaluation menée au vu de l'ensemble des données disponibles d'efficacité et de risque dans les conditions d'utilisation actuelles et ayant fait apparaître un rapport bénéfice-risque défavorable de la spécialité pharmaceutique MEDIATOR 150 mg, comprimé enrobé, contre son maintien sur le marché ;

Vu la lettre du 13 novembre 2009 informant les Laboratoires SERVIER de l'intention de l'Agence française de sécurité sanitaire des produits de santé de suspendre l'AMM de la spécialité pharmaceutique MEDIATOR 150 mg, comprimé enrobé et l'invitant à présenter ses observations ;

Vu la réponse des Laboratoires SERVIER en date du 23 novembre 2009 par laquelle ils proposent la modification du résumé des caractéristiques du produit afin de restreindre le libellé de l'indication thérapeutique, de limiter la prescription du médicament à certains spécialistes et d'ajouter une contre-indication ainsi que des mises en gardes spéciales et des précautions d'emploi, compte tenu de leur analyse ayant conclu à un rapport bénéfice/risque favorable de la spécialité précitée dans les nouvelles conditions d'utilisation proposées ;

Considérant le principe général de prééminence de la protection de la santé publique énoncé par le second considérant de la directive 2001/83/CE précitée ;

Considérant la mise en œuvre de la procédure prévue à l'article 107 de la même directive, à l'issue de laquelle, après avis du Comité des médicaments à usage humain de l'Agence européenne des médicaments, une décision définitive sera prise par la Commission européenne en ce qui concerne le devenir de l'AMM de la spécialité MEDIATOR 150 mg, comprimé enrobé ;

Considérant que dans l'attente de la décision de la Commission européenne, les autorités sanitaires nationales peuvent, lorsqu'une action urgente apparaît nécessaire pour protéger la santé publique à la suite de l'évaluation de données de pharmacovigilance, suspendre l'AMM de la spécialité concernée ;

Considérant qu'aux termes des articles L.5121-9 et R.5121-47 du code de la santé publique, l'AMM peut être suspendue notamment lorsque l'évaluation des effets thérapeutiques positifs du médicament au regard des risques pour la santé du patient ou la santé publique liés à sa qualité, sa sécurité ou son efficacité n'est pas considérée comme favorable ou lorsque l'effet thérapeutique annoncé fait défaut ;

Considérant que les notions de nocivité et d'effet thérapeutique ne peuvent être examinées qu'en relation réciproque et n'ont de signification relative qu'appréciées en fonction de l'état d'avancement de la science et compte tenu de la destination du médicament ;
Considérant que l'exigence d'une évaluation du rapport bénéfice/risque présenté par un médicament ne vise pas exclusivement l'octroi de l'AMM, mais implique une évaluation continue, et notamment dans le cadre d'une procédure de suspension d'AMM ;

Considérant en l'espèce que des données nouvelles modifient le profil de sécurité de la spécialité pharmaceutique MEDIATOR ; plus précisément, alors qu'aucune étude n'établit un bénéfice attendu du médicament permettant de contrebalancer les risques d'emploi, ceux-ci sont majorés. En effet, la réévaluation fait apparaître les éléments suivants :

Données d'efficacité

Il résulte des trois études disponibles que l'efficacité des spécialités à base de benfluorex, dans l'indication thérapeutique à ce jour revendiquée (adjuvant du régime adapté chez les diabétiques avec surcharge pondérale), est modérée. En effet :

- Etude DEL PRATO (1997), déjà examinée dans le cadre de la validation en 1999 de l'indication thérapeutique précitée : Il s'agit d'une étude multicentrique, randomisée, en double aveugle, d'une durée de 6 mois et dont l'objectif est d'évaluer l'efficacité et la sécurité d'emploi de benfluorex versus placebo et versus metformine, chez 438 patients diabétiques de type 2 non équilibrés par régime seul. Du fait des réserves méthodologiques relevées dans cette étude, aucune conclusion définitive sur la taille de l'effet n'a pu être formulée, même si les résultats du bras benfluorex versus placebo ont pu faire apparaître une diminution de -0,86% de l'hémoglobine glyquée (HbA1c) qui est le paramètre de référence dans la surveillance de l'équilibre glycémique des patients diabétiques.

- Etude MOULIN (2006), déjà examinée dans le cadre de la modification de l'AMM de la spécialité MEDIATOR 150 mg, comprimé enrobé par décision du 25 juillet 2007 : Il s'agit d'une étude multicentrique, internationale, randomisée, en double aveugle, d'une durée de 18 semaines et dont l'objectif est d'évaluer l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par sulphonylurées (SU) et intolérants ou ayant une contre-indication à la metformine. Les résultats de cette étude en termes d'efficacité du benfluorex en association aux sulphonylurées ont été une diminution de l'HbA1c de -0,82% par rapport à sa valeur de base dans le groupe benfluorex et de -1% versus le groupe placebo. Néanmoins, du fait de réserves méthodologiques concernant notamment les méthodes d'ajustement utilisées, une étude d'efficacité clinique complémentaire versus un comparateur actif en seconde intention est apparue nécessaire afin de conforter les résultats obtenus sur l'HbA1c.

- Etude REGULATE (2009), dont seuls les résultats préliminaires ont à ce jour été fournis : Il s'agit d'une étude multicentrique, randomisée, en double aveugle, contrôlée versus pioglitazone, d'une durée de 52 semaines, dont l'objectif est de comparer chez 840 patients diabétiques de type 2 insuffisamment contrôlés par SU, l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR 150 mg, comprimé enrobé à la dose maximale recommandée (450 mg/jour), à un traitement par pioglitazone à la dose maximale recommandée (45 mg/jour). Au vu des résultats disponibles, cette étude de non-infériorité n'a pas permis de démontrer la non infériorité sur l'HbA1c (critère principal) du benfluorex par rapport à la pioglitazone. En effet, la diminution de l'HbA1c a été de -0,54% sous benfluorex versus -0,88% sous pioglitazone. Le traitement par benfluorex aurait été considéré comme non-inférieur au traitement par pioglitazone si la borne supérieure de l'intervalle de confiance de la différence d'HbA1c entre les deux traitements avait été inférieure à 0,40%. Dans la mesure où la borne supérieure de l'intervalle de confiance est de 0,49%, le traitement par benfluorex n'est pas considéré comme au moins équivalent au traitement par pioglitazone (différence entre les deux traitements = 0,33 (0,08) %, intervalle de confiance à 98% = [0,17; 0,49], p=0,19).

Enfin, il est rappelé que le benfluorex n'est pas mentionné dans les recommandations françaises et internationales relatives à la prise en charge du diabète de type 2 car il est considéré uniquement comme un adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Données de sécurité

Depuis 1995, le benfluorex a fait l'objet de plusieurs mises au point en ce qui concerne les effets indésirables, ainsi que de deux enquêtes de pharmacovigilance, l'une en 1999 portant sur les troubles neuro-psychiques et la deuxième en 2004 suite à la notification d'effets de type amphétaminiques. Cette deuxième enquête a été étendue en 2005 aux hypertensions artérielles pulmonaires (HTAP), puis aux valvulopathies. La notification par les centres régionaux de pharmacovigilance (CRPV) de cas de valvulopathies cardiaques sous benfluorex et la publication de Boutet en 2009 (*Fenfluramine-like cardiovascular side-effects of benfluorex. Eur Respir J 20098 :33 :684-688. Boutet K*) rapportant 5 cas d'HTAP et 1 cas de valvulopathie cardiaque associé, après exposition au benfluorex, ont conduit à une actualisation

des données de pharmacovigilance, en vu d'un examen lors des séances de la Commission nationale de pharmacovigilance du 7 juillet et du 29 septembre 2009.

Données actualisées de l'enquête de pharmacovigilance en juillet 2009

Entre 1998 et juillet 2009, en France, 30 cas de valvulopathies cardiaques ont été rapportés :
- 19 cas issus de la notification spontanée (NS) dont 3 cas concernent également des HTAP post-capillaires ;
- 11 cas identifiés par le CRPV de Brest à la suite de l'interrogation du PMSI.

Les 30 valvulopathies rapportées sont monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Concernant la localisation de ces valvulopathies, 28 cas sont des insuffisances mitrales (grade 2-3 dans 17 cas), 24 cas sont des insuffisances aortiques (grade 1-2 dans 17 cas) et 11 cas sont des insuffisances tricuspides (sévères, de grade 3 dans 4 cas).
L'évolution de ces atteintes a été marquée par une chirurgie valvulaire dans 10 cas (plus 2 prévues), une stabilité dans 4 cas, une stabilité sous traitement dans 5 cas. Elle est inconnue dans 4 cas et en cours dans 5.
Parmi les valvulopathies opérées, 4 cas ont un aspect anatomo-pathologique des valves compatible avec celui décrit sous anorexigène. Dans les 2 autres cas opérés, l'anatomopathologie n'est pas spécifique.
A cet égard, il peut être rappelé que la cardio-toxicité des anorexigènes a une plausibilité biologique : la stimulation des récepteurs 5-HT2B, exprimés au niveau des valves cardiaques, peut induire une mitogénèse fibroblastique. Or le benfluorex est métabolisé en deux produits dont le N-benzoyloxy-2-ethyl-norfenfluramine.

Il ressort de l'évaluation de ces données d'une part qu'il existe un signal de cardiotoxicité (atteinte valvulaire) détecté par l'analyse de la notification spontanée et des données issues de l'exploitation du PMSI du CHU de Brest, d'autre part que la pharmacologie du benfluorex et de son métabolite la nor-fenfluramine doit être prise en considération dans l'analyse du mécanisme de la cardio-toxicité.

Données actualisées en septembre 2009 de l'enquête de pharmacovigilance par rapport à celles de juillet 2009

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon entre juillet et septembre 2009. Onze nouveaux cas de valvulopathie ont été rapportés dont 3 issus de la notification spontanée et 8 des notifications sollicitées provenant d'Amiens.
L'analyse de ces 11 nouveaux cas montre : une prédominance féminine, une durée moyenne de traitement de 3 ans, un âge moyen de survenue de 55 ans, une association à une hypertension artérielle pulmonaire dans 9 cas sur 11 cas rapportés et une atteinte de type insuffisance mitrale, isolée ou associée à une insuffisance aortique et/ou tricuspide.

Par ailleurs, 4 cas supplémentaires de valvulopathie ont été identifiés à Brest, ce qui porte, à ce jour, le total des cas de valvulopathie spontanément notifiés, sollicités ou par le biais de l'exploitation du PMSI, à 45.

Etude cas-témoin rétrospective menée par le groupe HTAP de Bretagne Occidentale (CHU de Brest)

La méthodologie de cette étude pour l'identification des cas de valvulopathies associées au benfluorex repose sur l'interrogation du PMSI en utilisant les codages « valvulopathies et diabète » et « valvulopathies et Médiator ».
L'étude analyse toutes les insuffisances mitrales, isolées ou associées, examinées au CHU de Brest depuis 2003. L'objectif est la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait pas le diagnostic de diabète ni l'Index de Masse Corporelle (IMC). L'exposition au benfluorex a été recherchée auprès du patient, de sa famille et de ses médecins, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas identifiés, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio = 40,4 (9,7 – 168,3, IC à 95%)), soit un risque relatif très important d'IM en cas d'exposition au benfluorex.
L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas le signal.

Malgré certaines limites méthodologiques, il apparaît que les résultats de cette étude confortent le signal de risque entre l'exposition au benfluorex et la survenue de valvulopathies.

Résultats préliminaires de l'étude REGULATE

Six cent quatorze patients, 309 dans le groupe benfluorex et 305 dans le groupe pioglitazone, ont eu une échocardiographie à l'inclusion et à 52 semaines après une exposition aux traitements d'une durée moyenne de 328 jours.

Concernant le profil de tolérance cardio-vasculaire, cette étude a mis en évidence dans le groupe traité par benfluorex versus le groupe pioglitazone :
- l'émergence d'anomalies valvulaires fonctionnelles statistiquement significatives (26,5% versus 10,9%, p<0,0001),
- des anomalies valvulaires morphologiques non statistiquement significatives (2,6% versus 1,3% respectivement, p=0,264).

En dépit de certaines limites méthodologiques de l'étude cas-témoin de Brest, elle est de nature à corroborer le signal d'une association entre l'exposition au benfluorex et la survenue de valvulopathie. Ce signal est considéré d'autant plus préoccupant que l'étude REGULATE met en évidence une émergence d'anomalies morphologiques et fonctionnelles valvulaires à la suite d'une exposition moyenne de seulement 328 jours. De plus, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne peut être exclue, notamment en raison des données d'utilisation du produit qui montrent une durée moyenne d'exposition d'environ 3 ans.
Par ailleurs, selon l'expertise présentée par les laboratoires SERVIER, parmi les 45 cas de valvulopathies notifiés (19 notifications spontanées, 16 notifications du CRPV de Brest, 10 notifications du CRPV d'Amiens), l'imputabilité d'une valvulopathie au benfluorex est forte pour 6 cas, possible dans 16 cas, la principale alternative étant une valvulopathie rhumatismale. L'imputabilité est faible dans 16 cas pour lesquels la présence de régurgitations valvulaires est difficile à interpréter en l'absence de tout détail concernant l'anatomie valvulaire. Enfin, l'imputabilité est très faible dans 7 cas pour lesquels une autre étiologie paraît plus probable. Toutefois, cette analyse ne remet pas en cause la mise en évidence du signal d'une association entre l'exposition au benfluorex et la survenue de valvulopathie.

Résultats préliminaires d'une étude de cohorte réalisée par la Caisse Nationale d'Assurance Maladie (CNAM) en octobre 2009

Il s'agit d'une étude de cohorte de type exposé-non exposé à partir des données du système national inter-régime de l'assurance maladie (SNIIRAM). Etaient éligibles les patients diabétiques traités (antidiabétiques oraux et/ou insuline) en 2006 et âgés de 40 à 69 ans. Les cas exposés ont été enregistrés de façon passive et définis par la délivrance et le remboursement en 2006 de médicament à base de benfluorex. Après chaînage des données, les évènements recherchés au cours de l'année n+1 et n+2 dans le PMSI 2007 et 2008 sont une hospitalisation pour une insuffisance valvulaire toutes causes confondues, une hospitalisation pour une insuffisance mitrale et chirurgie de remplacement valvulaire sous circulation extracorporelle pour une insuffisance valvulaire toutes causes confondues.
Les résultats portent sur 1 092 858 diabétiques dont 43 208 exposés au benfluorex en 2006. Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque est de 81 pour 100 000 dans le groupe exposé versus 29 pour 100 000 dans le groupe non exposé (RR=2,77 IC 95[1,95 ; 3,93]). Le risque d'hospitalisation pour insuffisance mitrale est de 53 pour 100 000 dans le groupe exposé versus 20 pour 100 000 dans le groupe non exposé RR=2,66 IC 95[1,7 ; 4,1]. Le risque de chirurgie en 2007 avec un remplacement valvulaire sous circulation extracorporelle (CEC) pour une insuffisance valvulaire toutes causes confondues est de 30 pour 100 000 dans le groupe exposé au benfluorex versus 9 pour 100 000 dans le groupe non exposé (RR=3,4 [1,9 ; 6,1]). Parmi les 13 personnes diabétiques exposées et ayant subi un remplacement valvulaire sous CEC en 2007, une est décédée en milieu d'année 2008. Pour les personnes exposées au benfluorex en 2006, les risques absolus et les risques relatifs sont en 2008 très proches de ceux observés en 2007. Le risque relatif des exposés au benfluorex de chirurgie valvulaire sous CEC est identique (3,4).

Bien que préliminaires, ces résultats confortent le signal de pharmacovigilance d'augmentation du risque de valvulopathie clinique chez les diabétiques, qui est établi au vu des données précitées. En effet, les résultats montrent que l'usage du benfluorex chez les diabétiques âgés de 49 à 59 ans est associé significativement dans les deux années qui suivent à des valvulopathies de régurgitation mitrales, aortiques et tricuspidiennes et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.

Considérant, au vu de cette situation particulièrement préoccupante en termes de santé publique, d'une part que les arguments développés par les Laboratoires SERVIER notamment dans la lettre précitée du 23 novembre 2009 ne remettent pas en question l'évaluation négative du rapport bénéfice/risque de la spécialité, et d'autre part que la proposition formulée lors de la séance de la Commission d'AMM du 23 octobre 2009 et réitérée dans la lettre du 23 novembre 2009 visant à modifier le résumé des caractéristiques du produit apparaît insuffisante. Notamment, la surveillance échographique pendant le traitement n'est pas de nature à prévenir le risque de survenue de valvulopathie, laquelle par ailleurs pourrait continuer à évoluer même après l'arrêt de benfluorex ;

Considérant d'une part que les données issues d'une publication récente*, citées par les Laboratoires SERVIER dans la lettre précitée du 23 novembre 2009, démontrent une relation temps-dépendant de l'évolution de la pathologie valvulaire sous fenfluramine ; D'autre part, concernant l'évolution d'une valvulopathie après arrêt du traitement de fenfluramine, la publication précitée montre qu'après un suivi moyen de 30 mois, l'insuffisance aortique liée à la prise de fenfluramine s'aggrave dans 15,2 % des cas, se stabilise dans 63,1 % des cas et s'améliore dans 21,7 % des cas ; De même, l'insuffisance mitrale s'aggrave dans 24,8 % des cas, se stabilise dans 47,4 % des cas et s'améliore dans 27,9 % des

---

** Dahl CM. BMC Med 2008;6 (34) :1-13.*

Annexe 4-44

cas. Une chirurgie valvulaire a été réalisée pour 38 (0,66 % de 5743) et 25 patients (0,44 %) souffrant respectivement d'insuffisance aortique d'insuffisance mitrale liées à l'exposition à la fenfluramine ;

Considérant que les cas de pharmacovigilance de stabilisation ou de régression de valvulopathie sous benfluorex constituent des données insuffisantes en nombre de cas et en termes de durée de suivi pour pouvoir être prédictifs de l'évolution de l'ensemble des valvulopathies observées avec le benfluorex ; En juillet 2009, un tiers des cas identifiés a dû subir une chirurgie valvulaire ;

Considérant, compte tenu de ce qui précède, que l'ensemble des nouvelles données susmentionnées (notifications spontanées et sollicitées, étude cas-témoins de Brest, PMSI, REGULATE) conforte le signal d'un risque de valvulopathie associé à l'exposition au benfluorex et que ce profil de toiérance du produit est inacceptable dans l'indication thérapeutique telle que définie par l'AMM ;

Considérant que l'évaluation des effets thérapeutiques positifs de la spécialité concernée au regard des risques pour la santé du patient ou la santé publique liés à sa qualité, sa sécurité ou son efficacité n'est donc pas considérée comme favorable dans l'indication d'adjuvant du régime adapté chez les diabétiques avec surcharge pondérale. Plus précisément, en l'état des données disponibles telles que présentées ci-dessus, tant en ce qu'elles concernent l'efficacité que la sécurité, il apparaît qu'alors que le bénéfice thérapeutique n'est pas fermement établi, il existe un risque d'effets indésirables graves pour les patients ;

Considérant que la sortie de l'arsenal thérapeutique de la spécialité MEDIATOR 150 mg, comprimé enrobé n'est pas de nature à occasionner de perte de chance pour les patients ;

D E C I D E :

ARTICLE 1er
L'autorisation de mise sur le marché octroyée le 16 juillet 1974 à la spécialité pharmaceutique dénommée :

MEDIATOR 150 mg, comprimé enrobé,

dont le titulaire est :
Les Laboratoires SERVIER,

est suspendue sous toutes ses présentations à compter du 30 novembre 2009, dans l'attente de la décision de la Commission européenne prise en application de l'article 107de la directive 2001/83/CE précitée.

ARTICLE 2
Le titulaire doit prendre toutes dispositions, notamment auprès des détenteurs de stocks, en vue de faire cesser la délivrance au public de la spécialité.

ARTICLE 3
Conformément au 3ème alinéa de l'article L. 5124-11 du code de la santé publique, l'exportation de la spécialité est interdite à compter du 30 novembre 2009.

ARTICLE 4
Le Directeur de l'Evaluation des Médicaments et des Produits Biologiques et le Directeur de l'Inspection et des Etablissements sont chargés, chacun en ce qui le concerne, de l'exécution de la présente décision qui sera publiée par extrait au journal officiel de la République Française.

Fait à Saint-Denis, le

24 NOV. 2009

Le Directeur Général

Jean MARIMBERT

COMMISSION EUROPÉENNE

Bruxelles, le 14.6.2010
C(2010)4127

DÉCISION DE LA COMMISSION

du 14.6.2010

concernant, dans le cadre de l'article 107 de la directive 2001/83/CE du Parlement européen et du Conseil, les autorisations de mise sur le marché des médicaments à usage humain contenant la substance active «benfluorex»

DÉCISION DE LA COMMISSION

du 14.6.2010

concernant, dans le cadre de l'article 107 de la directive 2001/83/CE du Parlement européen et du Conseil, les autorisations de mise sur le marché des médicaments à usage humain contenant la substance active «benfluorex»

(Texte présentant de l'intérêt pour l'EEE)

LA COMMISSION EUROPÉENNE,

vu le traité sur le fonctionnement de l'Union européenne,

vu la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire relatif aux médicaments à usage humain[1], et notamment son article 107,

vu l'avis de l'Agence européenne des médicaments, formulé le 18 mars 2010 par le comité des médicaments à usage humain, saisi le 2 décembre 2009,

considérant ce qui suit:

(1) Les médicaments à usage humain autorisés par les États membres doivent répondre aux exigences de la directive 2001/83/CE.

(2) À la suite de l'évaluation des données de pharmacovigilance concernant les médicaments à usage humain qui contiennent la substance active «benfluorex», la République française a informé l'agence, conformément à l'article 107, paragraphe 1, de la directive 2001/83/CE, que l'autorisation ou les autorisations de mise sur le marché devaient être suspendues.

(3) Le comité a préparé un avis, dont les conclusions figurent à l'annexe II de la présente décision, recommandant qu'une décision soit prise pour retirer les autorisations de mise sur le marché des médicaments concernés.

(4) Les mesures prévues par la présente décision sont conformes à l'avis du comité permanent des médicaments à usage humain,

[1] JO L 311 du 28.11.2001, p. 67.

A ADOPTÉ LA PRÉSENTE DÉCISION:

Article premier

Les États membres concernés retirent les autorisations nationales de mise sur le marché des médicaments visés à l'annexe I, sur la base des conclusions scientifiques et des motifs de retrait des autorisations de mise sur le marché figurant à l'annexe II.

Article 2

Les États membres sont destinataires de la présente décision.

Fait à Bruxelles, le 14.6.2010

Par la Commission
Paola TESTORI COGGI
Directeur général

ANNEXE II

CONCLUSIONS SCIENTIFIQUES ET MOTIFS DU RETRAIT DES AUTORISATIONS DE MISE SUR LE MARCHÉ PRÉSENTÉS PAR L'AGENCE EUROPÉENNE DES MÉDICAMENTS

CONCLUSIONS SCIENTIFIQUES

RÉSUMÉ GÉNÉRAL DE L'ÉVALUATION SCIENTIFIQUE DES MÉDICAMENTS CONTENANT DU BENFLUOREX (voir annexe I)

Le benfluorex est utilisé comme adjuvant dans la prise en charge du diabète de type 2 chez les patients en surcharge pondérale. L'indication thérapeutique actuellement autorisée en France est l'utilisation comme «*Traitement adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*». Le benfluorex agit sur le métabolisme des hydrates de carbone. Chez l'animal, on a pu observer les effets suivants:
- facilitation de la précipitation et de l'utilisation du glucose dans les cellules (rat);
- réduction de l'hyperglycémie chez le rat diabétique (privé ou non d'insuline), diminution de l'hyperglycémie (mesurée par l'aire de test de tolérance au glucose) chez le lapin.
Le benfluorex n'a aucune action sur la sécrétion d'insuline.

Les médicaments à base de benfluorex sont autorisés dans quatre États membres de l'UE sous une formulation en comprimés, le produit n'ayant été commercialisé que dans deux pays (la France et le Portugal) jusqu'au retrait des autorisations de mise sur le marché en novembre 2009 (voir annexe I pour la liste des médicaments à base de benfluorex autorisés dans l'UE). À Chypre et au Luxembourg, les médicaments contenant du benfluorex n'étaient plus commercialisés.

Le 25 novembre 2009, l'autorité compétente française (Afssaps) a émis une alerte rapide informant les États membres, l'Agence européenne des médicaments et la Commission européenne, conformément à l'article 107 de la directive 2001/83/CE, telle que modifiée, de sa décision de suspendre les autorisations de mise sur le marché pour tous les médicaments contenant du benfluorex en France, en raison d'une augmentation du risque de signal de cardiotoxicité (maladies valvulaires cardiaques) avec le benfluorex.

La décision de l'autorité compétente française était fondée sur les résultats actualisés d'une étude de pharmacovigilance, les données préliminaires de 3 études cliniques (l'étude rétrospective cas-témoin réalisée dans un hôpital de Brest, l'essai REGULATE et les données du fonds national d'assurance maladie française) et d'une publication récente (K. Boutet *Fenfluramine-like cardiovascular side-effects of Benfluorex,* Eur. Respir. J. 2009; 33: 684-688), qui ont décelé un risque de maladies des valves cardiaques et d'hypertension pulmonaire (HTP) chez les patients traités par le benfluorex.

Après réception de l'avis d'alerte rapide, l'autorité compétente portugaise a également décidé de suspendre l'autorisation de mise sur le marché de tous les médicaments à base de benfluorex au Portugal, le 30 novembre 2009.

Le CHMP a examiné la question conformément à l'article 107, paragraphe 2, de la directive 2001/83/CE, telle que modifiée, dans le cadre d'une procédure écrite lors des réunions plénières du CHMP de décembre 2009 et de mars 2010.

Sécurité

Les résultats actualisés de l'étude de pharmacovigilance concernant le risque de maladies des valves cardiaques avec le benfluorex et les données d'une publication récente sur ce sujet (K. Boutet *Fenfluramine-like cardiovascular side-effects of Benfluorex,* Eur. Respir. J. 2009; 33: 684-688) ont amené à conclure à l'existence d'une valvulopathie cardiaque et d'HTP dans la population générale des patients utilisant le benfluorex.

De plus, l'étude rétrospective cas-témoin réalisée à Brest afin de chercher un lien entre l'exposition au benfluorex et la survenue d'unc insuffisance mitrale inexpliquée établit une association entre l'exposition au benfluorex et l'apparition d'une valvulopathie.

Sur la base des données susmentionnées, le CHMP considère que le lien entre l'exposition au benfluorex et la survenue de maladies des valves cardiaques est confirmé. Le comité est d'avis que le lien est étayé par les résultats obtenus dans l'étude REGULATE, qui confirme le risque de valvulopathie avec le benfluorex et révèle l'apparition d'anomalies morphologiques et fonctionnelles des valves après seulement 328 jours d'exposition en moyenne.

En outre, les résultats d'une autre étude (étude de cohorte menée par le Fonds national de l'assurance maladie française) ont fait l'objet de commentaires de la part du TAMM dans son document de réponse à la liste de questions adoptée par le comité. Le manque de précision des informations relatives au diagnostic de maladie des valves cardiaques et le nombre limité de patients identifiés comme présentant une maladie des valves cardiaques et traités par le benfluorex (35 patients) ont été soulignés par le TAMM. Le CHMP maintient cependant son avis que ces données confirment elles aussi le signal de sécurité indiquant un risque de maladie des valves cardiaques lors de l'utilisation du benfluorex.

Enfin, se fondant sur les sources de données disponibles, le CHMP estime que le nombre de rapports spontanés de valvulopathies cardiaques associées au benfluorex est considérablement sous-estimé en raison du volume limité de données recueillies à partir des rapports spontanés dans cette situation, comme par exemple:
- le type d'effet du benfluorex (valvulopathie qui reste cliniquement asymptomatique pendant une longue période);
- le temps écoulé avant la survenue de l'événement (une très longue période d'exposition au benfluorex est nécessaire pour induire des modifications valvulaires).

Par conséquent, le CHMP considère que l'aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne pouvait pas être exclue, en particulier au vu de l'utilisation prolongée du produit sur la base de données d'utilisation qui ont fait apparaître un temps d'exposition moyen de 3 ans.

Comme le déclare le TAMM dans sa réponse par écrit, au moment de l'évaluation nationale de l'anomalie valvulaire cardiaque, il a proposé de maintenir le benfluorex sur le marché avec une restriction pour l'indication chez les patients ne présentant pas de signes d'anomalies valvulaires à l'échographie et la mise en œuvre d'une surveillance échocardiographique. Le TAMM a prévu d'interrompre le traitement en cas d'anomalies échocardiographiques.

Le CHMP n'a pas accepté cette proposition. Il estime que la surveillance échocardiographique additionnelle proposée par le TAMM ne pourrait pas apporter de solution à ce problème, du fait que la surveillance échocardiographique évite l'utilisation chez des patients présentant une valvulopathie antérieure, mais n'en évite pas le développement chez des patients qui ne présentent pas d'anomalies antérieures.

Rapport bénéfice/risque

Le benfluorex est utilisé comme «*Traitement adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*». Dans sa réponse par écrit, le TAMM considère qu'il y a un effet clinique significatif consistant sur le contrôle de la glycémie dans toutes les études réalisées avec le benfluorex chez des patients en surcharge pondérale présentant un diabète de type 2. Toutefois, le CHMP constate que le benfluorex est approuvé uniquement en tant que traitement adjuvant dans le traitement du diabète de type 2 chez les patients en surcharge pondérale: sur la base d'une importance très limitée de l'efficacité chez les patients diabétiques, il n'a jamais été accordé une indication en tant que monothérapie pour le traitement du diabète pour le benfluorex. En conséquence, le CHMP, après examen des données fournies par le TAMM et l'État membre, considère que le bénéfice du benfluorex n'est que limité dans la prise en charge du diabète de type 2.

Les résultats actualisés de la seconde étude nationale de pharmacovigilance, les données préliminaires de 3 études cliniques (l'étude rétrospective cas-témoin réalisée dans un hôpital de Brest, l'essai

REGULATE et les données de l'étude du Fonds national de l'assurance maladie française), ainsi que la publication récente de K. Boutet, démontrent le risque grave de valvulopathies cardiaques morphologiques et fonctionnelles et d'hypertension pulmonaire, associé à l'utilisation du benfluorex.

Le comité a noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue; cela suscite une inquiétude particulière étant donnée l'utilisation prolongée du produit, avec une durée d'exposition moyenne de 3 ans (sur la base des données d'utilisation).

Compte tenu de tous ces éléments, le CHMP a conclu que les médicaments à base de benfluorex sont nocifs dans les conditions normales d'utilisation et que le rapport bénéfice/risque pour benfluorex n'est pas considéré comme étant favorable. En conséquence, le comité a recommandé le retrait des autorisations de mise sur le marché pour les médicaments mentionnés dans l'annexe I.

MOTIFS DU RETRAIT DES AUTORISATIONS DE MISE SUR LE MARCHÉ

Considérant que

- le comité a pris en considération la procédure au titre de l'article 107 de la directive 2001/83/CE, telle que modifiée, pour les médicaments à base de benfluorex;

- le comité a conclu, après avoir examiné les données disponibles, que l'utilisation du benfluorex est nocive dans les conditions normales d'utilisation et conduit à une hypertension pulmonaire et à des valvulopathies cardiaques. Ces valvulopathies peuvent induire un affaiblissement progressif de la fonction cardiaque et des symptômes cliniques associés nécessitant, dans les cas graves, une chirurgie cardiaque;

- le comité a noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue, ce qui suscite une inquiétude particulière étant donné l'utilisation prolongée du produit, avec une durée d'exposition moyenne de trois ans (sur la base de données d'utilisation);

- le comité a examiné le rapport bénéfice-risque du benfluorex dans les conditions normales d'utilisation et a estimé que le risque prouvé susmentionné de maladie des valves cardiaques n'est pas acceptable, compte tenu du fait que le bénéfice du benfluorex n'est que limité dans le traitement du diabète de type 2;

- le comité, à la lumière des résultats ci-dessus, a conclu que le rapport bénéfice/risque des médicaments à base de benfluorex n'est pas favorable dans les conditions normales d'utilisation.

En application des dispositions de l'article 107, paragraphe 2, de la directive 2001/83/CE, telle que modifiée, le comité des médicaments à usage humain (CHMP) de l'Agence recommande le retrait des autorisations de mise sur le marché pour tous les médicaments à base de benfluorex énumérés dans l'annexe I.

Annexe 4-46

REUNION COMMISSION D'AMM N° 484 DU 1er JUILLET 2010

PROCEDURE NATIONALE

Spécialités concernées	
MEDIATOR 150 mg, comprimé enrobé	**Laboratoires Servier**
BENFLUOREX MYLAN 150 mg, comprimé enrobé	**Laboratoires Mylan**
BENFLUOREX QUALIMED 150 mg, comprimé enrobé	**Laboratoires Qualimed**

Principe actif: **benfluorex**

Caractère d'originalité **Décision de la Commission européenne en date du 14/06/10 de retrait des AMM nationales des spécialités composées de benfluorex – Article 107 de la Directive 2001/83 modifiée**

Classe ATC: **Autres antidiabétiques sauf insuline (Code ATC : A10BX06)**

CONTEXTE DE LA PRESENTATION en COM D'AMM du 12 novembre 2009

Le benfluorex a été une nouvelle fois présenté en Commission Nationale de Pharmacovigilance (CNPV) ; le signal relatif aux anomalies des valves cardiaques, soupçonné depuis plusieurs mois par les données de pharmacovigilance se trouvant confirmé par :

1. les données d'une étude cas /témoins brestoise rétrospective menée par le CHU de Brest.

2. les résultats d'une étude clinique (Etude REGULATE) dans laquelle en parallèle de l'analyse des données d'efficacité du benfluorex en association à un sulphonylurée (SU), une exploration de la tolérance cardiaque/impact du traitement sur les valves cardiaques a été menée.

Les données de l'étude cas /témoins, ainsi que les résultats préliminaires de l'étude REGULATE ont été présentés en CNPV le 09.09.09.

A l'issu de cette présentation, les membres de la CNPV ont considéré (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex, ceci malgré certaines limites méthodologiques soulevées pour l'étude Cas/témoins. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

L'ensemble des données a été transmis à la Commission d'AMM du 23.10.09 afin qu'elle puisse se prononcer – au vu de l'ensemble des données de bénéfice et de risque dans les conditions d'utilisation actuelles du produit - sur la balance bénéfice- risque du produit.

En l'absence de quorum à l'instant du vote, la commission d'AMM du 23.10.09 n'a pu rendre d'avis. En conséquence, le dossier est réexaminé par la commission d'AMM du 12 novembre 09.

RESUME DES DONNEES DE BENEFICE

Historique de l'évaluation des données d'efficacité : de 2000 à 2009-10-13

- Date d'AMM : 16-07-1976 avec une indication en tant qu'hypolipidémiant

- 1995. Inscription sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes. Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le CTPV a craint une dérive de l'utilisation du benfluorex comme anorexigène.

- 1987: validation de la 1ère tranche dans l'indication « hypertriglycéridémies »

- 1990 : dépôt du dossier de la 8ème tranche de validation dans l'indication en « diabétologie » ; nombreux échanges entre l'Afssaps et la firme entre 1990 et 1995 sur la nature des données à soumettre afin de valider cette indication (type d'étude, population cible, etc.), aboutissant finalement en 1998 au dépôt de l'étude Del Prato (étude de l'efficacité du benfluorex versus placebo et metformine sur les paramètres glucidiques (voir ci-dessous données cliniques). En attente de cette étude, l'indication telle que libellée lors de l'octroi de l'AMM a été maintenue.

- Septembre 2000: demande d'extension d'indication au «*Diabète de type II insulino-dépendant, en association au régime adapté, lorsque ce régime n'est pas suffisamment suffisant pour rétablir à lui seul l'équilibre glycémique* ». Une seule étude de phase III **(Etude Del Prato)**, randomisée, en double insu, benfluorex versus placebo et metformine a été soumise à l'appui de cette demande (A noter, cette étude a été réalisée à la demande de l'Afssaps; protocole revu en concertation avec l'Afssaps). Un avis défavorable a été émis par le Groupe de Travail PTC2 ainsi que par la COM d'AMM. Après recours de la firme de cette décision, cet avis a été maintenu par la COM d'AMM. En effet, compte tenu des défauts de la qualité méthodologique de cet essai (ayant l'objet par ailleurs d'une inspection), aucune conclusion n'a pu être formulée sur la taille de l'effet: i) du benfluorex versus placebo; ii) du benfluorex versus metformine (non-infériorité non démontrée : déséquilibre des taux d'HbA1c entre les groupes à l'inclusion, 68% seulement inclus dans l'analyse per protocole, 25% de patients inclus à tort). A noter également, aucune efficacité sur les paramètres lipidiques n'a été mise en évidence dans cette étude. En conclusion, la COM d'AMM (20-09-2002) a demandé qu'une étude évaluant l'efficacité du benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux soit effectuée; l'association devant être également étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisants rénaux, sujets âgés)

- 2007=> Réévaluation du rapport bénéfice Risque / Modification du code ATC

Conclusions de la réévaluation du bénéfice /risque demandé par la CNPV (AVIS DE LA COM d'AMM 419 DU 5 AVRIL 2007) (Extrait) faisant suite au Groupe de Travail DEUG N°6 du 21 10 2006 :

Après présentation et discussion des conclusions du Groupe de Travail DEUG sur les données d'efficacité et des conclusions de la CNPV sur les données de sécurité d'emploi, les conclusions suivantes ont été émises :

1. La COM d'AMM suit l'avis DEFAVORABLE émis par le Groupe DEUG au maintien de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée*», les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante dans les études soumises sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol.

2. La Commission d'AMM suit également l'avis du Groupe DEUG pour le maintien de l'indication : « *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* » dans son libellé actuel. En l'attente de données plus complètes sur l'efficacité du benfluorex en association aux autres antidiabétiques oraux, la COM d'AMM n'a pas souhaité modifier le libellé actuel. A ce jour, seule l'étude MOULIN a permis de montrer une efficacité du benfluorex sur l'HbA1c en association à un sulfamide

L'étude Moulin (publiée dans Diabetes Care en 2006) est une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par SU et intolérants ou ayant une contre indication à la metformine. Le critère principal était l'HbA1c ; les critères secondaires : insulinémie, glycémie à jeun, paramètres lipidiques, index d'insulino résistance HOMA. Trois sous-groupes ont été analysés : HbA1c > 8%, âge > 65 ans et clairance de la créatininémie < 80ml/mn. Etude de supériorité avec un différence de 06% entre les groupes sur l'HbA1c.

Résultats :

Après 18 semaines de traitement, les résultats d'efficacité sur les paramètres glucidiques de cette étude montrent que :

- l'HbA1c est diminuée de -0.82% dans le groupe benfluorex (versus baseline) et de 1% versus le groupe placebo. 34.2% et 19% arrivent à une HbA1c ≤ 7% et > 6.5% contre 11% et 5% respectivement sous placebo. Baisse de l'HbA1c significative dès la 4ème semaine ; d'après la firme, l'effet est du même ordre entre les trois sous groupes pré définis ;
- l'insulinorésistance s'améliore significativement sous benfluorex ; la glycémie à jeun baisse significativement dès la 4ème semaine sous benfluorex.

La perte de poids était de 1.3 kg sous benfluorex et de 0.7kg sous placebo

3. La COM d'AMM souhaite que les modifications d'ajout d'effets indésirables suivants tels que décidés par la CNPV soient mentionnées au sein de la rubrique 4.8. du RCP *: « troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) »* et de la rubrique correspondante de la Notice.

4. Une inspection de l'étude MOULIN, seule étude à ce jour ayant montré une efficacité sur les paramètres glucidiques a été proposée et acceptée par les membres de la COM d'AMM. Une saisine sera adressée en ce sens à la DIE (Direction de l'Inspection des Etablissements).

5. Enfin, les membres de la COM d'AMM souhaitent qu'une communication soit faite sur l'usage hors AMM de cette spécialité ainsi que sur la seule indication retenue après réévaluation des bénéfice/risque de cette spécialité.

Au total, le libellé de l'indication retenu est le suivant : «Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».

Code ATC

1) Avis Afssaps (Groupe DEUG du 13 09 2009

AVIS FAVORABLE à la modification du Code ATC ; le Code ATC retenu est le suivant : **DIVERS MEDICAMENTS DES VOIES DIGESTIVES ET DU METABOLISME/Code ATC A16X**

En effet, compte-tenu de la modification de l'indication avec suppression de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours nécessaire* », le code ATC actuel : HYPOCHOLESTEROLEMIANT ET HYPOTRIGLYCERIDEMIANT/Code ATC : C10AX04 n'est donc plus d'actualité.

Dans l'attente du reclassement du benfluorex selon la classification ATC par l'Organisation Mondiale de la Santé (OMS), sur proposition des laboratoires SERVIER auprès de l'OMS, le code ATC proposé par la firme soit : AUTRES MEDICAMENTS DU DIABETE/Code ATC : A10X n'est pas acceptable. En effet, selon les experts ce code ne peut être accepté compte tenu du fait que cette spécialité n'a pas à ce jour d'indication reconnue dans le diabète de type 2.

2) Code ATC octroyé par l'OMS => **Code ATC : A10X : AUTRES MEDICAMENTS DU DIABETE**

Année 2009 => Nouvelles données d'efficacité : Etude REGULATE

Analyse des données d'efficacité de l'Etude REGULATE

Titre de l'étude :

A one-year multicentre, international, randomised, doubleblind study with comparison of benfluorex (150 mg bid or 150 mg tid) *versus* pioglitazone (30 mg od or 45 mg od) in combination with sulfonylurea administered orally for the treatment of type 2 diabetes.

Méthodologie :

Il s'agit d'une multicentrique, randomisées, en double aveugle, contrôlée *versus* pioglitazone, d'une durée de 52 semaines, comparant chez 847 patients diabétiques de type 2, insuffisamment contrôlés par sulfamides hypoglycémiants (SU) l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR à la dose maximale recommandée (450 mg /jour, 1 comprimé pendant le repas), à un traitement par pioglitazone à la dose maximale recommandée (45 mg/jour, 1 comprimé au petit déjeuner)

Objectifs :

Le but de cette nouvelle étude était de comparer l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR versus un traitement par pioglitazone, en association à un SU, sur le contrôle glycémique et le profil lipidique.

L'objectif principal est de démontrer la non-infériorité de la combinaison SU + Benfluorex comparé à la combinaison SU + Pioglitazone sur l'évolution de l'HbA1c.

L'objectif secondaire est de démontrer la supériorité du benfluorex combiné aux SU comparativement à la Pioglitazone combiné aux SU sur le taux de cholestérol.

Les autres objectifs secondaires sont d'évaluer et de comparer ces combinaisons après 1 an de traitement sur : glycémie à jeun, l'insulinémie à jeun, le risque cardiovasculaire, la sécurité d'emploi et le coût de ces deux traitements.

Critères d'évaluation :

Critère principal : HbA1c mesuré à chaque visite (inclusion, 4, 8, 16, 28, 40 et 52 semaines)

Critères secondaires :

Paramètres lipidiques : LDL-cholestérol, cholestérol total, HDL-cholestérol, triglycérides à chaque visite.

Autres paramètres : glycémie à jeun (FPG), insulinémie à jeun (HOMA-IR), C-réactive protéine, mesure du tour de taille, poids.

Paramètres de sécurité d'emploi : événements indésirables, hypoglycémies, paramètres biologiques, examen cardiaque (ECG, échographie cardiaque à l'inclusion et à 12 mois)

Analyse statistique :

La borne de non-infériorité entre les deux traitements a été fixée à 0.4% d'HbA1c.

Résultats :

1. Caractéristiques de la population

Tableau 7 REGULATE Caractéristiques de la population randomisée

	benfluorex (n = 423)	pioglitazone (n = 423)
Âge (années)	59.6. ± 10.3	58.6 ± 10.6

	p-value (3)	0.19	

END = last value; (1): Estimate (Standard Error) of the difference (benfluorex minus pioglitazone)between adjusted group means (2): 95% Confidence Interval of the estimate (3): For a non-inferiority one-sided test (alpha = 2.5%) obtained from an analysis of covariance with baseline and country (fixed effects) as covariates and a 0.4% margin of clinical relevance

Au total, **la non-infériorité de benfluorex par rapport à la pioglitazone n'a pas été démontrée** (limite supérieure de l'intervalle de confiance à 0.49 pour une limite de non infériorité fixée à 0.40 (E (SE) = 0,33 (0,08) %, 95 % CI = [0,17; 0,49], p = 0,19).

3. Critères secondaires

Tableau 8 -REGULATE Evolution des principaux paramètres biologiques dans la population FAS

	Benfluorex			Pioglitazone			différence entre les groupes
	N	valeur initiale moyenne (SD)	différence pré-post (SD)	n	valeur initiale moyenne (SD)	différence pré-post (SD)	Δ (ES) IC 95%
Glycémie à jeun mmol/L	392	*9.9 (± 2.71)*	-1.20 (0.15)	396	*9.9 (± 2..51)*	-1.73 (0.23)	**0.56**** (0.18) [0.21;0.90]
HOMA- IR Index	332	*6.36 (± 5.30)*	-1.23 (0.38)	315	*6.83 (±7.34°*	-2.52 (0.35)	1.04 (0.41) [0.23;1.85]
Total Cholestérol mmol/L	396	*5.01 (± 0.99)*	-0.16 (0.04)	396	*5.02 (± 0.92)*	0.08 (0.05)	**-0.25**** (0.057) [-0.357;-0.134]
LDL cholestérol mmol/L	396	*3.11 0.83)*	-0.24 (0.03)	396	*3.15 (0.81)*	-0.12 (0.04)	**-0.13**** (0.05) **[-0.22;-0.04]**
Triglycérides mmol/L	397	*1.92 (± 0.97)*	-0.14 (0.05)	397	*1.96 (± 0.90)*	-0.21 (0.05)	0.058 (0.06) [-0.07 ;0.18]

****p < 0.001 **p< 0.01 *p< 0.05 †test non paramétrique*

On observe :

- une diminution du LDL-cholestérol moyen (-0,24) dans le groupe benfluorex plus importante que celle observée dans le groupe pioglitazone (-0.12).

- une diminution du cholestérol total moyen (-0.16) dans le groupe benfluorex comparativement à une augmentation dans le groupe pioglitazone (+0.08)

- une stabilité du HDL-cholestérol (0.01) dans le groupe benfluorex et une légère augmentation sous pioglitazone (+0.06)

- une diminution des concentrations de triglycérides comparable dans les 2 groupes.

Enfin, il y a une diminution du poids sous benfluorex (-1.6 kg) et une augmentation sous pioglitazone (3.3 kg).

Sécurité

La fréquence des effets indésirables est comparable entre les deux groupes (63,7% dans le groupe benfluorex versus 62,9% dans le groupe pioglitazone). Les effets indésirables les plus fréquents sont les infections et infestations (24,9% versus 28,6%), les troubles gastro-digestifs (14,7% versus 11,8%), et les troubles musculosqueletiques (13,1% versus 15,6%).

Les effets indésirables émergents dans le groupe benfluorex sont les hypoglycémies (9% versus 13,2% dans le groupe pioglitazone) et les diarrhées (4.3% versus 1,9%).

Au niveau cardiaque, 2 patients du groupe benfluorex versus 3 dans le groupe pioglitazone ont fait un infarctus du myocarde, 0 versus 1 pour les angines de poitrine, 1 versus 0 pour l'insuffisance cardiaque congestive, 0 versus 1 pour l'ischémie, 0 versus 1 pour le syndrome coronarien aigu et 1 versus 0 pour la cardiomyopathie congestive.

Enfin, il y a eu deux décès dans le groupe benfluorex contre 4 dans le groupe pioglitazone, ces décès n'étant pas reliés aux traitements.

CONCLUSIONS PRELIMINAIRES DE LA FIRME :

En conclusion, chez des patients diabétiques de type 2 insuffisamment contrôlés par SU, l'ajout d'un traitement par benfluorex pendant 12 mois permet/entraîne une diminution statistiquement significative de l'HbA1c.

L'effet antidiabétique du benfluorex est confirmé dans cette étude (diminution de -0,54% de l'HbA1c), bien que la non infériorité du benfluorex versus la pioglitazone ne soit pas démontrée.

La supériorité du benflurorex versus la pioglitazone sur la diminution du LDL-cholestérol est démontrée.

De plus, le benfluorex diminue significativement le cholestérol total contrairement à la pioglitazone.

Les deux traitements diminuent significativement les taux de triglycérides, la glycémie à jeun et améliore l'insulinorésistance.

Après un an de traitement, le poids ainsi que le tour de taille ont augmenté sous pioglitazone mais pas sous benfluorex.

Le profil de sécurité d'emploi est en ligne avec ce qui figure déjà dans le RCP

En ce qui concerne le profil de sécurité cardiaque (échographies cardiaques), aucune modification de la fraction d'éjection du ventricule gauche (FEGP) n'a été détectée dans les deux groupes de traitement.

Des régurgitations des valves cardiaques ont été observées plus fréquemment sous benfluorex que sous pioglitazone, mais sans retentissement clinique délétère (significatif).

La différence morphologique en termes d'anomalies des valves cardiaques dont les régurgitations (au dessus d'un grade 1) ne sont pas significatives.

Les anomalies émergentes (nouvelles) des valves cardiaques dans cette étude n'étaient pas associées à des signes ou symptômes cliniques.

Des analyses complémentaires visant à expliciter les anomalies valvulaires observées sont en cours.

Antécédent/Terrain cardiaque (nombre)	15
Médicaments associés (nombre) *Levothyroxine* *Antidépresseur IRS*	 9 7

Type et localisation des valvulopathies :

Les 30 valvulopathie rapportées sont monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Concernant la localisation de ces valvulopathies, 28 cas sont des insuffisances mitrales (sévères dans 17 cas), 24 cas sont des insuffisances aortiques et 11 cas sont des insuffisances tricuspides (sévères dans 4 cas).

Aspects anatomo-pathologiques des valvulopathies opérées

Des diagnostics anatomo-pathologiques sont effectués chez 6 patients opérés : 5 patients français et un cas espagnol rapporté dans une publication (Rafel Ribera J.).

a) 4 cas dont l'aspect anatomo-pathologique serait compatible avec celui décrit sous anorexigène :

TO060355 (Noize[1] 2006) : une femme de 48 ans, avec un BMI=25 kg/m^2, sous MEDIATOR® pendant 7 ans pour intolérance aux glucides.

BR20080051 (Boutet[2], cas n°6) : une femme de 50 ans ayant un diabète de type 2, avec un BMI=34 kg/m^2, sous MEDIATOR® de 2001 à 2007 et sous ISOMERIDE® pendant 1 à 3 mois 20 ans auparavant.

BR20090080 (Brest PMSI) : une femme de 54 ans, avec un BMI=30 kg/m^2, sous MEDIATOR® de septembre 2007 à décembre 2008, ayant pris des amphétamines 7 à 8 ans jusqu'en 1986.

S03000422 (R. Riber[3] J. 2003) : une femme de 50 ans, sous MEDIATOR® pendant 12 mois par intermittence.

b) Autres cas

Dans 2 cas, l'anatomopathologie n'est pas spécifique.

Dans les autres cas, seules les données échographiques sont disponibles.

Conclusions du rapporteur (CRPV de Besançon) :

Le CRPV de Besançon, rapporteur de cette enquête, a conclu à l'existence d'un signal de cardiotoxicité détecté par la notification spontanée et les données du PMSI. Il convient alors de confirmer ce signal par une étude épidémiologique (cas-témoin).

Le rapporteur souligne que la pharmacologie du benfluorex et de son métabolite, la nor-fenfluramine, devra être prise en compte dans l'analyse du mécanisme de la cardiotoxicité.

Compte tenu de ces nouvelles données de sécurité, le rapporteur propose une réévaluation du bénéfice/risque de benfluorex.

Présentation du Dr. Frachon (praticien, CHU de Brest):

Lors de cette réunion, le Docteur Frachon, du groupe HTAP de Bretagne Occidentale (CHU de Brest) a présenté la méthodologie appliquée à Brest pour l'identification des cas de valvulopathies associées au benfluorex.

L'identification des cas de valvulopathies a reposé sur :

i) le signalement spontané de 4 cas par des médecins brestois,
ii) l'interrogation du PMSI en utilisant le codage « valvulopathies et diabète » qui a mis en évidence 240 dossiers dont 3 cas compatibles et le codage « valvulopathies et Médiator® » qui a rapporté 23 dossiers dont 11 compatibles,
iii) une surveillance prospective avec 3 nouveaux cas.

Sur les 15 patients identifiés « compatibles » (dont 11 rapportés par le CRPV de Besançon et 4 très récents à l'étude), 12 étaient des femmes et 3 des hommes. L'âge moyen est de 58 ans (49-78). 6 patients sur 12 étaient diabétiques. La durée moyenne d'exposition est de 53 mois (12-144) avec un délai entre la première prise du médicament et le diagnostic de 97 mois (13-384). L'échographie cardiaque antérieure est normale dans 5 cas sur 7. L'exposition à d'autres anorexigènes concerne 5 patients sur 12, et à un antidépresseur de type inhibiteur de recapture de la sérotonine (IRSI) concerne 8 patients sur 10.
Les valves atteintes sont la valve mitrale et la valve aortique dans 100% des cas, avec une atteinte de la valve tricuspide dans 7 cas et de la valve pulmonaire dans un cas. Une chirurgie de remplacement valvulaire a été effectuée dans 8 cas.

Une analyse systématique de toutes les insuffisances mitrales (IM), isolées ou associées, examinées au CHU de Brest depuis 2003, est actuellement en cours. Plus de 600 dossiers d'IM sont classés en 3 groupes: 1) IM dans un contexte étiologique bien identifié 2) IM inexpliquées 3) IM non classables.
Une recherche de l'exposition au benfluorex sur un modèle de cas témoins est réalisée pour les cas identifiés par le PMSI et par une enquête téléphonique auprès du médecin et du patient.

Les résultats de cette étude sont attendus pour fin juillet 2009.

Présentation du laboratoire :

A l'issu de la présentation des données, les représentants des laboratoires Servier ont proposé deux modèles d'études :

i) une étude anatomopathologique sur un modèle exposé/non-exposé (ce modèle d'étude a été récusé par la commission),

ii) une étude cas-témoin ayant pour objectif de quantifier un éventuel sur-risque de valvulopathie associé au MEDIATOR® chez des patients atteints de valvulopathie idiopathique comparativement à des patients indemnes de valvulopathie. Cette étude se ferait sur une population de patients diabétiques ayant une échographie cardiaque.

Le protocole de cette étude serait disponible début Septembre2009 et permettrait dans le meilleur des cas d'avoir des résultats dans un an.

Par ailleurs, la firme a informé la CNPV que l'étude REGULATE, (MEDIATOR® + SU versus pioglitazone + SU) est actuellement en cours d'analyse. Cette étude incluant 840 patients dont 420 dans chaque bras, comporte une échographie cardiaque à T0 et à la 52ème semaine de traitement. Les résultats d'efficacité et de tolérance sont attendus pour la fin du 1er trimestre 2010.

Conclusions de la CNPV du 07 07 2009

Le responsable du CRPV de Brest, présent à la réunion de la CNPV, a informé les membres que les résultats de l'étude brestoise cas-témoin seront disponibles fin Juillet 2009. Les membres de la commission nationale avaient alors souhaité disposer des résultats de l'étude cas-témoin brestoise afin de se prononcer sur les mesures éventuelles à entreprendre.

Les membres de la CNPV ont également discuté de l'importance des utilisations hors AMM de ce produit, notamment dans la perte de poids, malgré la restriction d'indication.

La commission s'est prononcée en faveur (16 voix pour, 2 voix contre et 2 abstentions) de l'attente des résultats de l'ensemble des études en cours ou planifiées (laboratoires Servier et CRPV de Brest) avant de proposer d'éventuelles mesures.

Elle a toutefois souhaité qu'une communication soit effectuée auprès des professionnels de santé pour leur rappeler le bon usage du Benfluorex dans le cadre de l'AMM.

• CNPV du 29 septembre

=> Actualisation des données relatives aux valvulopathies présentées en CNPV du 07.07 2009 :

1- *Données de la pharmacovigilance :*

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon. 11 nouveaux cas de valvulopathie associés au benfluorex sont rapportés dont 3 issus de la notification spontanée et 8 de des notifications sollicitées et provenant d'Amiens. L'analyse de ces 11 nouveaux cas montre une prédominance féminine, une durée moyenne de traitement de 3 ans et un âge de survenue le plus fréquemment identifié de 55 ans. Dans 9/11 cas une association à une hypertension artérielle pulmonaire est rapportée, une atteinte de type insuffisance mitrale et aortique dans 6 cas et une atteinte mitrale+aortique+tricuspide dans 2 cas. Malgré des échocardiographies documentées, les données anatomopathologiques restent peu informatives.

Certains membres ont souligné qu'en cas de notification sollicitée dans d'autres bassins de population, de nombreux autres cas de valvulopathie associés au benfluorex pourraient être mis en évidence.

2- Données de l'étude Brestoise :

L'étude cas-témoin rétrospective menée par le CHU de Brest, a pour objectif la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait le diagnostic de diabète ou l'Index de Masse Corporelle (IMC). L'exposition au benfluorex est recherchée auprès du patient, de sa famille et de ses médecins, par téléphone, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio = 40,4 (9,7 – 168,3, IC à 95%)). L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas la significativité du résultat.

3- Données de l'étude « REGULATE » :

Les résultats préliminaires de l'étude REGULATE ont été présentés par le laboratoire Servier. Il s'agit d'une étude multicentrique, en double aveugle, comparant pendant 52 semaines chez 840 diabétiques l'efficacité et la sécurité de 2 traitements, benfluorex et SU versus pioglitazone et sulphonylurée (SU). Deux échographies cardiaques ont été réalisées : avant exposition (T0) et à la 52ème semaine. La non-infériorité de l'association benfluorex + SU par rapport à l'association pioglitazone + SU sur la réduction de l'hémoglobine glycosylée n'a pas été démontrée. L'effet a été plus important sur la baisse du LDL-cholestérol

Concernant le profil de tolérance, cette étude a mis en évidence dans le groupe traité par benfluorex, l'émergence d'anomalies valvulaires fonctionnelles statistiquement significatives (26,5% versus 10,9% respectivement, $p<0,0001$) ainsi que des anomalies valvulaires morphologiques non statistiquement significatives (2,6% versus 1,3% respectivement, $p=0,264$). Il est à souligner que les anomalies fonctionnelles apparues sous benfluorex n'ont pas de traduction clinique.

A l'issue de cette présentation, le laboratoire Servier a proposé des modifications du Résumé des Caractéristiques du Produit de Médiator®:

- rubrique 4.2 « Indication » : *Restriction aux diabétiques en échec de traitement après les anti-diabétiques oraux*

- conditions de prescription et de délivrance : *Prescription réservée aux spécialistes tels que diabétologues/endocrinologues.*

- *contre-indication aux patients présentant une anomalie valvulaire*

- *mise en place d'une surveillance échocardiographique.*

=> Discussion :

Les résultats de l'étude cas-témoin de Brest ont été largement débattus par les experts de l'Afssaps, les membres de la commission, les investigateurs et le laboratoire.

Les experts ont déploré ne pas disposer du protocole de l'étude. Plusieurs biais ont cependant été identifiés:

- le choix des témoins : si la question posée est de savoir si le benfluorex peut ou non être responsable de valvulopathies, les témoins ne devraient alors pas présenter de valvulopathie,
- le choix des valvulopathies inexpliquées : il est difficile d'être absolument sûr que le diagnostic ne soit pas biaisé,
- les cas et les témoins ont des caractéristiques très différentes. Une confusion par indication (lien entre caractéristiques des patients témoins et l'absence de traitement par benfluorex) ne peut être exclue. Les témoins ont très peu de chance d'être exposés au benfluorex,
- le faible nombre de patients exposés,
- le choix de l'anomalie valvulaire (limité à la valve mitrale).

Toutefois, malgré certaines limites méthodologiques de cette l'étude, les experts et les membres de la commission considèrent que le signal d'une relation entre l'exposition au benfluorex et la survenue de valvulopathies se confirme. Ce signal est d'autant plus préoccupant que l'étude « REGULATE » met en évidence une émergence d'anomalies morphologiques et fonctionnelles valvulaires à la suite d'une exposition d'environ un an au benfluorex (328 jours en moyenne). De plus, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne peut être exclue, notamment en raison des données d'utilisation du produit qui montrent une durée moyenne d'exposition d'environ 3 ans.

=> Conclusions de la CNPV du 29 septembre 2009 :

Les membres de la CNPV considèrent (25 voix pour et 1 abstention), que les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex, et ce malgré certaines limites méthodologiques. De même, ils considèrent (25 voix pour et 1 abstention) que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

Il est à noter que le dépôt par le laboratoire du protocole de l'étude cas-témoin, prévu initialement pour début septembre 2009 n'a pas encore été effectué.

La CNPV a été informée de la transmission de ces données à la Commission d'AMM au plus tard le 23 octobre 2009, afin qu'elle puisse se prononcer sur la balance bénéfice- risque du produit.

Rappel des données présentées au cours de la Commission du 23 octobre:

Présentation des données d'efficacité du benfluorex

Un résumé/Rappel des principales données d'efficacité du benfluorex a été effectué par le Docteur Catherine Rey-Quinio (Unité PTC2, DEMEB).

Les données d'efficacité soumises comportaient notamment les études suivantes :

- l'étude Del Prato (1997), déjà examinée dans le cadre de la validation de l'indication comme adjuvant du régime adapté chez les diabétiques avec surcharge pondérale en 1999. Il s'agissait d'une étude multicentrique, randomisée, en double aveugle de 6 mois qui évaluait l'efficacité et la sécurité d'emploi de benfluorex versus placebo et versus metformine, chez 438 patients diabétiques de type 2 non équilibrés par régime seul. Suite aux réserves méthodologiques relevées dans cette étude, seuls les résultats du bras benfluorex versus placebo avaient été retenus. Une diminution de -0,86% de l'HbA1c était observée dans le bras benfluorex versus placebo ; aucune conclusion définitive sur la taille de l'effet ne pouvant être cependant formulée compte tenu des réserves méthodologiques constatées dans cet essai.

- l'étude Moulin (2006), déjà examinée par la Commission d'AMM en 2007. Il s'agissait d'une étude multicentrique, internationale, randomisée en double aveugle, d'une durée de 18 semaines évaluant l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex versus placebo chez 325 patients diabétiques de type 2 mal contrôlés par un traitement par sulphonylurées (SU) et intolérants ou ayant une contre indication à la metformine. L'efficacité du benfluorex en association aux sulphonylurées semblait démontrée (HbA1c diminuée de -0.82% dans le groupe benfluorex (versus baseline) et de -1% versus le groupe placebo). Néanmoins, des réserves méthodologiques ayant été soulevées par les experts, une étude d'efficacité clinique complémentaire versus un comparateur actif en seconde intention avait été demandée afin de conforter les résultats obtenus sur l'HbA1c.

- l'étude Regulate (2009), dont seuls les résultats préliminaires ont été fournis, a été examinée en groupe DEUG le 22 octobre 2009. Il s'agit d'une étude multicentrique, randomisée, en double aveugle, contrôlée *versus* pioglitazone, d'une durée de 52 semaines, comparant chez 847 patients diabétiques de type 2 insuffisamment contrôlés par SU, l'efficacité et la sécurité d'emploi d'un traitement par MEDIATOR à la dose maximale recommandée (450 mg /jour, 1 comprimé pendant le repas), à un traitement par pioglitazone à la dose maximale recommandée (45 mg/jour, 1 comprimé au petit déjeuner). Cette étude de non-infériorité n'a pas permis de démontrer la non infériorité sur l'HbA1c (critère principal de jugement) du benfluorex par rapport à la pioglitazone (limite supérieure de l'intervalle de confiance à 0.49 pour une limite de non infériorité fixée à 0.40 (différence entre les deux traitements = 0,33 (0,08) %, intervalle de confiance à 98% = [0,17; **0,49**], p = 0,19). La diminution de l'HbA1c a été de -0.54% sous benfluorex versus -0.88% sous pioglitazone.

Présentation des données de sécurité d'emploi du benfluorex examinées au cours des CNPV du 07 juillet et du 29 septembre 2009

Au niveau sécurité d'emploi, un rappel des données concernant les valvulopathies, examinées au cours des CNPV du 07 juillet et du 29 septembre 2009, a été présenté par le Docteur Carmen Kreft Jais (département de pharmacovigilance), ainsi que par l'équipe du CHU de Brest ayant réalisé l'étude cas / témoins :

Depuis 1995, le benfluorex a fait l'objet de plusieurs mises au point des effets indésirables, ainsi que de deux enquêtes de pharmacovigilance, l'une en 1999 sur les troubles neuro-psychiques et la deuxième en 2004 du fait de la notification d'effets de type amphétaminiques. Cette enquête a été étendue en 2005 aux hypertensions artérielles pulmonaires (HTAP), puis aux valvulopathies. La notification par les CRPV de cas de valvulopathies cardiaques sous benfluorex et la publication de Boutet en 2009 (Fenfluramine-like cardiovascular side-effects of benfluorex. Eur Respir J 20098 :33 :684-688. Boutet K) rapportant 5 cas d'HTAP et un cas de valvulopathie cardiaque associé, après exposition au benfluorex ont conduit à une actualisation des données de PV, successivement pour la CNPV du 7 juillet 09 et celle du 29 septembre 09.

CNPV DU 7 JUILLET 2009

Entre 1998 et juillet 2009, en France, 30 cas de valvulopathies cardiaques ont été rapportés :

- 19 cas issus de la notification spontanée (NS) dont 3 cas concernaient également des HTAP post-capillaires

- 11 cas identifiés par le CRPV de Brest à la suite de l'interrogation du PMSI (Programme de médicalisation des systèmes d'information).

Les 30 valvulopathies rapportées étaient monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Concernant la localisation de ces valvulopathies, 28 cas étaient des insuffisances mitrales (grade 2-3 dans 17 cas), 24 cas étaient des insuffisances aortiques (grade 1-2 dans 17 cas) et 11 cas étaient des insuffisances tricuspides (sévères, de grade 3 dans 4 cas).

L'évolution de ces atteintes a été marquée par une chirurgie valvulaire dans 10 cas (+ 2 prévues), une stabilité dans 4 cas, une stabilité sous traitement dans 5 cas. Elle est inconnue dans 4 cas et en cours dans 5.

Parmi les valvulopathies opérées, 4 cas dont 2 ont fait l'objet d'une publication avaient un aspect anatomo-pathologique des valves compatible avec celui décrit sous anorexigène. Dans les 2 autres cas opérés, l'anatomopathologie n'était pas spécifique.

Pour mémoire, la cardio-toxicité des anorexigènes a une plausibilité biologique : la stimulation des récepteurs 5-HT2B, exprimés au niveau des valves cardiaques peut induire une mitogénèse fibroblastique. Or le benfluorex est métabolisé en deux produits dont le N-benzoyloxy-2-ethyl-norfenfluramine.

La conclusion de la CNPV de juillet 2009 a été i) qu'il existe un signal de cardiotoxicité (atteinte valvulaire) détecté par l'analyse de la notification spontanée et des données issues du PMSI du CHU de Brest, ii) qu'il est nécessaire de confirmer ce signal par une étude cas-témoins, iii) que la pharmacologie du benfluorex et de son métabolite la nor-fenfluramine doit être pris en considération dans l'analyse du mécanisme de la cardio-toxicité et iv) qu'une nouvelle réévaluation de la balance Bénéfice/Risque est à envisager, compte-tenu des nouvelles données de sécurité d'emploi.

CNPV DU 29 SEPTEMBRE 09

Une mise à jour des données de pharmacovigilance a été effectuée par le CRPV de Besançon entre juillet et septembre 09. Onze nouveaux cas de valvulopathie ont été rapportés dont 3 issus de la notification spontanée et 8 des notifications sollicitées provenant d'Amiens.

L'analyse de ces 11 nouveaux cas montre :

- une prédominance féminine,
- une durée moyenne de traitement de 3 ans
- un âge moyenne de survenue de 55 ans
- une association à une hypertension artérielle pulmonaire dans 9/11 cas rapportés
- une atteinte de type insuffisance mitrale, isolée ou associée à une insuffisance aortique et/ou tricuspide.

Les résultats des échocardiographies sont documentés, mais les données anatomopathologiques restent peu informatives. Il a été souligné qu'en cas de notification sollicitée dans d'autres bassins de population, de nombreux autres cas de valvulopathie associés au benfluorex pourraient être mis en évidence.

Le Docteur Frachon, du groupe HTAP de Bretagne Occidentale (CHU de Brest) a présenté la méthodologie de l'étude cas-témoin appliquée à Brest pour l'identification des cas de valvulopathies associées au benfluorex. Cette méthodologie repose sur l'interrogation du PMSI en utilisant les codages « valvulopathies et diabète » et le codage « valvulopathies et Médiator ».

L'équipe du CHU de Brest a présenté son étude cas-témoins, rétrospective, analysant toutes les insuffisances mitrales (IM), isolées ou associées, examinées au CHU de Brest depuis 2003. L'objectif est la recherche d'une association entre l'exposition au benfluorex et la survenue de cas d'insuffisance mitrale (IM) inexpliquée. La population source est constituée de tous les patients hospitalisés entre 2003 et 2009 dans le département de cardiologie ou le service de chirurgie cardiaque au CHU de Brest, et ayant un diagnostic d'IM. Les patients ayant une IM inexpliquée constituent les cas (n=27) et les patients ayant une IM expliquée constituent les témoins (n=54). Deux témoins ont été appariés à chaque cas sur les critères d'âge et de genre. L'appariement ne concernait pas le diagnostic de diabète ni l'Index de Masse Corporelle (IMC). L'exposition au benfluorex a été recherchée auprès du patient, de sa famille et de ses médecins, sur la base d'un questionnaire semi-structuré et à l'aveugle du statut cas ou témoin.

Sur les 27 cas identifiés, 19 avaient été exposés au benfluorex contre 3 témoins sur 54 ($p<0.001$ soit un odds-ratio = 40,4 (9,7 – 168,3, IC à 95%).

L'ajustement à différentes variables telles que le poids, le diabète ou l'exposition à la dexfenfluramine, ne modifie pas le signal.

Malgré certaines limites méthodologiques, les experts et les membres de la commission ont considéré que le signal de risque entre l'exposition au benfluorex et la survenue de valvulopathies était conforté.

Les résultats préliminaires de l'étude REGULATE ont été présentés par les laboratoires Servier lors de la CNPV du 29 septembre 09.

Concernant le profil de tolérance cardio-vasculaire, 614 patients, 309 dans le groupe benfluorex et 305 dans le groupe pioglitazone ont eu une échocardiographie à l'inclusion et à 52 semaines, après une exposition aux traitements d'une durée moyenne de 328 jours.

Cette étude a mis en évidence dans le groupe traité par benfluorex versus le groupe pioglitazone :

- l'émergence d'anomalies valvulaires fonctionnelles statistiquement significatives, 26,5% versus 10,9%, (p<0,0001),

- des anomalies valvulaires morphologiques non statistiquement significatives (2,6% versus 1,3% respectivement, p=0,264).

Il est à noter que i) la durée d'exposition moyenne au benfluorex est de 328 jours, ii) les anomalies émergentes fonctionnelles sont triviales, sans traduction clinique et iii) la lecture des échocardiographies s'est faite par couple mais avec connaissance des dates des échographies.

En dépit des certains limites méthodologiques de l'étude cas-témoin de Brest, les experts et les membres de la commission de PV ont considéré que le signal d'une association entre l'exposition au benfluorex et la survenue de valvulopathies se confirmait. Ce signal était considéré d'autant plus préoccupant que l'étude REGULATE mettait en évidence une émergence d'anomalies morphologiques et fonctionnelles valvulaires à la suite d'une exposition moyenne de seulement 328 jours. De plus, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne peut être exclue, notamment en raison des données d'utilisation du produit qui montrent une durée moyenne d'exposition d'environ 3 ans.

Les conclusions de la CNPV du 29 septembre 09 ont été que: les nouvelles données présentées confortent le signal d'un risque de valvulopathie associé à l'exposition au benfluorex. De même, ils ont considéré que le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, était inacceptable. En conséquence, les membres de la Commission Nationale de PV ont proposé un passage devant la Commission d'AMM afin que soit discutée une réévaluation de la balance Bénéfice/Risque des spécialités à base de benfluorex.

Audition de la firme

La firme (Servier) a été auditionnée au cours de la Commission d'AMM. Deux experts mandatés, M. Iung et M. Guillausseau, se sont exprimés sur respectivement l'analyse des anomalies valvulaires cardiaques et sur l'efficacité métabolique du benfluorex dans le diabète de type 2.

Selon l'expertise de M. Iung, parmi les 45 cas de valvulopathies notifiés (19 notifications spontanés, 16 notifications du CRPV de Brest, 10 notifications du CRPV d'Amiens), l'imputabilité d'une valvulopathie au benfluorex est forte pour 6 cas, possible dans 16 cas, la principale alternative étant une valvulopathie rhumatismale. L'imputabilité est faible dans 16 cas où la présence de regurgitations valvulaires est difficile à interpréter en l'absence de tout détail concernant l'anatomie valvulaire. Enfin, l'imputabilité est très faible dans 7 cas pour lesquels une autre étiologie paraît plus probable.

M. Guillausseau, diabétologue, a présenté un résumé des données d'efficacité de Mediator.

Au vu des données d'efficacité et de sécurité d'emploi du benfluorex exposées, des propositions de modifications de RCP de MEDIATOR ont été proposées par la firme afin de prendre en compte ce risque de valvulopathies.

- modification du libellé de l'indication (rubrique 4.1): *« Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale, intolérants à la metformine et insuffisamment contrôlés par un insulinosécréteur sulfamidé ou non. »*

- restriction de l'indication aux spécialistes (rubrique 4.1) : *«Le traitement doit être instauré par un médecin spécialiste en diabétologie, en endocrinologie ou en médecine interne. »*

- ajout d'une contre-indication (rubrique 4.3) : *« Anomalie valvulaire à l'échographie »*

- ajout de mises en gardes spéciales et précautions d'emploi (rubrique 4.4) : *« Des valvulopathies aortique ou mitrale ont été observées lors d'un traitement par benfluorex.*

Pendant le traitement : Une échographie devra être réalisée environ 6 mois après l'instauration du traitement. Un suivi échographique doit être effectué régulièrement. Le traitement par benfluorex

Avant de débuter le traitement : Une échographie doit être réalisée, afin de détecter une éventuelle valvulopathie asymptomatique. Si une atteinte valvulaire est diagnostiquée, le traitement par benfluorex est contre-indiqué (voir rubrique 4.3) devra *être arrêté en cas d'anomalie valvulaire cardiaque (voir rubrique 4.3).*

- ajout d'effets indésirables (rubrique 4.8) : *« Valvulopathie cardiaque (fréquence inconnue) »*

Au cours de la commission d'AMM, il a été rappelé entre autres que:

- le benfluorex ne fait pas partie des recommandations françaises et internationales de la prise en charge du diabète de type 2 car il est considéré uniquement comme un adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

- le benfluorex est essentiellement prescrit par des médecins généralistes (88%), bien souvent hors AMM, chez des patients obèses non diabétiques mais également chez des patients présentant une dyslipidémie. Pour rappel, l'indication « Adjuvant du régime adapté dans les hypertriglycéridémies » a été retirée en 2007 pour insuffisance de données d'efficacité dans cette indication.

- la grande majorité des patients diabétiques présentent des valvulopathies.

Au vu des questions soulevées par l'ensemble de ces résultats, il est demandé à la Commission d'AMM du 12 novembre 2009 de se positionner sur le bénéfice/risque des spécialités dont la substance active est le benfluorex.

AVIS DE LA COMMISSION D'AMM du 12 novembre 2009 :

Le dossier benfluorex a été examiné lors de la commission d'AMM du 23 octobre 2009. La Commission devait se prononcer – au vu de l'ensemble des données de bénéfice et de risque dans les conditions d'utilisation actuelles - sur la balance bénéfice- risque du benfluorex.
En l'absence de quorum à l'instant du vote, la commission d'AMM n'avait pu rendre d'avis. En conséquence, le dossier a été réexaminé par la commission d'AMM du 12 novembre.
Un rappel des données d'efficacité et de sécurité d'emploi du benfluorex déjà examinées lors de la précédente commission d'AMM a été effectué par les docteurs Catherine Rey-Quinio et Carmen Kreft-Jaïs respectivement.

D'autre part, depuis la dernière Commission, les résultats préliminaires d'une nouvelle étude effectuée par la CNAM (Caisse Nationale d'Assurance Maladie) sur le benfluorex ont été transmis à l'Afssaps ainsi qu' à la Direction Générale de la Santé. Les résultats préliminaires de cette étude ont été examinés et présentés par un méthodologiste, M. Lièvre, au cours de la Commission d'AMM :
Il s'agit d'une étude de cohorte de type exposé-non exposé à partir des données du système national inter-régime de l'assurance maladie (SNIIRAM). Etaient éligibles les patients diabétiques traités (antidiabétiques oraux et/ou insuline) en 2006 et âgés de 40 à 69 ans. Les cas exposés étaient enregistrés de façon passive et définis par la délivrance et le remboursement en 2006 de benfluorex. Après chaînage des données, les évènements recherchés au cours de l'année n+1 et n+2 dans le PMSI 2007 et 2008 étaient une hospitalisation pour une insuffisance valvulaire toutes causes confondues, une hospitalisation pour une insuffisance mitrale et chirurgie de remplacement valvulaire sous circulation extracorporelle pour une insuffisance valvulaire toutes causes confondues.

Les résultats ont porté sur 1 092 858 diabétiques dont 43 208 exposés au benfluorex en 2006. Le risque d'hospitalisation en 2007 pour insuffisance valvulaire cardiaque était de 81 pour 100 000 dans le groupe exposé versus 29 pour 100 000 dans le groupe non exposé (RR=2,77 IC 95[1,95 ; 3,93]).. Le risque d'hospitalisation pour insuffisance mitrale est de 53 pour 100 000 dans le groupe exposé versus 20 pour 100 000 dans le groupe non exposé RR=2,66 IC 95[1,7 ; 4,1]. Le risque de chirurgie en 2007 avec un remplacement valvulaire sous circulation extracorporelle (CEC) pour une insuffisance valvulaire toutes causes confondues était de 30 pour 100 000 dans le groupe exposé au benfluorex versus 9 pour 100 000 dans le groupe non exposé (RR=3,4 [1,9 ; 6,1]). Parmi les 13 personnes diabétiques exposées et ayant subi un remplacement valvulaire sous CEC en 2007, une était décédée en milieu d'année 2008. Pour les exposés au benfluorex en 2006, les risques absolus et les risques relatifs étaient en 2008 très proches de ceux observés en 2007. Pour les exposés au benfluorex ; le risque relatif de chirurgie valvulaire sous CEC était identique (3,4) pour 2007 et 2008..
Si l'étude présente certaines limites, notamment le manque de détails de l'analyse et de ses ajustements, ces résultats confortent le signal de pharmacovigilance, de risque de valvulopathies chez les diabétiques traités par benfluorex. En effet, les résultats montrent que l'usage du benfluorex chez les diabétiques âgés de 49 à 59 ans est associé significativement dans les deux années qui suivent l'exposition, à des valvulopathies de régurgitation mitrales, aortiques et tricuspidiennes et à des chirurgies de remplacement valvulaire sous circulation extracorporelle pour des valvulopathies de régurgitation.

La firme a été auditionnée au cours de la Commission d'AMM. Un rapport complémentaire du Pr B. Bauduceau sur l'efficacité métabolique du benfluorex dans le diabète de type 2 a été fourni.
La firme n'a pas contesté les résultats de l'étude de la CNAM, mais a émis quelques réserves méthodologiques.
Elle a proposé une modification supplémentaire du RCP par rapport à la version proposée lors de la Commission d'AMM du 23 octobre 09 : Ajout d' une surveillance échographique en rubrique 4.2 : « En association à un régime adapté, MEDIATOR constitue un traitement adjuvant : une surveillance régulière clinique, biologique et **échographique** de chaque patient sera instauré **(voir rubrique 4.4).** »
De plus, la firme a proposé la mise en place d'un plan de gestion des risques comprenant une communication renforcée auprès des médecins prescripteurs et des pharmaciens, ainsi que la définition de modalités de suivi des patients en cours de traitement et après l'arrêt du traitement.

Avis de la commission d'AMM

Il apparaît que l'ensemble des nouvelles données susmentionnées (notifications spontanées et sollicitées, PMSI, REGULATE) confortent le signal de risque de valvulopathies associé à l'exposition au benfluorex. Les membres de la Commission estiment que la surveillance échographique pendant le traitement n'est pas de nature à prévenir le risque de survenue de valvulopathie, laquelle par ailleurs pourrait continuer à évoluer même après l'arrêt de benfluorex.
Après débat, un vote a été sollicité pour la question suivante : Etes-vous pour ou contre le maintien du médicament (benfluorex) sur le marché ? Le résultat du vote a été le suivant : 1 voix pour, 18 voix contre, et 3 abstentions.

CONTEXTE DE LA COM D'AMM DU 1er juillet 2010

Rappel des conclusions et mesures prises suite à la réévaluation du rapport bénéfice-risque du benfluorex

Après examen des données actualisées relatives aux valvulopathies associées à la prise de benfluorex, issues des données de pharmacovigilance, de l'étude cas-témoin rétrospective du CHU de Brest ainsi que de l'étude REGULATE (étude multicentrique, en double aveugle, comparant pendant 52 semaines chez 840 diabétiques l'efficacité et la sécurité des deux traitements, benfluorex et sulphonylurée (SU) versus pioglitazone et SU), la Commission nationale de pharmacovigilance lors de sa séance du 29/09/09 a considéré que :

- les nouvelles données présentées confortent, malgré certaines limites méthodologiques, le

signal d'un risque de valvulopathie associé à l'exposition au benfluorex,
- le profil de tolérance du produit dans les conditions actuelles d'utilisation telles que définies dans l'AMM, est inacceptable.

Lors de ses séances du 23 octobre puis du 12 novembre 2009, après avoir étudié et discuté le rapport bénéfice-risque du benfluorex au vu des données disponibles, la Commission d'AMM s'est prononcée en défaveur du maintien sur le marché des spécialités composées de benfluorex.

Par conséquent, le directeur général de l'Afssaps a décidé en date du 24 novembre 2009 la suspension des AMM de ces spécialités, avec une prise d'effet le 30 novembre 2009, date à laquelle a été procédé au rappel des lots des spécialités commercialisées.

Décision de la Commission européenne en date du 14/06/10 :

Conformément aux dispositions de l'article 107 de la directive 2001/83/CE telle que modifiée, l'Afssaps a averti l'EMA, la Commission européenne et l'ensemble des Etats membres des décisions de suspension, ce qui a conduit à une évaluation européenne du rapport bénéfice-risque du benfluorex. Dans ce cadre, le CHMP a recommandé le retrait des AMM des spécialités composées de benfluorex.
Par décision du 14 juin 2010, la Commission européenne a enjoint les Etats membres concernés (Chypre, France, Luxembourg et Portugal) à retirer les AMM nationales.

Aussi, l'avis de la Commission d'AMM est aujourd'hui sollicité, conformément aux dispositions de l'article R. 5121-50 du code de la santé publique, quant au retrait des AMM des spécialités composées de benfluorex, suspendues en novembre 2009 dans l'attente de l'issue de la procédure d'évaluation européenne selon l'article 107 précité.

AVIS DE LA COMMISSION D'AMM n°484 du 1er JUILLET 2010 : AVIS FAVORABLE au retrait des AMM des spécialités contenant du benfluorex et ce,

- considérant qu'au terme de l'évaluation qu'il a menée et ayant concerné l'ensemble des médicaments contenant du benfluorex autorisés dans l'Union européenne, le CHMP de l'EMA a conclu que l'utilisation du benfluorex est nocive dans les conditions normales d'utilisation et conduit à des valvulopathies cardiaques. Ces valvulopathies peuvent induire une altération progressive de la fonction cardiaque et des symptômes cliniques associés nécessitant, dans les cas graves, une chirurgie cardiaque de remplacement des valves. Il a également noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue, ce qui suscite une inquiétude particulière étant donné l'utilisation prolongée du produit, avec une durée moyenne d'exposition de trois ans (sur la base de données d'utilisation) ;

- considérant qu'après avoir examiné le rapport bénéfice/risque du benfluorex dans les conditions normales d'utilisation, il a estimé que le risque prouvé susmentionné de maladie des valves cardiaques n'est pas acceptable, compte tenu du fait que le bénéfice du benfluorex n'est que limité dans le traitement du diabète de type 2 ;

- considérant que, au vu de ces éléments, le CHMP a adopté le 18 mars 2010 un avis recommandant à la Commission européenne d'enjoindre aux Etats membres de retirer les AMM de tous les médicaments à base de benfluorex ;

- considérant que suite à cet avis, la Commission européenne a, par décision du 14 juin 2010, demandé aux Etats membres concernés de retirer les AMM délivrées au niveau national des médicaments contenant du benfluorex et ce, en application des dispositions de l'article 107, paragraphe 2 de la directive 2001/83/CE précitée, au motif que l'évaluation des effets thérapeutiques positifs de ces produits au regard des risques pour la santé du patient liés à leur sécurité n'est pas favorable dans les conditions normales d'emploi.

1 BACKGROUND INFORMATION ON THE PROCEDURE

1.1 Referral of the matter to the CHMP

A Rapid Alert was circulated to CHMP, EMEA and Commission (see attachment 1) by France on 25 November 2009, following the suspension of the Marketing Authorisations of Benfluorex on 26 November 2009, triggering a review under Article 107 of Directive 2001/83/EC, as amended and referring the concerns to the CHMP for its opinion on whether the marketing authorisations for Benfluorex (Mediaxal, Mediator, Lipophoral) should be maintained, varied, suspended or revoked.

The CHMP agreed that the procedure described in Article 107 of Directive 2001/83/EC, as amended, was applicable.

The scope of the review was to review the benefit-risk ratio of medicinal products containing Benfluorex due to detection of cardiac valvulopathy excess risk.

1.2 Steps taken for the review procedure

- During the December Written Procedure, the following was agreed by CHMP:
  - Professor Philippe Lechat was appointed Rapporteur.
  - Professor Cristina Sampaio was appointed Co-Rapporteur.
  - The procedure under Article 107 started on 2 December 2009.
  - A consolidated list of questions (EMEA/CHMP/776192/2009) was adopted (see attachment 3).
- On 2 December 2009, a letter was sent to the MAHs for benfluorex-containing medicinal products informing them about the start of the procedure including the list of consolidated questions, the official notification from France to the CHMP/EMEA on the procedure under Article 107 of Directive 2001/83/EC, as amended, the assessment report of France, and the list of all MAHs involved in the review procedure.
- The CHMP and the EMEA received a MAH's response to the list of questions by 7 December 2009.
- On 11 December 2009, the Rapporteur's and the Co-Rapporteur's Assessment Reports were forwarded to the CHMP (see attachments 4 and 5).
- On 11 and 14 December 2009, the Rapporteur's and Co-Rapporteur's Assessment Reports were forwarded to the MAHs.
- On 17 December 2009, the CHMP adopted an opinion recommending the revocation of the Marketing Authorisations for medicinal products containing benfluorex.
- The Opinion is being forwarded to the European Commission, to Member States, to Iceland and to Norway and to the Marketing Authorisation Holders together with its annexes and appendices.
- On 18 March 2010, at the request of the European Commission, the CHMP adopted a revised opinion recommending the revocation of the Marketing Authorisations for medicinal products containing benfluorex.

- The Opinion is being forwarded to the European Commission, to Member States, to Iceland and to Norway and to the Marketing Authorisation Holders together with its annexes and appendices.

2 SCIENTIFIC DISCUSSION

2.1 Introduction

Benfluorex is used as an adjunct in the management of type 2 diabetes mellitus in overweight patients. The currently authorised therapeutic indication in France is as « *Adjuvant therapy of overweight diabetics, in combination with an appropriate diet*». Benfluorex has an action on carbohydrate metabolism. In animals, the following effects have been observed:

- Facilitation of precipitation and use of glucose in cells (rats)

- Reduction in hyperglycaemia in diabetic rats (insulin deprived or not), decrease in hyperglycaemia (measured by the glucose tolerance test area) in rabbits

Benfluorex has no action on insulino-secretion.

Medicinal products containing benfluorex are authorised in four EU Member States under a tablet formulation, with only 2 countries (France and Portugal) in which the product was marketed up to the suspension of the Marketing Authorisations in November 2009. In Cyprus and Luxembourg, medicinal products containing benfluorex were not marketed any longer.

On 25 November 2009, the French Competent Authority (Afssaps) issued a Rapid Alert informing the Members States, the EMEA and the European Commission in accordance with Article 107 of Directive 2001/83/EC, as amended, of its decision to suspend the marketing authorisations of all benfluorex containing medicinal products in France due to an increased risk of a cardiotoxicity signal (valvular heart diseases) with benfluorex. The decision of the French Competent Authority was based on:
- updated results of a Pharmacovigilance (PV) survey,
- preliminary data from 3 clinical studies (the retrospective case-control study performed in a Brest hospital, the REGULATE trial and the data from the French National Insurance Fund);
- and from a recent publication (K. Boutet *Fenfluramine-like cardiovascular side-effects of benfluorex*, Eur Respir. J. 2009; 33: 684-688) that have shown a risk of cardiac valve diseases and of pulmonary hypertension (PHT) for patients treated with benfluorex.

On 30 November 2009, the Portuguese Competent Authority decided as well to suspend the marketing authorisation of all benfluorex containing medicinal products in Portugal.

On 2 December 2009, on the starting day of the Article 107 for medicinal products containing Benfluorex started, the CHMP adopted a list of consolidated questions to be addressed to the MAHs. The MAHs were invited to comment on this List of questions which could have an impact on the conclusions of the Competent Authorities and the regulatory action described above, and to justify by additional data, as appropriate.

On 7 December 2009, the CHMP and the EMEA received only the brand leader's response (Laboratoires Servier) to the list of questions confirming in their cover page that *"no additional data were available since the conclusions of the French Competent Authority"*'s report. The Committee reviewed the MAH's response along with the data provided by the Member State (French assessment) and issued an opinion according to the Rapporteur and Co-Rapporteur's assessment reports at the December 2009 plenary meeting.

2.2 Clinical Safety

Since its marketing authorisation, several pharmacovigilance surveys have been performed on benfluorex, leading, among others, to the removal of its indication for hypertriglyceridemia.

The detection of a cardiotoxicity signal (valvular heart diseases) led to the current review by the CHMP. Updated results of a Pharmacovigilance survey, preliminary data 3 clinical studies (the retrospective case-control study performed in a Brest hospital, the REGULATE trial and the data from the French National Insurance Fund), and a recent publication (K. Boutet. *Fenfluramine-like cardiovascular side-effects of benfluorex*, Eur Respir. J. 2009; 33: 684-688) showed a risk of cardiac valve diseases and of pulmonary hypertension (PHT) for patients treated with benfluorex.

In this context, old study data such as the Del PRATO and MOULIN studies (including the MOULIN open-label extension) were also reviewed and taken into consideration into the conclusions reached by the CHMP.

2.2.1 Del PRATO study

Presentation of the study

The purpose of this study was the granting of the approval of the indication in treating diabetes. Only the results of the *versus placebo* arm were adopted and enabled the approval of the current indication.

The objective of this study was to assess the long-term efficacy (6 months) of benfluorex in improving the glycaemic control of type-2 diabetic patients poorly balanced by diet alone.

This international multi-centre, double-blind, parallel-group study involved 438 type-2 diabetic patients insufficiently controlled by diet alone. The study included a 2-month pre-inclusion period during which the patients received a placebo (single-blind) and dietary advice.

The principle efficacy criterion was HbA1c (centralised dosage, HPLC method). The secondary efficacy criteria were fasting blood glucose, insulinemia and lipid profile.

The tolerance criteria were the physical examination data (weight, heart rate, BP), creatininaemia and the recording of spontaneously-reported adverse events.

Discussion and conclusion on safety in the Del PRATO study

The reported events involved the gastro-digestive system: 13% with benfluorex and 10% with the placebo. Two serious events were considered to be linked to the treatment with benfluorex (vertigo, urticaria). These events were known to occur with benfluorex and figured amongst the adverse events mentioned in the summary of product characteristics. The numbers of drop outs were equivalent in both groups, 20% with benfluorex compared to 25% with placebo. No modifications to blood pressure and heart rate were observed. No patients died in the course of the study.

The most frequent adverse events were known digestive disorders (primarily diarrhoea). The numbers of drop outs as a result of adverse events were low (< 5%) and comparable: 14 out of 294 in the benfluorex group and 6 out of 142 in the placebo group.

To the MAH's opinion, a certain number of adverse events are known, mainly in the digestive area (diarrhoea and abdominal pain), and are generally moderate in intensity and rarely lead to treatment discontinuation.

In conclusion, the CHMP is of the opin ion that acceptability was comparable in the benfluorex and placebo groups, with the exception of digestive disorders.

2.2.2 MOULIN study and the MOULIN open-label extension

Presentation of the MOULIN study and its extension

The Moulin study was an international, multi-centre, double-blind study controlled against a placebo assessing the efficacy and safety of 18-week treatment with 450 mg/day of benfluorex compare to a placebo of 325 type-2 diabetic patients poorly controlled by treatment with sulphonylureas (SU) and with intolerance or contra-indication to metformin.

The study continued with a 16-week open-label period intended to obtain long-term efficacy and safety data for benfluorex when combined with a SU and, if required, acarbose.

The principal objective of this study was to demonstrate the superiority of treatment with Benfluorexcompared to the placebo, when combined with a sulphonylurea, in order to control glycaemia.

The primary efficacy criterion was HbA1c (%), assessed after 0, 4, 10 and 18 weeks of treatment. The secondary criteria were measurements of fasting blood glucose and fasting insulinaemia, as well as the lipid profile assessed at each visit.

The safety criteria were the physical examination data (weight, heart rate, blood pressure), electrocardiogram, standard biological monitoring and the recording of spontaneously-reported adverse events.

The extension of the MOULIN study

The objective of this 16-week open-label extension period was to obtain additional information on the efficacy and safety of Benfluorex®, when combined with a sulphonylurea. A third hypoglycaemic drug with a different action (acarbose) was introduced, if necessary, from the 9th week after the start of the extension period.

Nearly all the patients who finished the initial blind period of the study participated in the extension, i.e. 296 patients out of 297. More than 95% (n = 282) of them completed this extension.

Discussion and conclusion on safety in the MOULIN study

The proportion of patients who presented at least one adverse event was similar in the benfluorex group and the placebo group.

The most frequent adverse events were of a gastro-intestinal nature without however leading to more frequent drop outs.

Possible cases of hypoglycaemia were observed in 8.4% of patients treated with benfluorex and in 3.8% of patients treated with the placebo without any of these incidents having been deemed to be serious. The possible cases of hypoglycaemia were not confirmed by capillary blood glucose. The cases of hypoglycaemia were linked to the insulin-secreting treatment used in combination with benfluorex in this study. They were more frequent in the benfluorex group as a result of the stricter glycaemic control.

The incidence rates of psychiatric disorders were respectively 3.6% with benfluorex and 3.1% with the placebo. The number of reported cases of depression was balanced in both groups. No possible cases of withdrawal syndrome were reported.

The incidence rates of neurological disorders were respectively 9.0% with benfluorex and 6.3% with the placebo, principally headaches. A higher number of serious adverse events were observed in the benfluorex group, mostly linked to an underlying pathology: no causal links were reported, with the

exception of one case of digestive pain. No anomalies were detected during treatment with benfluorex regarding the electrocardiogram, biological safety parameters, changes to blood pressure or heart rate.

During the **study's open-label extension period** and compared to the blind period, the adverse effects observed were of the same kind (digestive), included few cases of hypoglycaemia (5.3%) and were not serious. The number of drop outs as a result of adverse events was 9/296, i.e. 3.1% - the exact same incidence rate as observed for the placebo group during the blind period (3.8%).

In conclusion, based on the aforementioned data, the CHMP concluded:

- that the safety results of the Moulin study and its extension confirmed the known effects regarding digestive tolerance of benfluorex;
- the incidence of digestive disorders did not increase in patients who had shown intolerance to metformin.

The MAH acknowledges, in their written response, that a certain number of adverse events (mainly in the digestive area) are known.

2.2.3 PHT and cardiac valve disease pharmacovigilance survey follow-up data

The CHMP reviewed the response package provided by the MAH along with the data provided by the Member State which examined the updated results of a national PV survey (particularly the data regarding the risk of PHT and cardiac valve diseases with Benfluorex) as well as the data from a recent publication on this subject (K. Boutet *Fenfluramine-like cardiovascular side-effects of benfluorex*, Eur Respir. J. 2009; 33: 684-688).

2.2.3.1 Pulmonary Hypertension (PHT) data

Between March 2007 and September 2009, 8 new cases of PHT were reported, i.e. a total of 28 cases, including 4 apparently idiopathic cases of PHT during treatment with benfluorex. Given the incidence of apparently idiopathic PHT in the general population, the Member State considered that the number of cases of apparently idiopathic PHT linked to use of benfluorex did not appear to represent a significant signal of the pulmonary toxicity of benfluorex. However it was recommended at the time that the spontaneous reporting of cases of PHT in the general population continue to be closely monitored. This issue has been followed up since several years at the Member State level in collaboration with the MAH.

The MAH did not comment on the PHT events within their response to the list of questions addressed by the CHMP.

The CHMP noted the above mentioned conclusions reached at the time with regards to PHT events.

2.2.3.2 Valve disease data

1 - Updating of the pharmacovigilance data and the retrospective case-control study performed in Brest hospital ("Brest case-control study")

- **Pharmacovigilance data**

On 7 July 2009, the Member State reviewed thirty cases of cardiac valve disease which occurred between 1998-2009 at national level:

- 19 spontaneously reported cases (SR), including 3 cases also involving post-capillary PHT;

- 11 cases identified by the Brest RPVC following interrogation of the PMSI (Information System Medicalisation Programme).

► *Patient characteristics:*

	SR: 19	PMSI: 11
Sex	Women: 24, men: 6	
Average age of appearance (years) *Women*: 54.6 *Men*: 62.2	 53.7 54.6	 56.4 69.7
BMI (kg/m^2) *18.5 to 24.9*: 5 cases *25 to 29.9*: 7 cases *≥ 30*: 8 cases	3 5 4	2 2 4
Average length of treatment (years) 5.3	5.6	4.6
Medical history / Diathesis (number) *Smoking*: 13 *Hypothyroidism*: 9 *Diabetes*: 9 *Dyslipidemia*: 12 *Rheumatoid polyarthritis*: 2	 10 7 5 10 1	 3 2 4 2 1
Cardiac medical history/Diathesis (number)	15	
Combined drugs (number) *Levothyroxine* *SSRI antidepressant*	 9 7	

► *Type and location of the valve diseases:*

The 30 reported cases of valve disease were monovalvular in 6 cases, bivalvular in 16 cases and trivalvular in 8 cases. As regards the location of these valve diseases, 28 cases were mitral insufficiencies (serious in 17 cases), 24 cases were aortic insufficiencies and 11 cases were tricuspid insufficiencies (serious in 4 cases).

► *Anatomopathological aspect of the valves requiring surgery*

Anatomopathological diagnoses were performed on 5 patients requiring surgery.

On 29 September 2009, 11 new cases of valvulopathy related to benfluorex were reported between July 2009 and September 2009 by a national pharmacovigilance centre, including 3 that were spontaneously reported and 8 reported upon request by another national PV center. The analysis of these 11 new cases showed

- a predominance of women,

- an average of 3 years treatment

- an age of appearance most frequently identified as 55 years old

- in 9/11 cases, combination with pulmonary hypertension was reported

- as well as mitral and aortic insufficiency damage in 1 case and mitral and aortic and tricuspid damage in 1 case.

The results of the echocardiograms were documented.

It was concluded on the existence of a cardiotoxicity signal detected via spontaneous reporting and the PMSI (Computerised Medical File Database) data and on the need to confirm this signal using an epidemiological study ("Brest case control study").

- **The retrospective case-control study**

The aim of the methodology used in the Brest hospital was to identify cases of valve disease linked to benfluorex. The methodology queried the PMSI using the "valve disease and diabetes" codes and the "valve diseases and Benfluorex" codes. Compared with the report in July 2009, 4 new cases were identified by using the PMSI. Therefore, on 29 September 2009, 45 cases of valve disease had been identified:

- 19 + 3 = 22 Spontaneous reports;
- 11+ 4 = 15 (Brest) following interrogation of the PMSI;
- and 8 reports requested from the national pharmacovigilance centre based on the echocardiogram records.

The 15 "compatible" cases identified at the Brest University Hospital Centre involved 12 women and 3 men, with a mean age at diagnosis of 58 years (49-78), mean BMI of 33 kg/m^2 (24-52), with diabetes in 6 of the 12 reported cases, a mean exposure duration of 53 months (12-144), a delay between the first dose of benfluorex and diagnosis of the valve disease of 97 months (13-384), an earlier normal echocardiogram in 5 of the 7 documented cases, an exposure to a serotonin reuptake inhibitor in 8 out of 10 of the documented cases.

The damaged valves were mitral and aortic in all cases, tricuspid in 7 out of 15 cases and pulmonary in 1 out of 15 cases. In 8 of these 15 cases, valve replacement surgery was performed.

The surgery provided diagnostic and both macroscopic and microscopic comparative elements:

- At a macroscopic level, the valve lesions primarily affected the elastic fibres in the form of non-specific fibromyxoid thickening, fibrous thickening of the large and small valves including fusion of the commissures and significant retraction of the subvalvular apparatus;

- At a microscopic level, the most "specific" description was a thickening and retraction of the valves including heavy fibrosis, formed from myofibroblasts in a pauci-cellular matrix of mucopolysaccharides without inflammatory infiltration; the valves showed fibrous plaques formed from myofibroblasts with a matrix of mucopolysaccharides and collagen, causing the retraction of the valves.

The aim of this retrospective study was, as mentioned earlier, to confirm or invalidate the "valve disease" signal. This case-control study analysed all the mitral insufficiencies (MI), both isolated and combined, examined at a specific hospital since 2003. Its objective was to look for a link between exposure to benfluorex and the occurence of cases of unexplained mitral insufficiency. The source population consisted of all the patients hospitalised between 2003 and 2009 in the cardiology department or cardiac surgery service, diagnosed with MI, i.e. 622 patients. The patients with an unexplained MI formed the cases (n=27) and the patients with an explained MI formed the controls (n=54). Two controls were matched to each case based on age and sex criteria. This matching involved neither the diabetes diagnosis nor Body Mass Index. The patient, his/her family and doctors were contacted by telephone to investigate possible exposure to benfluorex using a semi-structured questionnaire, without revealing his/her case/control status.

Of the 27 identified cases, 19 had been exposed to benfluorex compared to 3 controls out of 54 having been exposed to benfluorex ($p<0.001$ i.e. odds-ratio = 40.4 (9.7 – 168.3, 95% CI)).

The adjustment based on different variables such as weight, diabetes or exposure to dexfenfluramine did not modify the signal.

In this study, several potential biases were discussed.

- **Discussions and conclusions**

The MAH reviewed the above mentioned 45 cases of valve disease and based their response on the view of an independent expert to whom the narratives of these 45 cases were entrusted for analysis. The expert analysis concerned:

- The existence or not of anatomical documentation obtained during cardiac valve surgery in patients who had been operated,

- The existence or not of echocardiography documentation for the patients who had not been operated.

The imputability analysis was performed according to published criteria for the relationship of a cardiac valve disease to a drug treatment.

Among the 17 cases of operated cardiac valve diseases, the MAH considers that:

- 6 cases characterised by histological observations corresponding to the descriptions of drug-related cardiac valve diseases and for which there is no other attributable medicinal product administration are strongly suggestive of a drug-induced cardiac valve disease related to benfluorex;

- 6 cases are possibly related to benfluorex due to compatible echocardiography or macroscopic observations, but without histological confirmation and without being able to formally discard the alternative rheumatism aetiology. Patients' age could be an indication of a rheumatism cause, as too their geographical origin, though this last criterion was not available in the case narratives;

- 3 cases have low benfluorex imputability, where the lack of any echocardiography or macroscopic documentation does not allow the exclusion of another cardiac valve disease aetiology;

- 2 cases have a description of lesions suggesting another aetiology, therefore with a very low imputability.

Among the 15 patients who had not been operated but for whom the echocardiography describes the valvular lesions, the MAH considers that:

- 10 cases have possible benfluorex imputability, as the valvular lesions are compatible, although the alternative rheumatism aetiology could not be discarded, with the same comment as before concerning the age and geographical origin;

- 5 cases have very low benfluorex imputability as the medical history or the echocardiography descriptions suggest another cardiac valve diseasescause.

In 13 cases, no echocardiography documentation of the valvular lesions was available and therefore the MAH considers that no conclusion can be reached on the degree of imputability of benfluorex.
In conclusion, according to the MAH:

- the benfluorex imputability seems probable in 6 cases and possible in 16 cases, while the main alternative is a rheumatism-related cardiac valve disease;

- the imputability is low in16 cases where the presence of valvular regurgitations is difficult to interpret in the absence of any details concerning the valvular anatomy;

- finally, the imputability is very low in 7 cases for which another aetiology seems more likely.

The Member State acknowledged the methodological shortcomings of this retrospective case-control study, as addressed by the MAH; although these methodological shortcomings might produce a difference in risk to some extent, it was concluded that the significant difference observed is not fully explained by the shortcomings and hence that the signal of a link between exposure to benfluorex and the occurrence of valvulopathy was confirmed.

After reviewing the above mentioned data provided by the MAH and the Member State, the CHMP is of the opinion that the aforementioned association between exposure to benfluorex and the occurrence of valvular abnormality is most likely established.

3 - The REGULATE study

Following the results from the pharmacovigilance survey, the market leader proposed to conduct two studies: an anatomopathological study on an exposed/unexposed basis (refused on methodological grounds) and a case control study. Finally only the REGULATE study, which had already been conducted and whose preliminary results were available, provided additional safety and efficacy data.

As mentioned by the MAH in their written response, the REGULATE study, sponsored by the brand leader, started before the emergence of the safety signal.

The Member State was provided on 29 September 2009 with the preliminary results of this study.

Presentation of the study

This was a multi-centre, randomised, double-blind study controlled against pioglitazone, lasting 52 weeks, comparing for 847 type-2 diabetic patients, insufficiently controlled by sulphonylureas (SU), the efficacy and safety of treatment with Benfluorex at the maximum recommended dose (450mg/day, 1 tablet at mealtimes, 3 tab/day), with treatment with pioglitazone at the maximum recommended dose (45 mg/day, 1 tablet with breakfast)

The aim of this new study was to compare the efficacy and safety of treatment with Benfluorex compared to treatment with pioglitazone, in combination with a SU, on glycaemic control and lipid profile.

- The principal objective was to demonstrate the non-inferiority of the combination of SU and benfluorex compared to the combination of SU and pioglitazone on the changes to HbA1c.

- The secondary objective was to demonstrate the superiority of benfluorex combined with SU compared to pioglitazone combined with SU on the level of cholesterol.

- The other secondary objectives were to assess and compare these combinations after 1 year of treatment on fasting blood glucose, fasting insulinaemia and cardiovascular risk as well as the safety and cost of these two treatments. It should be noted that an echocardiogram was recorded at t_0 before treatment initiation and at the end of the treatment, t_{52wk}.

The primary efficacy criterion was HbA1c measured at each visit (inclusion, 4, 8, 16, 28, 40 and 52 weeks). The secondary criteria were lipid parameters (LDL-cholesterol, total cholesterol, HDL-cholesterol, triglycerides at each visit), fasting blood glucose (FBG), fasting insulinaemia (HOMA-IR), C-reactive protein, waist measurement, weight.

The safety parameters were adverse events, hypoglycaemia, biological parameters, cardiac examination (ECG, echocardiogram upon inclusion and after 12 months)

Discussion and conclusion on safety in the REGULATE study

The frequency of undesirable effects was comparable between the two groups (63.7% in the benfluorex group compared to 62.9% in the pioglitazone group).

- The most frequent undesirable effects were infections and infestations, gastro-intestinal disorders, and musculoskeletal disorders.
- The emergent adverse events in the benfluorex group were hypoglycaemia and diarrhoea.
- Two patients in the benfluorex group compared to 3 in the pioglitazone group suffered a myocardial infarction, 0 compared to 1 for angina pectoris, 1 compared to 0 for congestive heart failure, 0 compared to 1 for ischemia, 0 compared to 1 for acute coronary syndrome and 1 compared to 0 for congestive cardiomyopathy.
- Finally, there were two deaths in the benfluorex group compared to 4 in the pioglitazone group: these deaths were not linked to the treatments.

More specifically, regarding the cardio-vascular safety profile, 614 patients, 309 in the benfluorex group and 305 in the pioglitazone group, had an echocardiogram at t_0 and $t_{52\ weeks}$, after exposure to the treatments for an average of 328 days.

This study revealed in the group treated with benfluorex compared to the pioglitazone group, the emergence of statistically-significant functional valve anomalies, 26.5% compared to 10.9%, ($p<0.0001$), as well as non-statistically-significant morphological valve anomalies (2.6% compared to 1.3% respectively, $p=0.264$). The functional anomalies that appeared with benfluorex had no clinical impact.

These emergent anomalies are presented in table 1, below.

Table 1

Emergent valvular functional abnormality according to grade (ECHO2)

Emergent valvular abnormality	Grade Baseline to last		Benfluorex	Pioglitazone
Aortic regurgitation		n	309	302
(N = 611)	Grade 0 to 1	n (%)	40 (12.9)	3 (1.0)
	Grade 0 to 2	n (%)	1 (0.3)	-
	Grade 1 to 2	n (%)	1 (0.3)	-
Mitral regurgitation		n	309	300
(N = 609)	Grade 0 to 1	n (%)	21 (6.8)	13 (4.3)
	Grade 1 to 2	n (%)	1 (0.3)	1 (0.3)
Tricuspid regurgitation		n	304	299
(N = 603)	Grade 0 to 1	n (%)	33 (10.9)	15 (5.0)
	Grade 1 to 2	n (%)	-	2 (0.7)
Emergent clinically relevant valvular abnomalities (grade > 1)				
(N = 612)		n	309	303
		n (%)	2 (0.7)	3 (1.0)
Statistical analysis		OR (1)	0.65	
		95% CI (2)	[0.11 ; 3.94]	
		p-value (3)	0.642	

n: number of patients in the valvular Set ; Grade 0: absent; grade 1: trivial; grade 2: mild; % calculated as number of patients affected x 100/total number of patients in the group; (1) Odds Ratio; (2) 95% Confidence interval of the odds ratio; (3) Wald test

Regarding the type of anomalies observed, the MAH considers that most valve anomalies seen during the study (and only those for which any significant difference exists between the benfluorex group and the pioglitazone group) are of "trivial" grade, i.e. lower than grade 1 in the official classification quantifying aortic and mitral valve regurgitation, which comprises 3 grades: "mild" (grade 1),

"moderate" (grade 2) and "severe" (grade 3). Moreover, to the MAH's opinion, the « trace » abnormalities are in general stable and can regress.

In their response the MAH concluded as follows:

- on the above-mentioned anomalies:

"Trivial regurgitation is extremely common in the mitral and tricuspid valves, and a little less frequent in the aortic valve, but is generally considered practically physiological. It is asymptomatic, producing no discernible murmur on auscultation, and is thus only discovered on echocardiography. The likelihood of progression is not known with any accuracy, but comparison of the frequency of progression in these instances with that of more severe cardiac valve disease suggests little or no evolution in the majority of cases. The official recommendations concerning trivial regurgitation do not call for any special monitoring protocol."

- on the risk of worsening of these functional anomalies:

"The rapidity of change in valve disease has been assessed only from the "mild" state (grade 1) onwardsand depends upon aetiology. Rheumatic cardiac valve disease progresses slowly. Degenerative cardiac valve diseases progress more rapidly but with wide variation between individuals. There is currently no treatment available to slow down the progression of constituted (mild) degenerative or rheumatic valve disease. However, regression and stabilisation have been described with anorexigenic products after discontinuation of therapy"

The CHMP took into consideration the above response from the brand leader. However the CHMP is of the opinion that despite the methodological shortcomings of this study, the results issued from the prospective REGULATE study suggest a significant increase in valve disease in the treatment arm with benfluorex (26.5% vs 10.9 %, p <0.0001), which in some cases were accompanied by morphological changes (2.6% vs 1.3%, p <0.264). The CHMP therefore considers that although the difference may not be statistically significant it is nonetheless, clinically significant.

4 – Results of a Cohort Study conducted by the French National Insurance Fund (CNAM).

Presentation of the study

This was an exposed/unexposed cohort study, whose principle objective was to look for a possible link between exposure to benfluorex and the occurrence of valve diseases.

The results concerned 1,092,858 diabetic patients of between 40 and 69 years old, including 43,208 who were exposed to benfluorex in 2006.

The risk of hospitalisation in 2007 as a result of valve insufficiency was 81/100,000 in the exposed group compared to 29/100,000 in the unexposed group, i.e. a risk multiplied by 2.77 (CI 95 [1.95: 3.93]). The risk of hospitalisation as a result of mitral insufficiency was multiplied by 2.66 (CI 95 [1.7: 4.1]). Furthermore, the risk of valve replacement surgery requiring cardiopulmonary bypass, all causes included, was multiplied by 3.4 (CI 95 [1.9: 6.1]). The absolute and relative risks in 2008 were very similar to those observed in 2007.

Discussion and conclusion on safety in the CNAM Cohort study

Results of this additional study have been provided and commented in the MAH's response document to the list of questions adopted by the CHMP. Imprecision regarding information about the diagnosis of cardiac valve disease was pointed out by the MAH in addition to the limited number of patients identified as presenting cardiac valve disease and treated with benfluorex (35 patients).

Despite these comments, these data further confirmed the safety signal of cardiac valve disorders disease risk with benfluorex.

5- Conclusions

Based on the pharmacovigilance data and the retrospective case-control study presented earlier, the CHMP considers that the signal of a link between exposure to benfluorex and the occurrence of cardiac valve diseases is confirmed. The Committee is of the opinion that the signal was supported by the results shown in the REGULATE study which revealed the occurrence of morphological and functional valve anomalies after an average of only 328 days' exposure.

Regarding spontaneous reporting data, the CHMP explains the absence of a significant number of individual case safety reports in relation to the total exposure of Benfluorex over the years by considering the type of effect, i.e. long term, cumulative: spontaneous reporting data alone is not the best method to assess risk and frequency of event. Hence, absence of data does not provide evidence on the inexistence of risk.

The time to event, which is prolonged with the use of benfluorex, could derive from a dose-response that produces cumulative, long term effects.

Therefore, the CHMP is of the opinion that aggravation of the functional anomalies in case of prolonged exposure could not be ruled out, particularly given the prolonged use of the product based on utilisation data, which showed an average exposure time of 3 years.

2.3 Benefit Risk Assessment

Updated results of the pharmacovigilance survey regarding the risk of cardiac valve diseases with benfluorex and data from a recent publication on this subject (K. Boutet *Fenfluramine-like cardiovascular side-effects of benfluorex*, Eur Respir. J. 2009; 33: 684-688) lead to the conclusion of an existence of cardiac valvulopathy and PHT in the general population of patients using benfluorex.

In addition, the retrospective case-control study conducted in accordance with the French Competent Authority in order to look for a link between exposure to benfluorex and the occurrence of unexplained mitral insufficiency (retrospective case-control study performed in a Brest hospital), establishes an association between the exposure to benfluorex and the occurrence of valvulopathy.

Based on the aforementioned data, the CHMP considers that the signal of a link between exposure to benfluorex and the occurrence of cardiac valve diseases is confirmed. The Committee is of the opinion that the signal is supported by the results shown in the REGULATE study which confirms the risk of valvulopathy with benfluorex and reveals the occurrence of morphological and functional valve anomalies after an average of only 328 days of exposure.

Finally, the results of an additional study (cohort study conducted by the French National Insurance Fund) were commented by the MAH in their response document to the List of Questions adopted by the Committee. The imprecision regarding information about the diagnosis of cardiac valve disease and the limited number of patients identified as presenting cardiac valve disease and treated with benfluorex (35 patients) were pointed out by the MAH. However, the CHMP is of the opinion that these data further confirm the safety signal of a risk of cardiac valve disorders with the use of benfluorex.

Regarding spontaneous reporting data, the CHMP explains the absence of a significant number of individual case safety reports in relation to the total exposure of Benfluorex over the years by considering the type of effect, i.e. long term, cumulative: spontaneous reporting data alone is not the best method to assess risk and frequency of event. Hence, absence of data does not provide evidence on the inexistence of risk.

The time to event, which is prolonged with the use of benfluorex, could derive from a dose-response that produces cumulative, long term effects.

Therefore, the CHMP is of the opinion that aggravation of the functional anomalies in case of prolonged exposure could not be ruled out, particularly given the prolonged use of the product based on utilisation data, which showed an average exposure time of 3 years.

As stated in the brand's leader written response, at the time of the national evaluation of the cardiac valvular abnormality, the MAH proposed to maintain benfluorex on the market with a restriction to the indication in patients with no ultrasound evidence of valve anomalies and the implementation of echocardiographic monitoring. The MAH projected to discontinue the treatment in the event of echocardiographic anomalies.

This proposal was rejected by the Member State at the time; the MAH's suggestion is now discarded by the CHMP. The CHMP is of the opinion that additional echocardiographic monitoring as proposed by the MAH could not solve this issue due to the fact that echocardiographic monitoring prevent the use in patients with previous valvulopathy but do not prevent the development in patients who have no previous abnormalities.

Based on the confirmed increased risk of cardiac valvulopathy and the very limited efficacy on glycaemic parameters, the CHMP considers that the MAH's proposal was not acceptable.

3 OVERALL CONCLUSION

The updated results of the second national Pharmacovigilance survey, the preliminary data from 3 clinical studies (the retrospective case-control study performed in a Brest hospital, the REGULATE trial and the data from the French National Insurance Fund) and the recent publication from K. Boutet show the serious risk of cardiac morphological and functional valvulopathies and pulmonary hypertension associated with the use of benfluorex.

Benfluorex is used as an *"Adjuvant therapy of overweight diabetics, in combination with an appropriate diet"*. The MAH, in their written response, considers that there is a consistent significant clinical effect on blood glucose control in all the studies performed with benfluorex in overweight type 2 diabetic patients. However the CHMP, after review of the data provided by the MAH and the Member State, considers that the benefit of benfluorex is only limited in the treatment of type 2 diabetes as an adjunct in the management of type 2 diabetes mellitus in overweight patients.

Taking all these elements into account, the CHMP concluded that the medicinal products containing benfluorex are harmful under the normal conditions of use, and that the benefit/risk balance for benfluorex is not considered favourable. Therefore the Committee recommended the revocation of the Marketing Authorisations for the medicinal products referred to in Annex I.

4 ANNEXES

The list of the names of the medicinal products, Marketing Authorisation Holders, pharmaceutical forms, strengths and route of administration in the Member States are set out in Annex I to the Opinion.

5 ATTACHMENTS

1. Notification of referral for review under Article 107 of Directive 2001/83/EC, as amended received from France on 25 November 2009.
2. Assessment report of France dated 26 November 2009.

3. List of Questions (EMEA/CHMP/776192/2009) as adopted by the CHMP on 2 December 2009.
4. Rapporteur's assessment report on the MAH responses to the List of Questions dated 11 December 2009.
5. Co-rapporteur's assessment report on the MAH responses to the List of Questions dated 11 December 2009.

COMMISSION EUROPÉENNE

Bruxelles, le 14.6.2010
C(2010)4127

DÉCISION DE LA COMMISSION

du 14.6.2010

concernant, dans le cadre de l'article 107 de la directive 2001/83/CE du Parlement européen et du Conseil, les autorisations de mise sur le marché des médicaments à usage humain contenant la substance active «benfluorex»

DÉCISION DE LA COMMISSION

du 14.6.2010

concernant, dans le cadre de l'article 107 de la directive 2001/83/CE du Parlement européen et du Conseil, les autorisations de mise sur le marché des médicaments à usage humain contenant la substance active «benfluorex»

(Texte présentant de l'intérêt pour l'EEE)

LA COMMISSION EUROPÉENNE,

vu le traité sur le fonctionnement de l'Union européenne,

vu la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire relatif aux médicaments à usage humain[1], et notamment son article 107,

vu l'avis de l'Agence européenne des médicaments, formulé le 18 mars 2010 par le comité des médicaments à usage humain, saisi le 2 décembre 2009,

considérant ce qui suit:

(1) Les médicaments à usage humain autorisés par les États membres doivent répondre aux exigences de la directive 2001/83/CE.

(2) À la suite de l'évaluation des données de pharmacovigilance concernant les médicaments à usage humain qui contiennent la substance active «benfluorex», la République française a informé l'agence, conformément à l'article 107, paragraphe 1, de la directive 2001/83/CE, que l'autorisation ou les autorisations de mise sur le marché devaient être suspendues.

(3) Le comité a préparé un avis, dont les conclusions figurent à l'annexe II de la présente décision, recommandant qu'une décision soit prise pour retirer les autorisations de mise sur le marché des médicaments concernés.

(4) Les mesures prévues par la présente décision sont conformes à l'avis du comité permanent des médicaments à usage humain,

[1] JO L 311 du 28.11.2001, p. 67.

A ADOPTÉ LA PRÉSENTE DÉCISION:

Article premier

Les États membres concernés retirent les autorisations nationales de mise sur le marché des médicaments visés à l'annexe I, sur la base des conclusions scientifiques et des motifs de retrait des autorisations de mise sur le marché figurant à l'annexe II.

Article 2

Les États membres sont destinataires de la présente décision.

Fait à Bruxelles, le 14.6.2010

Par la Commission
Paola TESTORI COGGI
Directeur général

ANNEXE I

LISTE REPRENANT LES NOMS DE FANTAISIE, LES FORMES PHARMACEUTIQUES, LE DOSAGE DES MÉDICAMENTS, LA VOIE D'ADMINISTRATION ET LES TITULAIRES DES AUTORISATIONS DE MISE SUR LE MARCHÉ DANS LES ÉTATS MEMBRES (EEE)

Etat membre	Titulaire de l'autorisation de mise sur le marché	Nom de fantaisie	Dosage	Forme Pharmaceutique	Voie d'administration

ANNEXE II

CONCLUSIONS SCIENTIFIQUES ET MOTIFS DU RETRAIT DES AUTORISATIONS DE MISE SUR LE MARCHÉ PRÉSENTÉS PAR L'AGENCE EUROPÉENNE DES MÉDICAMENTS

CONCLUSIONS SCIENTIFIQUES

RÉSUMÉ GÉNÉRAL DE L'ÉVALUATION SCIENTIFIQUE DES MÉDICAMENTS CONTENANT DU BENFLUOREX (voir annexe I)

Le benfluorex est utilisé comme adjuvant dans la prise en charge du diabète de type 2 chez les patients en surcharge pondérale. L'indication thérapeutique actuellement autorisée en France est l'utilisation comme «*Traitement adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*». Le benfluorex agit sur le métabolisme des hydrates de carbone. Chez l'animal, on a pu observer les effets suivants:
- facilitation de la précipitation et de l'utilisation du glucose dans les cellules (rat);
- réduction de l'hyperglycémie chez le rat diabétique (privé ou non d'insuline), diminution de l'hyperglycémie (mesurée par l'aire de test de tolérance au glucose) chez le lapin.
Le benfluorex n'a aucune action sur la sécrétion d'insuline.

Les médicaments à base de benfluorex sont autorisés dans quatre États membres de l'UE sous une formulation en comprimés, le produit n'ayant été commercialisé que dans deux pays (la France et le Portugal) jusqu'au retrait des autorisations de mise sur le marché en novembre 2009 (voir annexe I pour la liste des médicaments à base de benfluorex autorisés dans l'UE). À Chypre et au Luxembourg, les médicaments contenant du benfluorex n'étaient plus commercialisés.

Le 25 novembre 2009, l'autorité compétente française (Afssaps) a émis une alerte rapide informant les États membres, l'Agence européenne des médicaments et la Commission européenne, conformément à l'article 107 de la directive 2001/83/CE, telle que modifiée, de sa décision de suspendre les autorisations de mise sur le marché pour tous les médicaments contenant du benfluorex en France, en raison d'une augmentation du risque de signal de cardiotoxicité (maladies valvulaires cardiaques) avec le benfluorex.

La décision de l'autorité compétente française était fondée sur les résultats actualisés d'une étude de pharmacovigilance, les données préliminaires de 3 études cliniques (l'étude rétrospective cas-témoin réalisée dans un hôpital de Brest, l'essai REGULATE et les données du fonds national d'assurance maladie française) et d'une publication récente (K. Boutet *Fenfluramine-like cardiovascular side-effects of Benfluorex,* Eur. Respir. J. 2009; 33: 684-688), qui ont décelé un risque de maladies des valves cardiaques et d'hypertension pulmonaire (HTP) chez les patients traités par le benfluorex.

Après réception de l'avis d'alerte rapide, l'autorité compétente portugaise a également décidé de suspendre l'autorisation de mise sur le marché de tous les médicaments à base de benfluorex au Portugal, le 30 novembre 2009.

Le CHMP a examiné la question conformément à l'article 107, paragraphe 2, de la directive 2001/83/CE, telle que modifiée, dans le cadre d'une procédure écrite lors des réunions plénières du CHMP de décembre 2009 et de mars 2010.

Sécurité

Les résultats actualisés de l'étude de pharmacovigilance concernant le risque de maladies des valves cardiaques avec le benfluorex et les données d'une publication récente sur ce sujet (K. Boutet *Fenfluramine-like cardiovascular side-effects of Benfluorex,* Eur. Respir. J. 2009; 33: 684-688) ont amené à conclure à l'existence d'une valvulopathie cardiaque et d'HTP dans la population générale des patients utilisant le benfluorex.

De plus, l'étude rétrospective cas-témoin réalisée à Brest afin de chercher un lien entre l'exposition au benfluorex et la survenue d'unc insuffisance mitrale inexpliquée établit une association entre l'exposition au benfluorex et l'apparition d'une valvulopathie.

Sur la base des données susmentionnées, le CHMP considère que le lien entre l'exposition au benfluorex et la survenue de maladies des valves cardiaques est confirmé. Le comité est d'avis que le lien est étayé par les résultats obtenus dans l'étude REGULATE, qui confirme le risque de valvulopathie avec le benfluorex et révèle l'apparition d'anomalies morphologiques et fonctionnelles des valves après seulement 328 jours d'exposition en moyenne.

En outre, les résultats d'une autre étude (étude de cohorte menée par le Fonds national de l'assurance maladie française) ont fait l'objet de commentaires de la part du TAMM dans son document de réponse à la liste de questions adoptée par le comité. Le manque de précision des informations relatives au diagnostic de maladie des valves cardiaques et le nombre limité de patients identifiés comme présentant une maladie des valves cardiaques et traités par le benfluorex (35 patients) ont été soulignés par le TAMM. Le CHMP maintient cependant son avis que ces données confirment elles aussi le signal de sécurité indiquant un risque de maladie des valves cardiaques lors de l'utilisation du benfluorex.

Enfin, se fondant sur les sources de données disponibles, le CHMP estime que le nombre de rapports spontanés de valvulopathies cardiaques associées au benfluorex est considérablement sous-estimé en raison du volume limité de données recueillies à partir des rapports spontanés dans cette situation, comme par exemple:
- le type d'effet du benfluorex (valvulopathie qui reste cliniquement asymptomatique pendant une longue période);
- le temps écoulé avant la survenue de l'événement (une très longue période d'exposition au benfluorex est nécessaire pour induire des modifications valvulaires).

Par conséquent, le CHMP considère que l'aggravation des anomalies fonctionnelles en cas d'exposition prolongée ne pouvait pas être exclue, en particulier au vu de l'utilisation prolongée du produit sur la base de données d'utilisation qui ont fait apparaître un temps d'exposition moyen de 3 ans.

Comme le déclare le TAMM dans sa réponse par écrit, au moment de l'évaluation nationale de l'anomalie valvulaire cardiaque, il a proposé de maintenir le benfluorex sur le marché avec une restriction pour l'indication chez les patients ne présentant pas de signes d'anomalies valvulaires à l'échographie et la mise en œuvre d'une surveillance échocardiographique. Le TAMM a prévu d'interrompre le traitement en cas d'anomalies échocardiographiques.

Le CHMP n'a pas accepté cette proposition. Il estime que la surveillance échocardiographique additionnelle proposée par le TAMM ne pourrait pas apporter de solution à ce problème, du fait que la surveillance échocardiographique évite l'utilisation chez des patients présentant une valvulopathie antérieure, mais n'en évite pas le développement chez des patients qui ne présentent pas d'anomalies antérieures.

Rapport bénéfice/risque

Le benfluorex est utilisé comme «*Traitement adjuvant du régime adapté chez les diabétiques avec surcharge pondérale*». Dans sa réponse par écrit, le TAMM considère qu'il y a un effet clinique significatif consistant sur le contrôle de la glycémie dans toutes les études réalisées avec le benfluorex chez des patients en surcharge pondérale présentant un diabète de type 2. Toutefois, le CHMP constate que le benfluorex est approuvé uniquement en tant que traitement adjuvant dans le traitement du diabète de type 2 chez les patients en surcharge pondérale: sur la base d'une importance très limitée de l'efficacité chez les patients diabétiques, il n'a jamais été accordé une indication en tant que monothérapie pour le traitement du diabète pour le benfluorex. En conséquence, le CHMP, après examen des données fournies par le TAMM et l'État membre, considère que le bénéfice du benfluorex n'est que limité dans la prise en charge du diabète de type 2.

Les résultats actualisés de la seconde étude nationale de pharmacovigilance, les données préliminaires de 3 études cliniques (l'étude rétrospective cas-témoin réalisée dans un hôpital de Brest, l'essai

REGULATE et les données de l'étude du Fonds national de l'assurance maladie française), ainsi que la publication récente de K. Boutet, démontrent le risque grave de valvulopathies cardiaques morphologiques et fonctionnelles et d'hypertension pulmonaire, associé à l'utilisation du benfluorex.

Le comité a noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue; cela suscite une inquiétude particulière étant donnée l'utilisation prolongée du produit, avec une durée d'exposition moyenne de 3 ans (sur la base des données d'utilisation).

Compte tenu de tous ces éléments, le CHMP a conclu que les médicaments à base de benfluorex sont nocifs dans les conditions normales d'utilisation et que le rapport bénéfice/risque pour benfluorex n'est pas considéré comme étant favorable. En conséquence, le comité a recommandé le retrait des autorisations de mise sur le marché pour les médicaments mentionnés dans l'annexe I.

MOTIFS DU RETRAIT DES AUTORISATIONS DE MISE SUR LE MARCHÉ

Considérant que

- le comité a pris en considération la procédure au titre de l'article 107 de la directive 2001/83/CE, telle que modifiée, pour les médicaments à base de benfluorex;

- le comité a conclu, après avoir examiné les données disponibles, que l'utilisation du benfluorex est nocive dans les conditions normales d'utilisation et conduit à une hypertension pulmonaire et à des valvulopathies cardiaques. Ces valvulopathies peuvent induire un affaiblissement progressif de la fonction cardiaque et des symptômes cliniques associés nécessitant, dans les cas graves, une chirurgie cardiaque;

- le comité a noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue, ce qui suscite une inquiétude particulière étant donné l'utilisation prolongée du produit, avec une durée d'exposition moyenne de trois ans (sur la base de données d'utilisation);

- le comité a examiné le rapport bénéfice-risque du benfluorex dans les conditions normales d'utilisation et a estimé que le risque prouvé susmentionné de maladie des valves cardiaques n'est pas acceptable, compte tenu du fait que le bénéfice du benfluorex n'est que limité dans le traitement du diabète de type 2;

- le comité, à la lumière des résultats ci-dessus, a conclu que le rapport bénéfice/risque des médicaments à base de benfluorex n'est pas favorable dans les conditions normales d'utilisation.

En application des dispositions de l'article 107, paragraphe 2, de la directive 2001/83/CE, telle que modifiée, le comité des médicaments à usage humain (CHMP) de l'Agence recommande le retrait des autorisations de mise sur le marché pour tous les médicaments à base de benfluorex énumérés dans l'annexe I.

Madame,

Je vous prie de bien vouloir trouver ci-joint la décision de retrait de l'autorisation de mise sur le marché de la spécialité pharmaceutique :

MEDIATOR 150 mg, comprimé enrobé.

La présente décision peut faire l'objet d'un recours contentieux devant la juridiction administrative compétente dans un délai de deux mois à compter de la date de réception.

Je vous prie d'agréer, Madame, l'expression de ma considération distinguée.

DECISION

du 20 JUIL. 2010

portant retrait de l'autorisation de mise sur le marché du médicament :

MEDIATOR 150 mg, comprimé enrobé

LE DIRECTEUR GENERAL DE L'AGENCE FRANCAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE

Vu la directive 2001/83/CE du Parlement européen et du Conseil du 6 novembre 2001 instituant un code communautaire relatif aux médicaments à usage humain, notamment l'article 107 ;

Vu le code de la santé publique, cinquième partie, notamment les articles L. 5121-9, L. 5121-20, R. 5121-21 et suivants, ainsi que l'article R.5121-158 ;

Vu la décision du Directeur général de l'Agence française de sécurité sanitaire des produits de santé (Afssaps) en date du 24 novembre 2009, portant suspension à compter du 30 novembre 2009 de l'autorisation de mise sur le marché (AMM) de la spécialité pharmaceutique MEDIATOR 150 mg, comprimé enrobé et ce, dans l'attente de la décision de la Commission européenne prise en application de l'article 107 de la directive susmentionnée ;

Vu l'avis de l'Agence Européenne des Médicaments (EMA) formulé le 18 mars 2010 par le Comité des Médicaments à Usage Humain (CHMP) ;

Vu la décision de la Commission européenne en date du 14 juin 2010, jointe en annexe à la présente décision ;

Vu l'avis de la Commission d'AMM prévu à l'article R. 5121-50 du code de la santé publique, en date du 1er juillet 2010, par lequel elle se prononce contre le maintien sur le marché de la spécialité pharmaceutique MEDIATOR 150 mg, comprimé enrobé ;

Vu la lettre du 6 juillet 2010 informant Les Laboratoires Servier de l'intention de l'Afssaps de retirer l'AMM de la spécialité pharmaceutique MEDIATOR 150 mg, comprimé enrobé et les invitant à présenter leurs observations ;

Vu la réponse des Laboratoires Servier en date du 15 juillet 2010 ;

Considérant le principe général de prééminence de la protection de la santé publique énoncé par le second considérant de la directive 2001/83/CE précitée ;

Considérant qu'aux termes des articles L.5121-9 et R.5121-47 du code de la santé publique, l'AMM peut être retirée notamment lorsque l'évaluation des effets thérapeutiques positifs du médicament au regard des risques pour la santé du patient ou la santé publique liés à sa qualité, sa sécurité ou son efficacité n'est pas considérée comme favorable ou lorsque l'effet thérapeutique annoncé fait défaut ;

Considérant que les notions de nocivité et d'effet thérapeutique ne peuvent être examinées qu'en relation réciproque et n'ont de signification relative qu'appréciées en fonction de l'état d'avancement de la science et compte tenu de la destination du médicament ;

Considérant que l'exigence d'une évaluation du rapport bénéfice/risque présenté par un médicament ne vise pas exclusivement l'octroi de l'AMM, mais implique une évaluation continue ;

Considérant l'alerte rapide émise par l'Afssaps le 25 novembre 2009, informant l'ensemble des Etats membres, l'EMA et la Commission européenne conformément à l'article 107 de la directive 2001/83/CE précitée, de sa décision de suspendre les AMM de tous les médicaments contenant du benfluorex en France, en raison de l'augmentation du risque de cardiotoxicité (maladies valvulaires cardiaques) ;

Considérant qu'au terme de l'évaluation qu'il a menée et ayant concerné l'ensemble des médicaments contenant du benfluorex autorisés dans l'Union européenne, le CHMP de l'EMA a conclu que l'utilisation du benfluorex est nocive dans les conditions normales d'utilisation et conduit à des valvulopathies cardiaques. Ces valvulopathies peuvent induire une altération progressive de la fonction cardiaque et des symptômes cliniques associés nécessitant, dans les cas graves, une chirurgie cardiaque de remplacement des valves. Il a également noté que des anomalies valvulaires cardiaques morphologiques et fonctionnelles peuvent s'observer après seulement 328 jours d'exposition en moyenne. En outre, une aggravation des anomalies fonctionnelles en cas d'exposition prolongée n'est pas exclue, ce qui suscite une inquiétude particulière étant donné l'utilisation prolongée du produit, avec une durée moyenne d'exposition de trois ans (sur la base de données d'utilisation) ;

Considérant qu'après avoir examiné le rapport bénéfice/risque du benfluorex dans les conditions normales d'utilisation, il a estimé que le risque prouvé susmentionné de maladie des valves cardiaques n'est pas acceptable, compte tenu du fait que le bénéfice du benfluorex n'est que limité dans le traitement du diabète de type 2 ;

Considérant que, au vu de ces éléments, le CHMP a adopté le 18 mars 2010 un avis recommandant à la Commission européenne d'enjoindre aux Etats membres de retirer les AMM de tous les médicaments à base de benfluorex ;

Considérant que suite à cet avis, la Commission européenne a, par décision du 14 juin 2010, demandé aux Etats membres concernés de retirer les AMM délivrées au niveau national des médicaments contenant du benfluorex, dont votre spécialité MEDIATOR 150 mg, comprimé enrobé et ce, en application des dispositions de l'article 107, paragraphe 2 de la directive 2001/83/CE précitée, au motif que l'évaluation des effets thérapeutiques positifs de ces produits au regard des risques pour la santé du patient liés à leur sécurité n'est pas favorable dans les conditions normales d'emploi ;

Considérant l'obligation incombant aux Etats membres de l'Union européenne de prendre toute mesure nécessaire à la mise en œuvre d'une décision de la Commission européenne prise dans le cadre de l'article 107 de la directive 2001/83/CE précitée ;

DECIDE:

ARTICLE 1er
L'autorisation de mise sur le marché octroyée validée le 22 avril 1987 à la spécialité pharmaceutique dénommée :

MEDIATOR 150 mg, comprimé enrobé,

dont le titulaire est :
LES LABORATOIRES SERVIER

est retirée sous toutes ses présentations.

ARTICLE 2
Le titulaire doit prendre toutes dispositions, notamment auprès des détenteurs de stocks, en vue de faire cesser la délivrance au public de la spécialité.

ARTICLE 3
Conformément au 3ème alinéa de l'article L. 5124-11 du code de la santé publique, l'exportation de la spécialité est interdite.

ARTICLE 4
Le Directeur de l'Evaluation des Médicaments et des Produits Biologiques et le Directeur de l'Inspection et des Etablissements sont chargés, chacun en ce qui le concerne, de l'exécution de la présente décision qui sera publiée par extrait au journal officiel de la République Française.

Fait à Saint-Denis, le 20 JUIL. 2010

Le Directeur Général

Jean MARIMBERT

Fabienne BARTOLI - Demande de l'IGAS concernant les DPI

De : Fabienne BARTOLI
À : aquilino morelle
Date : Lundi 10 Janvier 2011 20:20
Objet : Demande de l'IGAS concernant les DPI
CC : Anne-Carole.BENSADON@igas.gouv.fr; Etienne Marie; Jean MARIMBERT; eti...
Pièces jointes : DPI experts externes - SERVIER.xls

Bonsoir,

Comme convenu à l'instant avec aquilino, je vous envoie l'état récapitulatif (sous forme de tableau) des déclarations publiques d'intérêts des experts externes ayant déclaré un lien avec le laboratoire SERVIER depuis 1999.

A noter : les déclarations d'intérêts de Pierre DEMOLIS, Philippe LECHAT et Carmen KRET-JAIS sont mentionnées dans cette requête en tant qu'anciens experts externes.
Toutefois, les liens déclarés sont relativement anciens (il date de 1999 pour Mme KERFT-JAIS...)

Nous restons à votre disposition pour toute question complémentaire sur ce sujet

Cordialement,

FB
