Dans 7 cas l'histologie n'a pas permis de confirmer le diagnostic (3 cas) ou n'a pas été réalisée (4 cas). Parmi les 9 cas dont l'histologie confirmait le diagnostic, 8 patients recevaient du fluconazole.
Il s'agit de patients atteints de SIDA (CD4<30/mm3). Le délai d'apparition est compris entre 10 jours et 1 an et demi. Le traitement par fluconazole est utilisé à la posologie recommandée et l'apparition d'une M.A.T. n'a pas conduit à l'arrêt du traitement. L'évolution a été fatale dans 6 cas en 2 semaines à 8 mois et 2 fois stabilisée par des échanges plasmatiques répétés. Tous ces patients présentaient des facteurs de risque associés : infection à CMV (7), candidose (7), ainsi que des comédications : cotrimoxazole (7), ganciclovir (6) et zidovudine (4). L'imputabilité du fluconazole reste douteuse pour ces 8 observations.
L'analyse de l'étude cas-témoins montre une association significative entre l'apparition de M.A.T. et l'infection à CMV, la prise de fluconazole, ainsi que les deux associés.
Cependant, la méthodologie de cette étude paraît discutable notamment dans la sélection des cas, le diagnostic n'étant confirmé que dans 9 des 16 cas.

Les résultats ne permettent donc pas de confirmer ou d'infirmer le rôle du fluconazole dans la survenue de M.A.T. Les nouveaux cas de M.A.T. continuent d'être inclus dans l'étude. L'enquête officieuse reste donc ouverte.

Annexe 3-4

XII - Suivi de l'enquête ZAGAM® (sparfloxacine)

Le premier bilan présenté au dernier Comité Technique faisait état de 208 cas de phototoxicité avec 83 cas cliniquement graves (15,6%).

Au 31.05.1995, 371 observations ont été recueillies dont 22,3% présentent des lésions de brulûres graves (phlyctènes).

Certains paramètres sont précisés :

- le délai de survenue ainsi que la durée du traitement sont plus courts : 1,5 jours au lieu de 3, 3 jours au lieu de 5. L'influence de l'exposition solaire sur la gravité clinique se confirme mais il reste un certain nombre de cas où les lésions apparaissent sans exposition directe au soleil.

- la fréquence de survenue du mois de mai diffère peu du mois d'avril : 1 cas pour 683 patient et 1 pour 790 en avril.

Des mesures ont été prises à partir du 1er juin à la suite de la Commission Nationale de Pharmacovigilance du 24 mai 1995 : restrictions d'indications, renforcement de l'information sur la phototoxicité (nouveau RCP, lettre aux médecins et pharmaciens).

Les cas analysés survenant en juin sont actuellement au nombre de 12 avec 3 cas graves cliniquement (1/569). La fréquence reste élevée mais il est difficile de comparer cette fréquence aux chiffres précédents. La surveillance intensive doit se poursuivre pendant les mois ensoleillés avec une prochaine présentation au Comité Technique de septembre.

Un avis est demandé aux membres du Comité Technique sur le projet de feuille de recueil des cas de phototoxicité sous ZAGAM®. Il est souhaité de mieux présenter le paragraphe "Indications", et d' identifier le patient par ses initiales au lieu des trois première lettres.
Cette fiche sera à adresser au centre de Nancy qui effectuera la centralisation.

Il apparaît que certains médecins hospitaliers n'ont pas reçu le courrier d'information du laboratoire.

Les autres effets secondaires comprennent :

- 111 effets musculo-squelettiques dont 83 tendinites et 5 ruptures tendineuses,
- 100 effets neuro-psychiatriques (vertiges, ébriété, céphalées, insomnie, cauchemars, hallucinations, dysesthésies),
- 94 effets cutanés en dehors des cas de phototoxicité (essentiellement des réactions allergiques),
- 53 effets digestifs (nausées, vomissements, diarrhée, constipation, gastralgies),
- 39 réactions anaphylactiques,
- 11 observations d'élévation des transaminases,
- 7 atteintes hématologiques.

Les effets cardiologiques ont déjà fait l'objet d'une présentation au Comité Technique du mois de mai.

Annexe 3-4

XIII - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE DE LA SPECIALITE SORIATANE® (acitrétine)

Le C.R.P.V. de Reims a examiné la demande de modification d'information des laboratoires Roche concernant l'interaction entre l'alcool et l'acitrétine.

En 1990, une étude multicentrique cinétique menée dans les pays nordiques et en Angleterre a mis en évidence dans le plasma de patients traités par acitrétine (demi-vie = 50h) de l'étrétinate de demi-vie beaucoup plus longue (80 à 100j). Il apparait nécessaire de prendre en compte cette donnée afin de proposer une période de contraception adaptée à l'arrêt du traitement par l'acitrétine.

De plus, des études in vitro ont montré que l'éthanol pouvait favoriser dans la transformation de l'acitrétine en étrétinate. En 1992, une étude cinétique comparant la formation d'étrétinate à partir d'acitrétine en présence ou en l'absence d'alcool, montre qu'après absorption concomitante d'alcool, l'étrétinate a été retrouvé chez tous les sujets. En revanche, les taux d'étrétinate restaient inférieurs à la limite de quantification de la méthode de dosage lorsque l'acitrétine était administrée seule.

La mention dans les RCP d'une interaction avec l'alcool, d'une précaution d'emploi déconseillant la prise de boissons alcoolisées pendant le traitement et la conservation des mesures de contraception inchangées et identiques à celles initialement arrêtées pour l'étrétinate semblent donc justifiées. Le dossier sera présenté lors d'une prochaine Commission Nationale de Pharmacovigilance, après la recherche d'information complémentaire sur le seuil plasmatique d'action tératogène de l'étrétinate.

Annexe 3-4

XIV - ENQUETE OFFICIELLE SUR LES EFFETS INDESIRABLES DU MEDIATOR®

Le C.R.P.V. de Besançon a présenté les premières données issues de l'enquête officielle de pharmacovigilance sur les effets indésirables du benfluorex (MEDIATOR®), commercialisé par les laboratoires Servier.

Le benfluorex, indiqué comme adjuvant du régime adapté des hypertriglycéridémies et dans le diabète asymptomatique avec surcharge pondérale, possède une structure voisine de celle des anorexigènes.

Un total de 210 dossiers d'effets indésirables ont été recueillis. Ils sont majoritairement observés dans le cadre de polythérapies associant le MEDIATOR®. Il s'agit notamment d'atteintes hépatiques (hépatites mixtes, cytolytiques, cholestatiques et élévations de transaminases), d'atteintes hématologiques (leucopénie, hyperlymphocytose, thrombopénies isolées ou associées à une leucopénie, lymphopénie ou anémie), des effets cardio-vasculaires et des effets cutanés et allergiques (notamment 3 chocs anaphylactiques avec réadministration positive).

Dix notifications spontanées concernent des hypertensions pulmonaires d'allure primitive : 9 font partie de l'enquête sur les anorexigènes présentée en avril 1995, seul un cas est survenu postérieurement. Six d'entre elles ont été validées par l'expert et atteignent 4 femmes et 2 hommes âgés de 42 à 57 ans. Dans 3 cas, la chronologie d'apparition de la dyspnée est compatible avec la prise d'anorexigènes et de MEDIATOR®. Aucun cas n'a été observé lors d'une monothérapie par le benfluorex.

Depuis la commercialisation en 1976, les chiffres de vente sont en augmentation régulière, les prescriptions étant destinées à des femmes dans 2 cas sur 3.

Le Comité Technique prend note qu'il n'existe aucun cas d'hypertension pulmonaire d'allure primitive résultant d'une monothérapie au MEDIATOR® et souhaite que l'enquête reste ouverte.

XVI - QUESTIONS DIVERSES

- Le Comité technique de pharmacovigilance demande qu'une réflexion approfondie soit menée sur le rapport bénéfice/ risque de l'utilisation des gammaglogulines antitétaniques par rapport à la vaccination.

- Des irritations locales des mains ont été signalées lors de l'utilisation d'un savon contenant un antiseptique (Pousse-mousse Antibactérien®). Un courrier sera envoyé à l'unité de Pharmacovigilance qui transmettra au service compétent.

- Suite à une observation rapportant un mésusage d'IMIGRANE® échantillon médical, le Comité technique souhaiterait savoir s'il était prévu que les laboratoires Glaxo délivrent des échantillons gratuits de cette spécialité aux médecins.

- CELESTENE® injectable : Cette spécialité ne comporterait plus de sulfites dans sa composition. Le Comité technique souhaiterait avoir confirmation de cette information et s'interroge sur le moyen de distinguer les anciens lots avec sulfites de la nouvelle formulation.

- Le Comité technique est préoccupé par la circulation de produits présentés comme traitant le SIDA. L'analyse du traitement de Mr Beljanski a mis en évidence une quantité non négligeable de plomb. Un autre produit en provenance de la Suisse est composé de dérivés du safrol, connus pour leur pouvoir mutagène.

I - POINT VIGABATRIN (SABRIL®)

Le CRPV de Paris Pitié (C. SOUBRIE) a présenté les données récentes concernant les troubles du champ visuel retrouvés chez des patients traités par SABRIL®. En effet, après la notification et la publication de cas symptomatiques de constriction persistante du champ visuel, des études ont montré récemment que chez des patients asymptomatiques, un pourcentage élevé de patients (14 %) présentait des anomalies à l'examen périmétrique. La signification clinique et l'évolution de ces troubles ne sont pas connues.

Le Pr NORDMAN, qui a expertisé les données ophtalmologiques pour le compte de la firme Hoechst Marion Roussel, a détaillé les cas rapportés :
- Les caractéristiques des examens périmétriques des cas évoquent une anomalie d'origine rétinienne (régularité concentrique de l'atteinte portant principalement sur le champ nasal en épargnant relativement le champ temporal) ;
- Ce type de problème est peu fréquent en médecine générale ;
- La fréquence des cas symptomatiques est de l'ordre de 0,1 %. Elle contraste avec la fréquence de 10-15 % de cas asymptomatiques. On ne connait pas de formes de passage entre les 2 états, ni les éventuels facteurs déclenchants. Il n'y a pas eu d'aggravation observée à l'arrêt du traitement, des améliorations ont été rarement observées. C'est l'intensité de la constriction qui détermine vraisemblablement l'état symptomatique ou non, et lorsque la constriction préserve les 20° centraux, le patient est le plus souvent asymptomatique.

Le Pr NORDMAN a évoqué les étiologies possibles des constrictions périmétriques : un artefact lié au bord supérieur des lunettes chez les porteurs, le glaucome, la rétinopathie pigmentaire, l'hystérie.

Le Pr NORDMAN a souligné que l'examen par confrontation ne permettait de détecter que les formes majeures de réduction du champ visuel. En conséquence, l'examen qui devrait être utilisé pour dépister et suivre ces troubles est l'examen périmétrique automatisé, à cause du caractère subjectif de la méthode avec un opérateur. Une surveillance adéquate devrait comporter un examen avant la mise sous traitement, et des examens régulièrement tous les 6 mois. Il demeure qu'il n'existe pas de méthode permettant de suivre le champ visuel des enfants de moins de 6-8 ans.

Le Pr NORDMAN a jugé que les anomalies de l'électrorétinogramme observées chez le volontaire sain étaient vraisemblablement une conséquence de l'effet pharmacologique du traitement, sans rapport avec les constrictions du champ visuel observées.

De plus, le Pr NORDMAN a décrit un cas de constriction du champ visuel observé lors d'un traitement par progabide. La constriction observée chez ce patient était analogue aux cas trouvés avec le vigabatrin. Cela pourrait être en faveur d'une possible toxicité liée au mécanisme d'action impliquant le GABA.

Le Comité Technique a estimé que les nouvelles données ne justifiaient pas de modifier à nouveau le RCP en urgence et a souhaité que le sujet fasse l'objet d'une présentation à la Commission Nationale du 9 juin 1998.

Annexe 3-5

II - ADOPTION DU PROCÈS-VERBAL DU COMITÉ TECHNIQUE DU 26/02/98

Le procès-verbal du Comité Technique du 26 février a été adopté après les corrections suivantes :

Page 3	Dernier paragraphe : rajouter "l'efficacité de l'allopurinol dans le traitement de la goutte est indiscutable". Remplacer "souhaitable" par "décidée" et "permettrait" par "permet".
Page 4	Dans l'analyse de la littérature : L'énurésie et les oedèmes généralisés ne sont pas des effets antiadrénergiques.
Page 6	3ème ligne : remplacer "aigüe" par "aiguë". 9ème ligne : supprimer "puissant et sélectif".
Page 7	16ème ligne : rajouter "confusion mentale".
Page 14	Concernant les laboratoires RHONE POULENC RORER, remplacer "proarythmogène" par "arythmogène".
Page 16	Dernier paragraphe : "la France a rappelé aux Etats Membres sa préoccupation concernant les effets indésirables neurologiques, les pathologies auto-immunes au décours d'une vaccination contre l'hépatite B et l'intense couverture médiatique".
Page 19	12ème ligne : rajouter "hypotension artérielle". 14ème ligne : rajouter "anesthésiques généraux".
Page 21	Rajouter dans le titre "ALFATIL® LP". 6ème ligne : remplacer "obtenue" par "observée". Avant-dernière ligne : supprimer "puissants".
Page 23	3ème ligne : rajouter "...agoniste dopaminergique prescrit comme antiparkinsonien" 29ème ligne : remplacer "dossiers" par "notifications".
Page 24	Dans la conclusion : - supprimer "forte" - remplacer "intéraction" par "interaction" et rajouter "anticoagulants oraux"
Page 25	3ème ligne : Remplacer "1996." par "1995." Rajouter "... ces effets indésirables sont déjà inclus dans le RCP".
Page 26	Remplacer "la qualité médiocre des données" par "le texte bien que très correctement présenté".
Page 35	40ème ligne : Rajouter "*Eur J Clin Pharmac*"

Suivant les recommandations de Vancouver, le comité Technique a souhaité que la bibliographie soit référencée de manière homogène,.

IV - ENQUÊTE OFFICIELLE SUBUTEX® (buprénorphine) - POINT SUR LES DÉCÈS

Rappel :

Le Subutex® a obtenu une AMM en France le 31 juillet 1995 dans le cadre d'une procédure nationale et est commercialisé depuis février 1996.
Le Subutex® est indiqué dans le traitement substitutif des pharmacodépendances majeures aux opiacés, dans le cadre d'une prise en charge médicale, sociale et psychologique.
Il peut être prescrit par tout médecin, sur un bon extrait du carnet à souche pour une durée ne pouvant excéder 28 jours.
Toutefois, il est recommandé au médecin, notamment en début de traitement, de prescrire pour une durée plus courte afin de limiter le risque d'utilisation détournée par voie intraveineuse.

Une enquête officielle de pharmacovigilance a été initiée (CRPV de Grenoble) en septembre 1996, à la suite de la notification de cas de décès de personnes toxicomanes traitées par Subutex®.
La Commission Nationale de Pharmacovigilance du ***6 février 1997*** a examiné ***onze cas*** de décès alors rapportés : une dépression respiratoire était évoquée dans la majorité des cas, et la notion de prise de benzodiazépines souvent associée a fait évoquer un rôle potentialisateur éventuel.
De plus, la notion de mésusage avec utilisation intraveineuse avait été suspectée pour un certain nombre d'observations.
Le 24 mars 1997, sur proposition de la Commission Nationale, l'AMM a été modifiée afin de mentionner clairement le risque de dépression respiratoire apparaissant principalement lors de mésusage et d'association avec les benzodiazépines.

Le centre de Pharmacovigilance de Grenoble (Dr Mallaret), dans le cadre de l'enquête officielle de Pharmacovigilance, a présenté un point sur les décès rapportés sous buprénorphine.

A ce jour, le système national recense **32 observations de décès**.
Parmi ces cas, 21 patients étaient connus comme "toxicomanes"et 3 "polytoxicomanes".
La notion de mésusage intraveineux est très probable ou probable pour 7 patients (présence de seringue, témoins. ..).
La notion de prise de benzodiazépines est mentionnée pour 23 patients.
Il faut souligner que les dosages biologiques confirment la prise de benzodiazépine associée dans 20 cas (15 clorazepate, 5 flunitrazepam) et ne retrouvent que dans 2 cas une présence de buprénorphine seule.
De plus, 20 patients avaient à l'autopsie des signes évocateurs de syndrome asphyxique (dont 2 avec oedème pulmonaire, 1 avec possible défaillance cardiaque).
Dans 1 cas, l'autopsie retrouve des aliments dans les voies respiratoires.

Les causes de décès pouvant être évoquées chez les 32 patients sont :
- l'oedème pulmonaire,
- l'insuffisance hépatocellulaire,
- la fausse route,
- l'histaminolibération,
- la dépression respiratoire.

Il faut noter que les concentrations sanguines de buprénorphine, lorsque les dosages ont été réalisés, semblent être dans les limites des taux thérapeutiques et surtout moins élevées que les concentrations cérébrales. Ceci confirme les données de la littérature quant à la lipophilie de la buprénorphine et pourrait contribuer à la dépression respiratoire.
L'analyse de la littérature et les cas rapportés sont en faveur d'une cause de décès par dépression respiratoire, le risque dépresseur pouvant être augmenté par l'administration intraveineuse de la buprénorphine et majoré par l'association aux benzodiazépines.
Cependant, si la co-responsabilité des benzodiazépines ne peut être écartée, il existe des cas sans benzodiazépine associée (la recherche de benzodiazépines s'est avérée négative dans 3 cas de décès sur les 23 pour lesquels cette recherche avait pu être effectuée).

En conclusion :

Les données actualisées présentées ne remettent pas en cause le profil de sécurité de la buprénorphine, cependant une meilleure évaluation du risque de décès par dépression respiratoire serait souhaitable (études expérimentales, potentialisation par les benzodiazépines...).
Le Comité Technique souligne que la dispensation fractionnée de la buprénorphine, pour des durées ne pouvant excéder 7 jours, permettrait de limiter le risque d'utilisation détournée par voie intraveineuse.

Le Comité Technique souhaite par ailleurs que le développement de la spécialité associant buprénorphine et naloxone (SUBOXONE) par voie sublinguale se poursuive.
En effet la mise à disposition d'une telle spécialité limiterait le risque de mésusage et donc le risque de décès par dépression respiratoire de même que les risques infectieux liés à la pratique de la voie intraveineuse, et sans doute le "trafic" de la buprénorphine.

Le Dr Riché (CRPV de Brest) fera une présentation à un prochain Comité technique sur le potentiel d'interactions entre buprénorphine - benzodiazépines - méthadone.

V - POINT BENFLUOREX (MEDIATOR®)

Le Centre Régional de Pharmacovigilance de Besançon a effectué une mise au point concernant les

effets indésirables observés avec le benfluorex.

Le MEDIATOR® (chlorydrate de benfluorex) est commercialisé en France (depuis 1976) dans les indications suivantes :
- adjuvant du régime adapté dans les hypertriglycéridémies.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex est inscrit depuis le 10 mai 1995, comme les anorexigènes, sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales.

Sur les 291 notifications rapportées avec le benfluorex, 152 ont été retenues au 30 avril 1998 (lors de la précédente mise au point de juillet 1995, 101 notifications avaient été rapportées).

● Les atteintes hépatiques : 16 cas
Les cas les plus souvent rapportés sont des hépatites et des perturbations de la biologie hépatique : élévation des transaminases. Ces effets ne sont pas mentionnés dans le RCP.

● Les atteintes digestives : 16 cas
Les cas les plus souvent notifiés sont les diarrhées. Cet effet indésirable est mentionné dans le RCP.

● Les atteintes hématologiques : 8 cas
Les effets les plus fréquents sont les thrombopénies. Il n'y a pas eu de nouveaux cas rapportés depuis juillet 1995.

● Les atteintes respiratoires : 8 cas
Les cas rapportés sont principalement des toux et des hypertensions pulmonaires (dans les 2 cas rapportés, il existe un traitement anorexigène associé).

● Les atteintes cardiovasculaires : 11 cas
Des cas d'hypertension artérielle, de tachycardie, d'extrasystoles ventriculaires et de syndrome de Raynaud sont le plus souvent notifiés.

● Les atteintes rénales : 9 cas
Parmi lesquelles on observe le plus souvent des dysuries, des pollakiuries.

● Les atteintes métaboliques : 3 cas
Une hyperlipémie, une hypothyroïdie et une crise de goutte ont été rapportées.

● Les atteintes cutanées : 38 cas
Des urticaires, des chocs anaphylactiques, des eczémas, des vascularires, des érythèmes ainsi que des purpuras sont les effets les plus fréquents. Ces effets indésirables ne sont mentionnés pas dans le RCP.

Annexe 3-5

● Les atteintes neuro-psychiatriques : 27 cas
Des cas d'asthénie ou de somnolence sont le plus souvent notifiés ; ceux-ci sont mentionnés dans le RCP. Parmi les troubles psychiatriques, on observe principalement des cas d'agressivité, d'agitation, de nervosité, ou de délire. Les paresthésies sont les troubles neurologiques les plus fréquents.

● Les troubles de l'équilibre, vertiges : 16 cas
Dans 16 cas (sur les 152 rapportés), le benfluorex est associé avec un anorexigène.
En 1995, le nombre de boîtes de MEDIATOR® vendues a été estimé à 5 millions/an.

Le nombre d'effets indésirables observés ne semble pas plus important depuis la dernière mise au point de juillet 1995. Cependant on ne peut écarter la possibilité d'une déviation de l'utilisation du benfluorex comme anorexigène étant donné que l'indication "adjuvant de régime..." entretient une certaine ambiguïté. De plus, la métabolisation du benfluorex dans l'organisme entraîne la formation de norfenfluramine, métabolite apparenté à la fenfluramine, elle-même impliquée dans l'apparition d'hypertensions pulmonaires graves.

Compte tenu de la suspicion de détournement d'usage et de la formation lors de la métabolisation de norfenfluramine, le Comité Technique propose la mise en place d'une enquête officielle de Pharmacovigilance qui permettra, entre autres, de récupérer les chiffres de vente, afin d'infirmer ou de confirmer un éventuel mésusage, et les données précliniques.

L'enquête nationale est confiée au CRPV de Besançon et l'Observatoire de la Prescription sera consulté.

Annexe 3-5

VI - POINT VINORELBINE (NAVELBINE®) ET CARDIOTOXICITÉ

Ce travail a été réalisé par le Centre Régional de Pharmacovigilance de CAEN à la suite de la notification de deux atteintes myocardiques (une nécrose et une ischémie myocardique).

L'analyse des cas de la banque et des cas de la littérature met en évidence une cardiotoxicité potentielle.

Depuis la commercialisation, et jusqu'au 26 janvier 1998 (soit 9 ans de commercialisation), 24 dossiers ont été retenus : il s'agit de 10 accidents ischémiques, 7 troubles du rythme et 7 observations diverses (4 chocs cardiogéniques, 1 défaillance cardiaque congestive, 1 péricardite, 1 cardiopathie).
Il s'agit de 13 hommes et 11 femmes, d'âge moyen 59 ans et pour lesquels la vinorelbine avait été prescrite pour un cancer bronco-pulmonaire (13 cas), du sein (8 cas) et autres (3 cas).
11 personnes sur 21 avaient des antécédents cardio-vasculaires ; l'évolution est fatale dans 7 cas, inconnue dans 2 cas et favorable dans les autres cas.

La réintroduction a réentraîné l'apparition de troubles cardiaques dans 8 cas.

Il faut noter l'association (avec la même imputabilité) avec d'autres molécules connues pour leur éventuelles toxicité cardiaque dans 11 cas.

Pour la littérature, 8 articles rapportent une ischémie cardiovasculaire faisant suite à un traitement par la vinorelbine (pour 13 patients et 17 cures de vinorelbine). 4 cas sont des doublons des dossiers des CRPV.

Il est proposé l'ouverture d'une enquête officielle permettant de consulter les essais pré-cliniques, et les données internationnales.

Au vu de ces données, il faudra déterminer la nécessité de modifier ou non les rubriques "effets indésirables" et "précautions d'emploi" du RCP.

MEDIATOR (benfluorex)
Effets indésirables

Mise au point

Comité Technique du 30 Avril 1998

Confidentiel

M.DAVID
P.BECHTEL

Annexe 3-5

Le MEDIATOR (chlorhydrate de benfluorex) est commercialisé en France depuis [illegible] sous forme de comprimés, dosés à 150 mg. La posologie recommandée est 3 comprimés par jour.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène.
(Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Une enquête officieuse a été ouverte, suite à la première mise au point des effets indésirables du benfluorex, présentée lors du Comité Technique du 11 juillet 1995.

Pharmacocinétique humaine du chlorhydrate de benfluorex :

L'absorption gastro-intestinale du chlorhydrate de benfluorex est complète et rapide, avec une concentration plasmatique maximale entre 1h et 2 h après l'administration.
Le volume de distribution est faible : 0,37 ± 0,03 l/Kg chez l'homme (1,4 l/Kg chez le rat, 1,6 l/Kg chez le chien,0.36l/Kg chez le singe et 0,31 l/Kg chez le babouin.
Le chlorhydrate de benfluorex est métabolisé rapidement dans le foie. Au niveau tissulaire, il n'y a aucune accumulation ou rétention de métabolites.

Les métabolites principaux retrouvés dans l'urine sont :
- le 1-(3-trifluorométhylphényl)-2-N-(carboxyméthyl)amino propane : 65% de la dose
- le 1-(3-trifluorométhylphényl)-2-N-(2-hydroxyéthyl)amino propane : 22% de la dose

- la 3-trifluorométhylphényl)-1 -hydroxy-propanone-2 sous forme conjuguée (5% de la dose)
- la Nor-fenfluramine : 2% de la dose.

Les métabolites principaux retrouvés dans le plasma sont :
- le 1-(3-trifluorométhylphényl)-2-N-(carboxyméthyl)amino propane
- le 1-(3-trifluorométhylphényl)-2-N-(2-hydroxyéthyl)amino propane

On ne retrouve pas de benfluorex inchangé dans le plasma.,

A. BILAN GLOBAL :

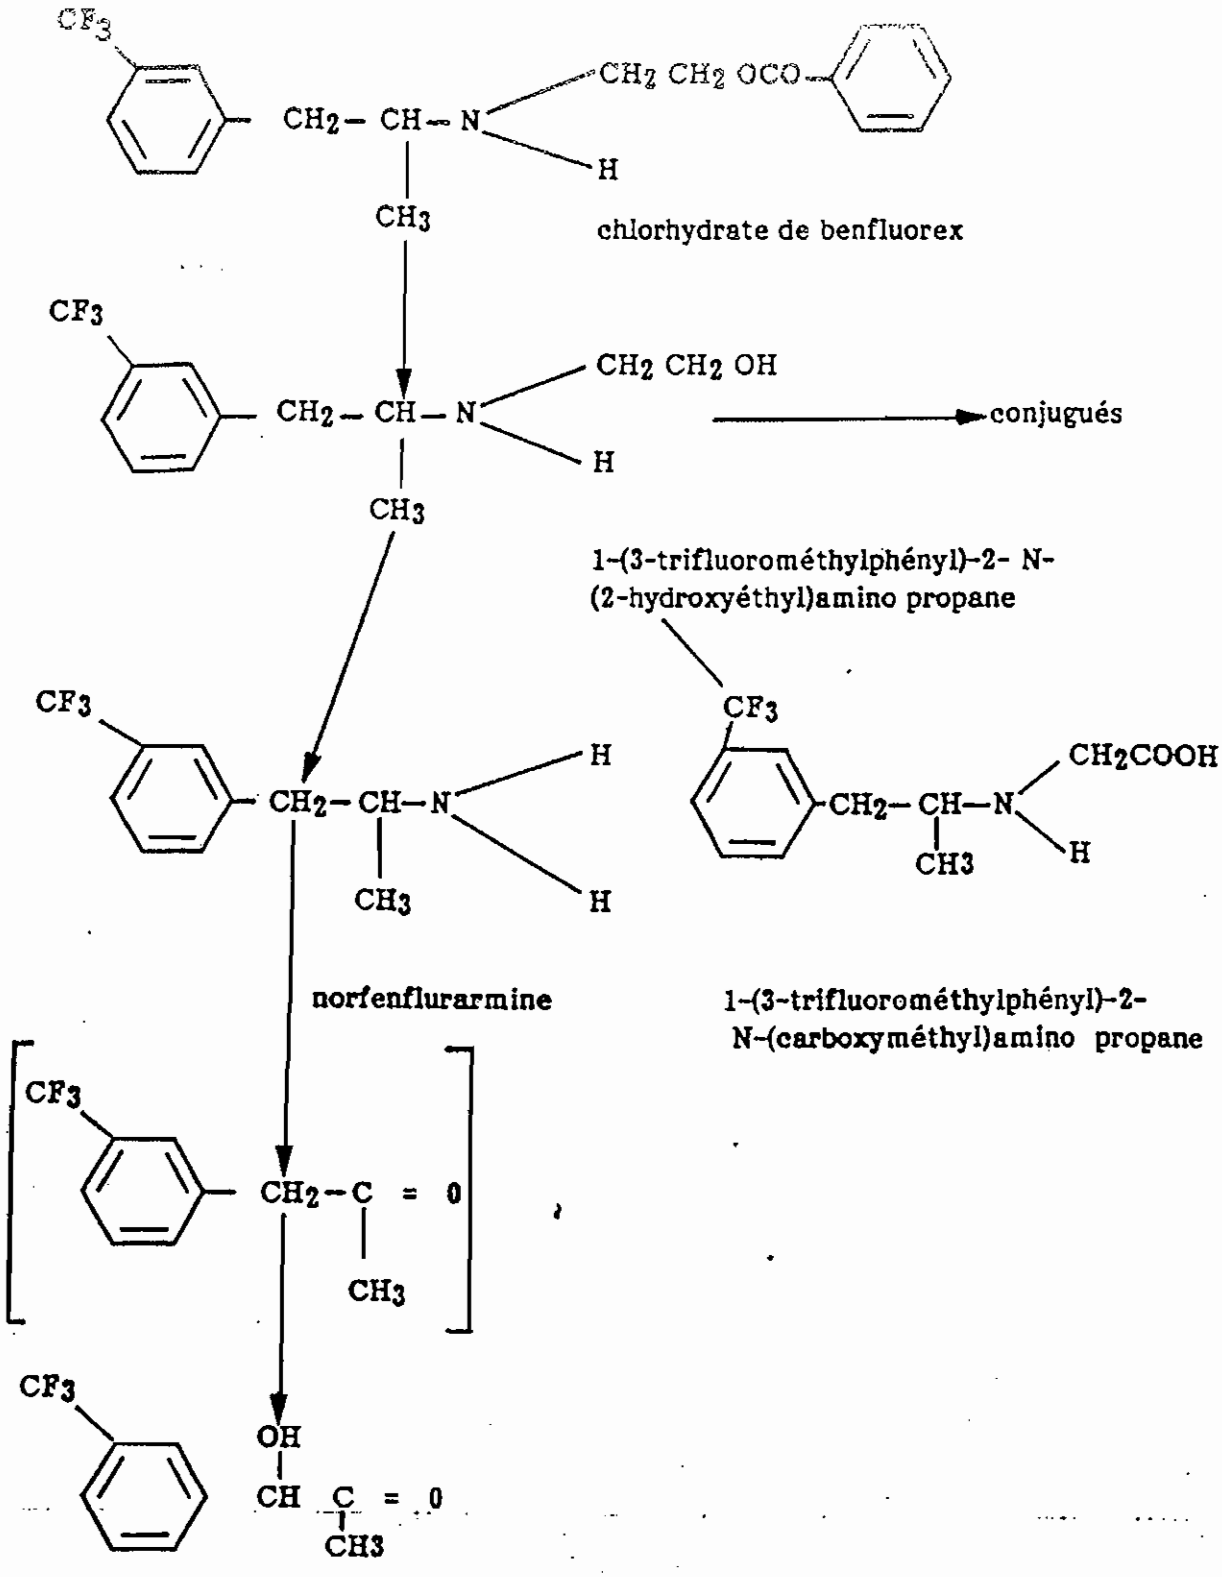
Parmi 291 notifications dans lesquelles le MEDIATOR est présent, et qui sont rapportées aux Centres Régionaux de Pharmacovigilance, 152 notifications ont été retenues.

Elles concernent 54 hommes et 97 femmes (1 sexe non précisé), dont l'age moyen est de :
- 57 ans pour les hommes (N = 54)
- 55,6 ans pour les femmes (N = 92)

Pour les notifications reçues jusqu'à 1995 , l'age moyen est de :
- 55,4 ans pour les hommes (N = 45)
- 56,7 ans pour les femmes (N = 66)

Pour les notifications reçues après 1995 , l'age moyen est de :
- 64,7ans pour les hommes (N = 9)
- 52,8 ans pour les femmes (N = 26)

Annexe 3-5



3-trifluorométhylphényl-1-hydroxypropanone-2

Annexe 3-5

Répartition des notifications par année de déclaration aux CRPV :

- 1985 : 3
- 1986 : 6
- 1987 : 7
- 1988 : 13
- 1989 : 9
- 1990 : 6
- 1991 : 11
- 1992 : 9
- 1993 : 21
- 1994 : 10
- 1995 : 21
- 1996 : 7
- 1997 : 26
- 1998 : 3

Répartition par classe-organe des effets indésirables notifiés au CRPV :

APPAREIL	Nombre de Notifications au 30 juin 1995	Nombre de Notifications au 30 avril 1998	
FOIE	9	16	7
APP. DIGESTIF (sauf foie)	13	16	3
HEMATOLOGIE	8	8	-
APPAREIL RESPIRATOIRE	4	8	4
CARDIO-VASCULAIRE	5	11	6
APPAREIL URINAIRE	7	9	2
PEAU - ALLERGIE	25	38	13
EURO-PSYCHIATRIE	19	27	8
VERTIGES	9	16	7
METABOLISME	2	3	1
TOTAL	101	**152**	51

N.B : les nouvelles notifications par rapport à la mise au point de Juillet 1995, sont imprimées «**en gras** » dans les tableaux suivants.
Dans la colonne, « traitement associé », le médicament est souligné, lorsque l'imputabilité bibliographique est supérieure au MEDIATOR.

Annexe 3-5

ATTEINTES HEPATIQUES

Dans 14 cas sur 26 cas d'hépatites ou perturbations de la biologie hépatique notifiés aux CRPV, le MEDIATOR est le seul suspect ou d'imputabilité égale ou supérieure aux médicaments associés.

Dans la majorité des dossiers, le délai de survenue est de ≅ 3 mois.

Dans les 13 cas de diarrhée rapportés, le MEDIATOR est utilisé en monothérapie, ou son imputabilité est supérieure aux médicaments associés.

Cet effet indésirable est mentionné dans les RCP.

III. ATTEINTES HEMATOLOGIQUES

- Dans toutes les observations, il existe un traitement associé, qui peut être responsable de l'effet indésirable.
- Aucun nouveau cas n'a été rapporté depuis la mise au point de Juillet 1995

-Ils concernent 3 hommes (Age moyen = 60,7 ans) et 5 femmes (Age moyen = 55,6 ans)

Annexe 3-5

- 3 cas d'érythème polymorphe, avec une évolution favorable à l'arrêt du MEDIATOR chez 2 hommes agés de 60 et 68 ans.

- 3 notifications de vascularite aigue leucocytoclasique:
  - dans 1 cas, l'évolution est favorable à l'arrêt du MEDIATOR (RE9420042)
  - dans 1 cas, l'évolution est favorable sans arrêt du MEDIATOR , mais avec un traitement corticoïde (lorsque la corticothérapie est arrêtée, 4 moisplus tard, survient un érythème polymorphe :MA9700957)
  - dans le troisième cas (MP9700134), l'évolution n'est pas complète malgré l'arrêt du MEDIATOR et une corticothérapie.

- 3 cas de purpura:
  - purpura des membres inférieurs avec un oedème apparu une semaine après le début du traitement par MEDIATOR (PP8990384)
  - purpura des membres inférieurs, s'étendant aux membres supérieurs, disparaissant 1 semaine après l'arrêt du traitement (CF9200106)
  - purpura rhumatoïde survenant après 2 semaines de traitement, l' évolution est inconnue (PO9700410)

IX. ATTEINTES NEURO-PSYCHIATRIQUES :

Elles concernent 18 hommes (Age moyen : 54,5 ans) , 25 femmes (Age moyen : 58,7 ans)

1. Asthénie, Somnolence, Impuissance :

16 cas ont été notifiés: il s 'agit de patients agés,en général, avec une pathologie lourde : diabète, insuffisance cardiaque...

Cet effet indésirable est mentionné dans les RCP.

Annexe 3-5

☆ MEDIATOR®

benfluorex

FORMES et PRÉSENTATIONS

Comprimé enrobé (blanc) : Boîte de 30.
Modèle hospitalier : Boîte de 100, sous plaquette thermoformée unidose.

COMPOSITION

	p cp	*p boîte*
Benfluorex chlorhydrate	150 mg	4,5 g

Excipients : amidon de maïs, carmellose sodique, cire d'abeille blanche, éthylcellulose, stéarate de magnésium, oléate de glycérol, polysorbate 80, povidone, silice colloïdale, saccharose, bicarbonate de sodium, talc, dioxyde de titane.

DC INDICATIONS

- Adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

DC POSOLOGIE et MODE D'ADMINISTRATION

3 comprimés par jour.
Cette posologie peut être prescrite d'emblée ou atteinte progressivement :
- 1 comprimé la première semaine au dîner,
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner,
- 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

Par la suite, la posologie peut être ramenée à 2, parfois 1 comprimé par jour, en fonction des résultats biologiques.
Coût du traitement journalier : 1,43 à 4,29 F.
En association avec le régime, Mediator constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

DC CONTRE-INDICATIONS

Pancréatites chroniques avérées.

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI

Mises en garde :
Les troubles métaboliques relevant d'un traitement par Mediator sont essentiellement observés chez l'adulte. La prescription de Mediator n'est donc pas justifiée chez l'enfant.
Précautions d'emploi :
Si, après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.
L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

DC GROSSESSE et ALLAITEMENT

Grossesse : Les résultats des études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence de données dans l'espèce humaine, ces résultats expérimentaux ne permettent pas de préjuger un effet malformatif. Cependant, par mesure de prudence, ne pas prescrire pendant la grossesse.
Allaitement : En l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

DC EFFETS INDÉSIRABLES

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.

DC SURDOSAGE

Conduite à tenir en cas d'absorption massive : le traitement sera purement symptomatique : lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

PP PHARMACODYNAMIE

Hypolipémiant :
Il agit sur plusieurs facteurs liés au risque athérogène.
- Actions de Mediator sur le métabolisme lipidique :
  - Mediator diminue l'absorption intestinale des triglycérides (rat). Cet effet, confirmé chez l'homme en pharmacologie clinique, repose sur la diminution d'activité de la lipase pancréatique.
  - Il réduit la synthèse hépatique des triglycérides et du cholestérol in vitro et in vivo (rat).
  - Il diminue la stéatose hépatique induite par des régimes riches en lipides, en glucides chez le rat obèse et au cours du diabète expérimental (rat).
  - Il limite l'incorporation du cholestérol dans la paroi artérielle (lapin).

  Ce mode d'action est susceptible d'expliquer la diminution du cholestérol et des triglycérides chez l'homme.
- Actions de Mediator sur le métabolisme glucidique :
  - Il facilite la pénétration et l'utilisation cellulaires du glucose (rat).
  - Il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'HPO chez le lapin.
  - Dans le diabète asymptomatique chez les patients obèses, il entraîne une baisse de la glycémie postprandiale et une amélioration de la courbe d'HPO supérieure à celle qu'on obtient avec un régime identique associé à un placebo.

  Mediator, n'ayant pas d'action sur l'insulinosécrétion, ne peut pas provoquer d'hypoglycémie.
- Effet complémentaire de Mediator :
  Chez des patients obèses hyperuricémiques traités par Mediator et régime, une baisse de l'uricémie d'environ 14 % a été observée.

Aucune interférence indésirable de Mediator avec les traitements associés au cours des études n'a été constatée.
Mediator :
- ne potentialise pas les anticoagulants,
- ne provoque pas d'hypoglycémie,
- n'interfère pas avec la fonction thyroïdienne.

PP PHARMACOCINÉTIQUE

- Absorption gastro-intestinale rapide et totale avec un pic maximal survenant entre 1 et 2 heures après l'administration.
- Élimination rapide et totale par voie urinaire : en 8 heures, une excrétion moyenne d'environ 74 % de la dose administrée est constatée.
  L'élimination se fait en 2 phases :
  - une première phase rapide (60 % en 3 ou 4 heures),
  - une deuxième phase lente, se terminant en 36 heures environ.

LISTE I
AMM 317 557.9 (1974, validée 1987) 30 comprimés.
317 559.1 (1974, validée 1987) 100 comprimés.
PRIX : 42,90 F (30 comprimés).
Remb Séc soc à 65 %. Collect.

REÇU LE
13 MAI 1998
SERVIER S.A.S.

Saint-Denis le, 11 MAI 1998

M. le Pharmacien Responsable
Laboratoires SERVIER
22 rue Garnier
92200 NEUILLY SUR SEINE

Monsieur,

J'ai l'honneur de vous faire connaître qu'une enquête de pharmacovigilance relative aux effets indésirables observés avec votre spécialité MEDIATOR® (Benfluorex), est officiellement mise en place sous la responsabilité du centre de Pharmacovigilance de Besançon dont le responsable est M. le Pr P. BECHTEL.

Je vous saurais gré, en conséquence, de bien vouloir lui communiquer, si il vous en formulait la demande, tous les renseignements ou dossiers qui pourraient être nécessaires à la bonne conduite de cette enquête.

Je vous prie d'agréer, Monsieur, l'expression de ma considération distinguée.

LE DIRECTEUR DE L'ÉVALUATION

Pr Jean-Michel ALEXANDRE

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis, le 21 DEC. 1998

COMITE TECHNIQUE DE PHARMACOVIGILANCE

(Procès-verbal de la réunion du Jeudi 10 septembre 1998)

Etaient présents

M. RICHE : Président
M. LE LOUET (suppléant de Mme ALBENGRES), Mme PENFORNIS (suppléante de M. ALLAIN H), Mme LAINE CESSAC (suppléante de M. ALLAIN P), M. ANDREJAK, Mme RADAL (suppléante de Mme AUTRET), Mme BAVOUX, Mme DAVID- LAROCHE (suppléante de M. BECHTEL), M. BIOUR, M. BLAYAC, Mme CARLHANT, M. CARON, Mme CHICHMANIAN, Melle DIORTE, Mme EFTHYMIOU, M. ESCHALIER, Mme SGRO (suppléante de M. ESCOUSSE), M. VIAL (suppléant de M. I - ADOPTION DU PROCÈS-VERBAL DES COMITÉS TECHNIQUES DU 25 JUIN 1998 ET DU 23 JUILLET 1998

Le procès-verbal de la séance du 25 juin 1998 a été adopté avec les modifications suivantes :

- Page 4 — 8ème ligne : remplacer "1/2474 unités" par "1/2474 seringues". Remplacer "1/10160 unités" par "1/10160 seringues".

  10ème ligne : remplacer "1/11544 unités" par "1/11544 comprimés".

- Page 18 — 3ème ligne : remplacer "percutanée" par "sous-cutanée".

- Page 20 — 7ème ligne : remplacer "Par ailleurs, ... collègues toxicologues" par "Le CRPV de Strasbourg a fait parvenir à l'Agence le détail des notifications reçues de la part du Dr Kintz avec leur chronologie. Par ailleurs, le Dr Kintz estime, à partir de discussions avec ses collègues toxicologues,...".

Le procès-verbal de la séance du 23 juillet 1998 a été adopté avec les modifications suivantes :

- Page 13 — Observation "vaccin BCG Pasteur®" : remplacer "chez un enfant" par "chez 8 enfants"

- Page 16 — "Antirétroviraux et grossesses - projet de suivi" : remplacer le texte entier par le texte suivant :

François MEYER (Direction de l'Evaluation / Agence du Médicament) et Françoise BAVOUX (CRPV de Saint-Vincent de Paul) ont présenté l'état actuel de la pharmacovigilance "antirétroviraux et grossesse" et les possibilités d'améliorations à venir.

En 1995, l'analyse des résultats de l'essai ACTG 076/ANRS 024 a mis en évidence une diminution du taux de transmission materno-foetale (TMF) du virus de l'immunodéficience humaine (VIH) de 25% chez les femmes non traitées à 8% chez les femmes traitées par la zidovudine durant la grossesse. La mise sur le marché des antiprotéases en 1996 a modifié la stratégie thérapeutique antirétrovirale et l'évolution de la maladie. Les patientes font des projets de vie et les cliniciens se trouvent confrontés de plus en plus fréquemment à une situation difficile : désir de grossesse, prévention de la transmission materno-foetale, exposition du foetus et de l'enfant à des médicaments nouveaux n'ayant pas fait l'objet d'évaluation en clinique.

Annexe 3-7

Le nombre de femmes atteintes par l'infection à VIH/sida menant à terme leur grossesse est de l'ordre de **600 par an**. Plusieurs structures sont actuellement engagées dans le suivi de ces grossesses en France.

- **L'Etude Périnatale Française** (EPF) de Unité INSERM 292 assure un suivi épidémiologique de la TMF du VIH, et des enfants séronégatifs jusqu'à l'âge de 18 mois. Il faut souligner que l'EPF n'enregistre pas les effets indésirables des médicaments.
Environ 450 enfants nés de mères atteintes par l'infection à VIH sont inclus par an dans l'EPF.

- **Des essais cliniques ayant pour objectif l'évaluation de la TMF du VIH**. L'évaluation des effets indésirables réalisée dans le cadre de l'essai ANRS 075 (seul essai actuellement en cours) doit être améliorée.
Chaque année, approximativement 150 nouveau-nés de mères séropositives ne sont inclus ni dans l'EPF ni dans un essai clinique de TMF et échappent donc a ce type de suivi.

- un "**registre**" destiné au repérage des enfants dont la mère a reçu de la zidovudine pendant la grossesse est tenu au niveau de la Direction des hôpitaux ; son fonctionnement est actuellement en cours de modification.

Enfin, une **enquête officielle de pharmacovigilance** relative aux issues des grossesses des femmes traitées par les antirétroviraux et les effets indésirables chez le nouveau-né, le nourrisson et l'enfant après exposition *in utero* aux antirétroviraux, dont le CRPV responsable est Paris Saint-Vincent de Paul, est mise en place depuis février 1998.

Aucune structure n'assure un recueil correct des effets indésirables survenant chez les femmes atteintes par le VIH traitées par antirétroviraux durant la grossesse et leurs nouveau-nés. La situation actuelle est caractérisée par une sous-notification extrême et l'absence d'analyse globale de ces effets indésirables alors que le nombre de femmes enceintes traitées par multithérapie augmente.

Il est nécessaire **d'inciter, par un monitorage actif, les praticiens concernés à déclarer au système national de pharmacovigilance les effets indésirables** survenant chez des femmes inclues ou non dans l'EPF ou un essai clinique de TMF du VIH. L'envoi d'une lettre associée à une "fiche de recueil d'effets indésirables survenant au cours de la grossesse" est prévu. Il est important que les praticiens soient contactés régulièrement afin de maintenir intact leur vigilance (relances téléphoniques, visites dans les maternités). Une attention particulière devra être portée sur les praticiens suivant les femmes en dehors de l'EPF ou d'un essai clinique.

Une analyse globale des données de tolérance doit être réalisée par le système national de pharmacovigilance, si possible en collaboration avec les structures existantes (EPF, Agence nationale de recherche sur le sida, Direction des hôpitaux), afin de permettre un échange d'informations. Actuellement, les responsables de l'EPF souhaitent que les effets indésirables soient d'abord notifiés à la cohorte puis au système de pharmacovigilance. Cette proposition

Annexe 3-7

de circuit de déclaration des effets indésirables n'est pas conforme au décret de pharmacovigilance de 1995. Les notifications d'effets indésirables recueillies par les CRPV seront centralisées par le CRPV de Saint-Vincent de Paul. Les données de pharmacovigilance émanant des CRPV seront complétées par celles déclarées dans le cadre des essais cliniques à l'Agence du médicament et présentées par les laboratoires pharmaceutiques dans les rapports périodiques de sécurité.

Une demande de subvention auprès du Conseil scientifique et du Conseil d'Administration de l'Agence du Médicament sera présentée le 14 octobre 98.

Annexe 3-7

II - TOUR DE TABLE DES CAS MARQUANTS

ALLOPURINOL MSD®
(allopurinol)
: Vertiges, troubles visuels, lésions dermatolologiques , céphalées, epistaxis survenus chez un homme de 48 ans, traité par ZYLORIC® depuis 23 ans, puis depuis 10 jours par ALLOPURINOL MSD®.
(CRPV de REIMS)

ARCALION® 200 mg
(sulbutiamine)
+ BREXIN®
(pyroxicam,
β-cyclodextrine) : Malaise avec hypotension (pression artérielle systolique : 7cm Hg) et troubles digestifs chez une femme de 48 ans. Réadministration positive de l'ARCALION®(CRPV de LIMOGES)

ARTOTEC®
(diclofénac +
misoprostol) : Douleurs angineuse chez un homme de 43 ans, 20 minutes après chaque prise d'ARTOTEC® (antécédents coronariens). Pas de récidive après l'arrêt du traitement.
(CRPV de RENNES)

BEFIZAL®
(bézafibrate) : Réaction de photosensibilité chez une femme de 50 ans.
(CRPV de MARSEILLE)

CUROSURF®
(fraction phospholipidique
de poumon de porc)
+ CLAROFAN®
(céfotaxime sodique)
+RANIPLEX®
(ranitidine)
+ CLAMOXYL®
(amoxicilline)
+ NETROMICINE®
(nétilmicine - sulfate de) : Hémorragie pulmonaire importante avec malaise, bradycardie, et défaillance multiviscérale chez un nouveau-né de 2 jours.
(CRPV d'AMIENS)

Annexe 3-7

DIAMOX® 250 mg
(acétazolamide)
+ ASPEGIC® 1000 mg
(acétylsalicylate de DL-lysine)
+ CYTOTEC®
(misoprostol)
+ HEPT-A-MYL®
(heptaminol)
+ ZYRTEC® 10 mg
(cétirizine)
+ SILOMAT®
(clobutinol) : Confusion, syndrome cérébelleux, désorientation temporo-spatiale et polypnée, acidose métabolique compensée avec alcalose respiratoire et hyperchlorémie chez une femme de 50 ans.
(CRPV de TOURS)

ENDOXAN®
(cyclophosphamide)
+ fluoro-uracile
+ tamoxifène : Colite hémorragique ischémique avec diminution de l'anti-thrombine III à 43 % chez une femme de 72 ans. Evolution favorable à l'arrêt du traitement. Réintroduction négative du fluoro-uracile et de l'ENDOXAN®.
(CRPV de STRASBOURG)

GENTALLINE®
(gentamicine) : Vertiges à J3 d'un traitement par GENTALLINE® chez une femme de 80 ans. Pas d'insuffisance rénale. Syndrome vestibulaire isolé (cf. Questions diverses).
(CRPV de MARSEILLE)

INTRONA®
(interféron alfa 2b recombinant)
+ DEROXAT®
(paroxétine)
+ XANAX®
(alprazolam) : Dépression, agressivité et homicide chez un homme de 32 ans.
(CRPV de MARSEILLE)

ISOBAR®
(méthyclothiazide,
triamtérène) : Pancréatite aiguë chez une femme de 73 ans.
(CRPV d'AMIENS)
Le CRPV d'Amiens présentera un point sur diurétiques thiazidiques et pancréatites lors du Comité Technique du 21 janvier 1999.

KETUM®
(kétoprofène gel) : - Eczéma et phlycthènes volumineuses chez un homme de 43 ans.
- Eczéma étendu et oedème chez une femme de 21 ans.
(CRPV de RENNES)

LIPANTHYL®
(fénofibrate) : - Réactions de photosensibilité chez un homme de 67 ans et trois femmes de 58 ans, 63 ans et 72 ans. Cet effet indésirable, bien connu des spécialistes, n'est pas mentionné dans le RCP des médicaments de la classe des fibrates.
(CRPV de MARSEILLE)
Le CRPV de Marseille présentera un point sur photosensibilisation et fibrates lors du Comité Technique du 21 janvier 1999.
- Eczéma aigu photoallergique chez un homme de 46 ans qui avait présenté 9 mois plus tôt un eczéma aigu bulleux au KETUM GEL® (kétoprofène).
(CRPV de STRASBOURG)
Le CRPV de Nantes fera un point lors du Comité Technique du 21 janvier 1999 sur les réactions croisées photoallergiques avec le kétoprofène administré par voie cutanée.

MALOCIDE®
(pyriméthamine)
+ QUINIMAX®
(quinine, quinidine, cinchonine,
cinchonidine) : Syndrome de Stevens-Johnson chez un homme de 37 ans. Antécédents de lésions de la muqueuse génitale sous FANSIDAR® (sulfadoxine, pyriméthamine) et FANSIMEF® (méfloquine, sulfadoxine, pyriméthamine).
(CRPV de RENNES)

Annexe 3-7

MIGWELL® (ergotamine, caféine, cyclizine) + CRIXIVAN® (indinavir) + EPIVIR® (lamivudine) + ZERIT® (stavudine)	:	Ergotisme chez un homme de 34 ans. (CRPV d'AMIENS)
PENTASA® (mésalazine)	:	- Pancytopénie et agranulocytose chez un nouveau-né (1 jour), la mère ayant été traitée pendant toute la grosssesse. (CRPV de RENNES) - Malformation cardiaque chez un foetus de 22 semaines, la mère ayant été traitée pendant toute la grossesse. (CRPV de ROUEN) Ces observations seront transmises au groupe de travail "grossesse"
RETROVIR® (zidovudine) + EPIVIR® (lamivudine) + ZOVIRAX® (aciclovir)	:	Augmentation isolée de la lipase chez un enfant de 10 mois. (CRPV de PARIS SAINT-VINCENT DE PAUL)
RIMIFON® (isoniazide) +LASILIX® (furosémide) + CORDARONE® (amiodarone) + AMLOR® (amlodipine) + NITRIDERM® (trinitrine) + EFFERALGAN® (Paracétamol)	:	Syndrome de Lyell d'évolution fatale chez un homme de 73 ans. (CRPV de CLERMONT-FERRAND)

Annexe 3-7

SAVARINE® (chloroquine proguanil)	:	Crise tonicoclonique chez un enfant de 14,5 ans. (CRPV de CLERMONT-FERRAND)
SPASFON-LYOC® (phloroglucinol) + EFFIPREV® (norgestimate, éthinylestradiol)	:	Choc anaphylactique chez une femme de 23 ans après la prise de phloroglucinol per-os. (CRPV de LYON)
STAMARIL® (vaccin amaril vivant, stabilisé)	:	2 cas graves de méningite aseptique après une vaccination par STAMARIL® ont été déclarés à l'unité de Pharmacovigilance par le laboratoire. Le CRPV de TOULOUSE présentera un point sur ce sujet lors du Comité Technique du 19 novembre 1998.
VIDEX® (didanosine) + CRIXIVAN® (indinavir) + ZERIT® (stavudine)	:	Pancréatite et acidose lactique traité par LEVOCARNIL® (lévocarnitine)) chez un homme de 33 ans. (CRPV de PARIS SAINT-VINCENT DE PAUL) Les CRPV de Paris Saint-Antoine et Paris Saint-Vincent de Paul feront un point sur analogues nucléosidiques, acidoses lactiques et pancréatites lors du Comité Technique du 21 janvier 1999.
VOLTARENE® injectable (diclofénac) + COLTRAMYL® injectable (thiocolchicoside)	:	Malaise avec perte de connaissance et d'urine, hypotension à 8 cm Hg de maximale chez un homme de 83 ans. Bilan négatif et EEG normal (diagnostic d'épilepsie éliminé). (CRPV de LIMOGES)

Annexe 3-7

ZOMIG® (zolmitriptan) + DEROXAT® (paroxétine)	:	Syndrome sérotoninergique entraînant l'hospitalisation après 2 jours de traitement par ZOMIG® pour migraine chez une femme de 26 ans, traitée depuis 6 mois par DEROXAT®. (CRPV de LILLE) L'unite de Pharmacovigilance transmettra cette observation au Groupe de Travail "interactions médicamenteuses"

III - POINT SUR LE SILDÉNAFIL (VIAGRA®)

Un point sur les données de pharmacovigilance du sildénafil (Viagra®) a été présenté par le Centre Régional de Pharmacovigilance de Rouen.

Le sildénafil agit par inhibition sélective et puissante de la phosphodiestérase de type 5 (PDE 5) dans les corps caverneux de la verge. Le sildénafil et son métabolite principal (N déméthyl) sont liés à 96% aux protéines plasmatiques. Le métabolisme hépatique du sildénafil fait intervenir la voie du CYP 3A4 (voie principale) et la voie du CYP 2 C9 (voie secondaire).
Le sildénafil est indiqué chez l'homme de plus de 18 ans dans le traitement de la dysfonction érectile.

Viagra® a été mis sur le marché aux Etats-Unis le 7 avril 1998. D'après les données IMS, jusqu'au 17 juillet 1998, le nombre de prescriptions a été estimé à 3 208 000 aux Etats-Unis.

Dans l'Union européenne, ce médicament enregistré selon une procédure centralisée avec les Pays-Bas comme pays rapporteur, a été autorisé par la Commission Européenne le 15 septembre 1998. Dans l'attente de la décision de la Commission Européenne, le Comité des Spécialités Pharmaceutiques a demandé au laboratoire de soumettre un rapport périodique d'évaluation sur les données de sécurité non pas sur une base semestrielle mais sur une base mensuelle. 2 rapports ont été soumis par le laboratoire.

Données internationales de sécurité d'après les rapports périodiques de tolérance

Le Centre Régional de Pharmacovigilance de Rouen a analysé les données contenues dans les 2 rapports de sécurité disponibles à ce jour.
Dans le dernier rapport de tolérance, sur la période du 16 juin 1998 au 15 juillet 1998, 761 événements ont été signalés par des professionnels de santé correspondant à 386 cas répartis en 150 cas graves et 236 cas non graves.

● Parmi les effets graves, 40 décès ont été rapportés dont 24 d'origine cardiaque probable et 16 de cause inconnue ; l'âge, connu dans 18 cas, est en moyenne de 60 ans avec des extrêmes compris entre 39 ans et 74 ans ; la posologie, connue dans 10 cas est en moyenne de 55 mg avec des extrêmes compris entre 50 et 100 mg.

La plupart des décès et des effets indésirables graves rapportés sont d'origine cardio-vasculaire ou cérébro-vasculaire. La notion de facteurs de risque cardio-vasculaire et/ou de prise concomitante de dérivés nitrés est retrouvée dans 2/3 des cas de décès dans le 1er rapport mais est difficile à évaluer dans le 2ème rapport.

Selon le rapporteur, il est nécessaire de mieux préciser les caractéristiques cliniques des patients traités en terme de facteurs de risque et d'antécédents cardio-vasculaires afin d'évaluer de façon précise le non-respect des contre-indications et de mieux identifier les patients à risque.

● De rares cas d'hypotension ont été rapportés.

Annexe 3-7

● Des troubles hématologiques divers ont été rapportés, à type d'hémolyse aiguë, C.I.V.D., épistaxis... L'effet antiagrégant plaquettaire potentiel du sildénafil mérite d'être gardé en mémoire.

● Les effets indésirables visuels sont à surveiller.

Données françaises

Deux effets indésirables ont été rapportés en France : un décès chez un patient de 78 ans traité par inhibiteurs calciques et dérivés nitrés et un cas d'agressivité chez un patient de 52 ans sans antécédent psychiatrique qui a pris en 1 semaine 3 comprimés de Viagra®. L'évolution a été favorable en 2 jours

Conclusion

Dans l'ensemble, les effets indésirables rapportés sont attendus compte-tenu de la pharmacologie du produit et de la population traitée.

Le Centre Régional de Pharmacovigilance de Rouen propose d'élaborer une fiche spécifique des effets indésirables destinée à standardiser le recueil des données et accepte d'analyser les rapports périodiques successifs de tolérance.

IV - POINT SUR LE BENFLUOREX (MÉDIATOR ®)

Le Centre Régional de Pharmacovigilance de Besançon a présenté, à la demande de l'Agence du Médicament, des données sur les chiffres de ventes et des données de cinétique du Benfluorex. L'Agence est en effet régulièrement interrogée par des pharmaciens inspecteurs de la santé sur la possibilité d'usage détourné de ce produit.

- Evolution des chiffres de vente

Depuis 1991, les ventes progressent régulièrement. Aucun pic n'a été observé au cours des mois qui ont suivi les mesures prises à l'encontre des anorexigènes. Il est toutefois, à noter que les ventes de ce produit sont d'environ 5 millions de boîtes, ce qui est loin d'être négligeable.

Il est en fait, difficile au vu des seuls chiffres de ventes de mettre en évidence un mésusage du produit. Il est donc indispensable pour affiner l'analyse de :

- disposer des données Dorema
- de pouvoir distinguer les nouvelles prescriptions des renouvellements
- de saisir l'observatoire des prescriptions

- Données cinétiques et de métabolisme

Les concentrations plasmatiques du Benfluorex sont atteintes en 1 à 2 heures, l'absorption est complète et le volume de distribution est faible de 0,37 l/kg. La fixation plasmatique est de 77 %. Le métabolite majeur est le 1-(3-trifluoromethylphenyl)-2N-2-(carboxymethyl)aminopropane. L'élimination est rénale avec 75 % du produit éliminé dans les 8 premières heures. Le Benfluorex est totalement métabolisé.

La norfenfluramine, métabolite du Benfluorex est retrouvée en faible quantité (2 %) dans les urines. Il est surprenant de constater que les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60 ng/ml). En effet, la Norfenfluramine formée à partir de la Fenfluramine, n'est plus transformée et se retrouve intacte dans les urines de 24 h à l'état d'équilibre à 7,4 % de la dose administrée. Alors que la norfenfluramine formée à partir du Benfluorex, est transformée en produit désaminé et oxydé.

Il n'y a aucune explication actuellement pour cette différence.

Le Comité Technique juge que ces informations sont insuffisantes et ne permettent pas d'être entièrement rassuré. En particuliers, le rapporteur devrait pouvoir disposer d'une analyse correcte des AUC.

Enfin, une question relative à la parenté chimique du Benfluorex avec les amphétaminiques est posée. Il a été rapporté qu'un patient âgé traité par MEDIATOR® avait présenté un test urinaire positif ; cette recherche avait été faite chez ce dernier dans le cadre d'une procédure judiciaire, son fils étant toxicomane. Les CEIP pourrait être interrogés à ce sujet.

Etude volontaires sains.

Annexe 3-7

V - POINT SUR LES ATTEINTES DÉMYÉLINISANTES DU SYSTÈME NERVEUX CENTRAL APRÈS VACCINATION CONTRE L'HÉPATITE B CHEZ L'ENFANT DE MOINS DE 15 ANS.

Le Centre Régional de Pharmacovigilance de Strasbourg a présenté le suivi de l'enquête relative aux affections démyélinisantes du système nerveux chez des enfants âgés de 15 ans au moins au cours d'une vaccination contre l'hépatite B.

Ce point fait état des observations rapportées depuis la date de commercialisation des vaccins jusqu'au 31 mars 1998.

Les propositions de critères d'atteintes démyélinisantes du système nerveux central survenant après une vaccination et validés par deux experts en neurologie ont été longuement exposées.Le comité technique a pris connaissance des difficultés rencontrées pour l'interprétation des IRM chez l'enfant.

Trente huit observations d'affections démyélinisantes (centrales et périphériques) ont été retenues, après élimination des doublons et avis de l'expert neuropédiatre. Vingt sept cas de ces 38 observations touchent le système nerveux central. Elles correspondent à 6 premières poussées de SEP, 1 SEP connue, 10 atteintes ophtalmologiques (névrite optique, névrite optique rétrobulbaire, diplopie, papillite), 4 myélites, 1 encéphalomyélite, 3 encéphalites, 2 "autres" atteintes démyélinisantes (paresthésie, hémiparésie, ...). Ces cas sont survenus chez 17 filles (62,9 %) et 10 garçons. Les âges des patients varient de 7 à 15 ans. 7 observations concernent des enfants de moins de 10 ans et 20 cas des enfants âgés de 11 à 15 ans. Des antécédents familiaux de sclérose en plaques sont retrouvés dans 4 dossiers.Un cas d'antécédent personnel de sclérose en plaques a été signalé. Le délai de survenue est inférieur ou égal à 2 mois dans 59,2 % des cas. La fréquence de survenue de ces effets ne semble pas dépendre du rang de vaccination (3 cas après P1, 9 cas après P2, 3 cas après P3, 10 cas après un rappel et 2 cas où le rang n'est pas indiqué). Les années de survenue s'échelonnent entre 1993 et 1997. En 1993, il y a eu 1 cas, en 1994 : 2 cas, en 1995 : 3 cas, en 1996 : 13 cas et en 1997 : 8 cas. Les profils de tolérance des vaccins ne semblent pas être différents : 18 cas sont rapportés avec l'ENGERIX B® et 8 cas avec le GENHEVAC B®. Dans 1 cas, le nom du vaccin en cause n'est pas précisé. Il n'existe aucun cas avec réadministration positive et avec rechallenge négatif.

A la suite de ce bilan, le comité technique a relevé l'absence de notifications chez le nourrisson.

Par ailleurs, le CRPVde Strasbourg a présenté une étude épidémiologique réalisée en milieu scolaire du Bas-Rhin auprès de collégiens vaccinés. Cette enquête consiste en un suivi de la tolérance du vaccin contre l'hépatite B (réactions locales, troubles visuels,...) par des médecins-scolaires. Ainsi, au niveau de ce département, 10.000 élèves des classes de 6ème ont été inclus dans cette étude. Cependant, au bout de 3 ans (à leur entrée en 3ème), on ne dénombrait plus que 100 lycéens par rapport à l'échantillon initial de 10.000. Le comité technique a trouvé cette initiative intéressante tout en soulignant deux problèmes majeurs : d'une part, les difficultés d'ordre pratique pour développer de telles études dans d'autres départements et d'autre part, le nombre de perdus de vue qui représente plus de 90% de l'échantillon initial.

Annexe 3-7

VI - ENQUÊTE OFFICIELLE SUR LA NÉVIRAPINE (VIRAMUNE®)

Le Centre Régional de Pharmacovigilance de Créteil a présenté un bilan des effets indésirables avec VIRAMUNE® (néviparine) dans le cadre de l'A.T.U. de cohorte pour la période 1er novembre 1997 - 2 juin 1998.

VIRAMUNE® a obtenue une Autorisation de Mise sur le Marché Européenne (procédure centralisée) en février 1998.

L'analyse des données de tolérance confirme la toxicité cutanée prédominante.

Le premier rapport périodique de tolérance comprend, en effet, un nombre important d'effets indésirables cutanés graves : syndrome de Lyell, syndrome de Stevens-Johnson, érythème polymorphe. Ce point sera présenté au CSP des 20-22 octobre 1998.

Annexe 3-7

VII - ENQUÊTE OFFICIELLE SUR LE GLIMÉPIRIDE (AMAREL®)

Les Centres Régionaux de Pharmacovigilance de Bordeaux et de Montpellier ont présenté un point sur les effets indésirables notamment à type d'atteintes hépatiques et d'hypoglycémies, au cours de la prise d'AMAREL®, sulfamide hypoglycémiant commercialisé en France par les Laboratoires Hoechst-Houdé depuis septembre 1997.

1) Atteintes hépatiques et glimépiride :

* Le Centre Régionnal de Pharmacovigilance de Bordeaux a présenté 15 observations d'atteinte hépatique rapportées en France chez des patients traités par AMAREL® (à la date du 8 août 1998).

Ces observations se répartissent de la façon suivante :
- 5 observations déclarées aux Centres de Pharmacovigilance
- 15 observations déclarées aux laboratoires, dont 5 doublons

Parmi ces 15 observations, 7 ont été exclues en raison d'une autre explication (une lithiase avec dilatation du cholédoque, une hépatite C, 3 cancer du pancréas, une angiocholite, une lithiase avec dilatation des voies biliaires et fistule).

Parmi les huit observations retenues (4 hommes, 3 femmes, 1 genre non précisé), l'âge moyen était de 63,5 ans. Sept observations ont été enregistrées comme graves. Il s'agissait d'une hépatite fulminante (ALAT à 583N, insuffisance rénale aiguë anurique, ictère et encéphalopathie), de 4 cytolyses (dont une avec des ALAT à 382N) et de 2 cholestases. L'évolution a été favorable pour 7 observations et fatale pour un cas (hépatite fulminante).
Le taux d'incidence des atteintes hépatiques a été estimé à 1 cas notifié pour 10 000 patients traités (pour une période de 10 mois).

* Au cours des essais cliniques en France, 2 cas d'atteinte hépatique ont été enregistrés. Une observation a été exclue (hépatite C). L'autre observation rapportait une augmentation modérée des enzymes hépatiques d'évolution inconnue.

* A l'étranger :
En mars 98, le glimépiride était commercialisé dans 22 pays (en Europe, Amérique du Nord, Centrale et du Sud, Asie). Le glimépiride a été commercialisé pour la première fois en Suède en Octobre 1995. 15 observations d'atteintes hépatiques graves ont été rapportées à l'étranger. Mais 2 ont été exclues (cancer du foie, cancer des voies biliaires), 3 étaient non documentées et 3 trop succintes. Parmi les 7 observations restantes, 4 au moins comportaient une autre explication (non médicamenteuse). Le seul décès était à priori lié à une insuffisance hépatique sur insuffisance cardiaque, compliquée d'infection respiratoire aiguë.

Au total, concernant les atteintes hépatiques, il n'y a guère d'élément nouveau par rapport au bilan présenté en Mars 98. La mention figurant dans le RCP et transcrite dans le Vidal 1998 parait suffisamment claire et explicite : "Des cas isolés d'augmentation des enzymes hépatiques ont été rapportés au cours du traitement avec les sulfonylurées, ainsi qu'une altération de la fonction hépatique accompagnée d'une cholestase avec ictère et d'une hépatite. Les symptômes disparaissent généralement après arrêt du traitement mais une hépatite sévère peut évoluer vers une insuffisance hépatique."

Il est nécessaire de continuer à surveiller le glimépiride pour avoir un recul d'un an par rapport au début de sa commercialisation en France (septembre 1997).

2) Hypoglycémies et glimépiride :

Le Centre Régional de Pharmacovigilance de Montpellier a présenté 90 cas d'hypoglycémies rapportés en France chez des patients traités par AMAREL® (à la date du 24 août 1998).

Ces observations se répartissent de la façon suivante :
- 10 cas d'hypoglycémie au cours des essais cliniques dont 3 cas graves. L'évolution a été favorable dans tous les cas (après "resucrage" intraveineux dans 2 cas et oral dans 1 cas, non précisé pour les autres observations).
- 8 observations déclarées aux Centres de Pharmacovigilance dont 5 graves. L'âge moyen était de 69,8 ans (extrêmes : 49-87 ans). La posologie de glimépiride était de 1 mg/j dans 3 cas, 2 mg/j dans 4 cas et 4 mg/j dans 1 cas. Le délai d'apparition par rapport au début du traitement était de 1 jour pour une observation, compris entre 1 à 4 jours dans 3 observations et supérieur à 3 jours dans 4 observations. Dans 5 observations, la valeur de la glycémie était connue et inférieure à 0,5 g/l. L'évolution a été favorable dans tous les cas (après "resucrage" intraveineux dans 3 cas et oral dans 2 cas). Hormis l'âge, il existait dans la plupart des dossiers d'autres facteurs de risque (insuffisance rénale dans 2 observations, interactions médicamenteuses dans 4 cas). Dans 3 observations graves sur 5, l'indication d'un traitement anti-diabétique oral était probablement excessive.
- 72 observations déclarées au laboratoire dont 17 enregistrés comme graves.
L'âge moyen était de 66,7 ans (extrêmes : 55-91 ans). Pour les cas graves, la posologie de glimépiride était de 1 mg/j dans 8 cas, 2 mg/j dans 3 cas et supérieure à 2 mg pour les 6 autres observations. Le délai d'apparition par rapport à la dernière prise du traitement était précisé dans 3 observations (1, 2 et 18 heures). Dans 8 observations, la valeur de la glycémie était connue et inférieure ou égale à 0,5 g/l. L'évolution a été favorable dans 12 cas et non précisée dans 2 autres. Un patient est décédé 6 mois plus tard d'une fibrose pulmonaire préexistante. Il existait des interactions médicamenteuses validées dans 11 observations sur 17 graves, et suspectées dans 2 autres observations. Hormis l'âge, il existe dans la plupart des dossiers d'autres facteurs de risque (insuffisance rénale dans 2 observations, interactions, effort physique inhabituel, anorexie dans 4 cas, pour une observation l'indication d'un traitement anti-diabétique oral était excessive, non-indication également suspectée dans un autre cas).

L'incidence a été estimée à 11-11,5 cas pour 10 000 patients traités quelque soit la gravité de l'hypoglycémie (3-3,2 cas pour 10 000 patients traités pour les hypoglycémies graves).

Au total, le nombre et la gravité des hypoglycémies semblent actuellement en accord avec ce qui est décrit dans la littérature pour les autres sulfonylurées. Etant donné la longue durée d'action de cet analogue du glibenclamide, le respect des contre-indications et l'évaluation des terrains à risque doit rester de mise. Le maniement de ce type de produit, surtout chez la personne âgée, doit être très prudent et une grande partie des hypoglycémies pourrait être évité par un bon respect des règles de bon usage. Les facteurs de risque sont tous repris dans le Résumé des Caractéristiques du Produit. Il est nécessaire de continuer à surveiller le glimépiride pour avoir au moins 1 an de recul par rapport au début de sa commercialisation en France (septembre 1997). Compte-tenu de la longue durée d'action du glimépiride, le Comité Technique de Pharmacovigilance souhaite la mise en place d'une réflexion sur le problème de l'utilisation de ce médicament ainsi que des autres hypoglycémiants oraux chez les personnes âgées.

Annexe 3-7

3) Autres effets et glimépiride :

Le Centre Régional de Pharmacovigilance de Montpellier a présenté 28 cas d'autres effets rapportés en France chez des patients traités par AMAREL® (23 provenant des Centres de Pharmacovigilance et 5 provenant du laboratoire).

Ces observations se répartissent de la façon suivante :
- Effets cutanés : 8 observations
- Effets hématologiques : 4 observations
- Effets digestifs : 5 observations (dont une pancréatite très peu documentée)
- Effets oculaires : 2 observations
- Effets divers : 9 observations

La plupart des effets notifiés sont connus et mentionnés dans le Résumé des Caractéristiques du Produit.

En conclusion, la ré-évaluation des données de pharmacovigilance du glimépiride ne montre pas de nouveauté en terme de nature, fréquence ou sévérité des effets rapportés. L'Autorisation de Mise sur le Marché a été enregistrée dans le cadre d'une reconnaissance mutuelle dont l'état membre de référence sont les Pays-Bas auxquels la France transmettra les résultats de cette analyse. La surveillance de ce médicament doit être poursuivie pour avoir un an de recul par rapport au début de sa commercialisation en France.

VIII - POINT SUR LES MÉDICAMENTS GÉNÉRIQUES

Lors du tour de table des cas marquants du comité technique du 27 mai 1998, le problème de la pharmacovigilance des génériques avait été abordé et les CRPV de Limoges et de Saint-Etienne, chargés de rassembler des exemples de cas marquants d'inefficacité ou d'effets indésirables survenus avec des génériques. Ce point a été discuté en présence du président du groupe de travail "médicaments génériques".

Le Directeur de l'évaluation a tenu à rappeler quelques définitions.

Le texte de référence concernant les médicaments génériques est l'article L601-6 du Code de la Santé Publique qui précise que "on entend par spécialité générique d'une autre spécialité une spécialité qui a la même composition qualitative et quantitative en principes actifs, la même forme pharmaceutique, et dont la bioéquivalence avec l'autre spécialité a été démontrée par des études appropriées de biodisponibilité".

Ainsi, le **médicament générique** est une copie conforme à l'original, équivalent sur le plan thérapeutique et dont l'intérêt majeur est un coût moins important par rapport au médicament original.
Cependant, des différences peuvent exister au niveau des principes actifs qui peuvent contenir des impuretés différentes suivant la voie de synthèse choisie. Il faut également vérifier que l'étude de bioéquivalence est fiable et extrapolable.
A l'échelle européenne, ces médicaments sont nommés **médicaments essentiellement similaires.** Les études de bioéquivalence ne sont pas, selon les textes européens et contrairement à la réglementation française, systématiques : elles sont faites en complément du dossier pharmaceutique afin de mettre en évidence des différences qui pourraient avoir des conséquences sur le plan clinique.
En France, le terme d'**équivalent thérapeutique** est également employé : il concerne des médicaments identiques en tout point, disposant parfois de la même chaîne de fabrication mais commercialisés par des laboratoires différents.

Le CRPV de Limoges s'est heurté à des difficultés lors de la recherche des observations : d'une part, les médicaments, produit de référence ou générique, sont souvent codés dans la banque selon leur dénomination commune internationale et d'autre part le droit de substitution dans les hôpitaux est déjà effectif compte tenu des listes limitatives des médicaments disponibles à la pharmacie. Généralement, les prescriptions et le dossier du patient mentionnent le produit de référence, plus connu que le générique mais la pharmacie délivre le produit dont elle dispose. Ceci conduit à des confusions faisant attribuer les effets indésirables au produit de référence plutôt qu'au générique.

Dans le cadre de l'enquête, 6 médicaments ont été retenus : acébutolol, allopurinol, furosémide, nifédipine, propranolol, trimébutine. La période d'interrogation de la base s'étendait jusqu'au 31 décembre 1997.
Concernant l'allopurinol, 18 observations ont été recensées. Dans 14 cas, le générique était administré en remplacement d'un traitement par ZYLORIC bien toléré et dans 9 cas, le ZYLORIC était repris sans problème après échec du générique (survenue d'un effet indésirable). Les effets étaient généralement bénins, surtout cutanés et digestifs.
Pour les autres produits retenus pour l'enquête, seulement 5 observations impliquent spécifiquement le générique.

Annexe 3-7

Globalement, deux types d'effets sont rencontrés : soit une modification de l'effet du générique par rapport au produit de référence (augmentation ou diminution de l'effet), soit des effets spécifiques du générique qui pourraient impliquer les excipients. La comparaison des compositions du produit de référence et du générique ne permet pas de donner une explication rationnelle de l'effet indésirable. De plus, il s'agit de cas isolés et aucune extrapolation n'est possible actuellement.

Le Comité technique a souhaité que les problèmes de traçabilité des produits réellement administrés aux malades puissent être résolus de la meilleure manière possible afin que les CRPV puissent disposer des données fiables pour la constitution des dossiers de pharmacovigilance susceptibles d'impliquer des génériques.

Enfin, il a été rappelé qu'un signal concernant la pharmacovigilance d'un médicament générique (effet indésirable, inefficacité) peut entraîner l'intervention de l'Inspection et qu'il pourra être procédé à la vérification de la qualité des principes actifs et des modes de fabrication.
Enfin, le Comité technique a proposé que le répertoire des génériques soit distribué aux CRPV.

IX - ENQUÊTE OFFICIELLE SUR LA GEMCITABINE (GEMZAR®)

Résultats de l'enquête officielle sur la tolérance du GEMZAR (gemcitabine) associée à la radiothérapie.

La gemcitabine est enregistrée en France selon une procédure nationale et est commercialisée depuis **juin 1996** sous le nom de GEMZAR® par les laboratoires Lilly.
Cet analogue nucléosidique de la déoxycytidine est indiqué par voie parentérale dans le traitement du cancer non métastatique du poumon non à petites cellules (NSCLC), de l'adénocarcinome du pancréas et dans le cancer du pancréas résistant au 5FU. La gemcitabine peut être associée à la radiothérapie de façon concomitante ou successive (gemcitabine pouvant alors être administrée avant ou après la radiothérapie).

Les résultats de l'enquête sur les effets indésirables de l'association gemcitabine-radiothérapie ont été présentés par le Centre Régional de Pharmacovigilance de Poitiers qui avait déjà étudié la cardiotoxicité de la gemcitabine (résultats de l'enquête officielle présentés lors du Comité Technique du 27 mai 1998).
Les observations ont été rapportées dans le cadre d'essais cliniques ou de la notification spontanée.

1. Association concomitante gemcitabine - radiothérapie

Lors d'essais cliniques dans le cancer du poumon, associant 1000 mg/m² de gemcitabine et 60Gy de radiothérapie sur 6 semaines, et dans le cancer tête et cou, associant 300 mg/m² par semaine de gemcitabine et 70Gy de radiothérapie sur 7 semaines, cette association a donné lieu à une toxicité inacceptable (fibroses pulmonaires et/ou oesophagiennes) qui a motivé l'arrêt de ce type d'essai. D'autres essais dans le cancer du poumon et du pancréas sont en cours et il n'a pas été rapporté à ce jour de toxicité excessive avec des doses de gemcitabine plus réduites.

En janvier 1996 et suite au deuxième rapport périodique, les laboratoires Lilly ont déposé une demande de modification de l'information pour ajouter dans le RCP le risque d'apparition de fibroses pulmonaires et oesophagiennes sévères lors de l'association concomitante gemcitabine et radiothérapie curative (rubriques "interactions médicamenteuses" et "mises en garde").

2. Association successive

- **Radiothérapie puis gemcitabine**

Au niveau mondial, 25 cas (9 cas français) évoquant un **phénomène de rappel** ont été signalés. Un phénomène de rappel est suspecté lorsque la localisation des événements survenus au décours du traitement par la gemcitabine, correspond aux territoires irradiés.

Chez 5 patients, la radiothérapie avait induit des complications post-radiques, suggérant que l'existence d'une **intolérance à la radiothérapie** facilite la survenue du phénomène de rappel.
Dans 3 cas, la **posologie** de la gemcitabine était supérieure à la dose recommandée de 1000mg/m²; la dose cumulée allait de 1 à 15,6 g/m².

Dans 7 cas, le **délai** entre la radiothérapie et la gemcitabine n'était pas documenté mais dans 11 cas sur 18, il existait une corrélation entre le délai radiothérapie et gemcitabine et le délai gemcitabine et apparition de l'effet indésirable.

Hormis les manifestations neurologiques chez les patients ayant reçu une radiothérapie cérébrale (5 cas), la **symptomatologie** est très homogène avec des manifestations cutanées à type de dermato-polymyosite. Elle est grave dans 19 cas sur 25.

Selon l'expert radiothérapeute, un mécanisme histopathologique possible serait l'existence d'une microartériopathie oblitérante inflammatoire induite par la gemcitabine.

L'évolution est favorable dans 10 cas sur 25 ; dans 12 cas, la symptomatologie a persisté ou s'est aggravée (fibrose pulmonaire, épaississement cutané avec douleurs persistantes) ; dans 3 cas, l'évolution était inconnue.

❒ **Gemcitabine puis radiothérapie**

Deux cas pouvant évoquer un **phénomène de radiosensibilisation** ont été rapportés.

Le rapporteur serait d'avis de **contre-indiquer l'association concomitante de la gemcitabine et de la radiothérapie à visée curative et palliative.**

Selon l'expert radiothérapeute, l'administration successive de la radiothérapie et de la gemcitabine pourrait être raisonnablement envisagé avec un délai d'un mois entre les deux thérapeutiques.

En conclusion, le Comité technique souhaite que les résultats de l'enquête officielle sur "gemcitabine et radiothérapie" et "gemcitabine et cardiotoxicité" soient présentés à la Commission Nationale de Pharmacovigilance du 22 septembre 1998.

Annexe 3-7

X - DEMANDE DE MODIFICATION DE L'INFORMATION MÉDICALE SUR LE CISAPRIDE (PREPULSID®)

Les données de sécurité actualisées et la demande de modification d'information de la spécialité Prépulsid® déposée par les laboratoires Janssen Cilag ont été présentées par le Centre de Pharmacovigilance de Lille.

1 - Contexte

a) Demande de modification de l'information

Le 30 juin 1998, l'Unité de Pharmacovigilance a reçu des laboratoires Janssen Cilag une demande de modification de l'information pour Prépulsid®.

Cette demande de modification a été déposée dans tous les pays de l'Union Européenne et concerne les rubriques 4.3 "contre-indications" et 4.5 "interactions médicamenteuses" (extension de la contre-indication actuelle (formes orales ou parentérales de kétoconazole, d'itraconazole, de miconazole, de fluconazole, macrolides (exceptée la spiramycine), antiprotéases et diphémanil") à la contre-indication de classe pour les antifongiques azolés et les macrolides, ajout de la néfazodone en contre-indication). A la rubrique 4.4 "mises en garde", les facteurs devant être évalués avant l'administration de cisapride afin d'évaluer le rapport bénéfice-risque sont énumérés. A la rubrique 4.6 "Grossesse et allaitement", une information sur l'utilisation du cisapride pendant la grossesse a été ajoutée. Au niveau de la rubrique 4.8 "effets indésirables", les effets de type cardio-vasculaire sont détaillés. De plus, les symptômes pouvant survenir en cas de réactions d'hypersensibilité sont décrits. Il est précisé dans la rubrique 4.9 "surdosage" que la bradycardie, facteur de risque de survenue de torsades de pointes, doit être recherchée et corrigée.

b) Information de la F.D.A.

En juin dernier en raison des effets arythmogènes du produit, la F.D.A. a pris la décision de réserver l'utilisation du cisapride au traitement de deuxième intention du reflux gastroesophagien avec un renforcement des rubriques "contre-indications et "mises en garde et précautions particulières d'emploi" du Résumé des Caractéristiques du Produit.
Ce sujet a été abordé au Comité des Spécialités Pharmaceutiques de juillet dernier où il a été demandé que le rapport bénéfice-risque de la spécialité soit réévalué au niveau national.

2 - Données de sécurité actualisées

En France, les données de sécurité cardiaque ont été évaluées à plusieurs reprises par la Commission Nationale de Pharmacovigilance et la Commission d'AMM et ont abouti à des modifications successives du RCP avec information des prescripteurs par une lettre aux prescripteurs en février 1995, janvier 1996 et juin 1997.

Du 31 mars 1996 au 31 mars 1998, 30 observations d'effets cardiaques ont été rapportées chez 11 enfants et 19 adultes. Ces observations se répartissent en 6 malaises, 4 syncopes, 3 sensations dysrythmiques, 8 morts subites, 3 arrêts circulatoires et/ou respiratoires.

Annexe 3-7

L'évolution a été fatale dans 11 observations chez 6 enfants et 5 adultes. Chez l'enfant, 4 décès correspondent à des tableaux de mort subite du nourrisson et 2 sont survenus chez des enfants âgés respectivement de 10 mois et 15 ans, porteurs d'antécédents et/ou des pathologies associées graves associées, cardiaques ou non cardiaques.

Après analyse de ces dossiers, aucun lien direct ne peut être établi entre la prise de cisapride et ces décès.
Les données électrocardiographiques étaient documentées dans 16 observations et comprenaient 4 cas d'extrasystoles auriculaires ou ventriculaires, 1 cas d'asystole, 1 cas d'élargissement de QRS, 4 cas de fibrillation ou tachysystolie auriculaire et 9 allongements de QTc dont 2 cas s'accompagnaient de torsades de pointes. Une hypokaliémie était présente dans ces 2 dernières observations. L'évolution a été favorable dans ces 16 observations.

En terme d'interaction médicamenteuse, une seule observation de syncopes itératives avec allongement de QTc sans enregistrement de trouble du rythme ventriculaire peut être retenue. Elle peut correspondre à une interaction pharmacodynamique avec le disopyramide, antiarythmique capable à lui seul de provoquer un tel effet indésirable.

3 - Données bibliographiques

Depuis la dernière Commission de Pharmacovigilance, 2 publications concernant les données cliniques chez l'enfant ont été analysées.

Levine et coll 1998[1] n'ont pas mis en évidence de modification du QTc par rapport au QT de base après un mois de traitement par cisapride à la dose de 0,8 mg/kg/j chez 30 enfants dont 10 prématurés.

En revanche, *Hill et coll 1998*[2] ont comparé l'intervalle QTc d'enfants âgés de 5 mois à 18 ans traités par cisapride à la dose moyenne de 0,67 ± 0,23 mg/kg/j [0,3 -1,68] à une population témoin de 1000 enfants normaux et ont mis en évidence une valeur de QTc moyen à 0,43 dans le groupe cisapride versus 0,42 dans le groupe témoin. Onze enfants sur 35 soit 31% ont eu un allongement de QT supérieur à 0,45. De plus 2 enfants ont développé une torsade de pointes lors d'un traitement associé à de l'érythromycine ou de la clarithromycine.

4 - Données de vente

Du 31 mars 1996 au 31 mars 1998, l'exposition au Prépulsid® en France a été estimée à 4 300 000 traitements-patients ou 5 744 000 mois de traitements.

Annexe 3-7

5 - Conclusion

Selon le rapporteur, la demande de modification de l'information paraît acceptable sous réserve de quelques amendements.

Cependant, les données de sécurité cardiaque du cisapride doivent servir de base à la réévaluation du rapport bénéfice-risque.

Annexe 3-7

XI - QUESTIONS DIVERSES

a) Techniques :

- Point sur les antibiotiques de la famille des aminosides et atteintes vestibulaires isolées :

Le CRPV de Marseille a réalisé un point sur les atteintes vestibulaires isolées survenant avec les aminosides, après avoir rapporté un cas survenu après une dizaine de jours de traitement par gentamicine et ayant laissé des séquelles graves et invalidantes. L'audiogramme de cette patiente était normal.

La rubrique "effets indésirables" du Résumé des Caractéristiques du produit (RCP) des aminosides mentionne la possibilité de survenue d'"atteintes cochléo-vestibulaires".

Après consultation d'experts, il s'avère que les atteintes vestibulaires isolées sont bien connues des spécialistes en ORL. Les vertiges qui en sont la principale manifestation peuvent être durables et invalidants. Par ailleurs, ces symptômes étant mal connus des médecins hors de cette spécialité, le patient est souvent orienté vers une consultation psychiatrique.
La gentamicine donne davantage d'atteintes vestibulaires que cochléaires. Les autres aminosides sont aussi concernés par les effets vestibulaires mais dans des proportions moindres et ceux-ci sont plus rarement isolés.
Dès l'apparition des premiers symptômes, les patients doivent être rapidement orientés vers une consultation spécialisée. La position allongée des patients ne permet pas ou limite l'expression clinique du vertige.
Les examens par Vidéo Nystagmométrie apportent une beaucoup plus grande sensibilité, ce qui permet de quantifier l'atteinte vestibulaire et de suivre son évolution.

Il paraît donc indispensable de modifier le RCP de ces produits afin d'attirer l'attention du prescripteur sur la symptomatologie.
Le Comité Technique souhaite la mise en enquête officielle des antibiotiques de la famille des aminosides concernant les atteintes cochléo-vestibulaires. Le CRPV de Marseille est désigné comme responsable de cette enquête.

- **ROACCUTANE® (isotrétinoine)** : le CRPV de Fernand-Widal a rapporté un cas d'usage criminel du ROACCUTANE® fort insolite. Le conjoint ne souhaitant pas avoir d'enfant, administrait à sa partenaire, actuellement enceinte de 8 semaines 1/2, une capsule de ROACCUTANE® par voie vaginale avant chaque rapport sexuel.

- **QUINIMAX® (quinine, quinidine, cinchonine, cinchonidine)** : les infectiologues du CHU de Strasbourg ont observé une fréquence importante d'effets indésirables connus de la quinine chez des malades traités par QUINIMAX®.
→ Les CRPV doivent interroger leur(s) service(s) d'infectiologie et rapporter les effets indésirables survenus avec ce médicament au CRPV de Strasbourg qui présentera un rapide bilan lors du CT du 22 octobre 1998.

- DEPAKINE® (acide valproïque) / DEPAMIDE® (valpromide) et grossesse / CRPV de Clermont-Ferrand : Le valpromide (Depamide®) a pour métabolite actif l'acide valproïque, or la rubrique "grossesse" du RCP de Depamide® est totalement différente de celle de Depakine®. Le CRPV de Clermont-Ferrand adressera un courrier concernant cette remarque à l'unité de pharmacovigilance qui le transmettra au Groupe de Travail "grossesse".

- Effets délictueux des médicaments / soumission chimique médicamenteuse :

Dans le cadre du dossier relatif à l'usage criminel des produits psycho-actifs, l'Agence du Médicament a été chargée par la Direction Générale de la Santé :

- d'assurer le fonctionnement d'un groupe de travail pluridisciplinaire et interministériel. Ce groupe coordonné par le Professeur Lagier, doit d'une part élaborer des recommandations de prise en charge clinique des victimes droguées à leur insu et d'autre part se charger de l'aspect analytique de ce dossier.
- de mener une réflexion sur les actions préventives à mettre en oeuvre au niveau de l'Autorisation de Mise sur le Marché de ces molécules, tant sur le plan des études à mener au cours du développement (potentiel amnésiant et désinhibiteur des produits) que sur la recherche de solutions galéniques.

Sur l'aspect préventif, l'Agence du Médicament a décidé d'effectuer un état des lieux afin de compléter la liste des produits cités dans le rapport. L'ensemble des 3 réseaux (Centres Régionaux de Pharmacovigilance, Centres Anti-poisons et Centres d'évaluation et d'information sur les Pharmacodépendances) sera donc sollicité. Par conséquent, il est demandé aux CRPV de recenser les observations de soumission chimique médicamenteuse dont ils auraient pu avoir connaissance.

b) Administratives :

- <u>Nouveaux points (récapitulatif)</u> :

- Analogues nucléosidiques / acidose lactique et pancréatite : CRPV de St-Antoine et St Vincent de Paul : Comité Technique du 21 janvier 1999.
- Thiazidiques et pancréatite : CRPV d'Amiens : Comité Technique du 21 janvier 1999.
- Stamaril® (vaccin amaril) / méningite aseptique : CRPV de toulouse : Comité Technique du 19 novembre 1998,
- ELOHES® (hydroxyéthylamidon) / complications hépatiques : CRPV de Paris St-Antoine : Comité Technique du 22 octobre 1998.
- Fibrates et photosensibilisation : CRPV de Marseille :Comité Technique du 21 janvier 1999.

- <u>Nouvelles enquêtes officielles (récapitulatif)</u> :

- Aminosides / atteintes cochléo-vestibulaires : CRPV de Marseille : Comité Technique du 17 décembre 1998.

Annexe 3-7

- Divers :

- Le CRPV de Limoges présentera lors du CT du 21 janvier 1999 un point sur TICLID® et, en particulier, l'évaluation de l'efficacité des mesures prises.

- Documents distribués :

- Relevé d'avis du groupe de travail "Interactions médicamenteuses" n° 27 du 11 mai 1998

- Liste des événements indésirables graves inattendus notifiés à l'Unité Essais Cliniques (Période du 30/06/98 au 28/08/98)

- Décret n°98-578 du 9 juillet 1998 (JORF du 11 juillet 1998) relatif aux autorisations d'importation et aux autorisations temporaires d'utilisation de médicaments à usage humain et modifiant le Code de la Santé Publique.

- Liste des antiretroviraux (AMM ou ATU) au 2 septembre 1998

- Calendrier des demandes de modification en cours - septembre 1998 -

- Circulaire de la Direction des Hôpitaux sur les solutions d'irrigation stérile à base de glycocolle 1,5 % du 4 août 1998

- 3 publications du *New England Journal of Medicine* Volume 339, number 11 (10 septembre 1998) concernant les anorexigènes et atteintes valvulaires.

I - ADOPTION DU PROCÈS-VERBAL DU COMITÉ TECHNIQUE DU 10 SEPTEMBRE 1998

Le procès-verbal de la scéance du 10 septembre 1998 a été adopté avec les modifications suivantes :

Page 6 : Observation ALLOPURINOL MSD® : supprimer le mot "intracrânienne".

Page 14 : Paragraphe "Données cinétiques et de métabolisme", 6e ligne : remplacer "métabolisme" par "métabolite".

Page 15 : 4é paragraphe : remplacer "Parmi les 48 observations.... (paresthésie, hémiparésie, ...)" par "Trente huit observations d'affections démyélinisantes (centrales et périphériques) ont été retenues, après élimination des doublons dans de l'expert neuropédiatre. Vingt sept cas de ces 38 observations touchent le système nerveux central. Elles correspondent à 6 premières poussées de SEP, 1 SEP connue, 10 atteintes ophtalmologiques (névrite optique, névrite optique rétrobulbaire, diplopie, papillite), 4 myélites, 1 encéphalomyélite, 3 encéphalites, 2 "autres" atteintes démyélinisantes (parestbésie, hémiparésie, ...). Ces cas sont survenus ... entre 1993 et 1997. En 1993, il y a eu 1 cas, en 1994 ..."

Remplacer "La majorité des cas est apparue en 1993 (1 cas) ... 1997 (8 cas) par "En 1993, il y a eu 1 cas, en 1994 : 2 cas, en 1995 : 3 cas, en 1996 : 13 cas et en 1997 : 8 cas."

5è paragraphe : remplacer "nouveau-né" par "nourrisson".

Page 16 : Titre : remplacer "néviparine" par "névirapine".

Page 18 : 11è ligne : remplacer "88 ans" par "87 ans".

31è ligne : remplacer le paragraphe par "L'incidence a été estimée à 11-11,5 cas pour 10000 patients traités quelque soit la gravité de l'hypoglycémie (3-3,2 cas pour 10000 patients traités pour les hypoglycémies graves)".

Page 20 : 4è paragraphe, 3è ligne : remplacer "substilution" par "substitution".

Page 24 : 2è paragraphe, 3è ligne : remplacer "dear doctor letter" par "une lettre aux prescripteurs".

Annexe 3-8

II- PRÉSENTATION DU REGISTRE FRANCAIS DES NEUTROPÉNIES CHRONIQUES SÉVÈRES

Le Dr Jean DONADIEU, hématologue dans le service d'Hématologie et d'Oncologie Pédiatrique à l'hôpital d'enfants Armand-Trousseau à Paris a présenté le Registre **Français** des neutropénies chroniques sévères, fichier regroupant une centaine d'observations. Par ailleurs et indépendamment de ce Registre Français, il existe un Registre **International** incluant 531 patients atteints également de neutropénies chroniques sévères.

Le G-CSF est un facteur de croissance de la lignée granulocytaire commercialisé par les laboratoires Amgen sous le nom commercial de Neupogen ® et également par les laboratoires Bellon- RPR sous le nom de Granocyte®. Seul le Neupogen® a une Autorisation de Mise sur le Marché dans l'indication des neutropénies chroniques sévères.
Il est à noter que les neutropénies chroniques sévères sont les seules pathologies où le G-CSF est administré **au long cours.**

D'après les résultats des deux registres, plusieurs effets indésirables sont suspectés :

- **Transformations leucémiques** :
La question de la responsabilité du G-CSF dans la survenue de leucémies secondaires est actuellement soulevée. La fréquence de survenue de ces transformations leucémiques diffère dans les deux registres (2% dans le Registre Français, 10% dans le Registre International). Selon le Dr Donadieu, cette différence s'expliquerait par le fait que, dans le Registre International, certaines neutropénies initialement non classées en syndrome précis étaient en fait des états pré-leucémiques (absence d'analyse cytogénétique médullaire initiale).
- **Ostéoporose** : peu de données concernant l'ostéodensité des patients sont cependant disponibles.
- **Carcinome rénal** : un cas chez une patiente du Registre Français, porteuse d'une glycogénose Ib.
- **Protéinurie**
- **Splénomégalie** :
Selon le Dr Donadieu, on n'assiste pas actuellement à une flambée des leucémies secondaires au cours de l'utilisation chronique du G-CSF ; par conséquent, une modification de l'indication du G-CSF dans les neutropénies chroniques sévères n'est pas justifiée.
Pour plus de clarté, il souhaiterait voir rassembler **dans un seul paragraphe** du RCP tous les examens à effectuer dans le cadre de la surveillance du traitement. Il propose : un examen cytogénétique médullaire annuel, une densité osseuse tous les 2 ans environ, une recherche annuelle de splénomégalie, une recherche par bandelette d'une hématurie et d'une protéinurie. Il s'interroge également sur l'intérêt de l'ajout d'une surveillance rénale échographique tous les 2 ans.

Au total, afin de faire le point sur toutes ces données et de situer le Registre Français par rapport au Registre international, une rencontre technique réunissant le Dr Donadieu, le Système National de Pharmacovigilance (qui sera représenté par le CRPV de Caen), l'Unité de Pharmacovigilance et l'Unité AMM Cancérologie Immunologie s'avère nécessaire.

Annexe 3-8

III - TOUR DE TABLE DES CAS MARQUANTS

ARTOTEC®
(diclofénac,
misoprostol) : Pancréatite aiguë chez un homme de 41 ans, alcoolique.
(CRPV de Nantes)

BUFLOMEDIL RATIOPHARM®
(buflomédil) : Crises comitiales généralisées (4 crises en 48 heures) 36 heures après la première prise de 2 comprimés du générique en remplacement du FONZYLANE® (buflomédil) chez une femme de 75 ans diabétique et angoreuse.
(CRPV de Nantes)

CLARITYNE®
(loratadine) : Extrasystoles et palpitations chez un homme de 49 ans. Réadministration positive.
(CRPV de Caen)

CRIXIVAN®
(indinavir) : - Dysfonctionnement et raideur articulaires chez un homme de 61 ans.
(CRPV de Nancy)
- 3 cas de gynécomastie, débutant par un syndrome inflammatoire très douloureux ; absence d'atteintes endocriniennes.
(CRPV de Paris - Pitié-Salpétrière)

DEROXAT®
(paroxétine) : 4 observations d'hématome chez 4 femmes âgées de 22, 30, 39 et 54 ans. Les résultats de l'enquête officielle sur les syndromes hémorragiques des inhibiteurs de la recapture de la sérotonine seront présentés lors du Comité technique du 17 décembre 1998.
(CRPV de Paris - Créteil)

DISULONE®
(dapsone, oxalate
de fer) : Agranulocytose chez une femme de 69 ans. Les rubriques du RCP "mises en garde" et "effets indésirables" sont à revoir. Ouverture d'une enquête officielle placée sous la responsabilité du CRPV de St-Etienne.
(CRPV de Saint-Etienne)

EFFEXOR®
(venlafaxine)
+ HUMORYL®
(toloxatone) : Syndrome sérotoninergique chez une femme de 52 ans.
(CRPV de Limoges)

ENGERIX B®
(Ag HBs)
+ DT POLIO®
(anatoxine diphtérique,
anatoxine tétanique,
vaccin poliomyélitique) : Myélite aiguë chez un homme de 34 ans.
(CRPV de Montpellier)

FORENE® I.M.
(isoflurane) : Relâchement utérin excessif, source d'hémorragies post abortum chez deux femmes de 15 ans et 34 ans.
(CRPV de Rouen)

FONZYLANE®
(buflomédil) : 3 observations de tentative de suicide lors de la prise de FONZYLANE® à fortes doses, entraînant des convulsions et des troubles du rythme cardiaque. La précédente information sur la gravité majeure de ces intoxications n'a pas eu l'impact souhaité auprès des médecin-urgentistes. Une réévaluation de l'efficacité des mesures prises sera effectuée par le CRPV de Limoges.
(CRPV de Lyon)

FUCIDINE®
(acide fusidique)
+ MINISINTRON®
(acénocoumarol) : Thrombopénie chez une femme de 80 ans.
(CRPV de Rennes)

Héparine sodique : Thrombopénie et thrombose veineuse et artérielle chez un homme de 83 ans, chez deux femmes âgées de 72 et 78 ans.
Dans deux cas la surveillance des plaquettes n'avait pas été faite.
(CRPV de Marseille)

HOLOXAN®
(ifosfamide)
+ UROMITEXAN®
(mesna) : Infarctus du myocarde, angor et syndrome de menace chez une femme de 48 ans.
(CRPV de Tours)

HYZAAR®
(losartan potassique,
hydrochlorothiazide) : Toxidermie bulleuse chez une femme de 79 ans.
(CRPV de Strasbourg)

Annexe 3-8

INNOHEP®
(tinzaparine sodique) : Plusieurs cas de décès et d'accidents hémorragiques survenus lors de l'utilisation de ce médicament. Les précautions d'emploi mentionnées dans le résumé des caractéristiques du produit paraissent insuffisantes. Il existe une confusion dans l'esprit des médecin-prescripteurs entre les doses préventives et curatives confirmant leur manque d'information sur ce médicament. Ouverture d'une enquête officielle placée sous la responsabilité des CRPV de Toulouse et Rouen.
(CRPV de Rouen)

LAROXYL®
(amitriptyline)
+ DEROXAT®
(paroxétine) : Syndrome sérotoninergique chez une femme de 59 ans (décès).
(CRPV de Limoges)

LOVENOX®
(énoxaparine sodique)
+ ORGARAN®
(danaparoïde) : Thrombopénie et thromboses multiples chez une femme de 75 ans (décès). Test d'agrégabilité positif avec ces 2 médicaments.
(CRPV de Saint-Etienne)

MABTHERA®
(rituximab)
+ STABLON®
(tianeptine)
+ SOLU-MEDROL® 40 mg/2 ml
(méthylprednisolone) : Hypertension, tachycardie auriculaire, dyspnée et oedème pulmonaire chez un homme de 66 ans (décès).
(CRPV de Nice)

METHOTREXATE®
(méthotrexate) : - Rupture hémorragique lors d'une grossesse extra-utérine chez une femme de 28 ans (utilisation hors AMM).
- Avortement spontané à 17 semaines de gestation chez une femme de 27 ans (utilisation hors AMM).
Un point sur l'utilisation du méthotrexate dans les grossesses extra-utérines sera effectué par les CRPV de Rouen et Paris-Broussais.
(CRPV de Rouen)

Nitrate de propyl : Malaise lipothymique et névrite optique ischémique transitoire chez un homme de 28 ans.
(CRPV de Strasbourg)

Annexe 3-8

OXEOL®
(bambutérol)
+ RISORDAN®
(isosorbide dinitrate)
+ LOXEN®
(nicardipine)
+ LASILIX® faible
(furosémide)
+ DIFFU K®
(chlorure de potassium)
+ ROVAMYCINE®
(spiramycine)
+ SOLUPRED®
(prednisolone) : L'augmentation de posologie de l'OXEOL® (1 à 2 comprimés) a entraîné un coma diabétique chez une femme de 89 ans (décès).
(CRPV de Nantes)

PRIMOBOLAN®
(méténolone)
DANABOL®
(méthanediénone) : 1 observation de diminution du taux d'HDL, à 20 fois inférieure à la normale chez un homme de 29 ans prenant des produits anabolisants et pratiquant du culturisme. Le CRPV de St Etienne enverra un courrier à l'Agence du médicament. Le CRPV de Saint-Etienne transmettra cette observation au C.E.I.P. correspondant.
(CRPV de St Etienne)

PROGRAF®
(tacrolimus)
+ CORTANCYL®
(prednisone) : 3 cas de diabète sucré survenus chez des hommes de 21 ans, 22 ans et 52 ans.
(CRPV de Paris - Broussais)

RETROVIR®
(zidovudine)
+ EPIVIR®
(lamivudine) : Acidose isolée persistante à 6 semaines de vie chez un prématuré.
(CRPV de Paris - Saint-Vincent de Paul)

RETROVIR®
(zidovudine)
+ CRIXIVAN®
(indinavir)
+ EPIVIR®
(lamivudine) : Dysfonctionnement et raideur articulaires chez un homme de 61ans.
(CRPV de Nancy)

ROACCUTANE®
(isotrétinoïne) : Lésions chéloïdiennes chez un homme de 24 ans.

(CRPV de Paris Fernand-Widal)

SALAZOPYRINE®
(sulfasalazine)
+ INDOCID®
(indométacine)
+ Sels d'Or : Hypoacousie chez un homme de 47 ans.
(CRPV de Limoges)

TAZOCILLINE®
(pipéracilline, tazobactam)
CLINOMEL®
(solutions d'acides aminés
avec électrolytes) : Plusieurs cas de rupture de poche plastique avec projection de liquide lors de la reconstitution du médicament . Le CRPV de Nantes enverra un courrier à l'Agence du médicament en mentionnant le N° de lot du médicament incriminé. L'Unité de Pharmacovigilance transmettra cette observation à l'Unité Accidents de la Direction de l'Inspection des Etablissements de l'Agence du médicament.
(CRPV de Nantes)

TECHNESCAN MAG 3®
(solution injectable de
technetium 99mTc) : Urticaire chez un nourrisson de 6 semaines.
(CRPV de Saint-Etienne)

TENORDATE®
(nifépidine, aténolol) : Dépression et idée suicidaire chez une femme de 50 ans. Régression à l'arrêt du traitement. Pas de symptôme sous TENORMINE® (aténolol).
(CRPV de Toulouse)

TERALITHE® 250
(lithium)
+ DEPAMIDE®
(valpromide) : Augmentation de la lithiémie chez un homme de 45 ans. Cette interaction n'est pas mentionnée dans les RCP de ces spécialités. L'observation sera transmise au Groupe de Travail "Interactions".
(CRPV de Caen)

TRIFLUCAN®
(fluconazole) : Agranulocytose chez un homme 42 ans. La modification du RCP est en cours.
(CRPV d'Angers)

VIDORA®
(indoramine)
+ ACTAPULGITE®
(attapulgite de Mormoiron
activée)

Annexe 3-8

+ DOLIPRANE®
(paracétamol)
+ SPASFON®
(phloroglucinol,
triméthylphloroglucinol)
+ VOGALENE®
(métopimazine)
+ RHINUREFLEX®
(ibuprofène,
pseudoéphédrine) : Malaise, somnolence, allongement du QT et torsade de pointes chez un enfant de 12 ans ayant pris accidentellement 15 comprimés de VIDORA®.
(CRPV de Clermont-Ferrand)

VIRACEPT®
(nelfinavir) : 1 cas de gynécomastie a été rapporté, sans atteinte endocrinienne.
(CRPV de Paris - Pitié-Salpétrière)

VIRACEPT®
(nelfinavir) : Hypercholestérolémie à 17,85 mmol/l chez un homme de 47 ans.
(CRPV de Saint-Etienne)

YU PING FENG SANG
(plante chinoise importée
illégalement en France,
présentée sous forme
de gouttes buvables) : Gynécomastie chez un enfant de 15 mois. Cette observation a été transmise à la D.G.S.
(CRPV de Saint-Etienne)

ZELITREX®
(valaciclovir) : Syndrome confusionnel chez une femme (âge inconnu). Plusieurs cas sont rapportés dans la Banque nationale de pharmacovigilance. Cette spécialité a fait l'objet d'une DMI. Cet effet indésirable devrait donc prochainement apparaître dans le RCP.
(CRPV de Marseille)

Annexe 3-8

ZELITREX®
(valaciclovir)
+ DI-ANTALVIC®
(paracétamol, dextropropoxyphène)
+ ASPEGIC® 250
(acétylsalicylate de lysine)
+ AMLOR®
(amlodipine)
+EUPANTOL®
(pantoprazole)
+ LASILIX®
(furosémide) : Syndrome confusionnel, nausées et vomissements chez un homme de 75 ans.
(CRPV de Montpellier)

ZELITREX®
(valaciclovir)
+ HALDOL®
(halopéridol)
+ PARKINANE®
(trihexyphénidyle)
+ GLUCOPHAGE®
(metformine)
+ ZOVIRAX®
(aciclovir)
+ RENITEC®
(énalapril) : Confusion mentale, coma et insuffisance rénale chez une femme de 72 ans.
(CRPV de Montpellier)

ZERIT®
(stavudine)
+ EPIVIR®
(lamivudine)
+ CRIXIVAN®
(indinavir) : Acidose lactique et stéatose hépatique chez une femme de 34 ans.
(CRPV de Toulouse)

ZOMIG®
(zomitriptan)
+ DESERNIL®
(méthysergide)
+ PROZAC®
(fluoxétine) : Accident ischémique transitoire, hémiparésie et paralysie faciale chez une femme de 49 ans. Cette observation sera transmise au Groupe de Travail "Interactions".
(CRPV de Tours)

IV - POINT SUR INHIBITEURS DE L'ENZYME DE CONVERSION ET HYPONATRÉMIES

Annexe 3-8

Le Centre Régional de Pharmacovigilance de Créteil a présenté un point sur les hyponatrémies associées à la prise d'inhibiteurs de l'enzyme de conversion.

Après recherche dans la banque de données du Système National de Pharmacovigilance, 42 cas ont été retrouvés. 30 d'entre eux mentionnaient un diurétique associé et 9 observations mentionnaient également la prescription d'un inhibiteur de la recapture de la sérotonine.

L'imputabilité a été jugée douteuse dans 30 observations, plausible dans 4 cas, vraisemblable dans 1 cas et n'a pas été évaluée dans 6 cas.

Au total, devant une incidence faible, un mécanisme mal connu, des traitements hyponatrémiants associés dans la plupart des cas, aucune modification de l'information ne semble actuellement justifiée.

Annexe 3-8

V - ENQUÊTE OFFICIELLE SUR LES SYNDROMES D'HYPERSENSIBILITÉ ET LES TOXIDERMIES A L'ALLOPURINOL

Le Centre de Pharmacovigilance de Rouen a présenté les résultats de l'enquête officielle relative aux syndromes d'hypersensibilité et toxidermies à l'allopurinol.

L'allopurinol est un uricofreinateur empêchant la formation de l'acide urique par inhibition de la xanthine-oxydase. Il est commercialisé depuis de nombreuses années (première AMM obtenue en 1967).

La notification en 1997, de 2 cas de vascularite et de 3 cas de décès consécutifs à des syndromes de Lyell a conduit à la réalisation d'un point sur les atteintes cutanées graves dont les résultats ont été présentés au Comité Technique du 26 février 1998 où il a été décidé l'ouverture d'une enquête officielle.

Cette enquête a été réalisée à partir de toutes les observations d'effets indésirables cutanés et de syndromes d'hypersensibilité notifiées aux Centres Régionaux de Pharmacovigilance et aux laboratoires concernés[1] entre janvier 1993 et décembre 1997.

Un total de 265 observations d'effets secondaires cutanés survenus en Francea été analysé. Il s'agit de 29 cas de syndrome d'hypersensibilité, 37 cas de toxidermies bulleuses, 152 cas d'autres toxidermies, 30 cas d'urticaire et 17 cas de prurit.

1- Syndrome d'hypersensibilité : 29 observations
Il s'agit de 17 femmes et 12 hommes dont la moyenne d'âge est de 62 ans.
L'imputabilité est plausible dans 10 cas et vraisemblable dans 3 cas.
Le délai d'apparition de l'effet est inférieur à 1 mois dans 14 cas, compris entre 1 et 6 mois dans 7 cas, supérieur à 6 mois dans 6 cas et inconnu dans 2 cas.
Dans 12 cas, le traitement par allopurinol a été poursuivi pendant plus de 10 jours après la survenue de l'effet indésirable.
L'évolution a été fatale dans 4 cas (dont 3 cas où le décès est du à l'effet indésirable). Dans l'un de ces 3 cas, le décès est survenu à la suite de la réintroduction de l'allopurinol.
Dans 24 cas, l'évolution a été favorable, sans séquelle et dans 1 cas, elle est inconnue.

2- Toxidermies bulleuses : 37 observations
Il s'agit de 17 femmes et 20 hommes dont la moyenne d'âge est de 65 ans.
L'imputabilité est plausible dans 14 cas et vraisemblable dans 6 cas.
Le délai d'apparition de l'effet est inférieur à 1 mois dans 21 cas, compris entre 1 et 6 mois dans 7 cas, supérieur à 6 mois dans 1 cas et inconnu dans 8 cas.
L'évolution a été fatale dans 7 cas (dont 6 cas où le décès est lié à l'effet indésirable). Dans l'un de ces 6 cas, le traitement par allopurinol a été continué pendant encore 3 semaines après la survenue de l'effet indésirable.
Aucun des décès n'est lié à une réintroduction du produit.

[1] Les laboratoires ayant une AMM pour une spécialité à base d'allopurinol et commercialisée sur la période étudiée sont les suivants :
Glaxo Wellcome (Zyloric®), GNR Pharma (Allopurinol GNR®), Merck Sharp Dohme Chibret (Allopurinol MSD®), Lafon Ratiopharm (Allopurinol Ratiopharm®), Sanofi (Desatura®), Bayer (Allopurinol Bayer®).

Dans 22 cas, l'évolution a été favorable et sans séquelle, dans 2 cas il y a eu guérison avec séquelles, dans 2 cas, le sujet n'est pas encore rétabli et dans 4 cas, l'évolution est inconnue.
La réintroduction de l'allopurinol a abouti dans 1 cas à un syndrome de Lyell, dans 3 cas à un syndrome de Stevens-Johnson et dans 1 cas à une éruption bulleuse.

3- Autres toxidermies : 152 observations
Il s'agit de 56 femmes et 94 hommes (dans 2 cas, le sexe n'est pas précisé) dont la moyenne d'âge est de 65,5 ans.
L'imputabilité est plausible dans 25 cas, vraisemblable dans 25 cas et très vraisemblable dans 5 cas.
Le délai d'apparition de l'effet est inférieur à 30 jours dans 61 cas, compris entre 1 et 6 mois dans 35 cas, supérieur à 6 mois dans 36 cas et inconnu dans 20 cas.
Dans 124 cas, l'évolution a été favorable et sans séquelle, dans 2 cas il y a eu guérison avec séquelles, dans 8 cas le sujet n'est pas encore rétabli et dans 18 cas, l'évolution est inconnue.

Durant les 5 dernières années, les ventes d'allopurinol correspondent à plus de 458 millions de mois de traitement, ce qui correspond à une fréquence d'effets indésirables de :
- 1 cas de syndrome d'hypersensibilité pour 16 millions de mois de traitement,
- 1 cas de toxidermie bulleuse pour 12,07 millions de mois de traitement,
- 1 cas de toxidermie sans facteur de gravité pour 3 millions de mois de traitement.

Plusieurs points ont été soulignés par le rapporteur :
- l'importance du nombre de réintroductions positives (15 cas sur 218 dossiers de toxidermie et syndromes d'hypersensibilité), ce qui a conduit au décès dans 1 cas et à la survenue de toxidermies bulleuses dans 5 cas,
- l'importance du délai entre la survenue de l'effet et l'arrêt du traitement (de 1 à 5 semaines dans 9 cas),
- dans 20% des cas, les effets indésirables surviennent plus de 6 mois après le début du traitement,
- aucune observation de syndrome d'hypersensibilité ou de syndrome de Lyell n'est rapportée avec les spécialités autres que le Zyloric®, ce qui peut s'expliquer par les chiffres de vente nettement supérieurs du Zyloric®.
3 observations de toxidermie ont été rapportées avec des génériques après substitution du Zyloric® par ceux-ci (Allopurinol Ratiopharm® et Allopurinol MSD®).

En conclusion, le rapporteur propose de modifier le RCP des spécialités contenant de l'allopurinol:

- **rubrique "indications"** : ajout de "l'hyperuricémie modérée asymptomatique (uricémie < 90 micro-mol/l) n'est pas une indication au traitement par allopurinol"
- **rubrique "posologie"** : le rapporteur propose une table d'adaptation de la posologie chez l'insuffisant rénal et le sujet âgé, en fonction de la clairance de la créatinine, qui ne figure pas dans le RCP actuel de l'allopurinol. Cette adaptation permettrait d'empêcher l'accumulation d'oxypurinol, qui semble être le facteur déclenchant de la majorité des syndromes d'hypersensibilité.
- **rubrique "effets indésirables"** : Les laboratoires GLAXO WELLCOME ont déposé une demande de modification de la rubrique "effets indésirables" de Zyloric®. Le texte proposé par le rapporteur, en accord avec les laboratoires GLAXO WELLCOME est le suivant :

"*Les réactions cutanées sont rares, mais peuvent être graves. Elles peuvent se manifester par des éruptions prurigineuses, érythémateuses, papuleuses, vésiculeuses ou bulleuses.*

Les délais d'apparition peuvent être longs, parfois de plusieurs années. L'apparition de ces manifestations cutanées doit faire cesser le traitement et contre-indique définitivement sa reprise en cas de toxidermie bulleuse. Si l'éruption a été bénigne et après guérison, une réintroduction à doses très faibles et progressivement croissantes peut être envisagée si nécessaire. Toute nouvelle manifestation cutanée doit faire interrompre définitivement le traitement. De façon exceptionnelle, des éruptions cutanées plus graves telles que des

Annexe 3-8

syndromes de Lyell ou Stevens-Johnson ont été signalées.

Manifestations hépatiques *:*

Les atteintes hépatiques, exceptionnellement graves, observées au cours des syndromes d'hypersensibilité peuvent être cytolytiques ou cholestatiques. Quelques cas d'hépatite granulomateuse isolée, réversible à l'arrêt du traitement, ont été signalés.

Hypersensibilité généralisée *:*

Ce syndrome, associe à divers degrés fièvre, altération de l'état général, éruption cutanée (parfois sévère avec syndrome de Lyell ou de Stevens-Johnson, vascularite), polyadénopathie, atteinte hépatique, altération de la fonction rénale, hyperéosinophilie. Il est rare mais peut être fatal. Il survient principalement chez des sujets insuffisant rénaux, où âgés, chez lesquels une adaptation de la posologie à la clearance de la créatinine n'a pas été effectuée (cf. posologie). Il doit être recherché chez tout patient présentant un ou plusieurs des signes cités. Il impose l'arrêt immédiat du traitement et contre-indique formellement sa reprise. Ces manifestations peuvent survenir à n'importe quel moment du traitement mais le plus souvent dans les 4 premières semaines.
L'arrêt précoce du traitement est la condition essentielle à une évolution favorable en quelques semaines."

Le Comité Technique a souhaité que le rapporteur sollicite l'avis d'experts néphrologues, dermatologues et allergologues sur ses propositions de modification du RCP, avant la présentation du dossier à la Commission Nationale du 10 novembre 1998.

Annexe 3-8

VI - POINT SUR L'HÉPATOTOXICITÉ DE EULEXINE® (FLUTAMIDE) ET ANANDRON® (NILUTAMIDE)

Le centre de pharmacovigilance de Tours a présenté les résultats de l'enquête officieuse concernant les effets indésirables hépatiques rapportés avec Anandron® (nilutamide) et Eulexine® (flutamide).
Ces 2 spécialités sont des anti-androgènes non stéroïdiens, agonistes du LH-RH qui bloquent les récepteurs androgéniques prostatiques.

Anandron® (comprimé à 50 mg et à 150 mg) est une spécialité indiquée dans le traitement du cancer de la prostate métastasé en association avec la castration chirurgicale ou chimique. Cette spécialité est autorisée depuis 1986 et commercialisée par les laboratoires Cassenne.

Eulexine® (comprimé à 250 mg) est une spécialité indiquée dans le traitement du cancer de la prostate métastasé, autorisée depuis 1986 et commercialisée par les laboratoires Schering Plough.

Cette enquête officieuse a été motivée par la survenue en avril 1996 d'un cas d'hépatite fulminante d'évolution fatale chez un patient de 64 ans traité par Eulexine® et Zoladex® depuis 6 mois, associés à Haldol®, Nozinan®, Artane® et Pervincamine® depuis 20 ans.

Cas rapportés avec Anandron® (nitulamide)

Tous les effets indésirables hépatiques déclarés aux centres de Pharmacovigilance depuis la mise sur le marché de cette spécialité jusqu'au 27 août 1998 ont été pris en compte.

21 effets indésirables hépatiques ont été déclarés aux centres de pharmacovigilance chez des patients âgés en moyenne de 70 ans ± 11 ans [43-89 ans]. Dans 5 observations, il s'agissait d'une atteinte de type cytolytique, dans 3 cas d'une atteinte cholestatique, dans 2 cas d'une atteinte mixte, dans 10 cas d'une atteinte hépatique sans précision, et dans 1 cas d'une hépatite fulminante. Le délai de survenue est en moyenne de 21 semaines avec des extrêmes compris entre 1 semaine et 2 ans ; dans 12 observations le délai de survenue était inférieur à 6 mois.

La dose était inférieure ou conforme à la dose préconisée dans le Résumé des Caractéristiques du Produit dans 11 observations, supérieure dans 6 observations et non documentée dans 4 observations. Dans 10 observations sur 21 (48%), l'atteinte a été considérée comme sévère. Le degré de gravité, documenté dans 7 observations, a été noté grave dans 6 d'entre elles.

L'évolution a été favorable dans 12 observations, en cours dans 2 observations, fatale dans 1 observation et n'était pas connue dans 6 observations.

Cas rapportés avec Eulexine® (flutamide)

Une enquête officielle de pharmacovigilance sur les effets hépatiques de l'Eulexine® ayant été réalisée par le centre de Pharmacovigilance de Clermont-Ferrand en mai 1991 ; seuls les cas déclarés après cette date et avant le 27 août 1998 ont été pris en compte.

Annexe 3-8

Depuis 1991 38 effets indésirables hépatiques ont été déclarés aux centres de pharmacovigilance chez des patients âgés en moyenne de 72 ans ± 8 ans [57-89 ans]. Ces effets se répartissent en 10 atteintes de type cytolytique, 8 atteintes cholestatiques, 3 atteintes mixtes, 14 atteintes sans précision et 3 hépatites dont 1 nécrose hépatique et 2 cirrhoses. Le délai de survenue est en moyenne de 30 semaines avec des extrêmes compris entre 5 jours et 5 ans ; dans 17 observations le délai de survenue était inférieur à 6 mois. La dose était inférieure ou conforme à la dose préconisée dans le Résumé des Caractéristiques du Produit dans 32 observations, supérieure dans 1 observation et non documentée dans 5 observations. Dans 13 observations sur 38, l'atteinte a été considérée comme sévère. Le degré de gravité, documenté dans 23 observations, a été noté comme grave dans 17 d'entre elles.

L'évolution a été favorable dans 25 observations, "en cours" dans 6 observations, "guérison avec séquelles" dans 1 observation, "fatale" dans 4 observations (décès sans rapport avec l'effet dans 1 observation et décès dû à l'effet dans 3 observations) et n'était pas connue dans 2 observations.
A la rubrique "Mises en garde" de l'actuel Résumé des Caractéristiques du Produit, un contrôle périodique de la fonction hépatique est préconisé.

Le nombre de cas rapportés d'atteintes hépatiques est plus faible pour la spécialité Anandron® que pour la spécialité Eulexine®. En revanche, les atteintes hépatiques paraissent plus sévères avec Anandron®. Ceci laisse supposer soit que Eulexine® est à l'origine d'atteintes hépatiques moins sévères soit qu'une surveillance régulière des transaminases préconisée seulement dans le Résumé des Caractéristiques du Produit Eulexine® pourrait en limiter la sévérité.

Selon le rapporteur il paraît nécessaire de modifier la rubrique "effets indésirables" du Résumé des Caractéristiques du Produit de l'Anandron® afin de faire apparaître la possibilité d'hépatite sévère. De plus, la pertinence d'une surveillance systématique des transaminases devra être discutée.
La rubrique "effets indésirables" du Résumé des Caractéristiques du Produit de l'Eulexine® paraît adaptée. La périodicité du contrôle de la fonction hépatique préconisé dans le Résumé des Caractéristiques du Produit devra être discutée.

Au total, le comité technique a proposé de mettre en place une enquête officielle de pharmacovigilance pour les spécialités contenant le nilutamide ou le flutamide.
Le dossier sera examiné à la Commission Nationale de Pharmacovigilance de décembre 1998 en présence d'experts hépatologues.

Annexe 3-8

VII - POINT SUR L'HÉPATOTOXICITÉ DE LA CÉTIRIZINE (ZYRTEC®, VIRLIX®)

A la suite de l'examen d'une demande de modification et d'une demande d'éxonération relatives à la Cétirizine, le Centre Régional de Pharmacovigilance de Reims avait souhaité revoir la tolérance hépatique de ce produit. Un bilan des effets hépatiques notifiés avec la cétirizine est donc présenté en Comité Technique.
Cette évaluation s'est appuyée sur les données du Système National de Pharmacovigilance et les données des rapports périodiques de tolérance (PSUR) fournis par les laboratoires.

La Cétirizine est commercialisée par les laboratoires Synthélabo et UCB, respectivement sous les noms de spécialités Virlix® et Zyrtec®.

Les chiffres de ventes connus pour des périodes différentes sont les suivants :
- 14 972 405 boîtes de 15 cp pour Virlix® entre le 01/01/93 et 31/12/97
- 28 922 892 boîtes de 15 cp pour le Zyrtec® entre le 01/07/88 et le 31/12/94

L'analyse de la base nationale permet de retenir seulement 6 observations ; pour 5 d'entre elles, la chronologie est évocatrice et un cas de rechallenge positif a été publié par le CRPV de Tours.

Les cas rapportés par les laboratoires sont peu documentés, une cholestase associée à une cytolyse (transaminases à 5 N) chez un patient présentant une lithiase biliaire est décrite.

Les données de la littérature sont pauvres, HEPATOX signale trois publications dont le cas publié par le CRPV de Tours.

Les données de pré clinique et les essais cliniques ne montraient pas d'hépatotoxicité. Quelques cas ont été signalés en "postmarketing". Toutefois le caractère exceptionnel de ces derniers ne permet pas de modifier le libellé du Résumé des Caractéristiques du Produit.

Annexe 3-8

VIII - POINT SUR LA PHARMACOVIGILANCE EUROPÉENNE.

Compte-rendu du groupe de travail de Pharmacovigilance de l'Agence Européenne des 7 et 8 octobre 1998.

- **Terfénadine (article 12)** : les décisions de la Commission Européenne doivent être appliquées par les Etats Membres avant le 22 octobre 1998. En France, la suspension de l'AMM est effective jusqu'au 11 février 1999.

- **Anorexigènes (article 15a)** :
- fenfluramine / dexfenfluramine et amfépramone / phentermine : Les réponses aux questions adressées aux firmes sont attendues pour le 1er mars 1999 au plus tard et seront examinées par le Comité des Spécialités Pharmaceutiques (CSP) de mars 1999, en présence des firmes. L'opinion du CSP est attendue pour le mois d'avril 1999.
- Clobenzorex, fenbutrazate, fenproporex, mazindol, méfénorex, norpseudoéphédrine, phendimétrazine, propylhexédrine : initiation d'un article 15a (Autriche rapporteur, France et Allemagne co-rapporteur) afin de réévaluer le rapport bénéfice / risque de tous ces anorexigènes amphétaminiques. Le rapport d'évaluation circulera parmi les Etats Membres à partir du 30 janvier 1999 et sera discuté au CSP du mois de février 1999. L'opinion du CSP est attendue pour le mois d'avril 1999.
  L'Italie pose le problème du MEDIATOR® (benfluorex) en raison de l'analogie structurale avec la fenfluramine et craint la survenue de valvulopathies associées à l'utilisation de ce médicament. Ce problème sera discuté au prochain groupe de travail des 24 et 25 novembre 1998.

- **Sparfloxacine (ZAGAM®) (article 12, France rapporteur)** : le rapport d'évaluation de la France concernant le protocole de l'étude d'efficacité a circulé parmi les Etats Membres pour information et sera discuté lors du CSP du mois d'octobre 1998.

- **Kétorolac (TORADOL®) / risque hémorragique et augmentation de la mortalité** : le Royaume-Uni a présenté son rapport d'évaluation. Deux études italiennes et une synthèse espagnole ont été distribuées. Le Royaume-Uni analyse et prépare ses commentaires sur les trois études publiées adressées par la firme. Ce sujet sera de nouveau discuté lors du groupe de travail du mois de novembre 1998.

- **Sildénafil (VIAGRA®)** : le groupe de travail a jugé nécessaire la réalisation d'une étude post-marketing par la firme. Par ailleurs, l'infofax de l'Allemagne concernant les interactions avec les nitrates sera discuté lors du Working Party du mois de novembre 1998.

- **Inhibiteurs des protéases / lipodystrophies, hyperlipidémies, altération du métabolisme du glucose, pancréatites, complications cardio-vasculaires** : un libellé commun pour la classe des inhibiteurs des protéases a été finalisé pour adoption lors du CSP du mois d'octobre 1998 où sera choisie la procédure à appliquer (mesure de restriction urgente ou variation de type II). Les prescripteurs seront informés par le biais d'une lettre d'information où d'un bulletin national selon les Etats Membres. Il a, par ailleurs, été jugé nécessaire que les firmes ré-analysent les données cliniques et mettent en place des études de tolérance. Désormais, les produits de cette classe seront revus ensembles.

- **Analogues nucléosidiques / lipodystrophies, acidoses lactiques, stéatoses hépatiques** : la révision du libellé commun concernant les acidoses lactiques a été jugées nécessaire. La Suède adressera sa proposition de libellé commun aux Etats-Membres avant le CSP du mois d'octobre 1998. Il a par ailleurs été demandé aux firmes de revoir le problème des lipodystrophies dans le prochain rapport périodique actualisé de tolérance.

- **Tolcapone (TASMAR®) / hépatotoxicité** : Ce médicament est enregistré selon une procédure européenne

Annexe 3-8

centralisée avec l'Irlande comme pays rapporteur. A la suite de 2 notifications d'hépatite fulminante mortelle, la firme a fait une présentation orale lors du Working Party. Celui-ci a adopté un libellé pour le RCP et la notice qui seront modifiés dans le cadre d'une mesure urgente de restriction avec envoi d'une lettre d'information aux prescripteurs. Au total, 60 000 patients dans le monde dont 1500 en France ont reçu un traitement par TASMAR®. Lors des essais cliniques de phase III (pré-AMM), des observations d'élévations de transaminases hépatiques ont été signalées mais il n'y avait pas de différence statistiquement significative entre le groupe placebo et le groupe tolcapone. Ces atteintes hépatiques avaient fait l'objet d'une précaution d'emploi signalée dans le RCP.

- **Thiomersal (dérivé mercuriel) / hypersensibilité et neurotoxicité** : Le groupe de travail a approuvé les conclusions du pays rapporteur (Irlande) : inscription comme excipient à effet notoire, mise en garde dans le RCP concernant la neurotoxicité et la sensibilisation au produit (la neurotoxicité n'a cependant pas été retenue lors de l'utilisation de cet excipient dans les vaccins). Par ailleurs, l'OMS en 1990 avait recommandé de ne pas dépasser une exposition de 200 µg/semaine de mercure organique (correspondant environ à 400 µg de thiomersal) chez l'adulte (excepté chez la femme enceinte). En septembre 1998, le groupe de travail a recommandé de ne pas dépasser une exposition de 200 µg/an de mercure organique chez l'enfant quelque soit l'apport (alimentaire ou médicamenteux). Par ailleurs, la dose maximale pouvant être administrée chez l'enfant, dans le cadre du schéma vaccinal est de 500 µg de thiomersal pour les 2 premières années.

- **Contraceptifs oraux de troisième génération / risque cardio-vasculaire** : Le rapport de l'étude MICA a circulé parmi les Etats Membres pour information. Le groupe de travail a été informé de la création d'un groupe *ad hoc* d'experts sur les contraceptifs oraux et le risque cardio-vasculaire à compter du 15 octobre 1998.

- **Vaccins contre l'hépatite B / Atteintes démyélinisantes et pathologies auto-immunes**
la France a exposé les résultats des dernières études épidémiologiques et les mesures prises par le Secrétariat d'Etat à la Santé. La France et l'Allemagne ont envisagé la nécessité de modifier la rubrique "mise en garde et précautions d'emploi" du RCP, ce qui n'a pas été approuvé par les autres Etats Membres. Le groupe de travail de pharmacovigilance a proposé au CSP de réunir un groupe *ad hoc* d'experts pour une évaluation complète du problème.
La France fera circuler un rapport d'évaluation parmi les Etats Membres en novembre 1998.

- **Cisapride (PREPULSID®) / cardiotoxicité** : certains Etats Membres ont contre-indiqué l'utilisation du cisapride chez l'enfant de moins de 3 mois. Dans d'autres Etats Membres, il s'agit uniquement d'une contre-indication relative.
Dans la plupart des Etats Membres, le cisapride est utilisé dans cette tranche d'âge.
La France adressera un infofax afin de recueillir les indications du cisapride dans chaque Etat Membre puis adressera un rapport d'évaluation sur le bénéfice / risque du produit pour discussion en novembre 1998.

- **Albumine / augmentation de la mortalité** : le Royaume-Uni a présenté son rapport d'évaluation sur l'article de Cochrane paru dans le BMJ 1998 (Human albumin administration in critically ill patients : systelatic review of randomized controlled trials. Brit Med J ; 317 : 235-240). L'Allemagne a également fait circuler un rapport d'évaluation concernant cet article. Il existe également des études non citées dans l'article du BMJ. Ce sujet sera de nouveau discuté en janvier 1999 après réunion d'experts dans chaque Etat Membre.

- **Anti-histaminiques non sédatifs / révision des mises en garde sur les risques cardio-vasculaires** : le groupe de travail a approuvé l'ajout de recommandations dans le RCP de l'astémizole sous forme d'un libellé commun à tous les Etats Membres. L'utilisation chez l'enfant âgé de 2 à 6 ans est jugée acceptable si les firmes fournissent des données de sécurité rassurantes.

Annexe 3-8

Les données concernant l'ébastine seront discutées en novembre 1998.
Les Etats Membres doivent adresser à la Finlande leurs commentaires sur le projet de RCP de la loratadine. Le projet de RCP révisé sera discuté en novembre 1998.

- **Aprotinine (TRASYLOL®) / infarctus du myocarde, thrombose du greffon, augmentation de la mortalité** : les Pays-Bas doivent adresser un rapport d'évaluation actualisé prenant en compte les données des laboratoires BAYER, pour discussion en novembre 1998.

- **Isotrétinoine / dépression, psychose, suicide, effets indésirables cutanés** : les modifications de RCP relatives aux réactions psychologiques sont en cours de réalisation ou déjà réalisées dans les différents Etats Membres. La France a informé le groupe de travail que des réactions cutanées après épilation à la cire ont été rapportées. Cet effet indésirable est déjà mentionné dans le RCP de plusieurs Etats Membres et doit faire l'objet d'une variation de type II en France.

- **Lamotrigine (LAMICTAL®)** : La suède adressera un rapport d'évaluation sur l'utilisation du lamictal® en pédiatrie pour discussion en novembre 1998.

- **Traitements substitutifs hormonaux contenant des oestrogènes / augmentation du risque de cancer du sein** : le groupe de travail a jugé nécessaire d'introduire un libellé harmonisé dans le RCP de ces spécialités. Le libellé ainsi que la procédure a suivre seront discutés en novembre 1998.

- **Propacétamol (PRO-DAFALGAN®) / eczéma de contact** : une reformulation de ce médicament est en cours.

- **Inhibiteurs sélectifs de recapture de la sérotonine / syndrome de sevrage** : en juin 1998, le Royaume-Uni a proposé un libellé afin d'harmoniser le RCP de ces produits. Ce sujet sera discuté en novembre 1998.

- **Sertindole (SERDOLECT®) / cardiotoxicité / demande de modification par la firme** : le Royaume-Uni a adressé un rapport d'évaluation dans le cadre de la procédure de reconnaissance mutuelle. Les pays commercialisant cet anti-psychotique sont extrêmement inquiets en raison de notifications de morts subites (en rapport avec l'effet proarythmique) et envisagent de prendre rapidement des mesures. La France n'est pas concernée par cette procédure de reconnaissance mutuelle , il y a cependant quelques essais cliniques en cours.

- **Vigabatrin (SABRIL®) / atteinte du champ visuel** : une évaluation globale du rapport bénéfice / risque a été jugée nécessaire. Une procédure d'arbitrage dans la cadre d'un article 12 de la Directive 75/319/CEE à été engagée auprès du CSP par la Finlande.

Annexe 3-8

IX - ENQUETE OFFICIELLE SUR LA CARDIOTOXICITE DE LA NAVELBINE® (VINORELBINE)

La vinorelbine (Navelbine®) est un oncostatique du groupe des vinca-alcaloïdes. Elle est commercialisée en France depuis 1989, par les laboratoires Pierre Fabre Médicament avec pour indication première, le traitement des cancers du poumon non à petites cellules et depuis 1992, le traitement du cancer du sein métastatique. A la suite de la notification de 2 accidents ischémiques, une enquête sur les effets indésirables cardiaques a été réalisée par le centre de pharmacovigilance de Caen.
Les données de la littérature (8 publications), des centres régionaux de pharmacovigilance (28 dossiers) et de la firme (27 dossiers, doublons exclus) recueillies entre 1er janvier 1989 et le 21 juin 1998 ont été évaluées. Les données internationales de la firme ont finalement été exclues de l'analyse car elles étaient insuffisamment informatives et/ou n'apportaient rien de nouveau par rapport aux données françaises.
Les notifications spontanées comprennent 42 observations d'accidents ischémiques, 8 troubles du rythme et 5 accidents cardiaques divers.

Les accidents ischémiques.
Il s'agit de 12 infarctus du myocarde, 9 cas d'angine de poitrine et 21 douleurs thoraciques.
Le délai d'apparition était inférieur à 60 minutes dans 27 cas. L'évolution a été fatale dans 5 cas et favorable dans 32 cas. La notion de réintroduction positive est présente dans 18 dossiers. Aucun antécédent cardio-vasculaire n'a été signalé pour 20 dossiers (sur 35 où cette donnée a pu être renseignée), aucun antécédent de tabagisme pour 3 dossiers (sur 14 dossiers), les patients avaient eu une irradiation médiastinale dans 12 cas (sur 34 dossiers) ou une chimiothérapie cardiotoxique pour 15 patients (sur 34). Il n'existe pas de donnée sur le volume perfusé et la durée de perfusion.

Les troubles du rythme.
Il s'agit d'un arrêt cardio-circulatoire, de 5 tachycardies, d'un bloc auriculoventriculaire, d'un flutter auriculaire.

Les autres manifestations sont : 2 chocs cardiogéniques, une défaillance cardiaque congestive et un cas de péricardite.
Il pourrait s'agir d'une toxicité indirecte (induction d'un spasme coronarien) ou d'une toxicité directe (la vinorelbine exerçant son action sur les myofibrilles).
Une estimation de l'incidence des cas notifiés a été calculée à partir d'une posologie totale moyenne arbitrairement fixée à 400 mg par patient. Il existe très probablement une sous notification des cas (bien connue avec ce type de médicament). On peut remarquer aussi que le tabagisme n'est renseigné que pour 25% des observations alors que 65% des patients sont traités pour cancer broncho-pulmonaire non à petites cellules.

Au total, les accidents ischémiques représentent 67% de l'ensemble des cas avec une évolution fatale pour 12 % des cas.
Il doit être envisagé de mentionner une information sur ces effets indésirables cardiaques (douleurs précordiales, infarctus du myocarde, modifications transitoires de l'ECG symptomatique d'une ischémie coronaire ou d'un trouble du rythme) figure dans la rubrique effets indésirables du RCP. De plus une précaution d'emploi devrait être indiqué pour les patients présentant une pathologie cardiaque ischémique.
Ce dossier sera présenté à la prochaine Commission Nationale de Pharmacovigilance.

Il a été rappelé que le centre devra étendre cette enquête aux autres médicaments du groupe des vinca-alcaloïdes.

Annexe 3-8

X - POINT SUR LES LEUCÉMIES INDUITES PAR NOVANTRONE® (MITOXANTRONE)

La mitoxantrone est un cytostatique de la famille des anthraeènediones apparentée aux anthracyclines. Elle est commercialisée par les laboratoires Wyeth-Lederlé (A.M.M. obtenue en 1985) sous le nom de Novantrone®. Elle est indiquée dans le traitement du cancer du sein et particulièrement dans les cancers avancés du sein métastatiques, dans les leucémies aiguës myéloïdes et dans les lymphomes non hodgkiniens. La Novantrone® est également commercialisée dans 7 autres pays européens (Allemagne, Portugal, Grèce, Danemark, Suède, Norvège et Finlande).

La mitoxantrone est utilisée dans le traitement adjuvant du cancer du sein en per-opératoire en perfusion unique quel que soit le type de thérapeutique postérieure, ou dans les protocoles de type FMC (fluoro-uracile, mitoxantrone et cyclophosphamide) à la dose de 12 mg/m² en alternance avec la radiothérapie à raison de 4 à 6 cures successives.

Le Dr Catherine SGRO (CRPV de Dijon) et le Dr Gilles Chaplain (Registre des cancers gynécologiques de la Côte d'Or) ont présenté les résultats d'une enquête officieuse sur la hémopathies induites par la mitoxantrone.

Un total de 11 observations d'hémopathies survenues après l'administration de mitoxantrone ont été rapportées aux Centres Régionaux de Pharmacovigilance. Il s'agit de 9 cas de leucémies aiguës non lymphocytaires et de 2 myélodysplasies. En raison de la difficulté d'établir le diagnostic cytologique de myélodysplasie, seules les observations de leucémies aiguës non lymphocytaires ont été analysées dans cette enquête.

Concernant les 9 leucémies aiguës non lymphocytaires, l'âge moyen des patients lors du diagnostic du cancer du sein est de 45 ans, l'âge moyen des patients lors du diagnostic de la leucémie aiguë non lymphoblastique (LANL) est de 48 ans. Dans les deux cas cet âge moyen serait inférieur à l'âge moyen des patients dans la population générale chez qui un cancer du sein ou une LANL sont diagnostiqués. Le délai moyen de survenue entre le début de l'administration de la mitoxantrone et de la découverte de la LANL est de 23 mois. La dose cumulée moyenne de mitoxantrone administrée aux patientes est de 108 mg, ce qui semble indiquer que ces patientes ont bénéficié d'un traitement adjuvant non intensifié de leur cancer du sein (soit une dose de 12 mg/m² de mitoxantrone par cycle). Les LANL observées chez les patientes sont dans 50 p. cent des cas des LAM 3 selon la classification FAB. L'évolution a été fatale dans 4 cas sur 9.

6 observations d'hémopathies malignes ont été rapportées aux cours d'essais cliniques. Seules 2 observations de myélodysplasies n'ont pas été notifiées au système national ou publiées. Un total de 19 observations ont été rapportées au laboratoires Wyeth-Lederlé, 2 observations ont également été rapportées aux CRPV. Il s'agit de 18 LANL et de 1 myélodysplasie. Enfin, 21 cas de LANL ainsi que 2 cas de myélodysplasie ont été publiés.

Le Dr Gilles Chaplain a présenté les résultats d'une étude réalisée avec les données des registres de la Côte d'Or (registre des hémopathies malignes et registre des cancers gynécologiques).

Annexe 3-8

Dans ce département pour lequel le recueil peut être considéré comme exhaustif, 15 cas d'hémopathies ont été identifiés dans une cohorte de 3600 femmes ayant un premier cancer du sein entre 1982 et 1996 ; il s'agit de 10 cas de LANL et de 5 myélodysplasies.

Les résultats moutrent que :

- le risque de LANL dans cette cohorte est approximativement 12 fois celui de la population du département,
- le risque de LANL chez les femmes n'ayant pas reçu un protocole incluant la mitoxantrone est approximativement 4 fois celui de la population du département,
- le risque de LANL chez les femmes ayant bénéficié d'une traitement adjuvant incluant la mitoxantrone est approximativement 175 fois celui de la population du département,
- enfin, 7 des 10 cas de LANL dans cette cohorte sont survenus chez les 350 patientes ayant bénéficié d'un protocole incluant de la mitoxantrone.

Les données de la littérature confirment que les hémopathies survenant après une chimiothérapie sont habituellement des LANL et des myélodysplasies. Le risque relatif de développer une LANL ou une myélodysplasie après un cancer du sein serait multiplié par 1,5 par rapport à la population générale.

Le rapporteur a demandé un financement public ou privé afin de poursuivre cette étude.

Au vu de ces résultats le Comité Technique de Pharmacovigilance souhaite que :

1 - une enquête officielle de pharmacovigilance visant à évaluer la survenue d'hémopathies malignes après l'administration de mitoxantrone soit ouverte et que la suvenue d'hémopathies malignes après l'administration des anthracyclines soit étudiée,

2 - ce dossier soit présenté au groupe immunohématologie de l'Agence du 23 octobre 1998,

3 - un avis sur la qualité méthodologique de l'étude soit demandé.

Annexe 3-8

XI - DEMANDE DE MODIFICATION ET POINT SUR LA NÉPHROTOXICITÉ DE HOLOXAN® (IFOSFAMIDE).

Le centre de pharmacovigilance de Paris Saint-Vincent-de-Paul a présenté les compléments des résultats de l'enquête officieuse et de l'examen de la demande de modification de l'information de la spécialité Holoxan®.

En effet, à la suite de la présentation de ce dossier au comité technique du 16 octobre 1997, celui-ci avait demandé au centre de pharmacovigilance de compléter le travail par une analyse des effets neurologiques de l'ifosfamide et des interactions médicamenteuses et de recueillir l'avis d'experts. Un avis d'experts cancérologues, néphrologues et pédiatres a donc été sollicité.

Dans l'Application nationale de pharmacovigilance, entre 1985 et le 31 octobre 1997, 161 observations ont été enregistrées avec le principe actif ifosfamide. Parmi ces observations seuls les effets neurologiques associés ou non à une atteinte rénale, les effets rénaux et les effets urologiques ont été analysés représentant un total de 76 observations.

31 observations d'effets rénaux isolés ont été enregistrées. L'effet indésirable le plus fréquemment rapporté est l'insuffisance rénale aigüe. Le délai d'apparition précisé dans 23 observations se situe entre 1 et 30 jours dans 20 d'entre elles. L'évolution a été favorable dans 19 observations, inconnue dans 5 observations, "séquellaire" dans 3 observations (persistance d'une insuffisance rénale à distance) et fatale dans 4 observations.

20 observations d'effets neurologiques centraux sans atteinte rénale associée ont été signalées entre 1992 et 1997. Ces effets neurologiques ont été considérés comme sévères dans tous les cas. Les signes cliniques ont été une encéphalopathie dans 7 observations, un syndrome confusionnel dans 5 observations, un coma dans 2 observations, un syndrome cérébelleux dans 2 observations, et un accident vasculaire cérébral dans 1 observation. L'évolution a été favorable dans 10 observations, fatale dans 3 observations, avec séquelles dans 1 observation et inconnue dans 3 observations.

21 observations d'effets neurologiques associés à une atteinte rénale ont été rapportées. Dans toutes ces observations, l'atteinte a été considérée comme sévère. Ces effets se répartissent en 5 observations de coma avec insuffisance rénale ou anurie, 7 observations d'encéphalopathie avec insuffisance rénale, 2 observations de convulsions avec hyponatrémie ou hypokaliémie, 1 observation de myoclonie, 5 observations de syndrome confusionnel avec une insuffisance rénale ou une hyponatrémie et 1 observation d'hallucinations avec insuffisance rénale. Dans 15 observations, le délai d'apparition était inférieur à 5 jours. L'évolution a été favorable dans 13 observations, fatale dans 6 observations et inconnue dans 2 observations.

4 effets urologiques ont été enregistrés entre 1985 et 1992. Il s'agit de 3 cystites hémorragiques et d'une rétention urinaire. Dans aucune des observations, un traitement par mesna n'a été associé. L'évolution a été favorable dans 3 observations et notée "en cours" dans 1 observation.

Annexe 3-8

Pour les effets indésirables rénaux, selon le rapporteur, il paraît nécessaire de compléter l'information avec des modifications au niveau des rubriques "effets indésirables" et "mises en garde spéciales et précautions d'emploi" en insistant sur le risque de développer des lésions rénales chroniques plusieurs années après l'arrêt du traitement par ifosfamide et donc l'intérêt de surveiller les marqueurs de toxicité tubulaire rénale à distance.

Pour les effets indésirables neurologiques, selon le rapporteur, il paraît aussi nécessaire de modifier le libellé des rubriques "effets indésirables" et "mises en garde et précautions d'emploi".

Le rapporteur a fait des propositions de modifications de libellé des rubriques "mises en garde et précautions d'emploi", "effets indésirables", "interactions médicamenteuses" et "pharmacocinétique".

Au total, le comité technique a demandé de mettre les spécialités Holoxan® en enquête officielle de pharmacovigilance sous la responsabilité du centre de pharmacovigilance de Paris Saint-Vincent-de-Paul.

Annexe 3-8

XII - ENQUÊTE OFFICIELLE SUR L'ALVERINE (SPASMAVERINE®, HEPATOUM®, METEOSPASMYL®, SCHOUM®)

A la suite de la notification d'un choc anaphylactique sous METEOSPASMYL® avec réintroduction positive et après un bilan préliminaire sur cette spécialité, le CRPV de Bordeaux a été chargé d'une enquête officielle de pharmacovigilance concernant l'ensemble des spécialités contenant de l'alvérine.

L'alvérine est un antispasmodique musculotrope, proche de la papavérine et de la mébéverine. Quatre spécialités contenant de l'alvérine sont actuellement commercialisées : HEPATOUM® solution buvable (laboratoires Hépatoum), METEOSPASMYL® (laboratoires Mayoli-Spindler), SCHOUM® solution buvable (laboratoires Pharmygiène-Scat), SPASMAVERINE® (laboratoires Théraplix).

56 observations d'effets indésirables ont été retenues concernant uniquement les spécialités METEOSPASMYL® et SPASMAVERINE®, aucun effet indésirable n'ayant été notifié pour les deux autres spécialités. Il s'agit essentiellement d'observations de réactions allergiques et d'atteintes hépatiques. Les autres effets indésirables notifiés étaient notamment des effets neurologiques (10 cas) et cutanés (6 cas).

1. Réactions allergiques

18 cas de réactions allergiques ont été retenues : urticaire ou urticaire géante (5 cas), urticaire avec oedème et/ou oedème de la face et/ou gêne respiratoire (7 cas), oedème de la langue ou laryngé (2 cas), choc (4 cas) dont 3 avec réintroduction positive. Ces réactions sont survenues le plus souvent lors d'une première prise. Le délai d'apparition des symptômes après la prise est dans la majorité des cas inférieur à 2 heures. L'évolution a toujours été favorable. Les tests cutanés pratiqués chez trois patients ont été négatifs. 16 observations ont une imputabilité I3 (C3S1) et 2 cas une imputabilité II (C2S1).

2. Atteintes hépatiques

11 cas d'atteintes hépatiques sous METEOSPASMYL® ont été retenues. Dans 9 cas, un ictère ou un signe d'appel (prurit, douleur abdominale, asthénie) avaient motivé un bilan hépatique. Dans 6 cas, le bilan hépatique a mis en évidence une élévation à 20 N des ALAT. L'atteinte hépatique était le plus souvent cytolytique (8 cas). Dans 9 cas, la durée de traitement était inférieure ou égale à 3 mois. Dans 7 cas, l'effet était grave (6 hospitalisation, 1 décès d'étiologie inconnue). Un cas de réintroduction positive a été notifié. L'imputabilité des observations a été C3S2 dans 1 cas, C2S2 dans 5 cas, C2S1 dans 2 cas et C1S2 dans 1 cas et C1S1 dans 2 cas. Deux de ces cas ont été publiés en 1997.

L'analyse des observations montrent que l'alvérine entraîne rarement des réactions anaphylactoïdes et des atteintes hépatiques. Le Comité technique estime qu'il est nécessaire de créer une rubrique effets indésirables dans le RCP de l'ensemble des spécialités contenant de l'alvérine afin de mentionner la survenue de ces effets indésirables.

Le dossier sera présenté à la Commission Nationale de Pharmacovigilance du 10 novembre 1998.

XIII - POINT SUR ELOHES® (HYDROXYÉTHYLAMIDON) ET HÉPATOXICITÉ

L'ELOHES® 6 p. cent est une spécialité commercialisée par les Laboratoires Fresenius France, qui a obtenu une A.M.M. le 29 novembre 1990. Il s'agit d'une spécialité contenant un substitut du plasma, l'hydroxyéthylamidon (poids moléculaire de 200 KD) à 6 p. cent. L'ELOHES® est indiqué :

- dans le traitement des défaillances circulatoires aiguës lors de chocs hypovolémiques, hémorragiques, toxi-infectieux, traumatiques ou au cours des brûlures étendues,

Annexe 3-8

- dans le traitement des échanges plasmatiques en association avec l'albumine,

- en cas d'hémodilution normovolémique.

Sept observations de surcharge des cellules de Kupffer ont été rapportées entre Avril et Août 1998 au Centre Régional de Pharmacovigilance de Saint-Antoine. Les patients ont reçu une dose moyenne d'hydroxyéthylamidon de 1200 g (690 - 1800) pendant une période moyenne de 5,2 mois (1 mois 1/2 - 18 mois). Un examen histopathologique d'un fragment de parenchyme hépatique réalisé chez chacun des 7 patients a montré la présence de microvacuoles dans le cytoplasme des cellules de Kupffer. Cliniquement, les patients présentaient une anorexie associée à une altération de l'état général s'accompagnant d'une augmentation des GammaGT à 1,5 - 2 N.

Au vu de ces données, le Comité Technique de Pharmacovigilance a décidé d'ouvrir une enquête officielle concernant les atteintes hépatiques associées à l'administration d'hydroxyéthylamidon.

Annexe 3-8

XIV - QUESTIONS DIVERSES

a) Techniques :

- **DOXIUM® (dobésilate) :** Lors de l'examen de la DMI, 5 observations graves d'agranulocytose ont été signalés avec ce médicament. La gravité de ces effets indésirables nécessite l'ouverture d'une enquête officielle placée sous la responsabilité du CRPV de Brest.

- **Vaccins contre l'hépatite B :** Une réunion d'experts s'est tenu le 21 septembre 1998 à l'Agence du médicament. L'analyse des deux principales études montrent une tendance à l'augmentation du risque mais non significatif. De ce fait, aucune relation de causalité n'a pu être démontré entre la vaccination contre l'hépatite B et la survenue d'atteintes démyélinisantes du système nerveux central. L'incidence de l'hépatite B a fortement diminué, mais on estime à 100.000, le nombre de porteurs sains de l'hépatite B avec un risque de passage à la chronicité et d'apparition de cirrhose ou cancer du foie. La décision du Secrétaire d'Etat à la Santé, s'appuyant sur le principe de précaution, est de suspendre la vaccination systématique (mais non obligatoire) chez les pré-adolescents sans prise en compte du risque individuel. C'est un réaménagement de la stratégie vaccinale sans remettre en cause la vaccination pour la population à risque et les nourissons. A la demande du Secrétaire d'Etat à la Santé, la rubrique "précautions d'emploi" du RCP des vaccins sera étendue aux antécédents familiaux et personnels de pathologies auto-immunes. La dernière réunion de l'OMS conteste la décision de la France concernant la suspension de la vaccination systématique chez les pré-adolescents, arguant qu'il n'y a aucune raison de remettre en cause la stratégie vaccinale et que cette décision peut avoir des conséquences graves sur la population non protégée. La Communauté européenne demande à la France d'apporter des données supplémentaires pour inclure éventuellement ces nouvelles précautions d'emploi dans le RCP des 2 vaccins contre l'hépatite B enregistrés selon une procédure européenne de reconnaissance mutuelle :
  - HB VAX DNA® : France, Etat membre de référence ;
  - ENGERIX B® : Belgique, Etat membre de référence.

Il est demandé à tous les CRPV d'informer l'Agence du médicament avant la transmission de toute communication écrite à l'ensemble des professionnels de santé, différente du dossier de presse fourni par le Ministère de la Santé.

- **UTROGESTAN® (progestérone)** : à la suite de la survenue d'hépatites chez des femmes enceintes prenant ce médicament au cours du 2ème ou 3ème trimestre de grossesse dans le but de prévenir un accouchement prématuré, alors même que son utilisation est formellement contre-indiquée pendant cette période, et compte tenu du fait que ce médicament ne nécessite pas de prescription, une réévaluation du rapport bénéfice/risque de ce médicament sera effectuée . Une information des professionnels de santé avait été diffusée en juin et septembre 1998 par le laboratoire pharmaceutique commercialisant ce médicament.

- **EQUANIL® (méprobamate) :** une note sera envoyée à l'ensemble du réseau de toxicovigilance afin que soit évaluée l'efficacité des mesures prises depuis septembre 1997 (diminution de la taille des conditionnements : 30 et 50 comprimés) afin de limiter la toxicité de ce médicament lors des surdosages.

- **CLOMID® (clomifène) / Point sur l'utilisation détournée dans la stérilité masculine** (CRPV de Limoges) :
2 observations figurent dans la Banque nationale de pharmacovigilance concernant l'utilisation de ce médicament chez l'Homme (en dehors des indications mentionnées dans l'AMM) dans le but de stimuler la spermatogénèse. A ce jour, ce médicament n'est pratiquement plus utilisé pour traiter la stérilité masculine en raison du manque d'efficacité.

- **SUBUTEX® (buprénorphine)** : l'utilisation de ce médicament, déconseillée mais pourtant largement

Annexe 3-8

répandue chez la femme enceinte provoque des phénomènes de sevrage chez le nouveau-né. Ces phénomènes de sevrage semblent être moins importants lorsque l'administration du SUBUTEX® n'est pas associée à la méthadone. Mais il est difficile de savoir ce que la femme enceinte toxicomane a réellement aborbé : pour le savoir, des prélèvements sanguins et urinaires peuvent être réalisés. Des services de néonatalogie ont mis en place une étude pour mieux cerner les phénomènes de sevrage chez le nouveau-né dont la mère prenait des médicaments de substitution. Les CRPV pourraient être amenés à collaborer à ce propos. Ce sujet sera réexaminé lors de la présentation relative à l'élixir Parégorique dans le traitement du syndrome de sevrage du nouveau-né.

- **Grossesses et antirétroviraux** : le projet de suivi des enfants dont les mères ont été traitées pendant leur grossesse par des antirétroviraux sera à nouveau soumis au prochain Conseil scientifique de l'Agence du Médicament du 16 novembre 1998. Un compte-rendu sera fait lors du prochain CT du 19 novembre 1998.

- **HEMOCLAR® pommade (polyester sulfurique de pentosane)** : un point sur les risques de sensibilisation liés à l'application de la pommade HEMOCLAR® sera présenté par le CRPV de Limoges lors du prochain CT du 19 novembre 1998.

- **Vente illégale de millepertuis** : Une société commercialise et fait de la publicité auprès des psychiatres concernant un produit à base de millepertuis présenté comme ayant des propriétés antidépressive et anxiolytique, c'est-à-dire comme un médicament. L'Agence du médicament n'a reçu aucun dossier de demande d'AMM pour un produit composé de millepertuis, cité dans cette publicité. Le millepertuis ne fait pas parti des 34 plantes autorisées à la vente libre. Le dossier a été transmis à la DGS.

- **Radiopharmaceutiques** : ces produits ne figurent pas dans le dictionnaire des spécialités VIDAL, il est donc impossible de prendre connaissance du résumé des caractéristique du produit. A priori, les produits radiopharmaceutiques figureront dans le référentiel de l'Agence du médicament. Ce problème sera soumis à Monsieur Oustrin, Président du groupe des médicaments radiopharmaceutiques. Il sera notamment invité lors d'un prochain Comité technique pour discuter de la pharmacovigilance des produits radiopharmaceutiques.

Annexe 3-8

- **Suivi des vasoconstricteurs en pédiatrie** : Au vu des données de pharmacovigilance, le rapport bénéfice/risque des spécialités contenant des vasoconstricteurs a été considéré comme défavorable chez l'enfant de moins de 30 mois (Commission d'AMM du 04/07/97). De plus, il a été demandé aux laboratoires titulaires d'une autorisation de mise sur le marché de spécialités à base de vasoconstricteurs indiquées chez l'enfant de moins de 12 ans de fournir toutes les données actualisées permettant d'évaluer le rapport bénéfice-risque chez l'enfant de 30 mois à 12 ans.

L'ensemble des données disponibles permettant la réévaluation du rapport bénéfice-risque chez l'enfant de 30 mois à 12 ans ont été fournies par les laboratoires en mai 1998. Elles ont alors été analysées par la Commission d'Autorisation de Mise sur le Marché. Ses conclusions ont été les suivantes:

- concernant la spécialité SUDAFED® sirop, il n'a pu être conclu à un rapport bénéfice/risque favorable en l'absence de données d'efficacité fournies par le laboratoire mettant en évidence un bénéfice dans cette tranche d'âge et du risque de survenue de troubles neurologiques décrits plus fréquemment chez l'enfant en particulier au cours d'épisodes fébriles ou lors de surdosage.
Une contre-indication chez l'enfant de moins de 12 ans a donc été décidée.

- pour les spécialités ACTIFED® solution buvable et ACTIFED® comprimés, les données fournies dans le dossier ne permettaient pas d'établir le bénéfice chez l'enfant de moins de 12 ans. Il est apparu légitime à la Commission d'Autorisation de Mise sur le Marché conformément à la demande des laboratoires Warner Lambert de contre-indiquer les spécialités ACTIFED® solution buvable et comprimé chez l'enfant de moins de 12 ans.

- pour la spécialité RINUTAN®, solution buvable, le rapport bénéfice/risque a été jugé favorable chez l'enfant de plus de 30 mois.

- **Paracétamol et atteintes hépatiques :** il y a 2 ans, une observation d'hépatite fulminante avait été signalée chez un enfant ayant reçu du paracétamol à des doses supérieures à la posologie maximale recommandée. La littérature faisait également état de plusieurs publications concernant des atteintes hépatiques plus ou moins sévères chez des enfants recevant des doses supra-thérapeutiques. Une étude sur l'hépatatotoxicité du paracétamol à doses subnormales avait alors été mise en place sous la responsabilité des CRPV de Paris-St-Antoine et Tours mais n'a jamais aboutie. Le Comité Technique a décidé de clôturer cette étude.

- **QUINIMAX® (quinine, quinidine, cinchonine, cinchonidine) :** le CRPV de Strasbourg, lors du CT du 10 septembre 1998, signalait que les infectiologues du CHU de Strasbourg avaient observé un nombre important d'effets indésirables connus de la quinine avec le QUINIMAX®. Après consultation des différents CRPV, il semble qu'il n'y ait pas de problèmes particuliers en France concernant la tolérance de ce médicament.

- **EPITOMAX® (topiramate)** : 1 observation d'hépatite fulminante a été publiée dans la littérature. Ouverture d'une enquête officielle confiée aux CRPV de Toulouse et Paris-St Antoine.

- **SABRIL®** (vigabatrin) : plusieurs cas d'atteintes visuelles (rétrécissement du champ visuel) ont été rapportés. Ouverture d'une enquête officielle confiée au CRPV de Paris-Pitié Sapêtrière.

b) Administratives :

- **Procédure officielle de gestion des DMI** : cette procédure est en cours d'élaboration à l'Unité. Le schéma final concernant cette procédure sera présenté lors du prochain CT du 19 novembre 1998. Cette procédure imposera lors de la DMI, la soumission par l'entreprise pharmaceutique d'un rapport d'expert dans lequel

Annexe 3-8

figure une revue complète des données de tolérance ainsi qu'un argumentaire justifiant la demande.

- Une journée de pharmacovigilance aura lieu à la Cité des Congrès de Nantes, le lundi 15 mars 1999, organisée par le CRPV de Nantes.

- Nouveaux points (récapitulatif) :

- Méthotrexate / utilisation dans les grossesses extra-utérines : CRPV de Rouen et Paris-Broussais.
- Hémoclar® pommade / sensibilisation : CRPV de Limoges : CT du 19 novembre 1998.
- Benzodiazépines / accidents de la route : CRPV de St Etienne et Paris-Fernand Widal.

- Nouvelles enquêtes officielles (récapitulatif) :

- Vinca-alcaloïdes : extension de l'enquête officielle de la Navelbine® (vinorelbine) à tous les vinca-alcaloïdes / cardiotoxicité : CRPV de Caen.
- Novantrone® (mitoxantrone) / leucémies : CRPV de Dijon.
- Disulone® (dapsone, oxalate de fer) / agranulocytose : CRPV de St-Etienne.
- Innohep® (tinzaparine sodique) / accidents hémorragiques : CRPV de Toulouse et Rouen.
- Eulexine® (flutamide) - anandron® (nilutamide) / hépatotoxicité : CRPV de Tours.
- Holoxan® (ifosfamide) / néphrotoxicité : CRPV de Paris-St Vincent de Paul.
- Elohes® (hydroxyethylamidon) / hépatotoxicité : CRPV de Paris-St Antoine.
- Doxium® (calcium dobésilate) / agranulocytose : CRPV de Brest.
- Sabril® (vigabatrin) / atteintes visuelles : CRPV de Paris-Pitié Salpêtrière.
- Epitomax® (topiramate) / hépatotoxicité : CRPV de Toulouse et Paris-St Antoine.
- Buflomédil (réévaluation des mesures prises) : CRPV de Limoges.

- Nouveaux dossiers distribués :

- Toprec® sirop pédiatrique (kétoprofène) : demande d'AMM nationale pouvant devenir une reconnaissance mutuelle, France Etat membre de référence : CRPV de Caen.

- Floxyfral® (fluvoxamine) : demande d'extension d'indication aux "TOC chez l'adulte" : CRPV de Montpellier.

- Documents distribués :

- Nouveau calendrier des CT et CN pour l'année 1999 (les CT auront lieu désormais les mardis)

- Liste des événements indésirables graves inattendus notifiés à l'Unité Essais Cliniques

- Extrait du Journal Officiel du 07/07/98 : décision du 23/06/98 portant inscription au répertoire des groupes génériques mentionné à l'article R.5143-8 du code de la santé publique

- Compte-rendu du 20ème meeting OMS (Genève 29 sept - 2 oct 97)

- Calendrier des demandes de modification de l'information en cours - octobre 1998 -

- Liste des ATU cohorte

- Relevé d'avis du GT interactions n°28

Annexe 3-8

- Contenu du livret "interactions médicamenteuses" du dictionnaire des spécialités Vidal, édition 1999

- Questions relatives à la sécurité du manuel de préparation à l'accréditation (discussion lors du prochain CT du 19 novembre 1998)

DIRECTION DE L'EVALUATION Saint-Denis, le
Unité de Pharmacovigilance

COMITE TECHNIQUE DE PHARMACOVIGILANCE
(Procès-verbal de la réunion du Jeudi 17 décembre 1998)

Etaient présents

M. RICHE : Président
M. BEGAUD : Vice-Président
Mme ALBENGRES, Mme POLARD (suppléante de M. ALLAIN H), M. ANDREJAK, Mme JONVILLE-BERA (suppléante de Mme AUTRET-LECA), Mme BAVOUX, M. BECHTEL, M. BIOUR, Mme CARLHANT (représentant le CRPV de Brest), M. CARON, Mme SPREUX (suppléante de Mme CHICHMANIAN), M. ESCHALIER, M. ESCOUSSE, Mme GINISTY (représentant le CRPV de Paris - F. Widal), Mme HARAMBURU, M. IMBS, Mme JEAN-PASTOR (suppléante de Mme JOUGLARD), Mme KREFT-JAIS, Mme LAINE-CESSAC, M. LAROUSSE, M. MERLE, M. MONTASTRUC, Mme LACOTTE (suppléante de M. MOULIN), M. GILLET (suppléant de M. NETTER), M. OLLAGNIER, Mme JASSON (suppléante de Mme SOUBRIE), Mme NOBLET (suppléante de M. THUILLEZ), Mme GERMAIN (suppléante de M. TRENQUE), M. VANDEL, M. VIAL.
Mme TUBERT-BITTER (représentant Monsieur le Directeur Général de l'INSERM),
Mme CASTOT (représentant Monsieur le Directeur Général de l'Agence du Médicament).

Conseiller Scientifique : M. LAGIER

Assistaient à la réunion (C.R.P.V.) :
Mme BAGHERI, Melle CHAUMERLIAC, Mme CHIFFOLEAU, Mme DAVID- LAROCHE, Melle FERARD, Mme GENESTE, Mme GUY, Mme LAGARCE, M. QUESTEL, Mme RADAL, Melle RICHER, Mme ZENUT.

Unité de pharmacovigilance

Melle DELEAU
Mr DHANANI
Mme FOSSET-MARTINETTI
Mme LEREBOURS
Mme MORIN
Mme PARIENTE-KHAYAT
Melle PIERRON
Melle VERSTUYFT
Mme WECHSLER

Assistaient à la réunion (D.E.V.) :

Mme DEWILDE
Mme DURANTEAU
Mme GUENANECHE
Mme PAVLOVIC
Mme PELANNE
Mme REIDIBOYM
Mme REY QUINIO

Etaient excusés

M. BLAYAC
M. MALLARET
Madame le Directeur des Hôpitaux
Monsieur le Directeur Général de la Santé

I - ADOPTION DES PROCÈS-VERBAUX DES SÉANCES DU 22 OCTOBRE 1998 ET DU 19 NOVEMBRE 1998

- Séance du 22 octobre 1998

Le procès verbal a été adopté avec les modifications suivantes :

Page 4 : 29è ligne : remplacer “un examen annuel de la rate” par “une recherche annuelle de splénomégalie”.

Page 11 : Observation ZOMIG® : supprimer “décès”.

Page 16 : 6è ligne : remplacer “chimique, autorisée depuis 1986" par “chimique. Cette spécialité est autorisée depuis 1986".

Page 20 : 4è ligne : remplacer “Lypodystrophie” par “lipodystrophie”.

Page 21 : Dernière ligne : remplacer “proarythmogène” par “proarythmique”.

Page 23 : Paragraphe “troubles cardiaques” : remplacer “il s’agit d’un arrêt cardiaque, de 5 tachycardie” par “il s’agit d’un arrêt cardio-circulatoire, de 5 tachycardies”.

- Séance du 19 novembre 1998

Le procès verbal a été adopté avec les modifications suivantes :

Page 5 : 8è ligne : ajouter “en hydroxyéthylamidon” après “surcharge Kupfferienne”.

II - TOUR DE TABLE DES CAS MARQUANTS

Seuls sont signalés les cas d'effets indésirables donnant suite à des mesures (mise en enquête, notes, ...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **DEPAKINE CHRONO® (valproate de sodium) / CRPV d'Amiens** : 3 observations de syndrome extra-pyramidaux chez deux femmes de 67 et 72 ans et 1 homme de 73 ans.
➔ Un point sur Depakine® et syndromes extra-pyramidaux sera réalisé par le CRPV d'Amiens, pour le Comité technique du 23 février 1999.

- **LOCABIOTAL® (fusafungine) / CRPV de Reims** : oedème de Quincke laryngé majeur chez un jeune homme de 17 ans ayant des antécédents personnels d'allergie médicamenteuse. Décès.
Cette spécialité n'est pas inscrite sur liste. En octobre 1997, les annexes I et II de l'AMM ont été modifiées afin de rajouter la possibilité de survenue d'oedème de Quincke et très exceptionnellement de cas de bronchospasme et de choc anaphylactique nécessitant l'arrêt du traitement. Ces modifications ne figurent pas dans la mise à jour du dictionnaire Vidal 1998.
➔ Une note a été adressée au Directeur de l'Evaluation.

- **TISSUCOL® (colle biologique) / CRPV de Paris - St Vincent de Paul** : bronchospasme, urticaire, chute tensionnelle sans tachycardie puis état de choc chez un homme de 51 ans. Décès malgré l'administration de doses massives d'adrénaline. Ce patient était traité au long cours par du CARTEOL® (cartéolol).
Le TISSUCOL® est utilisé dans le cadre d'une ATU de cohorte. Un avis favorable a été donné récemment à la demande d'AMM. Les annexes I, II et III de l'AMM sont en cours de rédaction. Ce produit contient de l'aprotinine d'origine bovine. Les réactions anaphylactiques semblent fréquentes.
➔ Un point sur les réactions anaphylactiques avec les colles biologiques (TISSUCOL® et BIOCOL®) sera réalisé par le CRPV de Paris-St Vincent de Paul pour le Comité Technique du 23 février 1999.

- **Stallergènes DER PTERONYSSINUS / CRPV de Reims** : choc anaphylactique et arrêt cardiaque survenus 20 minutes après l'injection chez une enfant de 9 ans. Décès.
➔ Aucune autre observation n'a été rapportée avec ce lot de Stallergènes.

- **TOMUDEX® (raltitrexed) / CRPV d'Angers** : aplasie médullaire de stade IV chez un homme de 67 ans. Réadministration positive. Décès. Cet effet n'est pas mentionné dans le Résumé des Caractéristiques du Produit (RCP).
➔ Le CRPV d'Angers contactera le laboratoire afin de savoir s'il envisage de déposer une demande de modification de l'information.

- **VADILEX® (ifenprodil) / CRPV de Limoges** : malaise, perte de connaissance et mouvements cloniques survenant chez un homme de 47 ans, 5 minutes après l'injection de Vadilex®. La présentation de la plaquette d'information de Vadilex®, distribuée par le laboratoire, ne permet pas une lecture correcte de l'information.
➔ Le CRPV de Limoges adressera un courrier à ce sujet à la Commission de la Publicité de l'Agence du Médicament.

III - ENQUÊTE OFFICIELLE INNOHEP® (TINZAPARINE SODIQUE) ET ACCIDENTS HÉMORRAGIQUES : CRPV de Toulouse et Rouen.

Le CRPV de Toulouse a présenté les résultats de l'enquête officielle concernant les accidents hémorragiques

sous tinzaparine sodique, enquête initiée suite à la notification aux CRPV de Toulouse et Rouen de plusieurs cas graves d'hématomes ou d'hémorragies.
Les données de l'enquête révèlent l'existence d'une confusion dans l'utilisation de la tinzaparine par les professionnels de santé : plusieurs cas de mésusage (indications hors AMM) et de surdosage ont pu concourir à la survenue de certains effets indésirables graves hémorragiques. Deux facteurs de risque sont également retrouvés : sujets âgés (plus de 75 ans) et insuffisance rénale. Le rapporteur propose donc :
1) une amélioration du RCP de la tinzaparine par l'ajout, dans la rubrique "Mise en garde et précautions d'emploi" d'une phrase : "Il est impératif de ne pas dépasser les posologies recommandées. Dans le cas contraire, des accidents hémorragiques, parfois graves peuvent s'observer chez des sujets à risque (sujets âgés, insuffisants rénaux ....)"
2) des réunions d'information avec la collaboration des CRPV, réunions organisées par le laboratoire
3) une étude pharmacocinétique chez le sujet très âgé (> 75 ans)

Par ailleurs, le Comité Technique souhaite que l'enquête soit étendue à toutes les héparines de bas poids moléculaire.

Le dossier sera examiné à la Commission Nationale du 22 décembre 1998.

IV - ENQUÊTE OFFICIELLE LAMICTAL® (LAMOTRIGINE) : CRPV de Nantes

Le CRPV de Nantes a présenté les résultats de l'enquête officielle sur le LAMICTAL® (lamotrigine).
Tous les effets indésirables rapportés sont indiqués dans le RCP exceptée la notion de possible aggravation de certaines formes d'épilepsie qui devra être signalée dans la rubrique "effets indésirables".
Le CRPV complétera l'enquête avec les données internationales et les chiffres de vente du laboratoire.
Les nouveaux résultats seront présentés au Comité technique du 23 février 1999 puis en Commission nationale.
Le suivi de ce produit faisant l'objet d'une préoccupation européenne, l'avis de la Commission Nationale sera transmis aux Etats membres.

V - ENQUÊTE OFFICIELLE ZOLOFT® (SERTRALINE) : CRPV de Lyon et Clermont-Ferrand

Les CRPV de Lyon et Clermont-Ferrand ont présenté les résultats de l'enquête officielle sur le ZOLOFT® (sertraline).
Au vue de ces données, les centres rapporteurs proposent de modifier le RCP en ce qui concerne les effets indésirables suivants :
- hépatiques, digestifs, hématologiques, dermatologiques, cardio-vasculaires, endocriniens et génito-urinaires, métaboliques et hydroélectrolytiques, neuropsychiques, syndromes de sevrage, syndromes sérotoninergiques.

Ce dossier sera présenté à la Commission nationale du 10 février 1999.

VI - ENQUÊTE OFFICIELLE SUR LES ANTIGÈNES À VISÉE IMMUNOSTIMULANTE : RÉSULTATS PRÉLIMINAIRES : CRPV de Saint-Etienne

L'enquête officielle de pharmacovigilance sur les antigènes à visée immunostimulante, réalisée par le CRPV de Saint Etienne concerne cinq spécialités : BIOSTIM®, RIBOMUNYL®, IMOCUR®, IRS®19, RHINOPTEN®.

Dans un premier temps, compte-tenu du nombre d'observations très important pour chaque spécialité, seuls les résultats de l'enquête BIOSTIM® ont été présentés.

1190 notifications dans lesquelles apparait BIOSTIM®, quelle que soit sa forme, ont été recensées depuis sa commercialisation jusqu'au mois d'août 1998, seulement 300 observations ont pu jusqu'alors être étudiées. Devant le nombre important de cas graves, avec réintroduction positive, il semble nécessaire de faire apparaître ces effets dans le RCP.

Ces propositions de modification du RCP seront revues au comité technique du 23 février 1999, lors de la présentation des résultats de l'enquête concernant les autres antigènes à visée immunostimulante.

VII - POINT SUR LES ATTEINTES OESOPHAGIENNES SECONDAIRES A LA PRISE DE TETRACYCLINES EN COMPRIME : CRPV de Paris-Créteil

A la suite de la présentation d'un cas d'ulcère de l'oesophage dû à un traitement par Tolexine® (doxycycline) lors du comité technique du 13 novembre 1997, le CRPV de Créteil a été chargé de faire un point sur les atteintes oesophagiennes sous tétracyclines en comprimés.

Ceci fait suite à l'étude réalisée en 1994 par le CRPV de Tours portant sur les complications oesophagiennes secondaires à la prise de doxycycline (forme orale).
Considérant la survenue d'atteintes oesophagiennes et que le risque de ces atteintes était plus élevé avec la forme gélule que la forme comprimé, la Commission nationale de Pharmacovigilance avait proposé, le 06 octobre 1994, de modifier le RCP de toutes les spécialités (forme gélule) contenant de la doxycycline (excepté la VIBRAMYCINE®, sous forme de comprimés pelliculés) aux rubriques "Effets indésirables, Mode d'administration et Précaution d'Emploi" et de réévaluer le dossier pharmaceutique, afin que la forme comprimé pelliculé remplace la forme gélule.

Le comité technique de Pharmacovigilance a décidé de mettre en enquête officielle la doxycycline, sous la responsabilité des CRPV de Créteil et Tours. Les résultats devront être présentés sous la forme d'un récapitulatif des observations rapportées depuis octobre 1994, par forme (gélules, comprimés), par produit (y compris les génériques), par année avec les chiffres de vente.

VIII - ENQUÊTE OFFICIELLE ROACCUTANE® (ISOTRETINOÏNE) : CRPV de Tours, Paris - Broussais et Rouen

Les CRPV de Tours, Paris-Broussais et Rouen ont présenté les résultats de l'enquête officielle concernant le Roaccutane®, portant sur les effets indésirables suivants:

- modifications de la glycémie - diabète
- effets indésirables pleuro-pulmonaires
- effets indésirables visuels
- effets indésirables digestifs
- effets indésirables ostéo-musculaires
- effets sur le métabolisme lipidique
- troubles psychiatriques.

Les rapporteurs ont donc proposé des modifications du RCP au niveau des rubriques "effets indésirables", "mises en garde et précautions d'emploi" concernant les modifications de la glycémie-diabète, les effets indésirables pleuro-pulmonaires, visuels, ostéo-musculaires, et les effets sur le métabolisme lipidique.

Il a été rappelé que la mention de troubles psychiatriques à type de psychose, ainsi que les risques de suicide et de tentative de suicide ont été renforcés dans le RCP, dans le cadre de l'enquête de pharmacovigilance européenne (Royaume-Uni rapporteur).

Par ailleurs, un expert pneumologue sera chargé de revoir les cas d'effet pulmonaire pour faire la part entre un bronchospasme et une crise d'asthme.
Cette enquête officielle sera présentée en Commission Nationale le 10 Février 1999.

IX - ENQUÊTE OFFICIELLE MEDIATOR® (BENFLUOREX) : CRPV de Besançon

Le CRPV de Besançon a présenté les résultats de l'enquête officielle sur le MEDIATOR® (benfluorex) ainsi que les données sur le métabolisme de la molécule.

Bilan des effets indésirables :
Les effets cutanés et / ou allergiques pourraient être rajoutés dans le RCP.

Métabolisme :
La norfenfluramine produite à partir du benfluorex est retrouvée dans les urines avec une concentration de 2 % (contre 7,4 % pour la norfenfluramine produite à partir de la fenfluramine). Il est donc peu probable que le benfluorex induise les mêmes effets que la fenfluramine.

L'Italie qui propose que le benfluorex soit inclus dans l'article 15a européen relatif aux fenfluramines, a en charge une enquête sur cette molécule. Le CRPV de Besançon adressera une copie de son rapport à l'Agence Italienne qui prépare un rapport pour le groupe de travail de pharmacovigilance européen de février 1999.

X - POINT PHARMACOVIGILANCE EUROPEENNE

- Vigabatrin / rapport bénéfice risque / atteintes du champ visuel / article 12 :
Un article 12 a été initié avec la Finlande comme pays rapporteur et le Royaume-Uni comme pays co-rapporteur.
GABITRIL® : La France, en tant qu'Etat membre de référence pour la tiagabine (GABITRIL®) a fait part de son inquiétude quant aux troubles du champ visuel rapportés dans le 4ème PSUR de cette spécialité.
A ce sujet, une réunion à eu lieu à l'Agence du Médicament, en présence du CRPV de Toulouse (responsable de l'enquête officielle) et des laboratoires SANOFI. A l'issu de cette réunion, il a été proposé d'ajouter, dans le RCP de la tiagabine, une précaution d'emploi relative aux troubles du champ visuel.

- Sertindole / morts subites / article 15 :
Alors qu'un article 15 est en cours, la plupart des Etats membres ont suspendu l'autorisation de mise sur le marché du produit. Dans les Etats où il n'est pas autorisé, l'inclusion de patients dans les essais cliniques a été également suspendue.
La France n'est pas concernée par cette procédure de reconnaissance mutuelle.

- Kétorolac (TORADOL®) / risque hémorragique et augmentation de la mortalité :
Un concensus concernant les indications et les doses recommandées a été jugé nécessaire afin que chaque Etat membre concerné effectue ces modifications au niveau national. Le Toradol® n'est pas commercialisé en France.

- Inhibiteurs de protéases (indinavir, nelfinavir, ritonavir, saquinavir) / rhabdomyolyse :
Le libellé commun concernant les rhabdomyolyses, pour la classe des inhibiteurs de protéases sera soumis pour adoption au CSP de décembre 1998.

- Inhibiteurs de la cathécol O-méthyltransférase - Tolcapone (TASMAR®) / suspension de l'AMM -

Entacapone (COMTESS®, COMTAN®) / mesure urgente de restriction :
Comme suite à l'avis donné par le Comité des Spécialités Pharmaceutiques de l'Agence Européenne d'Evaluation des médicaments et la recommandation de la Commission Européenne, l'Agence du Médicament a décidé de suspendre l'utilisation du TASMAR® en France sous toutes ses formes (comprimés dosés à 100 mg et 200 mg à compter du 17 novembre 1998.
Le RCP de l'entacapone a ete modifié dans le cadre d'une mesure urgente de restriction le 23 novembre 1998 afin d'y inclure la possibilité de survenue de rhabdomyolyses et d'un syndrome malin des neuroleptiques.

- Rituximab (MABTHERA®) / mesure urgente de restriction :
A la demande du CSP, les laboratoires sont venus exposer les données concernant les effets allergiques du rituximab aux membres du groupe de travail de pharmacovigilance et aux membres du CSP. Une proposition de modification du RCP, une lettre d'information aux prescripteurs et une liste de questions aux laboratoires ont été finalisées.

- Inhibiteurs sélectifs de recapture de la sérotonine / syndrome de sevrage, dépendance et utilisation au long cours :
Le Royaume-Uni résumera son rapport d'évaluation en tenant compte de la lettre de M. C. Medawar intitulée "SSRIs, EMEA and the CPMP"et des compléments apportés par l'Allemagne et la France. Ce dossier sera de nouveau discuté en février 1999.
Par ailleurs, le groupe de travail de pharmacovigilance demande au groupe de travail "sécurité" d'évaluer les données pré-cliniques sur le potentiel de dépendance de cette classe médicamenteuse.

- Alendronate (FOSAMAX®) / atteintes oesophagiennes et gastro-intestinales :
Malgrès le respect des précautions d'emploi, il existe toujours des notifications préoccupantes d'atteintes digestives, parfois mortelles.
Certains Etats membres ont informé ou vont informer les prescripteurs sur le risque d'atteintes digestives survenant avec l'alendronate. Les données disponibles jusqu'à présent ont été jugées insuffisantes pour modifier le RCP. Le Royaume-Uni demandera au laboratoire les résultats d'un essai clinique et d'une étude épidémiologique en cours aux USA, dès qu'ils seront disponibles. Il sera également demandé au laboratoire de fournir des données sur une étude épidémiologique utilisant le GPRD ainsi qu'un rapport étudiant la possibilité de reformuler la spécialité.

- Anti-histaminiques non sédatifs / mise en garde sur les risques cardio-vasculaires :
Le libellé de la loratadine sera finalisé par procédure écrite. Les données concernant l'ébastine seront discutées en février 1999.

- Produits de contraste iodés de haute osmolarité (HOCM) / réévaluation du risque :
Le risque associé aux HOCM est plus élevé que celui associé aux produits de faible osmolarité. Les allemands veulent retirer ces produits du marché. La majorité des Etats membres souhaitent discuter de ce problème au niveau national. Ce sujet sera de nouveau discuté en mars 1999.

- Traitements substitutifs hormonaux / augmentation du risque de cancer du sein :
Le Royaume-Uni souhaite ajouter les résultats d'une méta-analyse dans la rubrique " mises en garde et précautions d'emploi ". La rédaction d'un libellé commun concernant cette rubrique a été jugée nécessaire. Le Royaume-Uni complète son rapport en tenant compte des RCP des différents Etats membres, pour discussion en février 1999.

- Inhibiteurs de recapture de la sérotonine / risque hémorragique :
La Suède adressera un rapport sur les inhibiteurs de recapture de la sérotonine et le risque hémorragique à tous les Etats membres pour discussion en février 1999. Elle souhaite une harmonisation des RCP car elle considère qu'il s'agit d'un effet de classe.
En France, les résultats de l'enquête officielle seront présentés par le CRPV d'Angers, au Comité technique du 26 janvier 1999.

- Immunoglobulines polyvalentes / atteintes rénales :
A la suite de la diffusion par la FDA de nouvelles recommandations aux professionnels de santé, la France adressera aux Etats membres un rapport sur ce sujet.

XI - QUESTIONS DIVERSES

1) Questions diverses techniques :

- **Psychotropes et usage criminel** : le CRPV de Paris - F. Widal, responsable de l'enquête officieuse, a présenté le modèle de la fiche de recueil des observations de "soumission chimique" (cf. Annexe 3). Il est instamment demandé aux CRPV de transmettre dans les meilleurs délais au CRPV de Paris - F. Widal, les observations dont ils pourraient avoir connaissance.
Psychotropes et troubles comportementaux majeurs : le CRPV de Paris - F. Widal, responsable de l'enquête officieuse, a présenté le modèle de la fiche de recueil des observations qui devra être remplie en plus de la feuille d'observation de pharmacovigilance habituelle (cf. Annexe 4).

- Le CRPV d'Angers a été contacté par un médecin au sujet des suppositoires HEXAPNEUMINE enfant® qui sont désormais contre-indiqués chez l'enfant de moins de 12 ans sans la moindre information des prescripteurs. Seuls les pharmaciens d'officine ont été informés par les laboratoires. Il s'agit en fait d'une modification dans la cadre de la validation de l'AMM de cette spécialité (la dose de pholcodine par prise n'est pas adaptée aux enfants de moins de 12 ans).
Le CRPV de Rennes a été contacté pour le même type de question concernant les suppositoires TRENTADIL enfant® (spécialité validée, désormais contre-indiqués chez l'enfant de moins de 12 ans).
➔ Il est demandé aux CRPV recevant des questions suite à la révision de RCP dans le cadre de la validation, d'adresser un courrier à l'unité de pharmacovigilance qui le transmettra à la Direction de l'évaluation.

- Le CRPV de Limoges souhaite attirer l'attention sur le fait que les monographies des diurétiques dans le dictionnaire Vidal ne sont pas homogènes en ce qui concerne les rubriques "précautions d'emploi" et "contre-indications".
Une note sera adressée à l'évaluateur de la DEV en charge de cette classe thérapeutique.

- Le CRPV de Besançon a proposé de faire une revue de la littérature concernant la pharmacogénétique, lors d'un prochain Comité Technique.

- Le CRPV de Bordeaux a fait remarquer que la monographie de DIMETANE expectorant enfant® dans le dictionnaire Vidal contient quelques incohérences, a savoir des informations non adaptées à l'enfant. En effet, le sirop est contre-indiqué en cas de rétention urinaire liée à des troubles urétro-prostatiques et l'attention des conducteurs de véhicules est attirée sur les risques de somnolence.
Il s'avère que ces informations doivent figurer dans le RCP, dans le cas où le produit serait administré à un adulte, même s'il est destiné à l'enfant.

- Une remarque a été faite quant au problème des médecins qui ne notifient pas dans le cadre de la notification spontanée les effets indésirables liés aux antirétroviraux, notament lorsque les patients sont inclus dans une cohorte.

- Une réunion avec l'ANRS est prévue début 1999 au sujet des troubles du métabolisme glucido-lipidique liés aux antirétroviraux. Par ailleurs, un groupe de travail concernant ce sujet a été créé à l'Agence Européenne.

2) administratives :

- Lorsque les CRPV présenteront en Comité technique un rapport concernant un médicament enregistré selon une procédure européenne (procédure centralisée ou reconnaissance mutuelle), il est proposé que ce rapport soit directement rédigé en anglais et qu'il soit accompagné d'un résumé en français.

- Il est rappelé aux CRPV que malgré les difficultés rencontrées dues au manque de moyens, la saisie et le

recueil des effets indésirables graves est une mission prioritaire (cf. Art. 5144-14 du Décret du 13 mars 1995).

- <u>Nouveaux points (récapitulatif)</u> :

- Colles biologiques et choc allergique : CRPV de Paris St-Vincent de Paul (CT 23/02/99)
- DEPAKINE® et syndromes extra-pyramidaux : CRPV d'Amiens (CT 23/02/99)

- <u>Nouvelles enquêtes officielles (récapitulatif)</u> :

- Héparines de bas poids moléculaire et accidents hémorragiques : CRPV de Toulouse
- Doxycycline et atteintes oesophagiennes : CRPV de Tours et Créteil

- <u>Documents distribués</u> :

- Calendrier des demandes de modification en cours - décembre 1998 -
- Liste des évènements indésirables graves inattendus notifiés à l'Unité Essais Cliniques

CHU Jean Minjoz 25030 BESANCON Cedex

MEDIATOR (benfluorex)

ENQUETE OFFICIELLE

Comité Technique du 17 Décembre 1998

Confidentiel

M.DAVID-LAROCHE
P.BECHTEL

Annexe 3-9

Le MEDIATOR (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par le laboratoire BIOPHARMA, sous forme de comprimés, dosés à 150 mgL
La posologie recommandée est de 3 comprimés par jour.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène.
(Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Une enquête officieuse a été ouverte, suite à la première mise au point des effets indésirables du benfluorex, présentée lors du Comité Technique du 11 juillet 1995.
Deux mises au point ont été faites :

-le 30 Avril 1998 sur les effets indésirables du benfluorex, rapportés aux CRPV
-le 10 Septembre 1998 sur le métabolisme et les chiffres de vente du benfluorex.

<u>Les effets indésirables rapportés dans les RCP sont :</u>

- effets digestifs : nausées, vomissements, gastralgies, diarrhée
- asthénie
- somnolence
- état vertigineux

2

Annexe 3-9

DONNEES PHARMACOCINETIQUES ET METABOLIQUES
CHLORHYDRATE DE BENFLUOREX

I- Pharmacocinétique.

L'absorption gastro-intestinale du chlorhydrate de benfluforex est complète et rapide, le Tmax est compris entre 1h et 2h.
Le volume de distribution est de 0.37+/- 0.03l/kg chez l'homme.
Chez le rat il est de 1.4l/kg.
Chez le chien de 1.6l/kg.
Chez le singe de 0.36l/kg.
Chez le babouin de 0.31l/kg

On notera que le volume de distribution est identique chez les primates et chez l'homme.

II. Métabolisme.

Le benfluorex est rapidement métabolisé au niveau du foie. Il produit au moins 9 métabolites. (Fig 1). Des données récentes utilisant notamment des méthodes de détection spécifiques et sensibles ont permis de montrer qu'il existait deux métabolites principaux (fig 2) :

- le 1-(3 trifluorométhylphényl)-2N-2-(carboxymethyl)amino propane (S1475)
- la norfenfluramine (S 585)

Une étude réalisée chez 6 volontaires sains qui ont reçu pendant 14 jours une dose quotidienne de 3fois 150mg de benfluorex, a montré que :

- l'état stationnaire était atteint en 4 à 5 jours
- au bout des 14 jours la concentration plasmatique de benfluorex était très faible, autour de 10ng/ml, la concentration plasmatique du métabolite S1475 était très importante, aux alentours de 200ng/ml, la concentration plasmatique du norfenfluramine ne dépassait pas 30ng/ml (fig 3).

Il est très intéressant de comparer les métabolites produits par la biotransformation de benfluorex à ceux produits par la biotransformation de la fenfluramine (fig 4). La norfenfluramine représente la voie principale du métabolisme de la fenfluramine avec des concentrations urinaires de 7,4% de la dose pour la forme libre et de 50,7% pour la forme conjuguée à l'acide glucuronique.

Sans qu'il y ait d'explications à partir de la fenfluramine il semble que la norfenfluramine produite ne subit aucune biotransformation supplémentaire, alors que la norfenfluramine produite à partir de benfluorex est transformée en 3-trifluorométhylphényl-1-hydroxypropanone-2. Ce qui explique qu'on ne trouve pas plus de 2% de norfenfluramine dans l'urine.

Annexe 3-9

I. ATTEINTES HEPATIQUES :

23 cas d'hépatites ou de perturbations de la biologie hépatique ont été notifiés : (le benfluorex est le seul suspect ou d'imputabilité égale ou supérieure aux médicaments associés)

-15 aux CRPV, 9 au laboratoire (dont 1 doublon) .

Elles concernent 15 femmes (âge moyen : 55,1 ans) et 8 hommes (âge moyen (58,6 ans)

Dans 7 cas le benfluorex a une imputation plausible:

DJ9300271 : Femme de 50 ans , traité pendant 2 semaines par MEDIATOR, une préparation d'aubépine, 200mg, et amfépramone 35 mg ,citrarginine, Veinobiase et depuis 1 mois et demi par AXONYL.
ALAT = 625 UI/L, ASAT : 303 UI/L, γGT: 656 UI/L, Ph.Alc. : 198 UI/L.
Evolution favorable 2 semaines après l'arrêt du traitement ,sauf les γGT qui sont encore à 171 UI/L

NY8804047=060K94 (doublon) : homme de 47 ans, traité par MEDIATOR, pendant 6 mois, puis 3 mois (après un arrêt de 3 mois)
ALAT : 375 UI/L , ASAT : 105 UI/L, γGT : 182 UI/L
L'évolution est lentement favorable dans un délai de 2 mois.

DJ9100164 : homme de 61 ans, éthylique chronique, traité depuis 4 ans par RENITEC, DOGMATIL, LASILIX, depuis 1 an par RYHMODAN et depuis 3 ans par MEDIATOR.
ALAT : 1350 UI/L, ASAT : 410 UI/L, γGT : 280 UI/L
La régression de l'hépatite est partielle à l'arrêt de toutes les thérapeutiques, chez ce patient éthylique.

NC9600020 :Femme de 39 ans, traité par MEDIATOR depuis 8 mois.
ALAT: 205 UI/L (4N), ASAT : 89 UI/L (2N), γGT: 134 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

NY9608618 : Femme de 36 ans, traité par MEDIATOR, pour cure d'amaigrissement pendant 4 mois.
ALAT : 126 UI/L, ASAT : 41UI/L, γGT : 110 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

BX9700024 : Femme de 59 ans, apparition d'un ictère avec prurit, après 4 semaines de traitement par MEDIATOR. (LOXEN et ACUILIX sont pris au long cours)
ALAT: 1017 UI/L (30N), ASAT : 391 UI/L (10N), γGT : 1042 UI/L, Ph. alc. : 907 UI/L (4N)

10010325 : Homme de 42 ans présentant une cytolyse modére et une cholestase discrète 3 semaines après le début d'un traitement par MEDIATOR, pour hypertriglycéridémie et diabète modéré.
L'évolution est favorable à l'arrêt du MEDIATOR.

Dans 1 cas, l'imputation est vraisemblable :

Observation 120039 : observation très succinte du laboratoire, concernant une augmentation des γGT (169 UI/L) , chez une femme de 70 ans, qui était traitée par ailleurs par Diamicron, Icaz et Hypérium. La réintroduction a été positive.

Dans 15 cas, l'imputation est douteuse : dont 10 C2,S1, 5 C1,S1

Conclusion : Plusieurs cas d' augmentations de transaminases et/ou de γGT ont été rapportés.
La plupart du temps, le MEDIATOR est en association avec d'autres médicaments qui ont la même imputabilité.
Dans quelques cas, le MEDIATOR est le seul médicament pris par le ou la patiente.
Dans la majorité des dossiers, le délai de survenue est de ≅ 3 mois.

Cet effet indésirable n'est pas mentionné dans les RCP

N.B : les nouvelles notifications par rapport à la mise au point de Juillet 1995, sont imprimées «en gras » dans les tableaux suivants.
Dans la colonne, « traitement associé », le médicament est souligné, lorsque l'imputabilité bibliographique est supérieure au MEDIATOR.

10

Annexe 3-9

[illegible] d'hépatites ou de perturbations de la biologie hépatique [illegible] suspect ou d'imputabilité égale ou supérieure aux médicaments associés

-15 aux CRPV, 9 au laboratoire (dont 1 doublon) .

Elles concernent 15 femmes (âge moyen : 55,1 ans) et 8 hommes (âge moyen (58,6 ans)

Dans 7 cas le benfluorex a une imputation plausible:

DJ9300271 : Femme de 50 ans , traité pendant 2 semaines par MEDIATOR, une préparation d'aubépine, 200mg, et amfépramone 35 mg ,citrarginine, Veinobiase et depuis 1 mois et demi par AXONYL.
ALAT = 625 UI/L, ASAT : 303 UI/L, γGT: 656 UI/L, Ph.Alc. : 198 UI/L.
Evolution favorable 2 semaines après l'arrêt du traitement ,sauf les γGT qui sont encore à 171 UI/L

NY8804047=060K94 (doublon) : homme de 47 ans, traité par MEDIATOR, pendant 6 mois, puis 3 mois (après un arrêt de 3 mois)
ALAT : 375 UI/L , ASAT : 105 UI/L, γGT : 182 UI/L
L'évolution est lentement favorable dans un délai de 2 mois.

DJ9100164 : homme de 61 ans, éthylique chronique, traité depuis 4 ans par RENITEC, DOGMATIL, LASILIX, depuis 1 an par RYHMODAN et depuis 3 ans par MEDIATOR.
ALAT : 1350 UI/L, ASAT : 410 UI/L, γGT : 280 UI/L
La régression de l'hépatite est partielle à l'arrêt de toutes les thérapeutiques, chez ce patient éthylique.

NC9600020 :Femme de 39 ans, traité par MEDIATOR depuis 8 mois.
ALAT: 205 UI/L (4N), ASAT : 89 UI/L (2N), γGT: 134 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

NY9608618 : Femme de 36 ans, traité par MEDIATOR, pour cure d'amaigrissement pendant 4 mois.
ALAT : 126 UI/L, ASAT : 41UI/L, γGT : 110 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

BX9700024 : Femme de 59 ans, apparition d'un ictère avec prurit, après 4 semaines de traitement par MEDIATOR. (LOXEN et ACUILIX sont pris au long cours)
ALAT: 1017 UI/L (30N), ASAT : 391 UI/L (10N), γGT : 1042 UI/L, Ph. alc. : 907 UI/L (4N)

10010325 : Homme de 42 ans présentant une cytolyse modére et une cholestase discrète 3 semaines après le début d'un traitement par MEDIATOR, pour hypertriglycéridémie et diabète modéré.
L'évolution est favorable à l'arrêt du MEDIATOR.

Dans 1 cas, l'imputation est vraisemblable :

Observation 120O39 : observation très succinte du laboratoire, concernant une augmentation des γGT (169 UI/L) , chez une femme de 70 ans, qui était traitée par ailleurs par Diamicron, Icaz et Hypérium. La réintroduction a été positive.

Dans 15 cas, l'imputation est douteuse : dont 10 C2,S1, 5 C1,S1

Conclusion : Plusieurs cas d' augmentations de transaminases et/ou de γGT ont été rapportés.
La plupart du temps, le MEDIATOR est en association avec d'autres médicaments qui ont la même imputabilité.
Dans quelques cas, le MEDIATOR est le seul médicament pris par le ou la patiente.
Dans la majorité des dossiers, le délai de survenue est de ≅ 3 mois.

Cet effet indésirable n'est pas mentionné dans les RCP

12

Annexe 3-9

- BX88003099, patient de 53 ans, éthylique, traité depuis 13 ans par MEDIATOR, ZYLORIC et VISKEN . L'évolution n'est pas connue.

-LY9500598 , femme de 59 ans, hospitalisée pour tentative d'autolyse, traitée par de nombreux médicaments: évolution inconnue, dossier très succinct.

II. AUTRES ATTEINTES DIGESTIVES :

Elles concement 14 femmes (âge moyen : 60,6 ans) et 7 hommes (âge moyen : 61,7 ans)

- Dans les 14 cas de diarrhée rapportés, (10 femmes et 4 hommes), le MEDIATOR est utilisé en monothérapie, ou son imputabilité est supérieure aux médicaments associés.

Cet effet indésirable est mentionné dans les RCP.

- 3 cas d'ulcères ont été rapportés par le laboratoire:

- 10060052 : homme de 74 ans, reçoit MEDIATOR, depuis 6 à 8 mois, LIPANTHYL depuis 10 ans , TANAKAN et des AINS. Une fibroscopie montre des ulcères multiples qui nécessitent non seulement l'arrêt des AINS mais de toute thérapeutique.
L'évolution est favorable après prescription d'antiulcéreux. (C1,S1)

- 10540930 : Femme de 64 ans, hospitalisée pour ulcère gastrique, après 3 mois de traitement par MEDIATOR et après 1 an de GLUCOPHAGE RETARD, EUGLUCAN, ZESTRIL, LIPUR.
Le MEDIATOR est arrêté.
L'évolution est favorable après traitement par anti-acide, pansement gastrique et perfusion. (C1,S1)

--10060587 : Femme de 72 ans, avec diabète, HTA, traitée par MODURETIC et ALDOMET depuis plusieurs années et MEDIATOR depuis 3 jours. Apparition de gastralgies intenses après prise de MEDIATOR, avec réadministration positive. (C3,S1)
L'évolution est favorable à l'arrêt du MEDIATOR.
Une fibroscopie ultérieure met en évidence un ulcère duodénal.

- 1 cas de rectocolite hémorragique : (1054P69) chez une femme de 46 ans traitée au long cours par DAONIL, GLUCOPHAGE RETARD, INSULINE, LEVOTHYROX et ELISOR, apparition d'une diarrhée aigue, sanglante et colite inflammatoire ressemblant à une colite hémorragique après 1 cp de MEDIATOR.

L'évolution est favorable après administration de PENTASA. (C2,S1)

II. A. TABLES HEMATOLOGIQUES

14 observations (8 CRPV, 6 laboratoire) ont été rapportées.

Elles concernent 5 hommes (âge moyen : 62,2 ans) et 9 femmes (âge moyen : 57 ans) .

- Aucun nouveau cas n'a été rapporté depuis la mise au point de Juillet 1995

- L'imputabilité est douteuse dans tous les cas : 11 C1,S1
3 C2,S1

Dans la plupart des observations, il existe un traitement associé, qui peut être responsable de l'effet indésirable

-Dans l'observation 10050F09 : (C2,S1) il s'agit d'1 femme de 70 ans, avec HTA, hyperlipémie, angor et antécédents d'ulcère gastrique, traitée par MEDIATOR depuis 3 semaines:
apparition de purpura et d'hémorragie digestive : plaquettes<5000/mm3 et hémoglobine à 9g/l
La recherche d'anticorps antiplaquettes est positive.
L'évolution est favorable après arrêt du MEDIATOR

IV. ATTEINTES RESPIRATOIRES :

20 notifications (10 CRPV et 11 laboratoire) dont 1 doublon ont été rapportées, concernant

- 11 hypertensions pulmonaires:.9 dossiers ont été expertisés par le Professeur WEITZENBLUM , 6 ont été classés en HTA P d'allure primitive lors de l'enquête « anorexigènes et HTAPP», 3 en hypertensions pulmonaires post-embolique(1) et post-capillaire(2).
Elles concernent 9 femmes (âge moyen : 54,8 ans) et 2 hommes (âge moyen : 48 ans)

Le MEDIATOR n'est jamais prescrit seul : il est présent en association à un ou plusieurs anorexigènes (ISOMERIDE : 10 fois, PONDERAL : 2 fois)
Ces cas font partie de l'enquête concernant les anorexigènes

La durée de traitement par MEDIATOR est imprécise dans 5 cas sur 11.
Dans les 6 autres cas, la durée de traitement va de plusieurs mois à 4 ans.

La prise de MEDIATOR et d'anorexigènes est concommitante dans 5 cas, antérieure dans 2 cas, postérieure dans 3 cas, imprécise dans 1 cas.

– 5 cas de toux, après des traitements allant de 8 à 34 mois. L'évolution est inconnue dans 2 cas.

Dans 1 observation (541078), dont l'imputabilité est vraisemblable, chez une femme de 70 ans, traitée par MEDIATOR pour un diabète et AMLOR pour HTA depuis 2 mois, apparition d'une toux sèche qui disparait à l'arrêt du MEDIATOR.
Les dates de prise de MEDIATOR ne sont pas précisées: seul un rechallenge positif est noté. (C3,S1),

- des cas de syndrome hémorragique intra-alvéolaire (MP9500482), tuberculome (SE9400175), pneumopathies interstitielles (LM9800297 et NT9800036) ont tous une imputabilité douteuse: soit une autre étiologie est fortement évoquée, soit l'évolution est inconnue.

V. ATTEINTES CARDIOVASCULAIRES :

18 notifications ont été rapportées : 12 par les CRPV, 6 par le laboratoire

Elles concernent 3 hommes (âge moyen : 51 ans) et 14 femmes (âge moyen : 48,3 ans)

- 3 cas d'hypertension artérielle : dont une observation plausible :

NC9100093 : chez une femme de 51 ans, hypertendue traitée par LOPRESSOR depuis 5 ans, la tension est montée progressivement de 150/90 à 180/110 après introduction de MEDIATOR, malgré l'ajout de RENITEC. La tension a diminué lorsque le MEDIATOR a été arrêté.

17

Annexe 3-9

- une fibrillation auriculaire (C2,S2) chez une femme de 25 ans après 9 mois de MEDIATOR, CANOL et TEALINE et 6 mois de MODERATAN. Evolution favorable à l'arrêt de tout le traitement.

- 3 syndromes de Raynaud dont un plausible C2,S2 et 2 douteux (C2,S1 et C1,S1)

- les autres notifications sont isolées et d'imputabilité douteuse

18

Annexe 3-9

13 notifications ont été rapportées : 9 par les CRPV et 4 par le laboratoire

Elles concernent 5 hommes (âge moyen : 66,6 ans) et 8 femmes (âge moyen : 55,2 ans)

-3 cas de dysurie, d'imputation :
C3,S1 : réadministration positive mais durée de traitement inconnu
C2,S2 : apparition après 5 mois de MEDIATOR, évolution favorable à l'arrêt de celui-ci
C2,S1 : apparition après 48 h de traitement par MEDIATOR (cystite concommitante)

- 4 cas de pollakurie :
- en début de traitement 1j,2j et 16j
- ou réadministration positive après 4 mois de traitement

-1 cas de cystalgie (C2,S1) chez une femme de 33 ans après 8 jours de traitement.
L'évolution est favorable à l'arrêt de MEDIATOR

- les autres dossiers ont tous une imputabilité douteuse:
- anurie (MA8900044)
- glomérulonéphrite (LY8700356),
- syndrome néphrotique (BX9700689),
- créatininémie augmentée(10060463)
- soit le dossier est succinct
- soit l'évolution est inconnue ou l'évolution n'est pas favorable à l'arrêt du traitement:
- soit une autre étiologie est possible

VII. ATTEINTES METABOLIQUES :

21 Notifications ont été rapportées , 18 par le laboratoire, 3 par les CRPV.

Elles concement 11 hommes (âge moyen : 58,7 ans) et 10 femmes (âge moyen : 56,7 ans)

Dans 13 cas, c'est 1 effet lié à aux propriétés pharmacologiques du médicament lui-même:

- hypoglycémie : 6 cas
- malaise hypoglycémique : 1 cas
- hyperglycémie : 2 cas

- hyperlipémie : 2 cas
- augmentation des triglycérides : 2 cas

-3 cas de lactacidémie d'imputabilité douteuse

-dans 1 cas (10060F73), chez un homme de 68 ans, la lactacidémie est à 4.13mmol/l (normale 0.55-2.20) après un traitement de 37 jours par MEDIATOR. Un mois après de MEDIATOR, elle est de 2.27mmol/l.

-2 dossiers succincts: pas de précision sur l'arrêt du MEDIATOR (10060683)
évolution inconnue (10060356)

- 2 cas de goutte chez 2 hommes de 61 et 71 ans (LASILIX est associé dans les 2 cas : C3,S2,B3 et C1,S1,B3)

- 2 cas d 'amaigrissement déclaré par un médecin au laboratoire (10060446 et 10060447) : perte de 5 Kg chez un homme de 36 ans après 1 mois de traitement, perte de 8 Kg chez une femme de 67 ans après 2 mois de traitement pour hypercholestérolémie.

NY9810174	F,67	5 sem	C1,S1		F	

21

Annexe 3-9

1 . Allergie, eczema :

Parmi les 27 réactions allergiques, on note:

- 14 cas d'urticaire dont 5 cas d'urticaires géantes ou généralisées
- 4 oedèmes de Quincke ou oedème laryngé
- 6 chocs anaphylactiques
- 3 allergies cutanées

Le délai de survenue est le plus souvent très rapide (1 jour), l'imputation sera donc souvent vraisemblable (15 fois) ou plausible (3 fois).
Elle est douteuse dans les cas où il y a eu un traitement correcteur : 9 fois

Parmi les 6 cas d'eczéma, d'imputabilité douteuse, l'évolution est favorable dans 4 cas.
L'eczéma n'est pas guéri dans 2 cas. (NC9300394 etNY9809751)
Dans l'observation 540W61, le délai d'apparition est long (2 ans) et la crème cosmétique semble être en cause.

2. Eruption, vascularite, purpura

30 notifications ont été rapportées : 20 par les CRPV, 10 par le laboratoire

Elles concernent 18 femmes agées de 47,7 ans et 12 hommes agés de 52,6 ans

Les éruptions cutanées sont variées:

- 16 cas de prurit, d' éruptions érythèmateuse, maculeuse, papuleuse ou maculopapuleuse dont 6 cas d'imputabilité vraisemblable (réadministration positive)

- 3 cas d'érythème polymorphe, avec une évolution favorable à l'arrêt du MEDIATOR, chez 2 hommes agés de 60 et 68 ans. Le délai d'apparition est respectivement de 15 jours et de 6 mois (!).
Dans le 3° cas, (MA9700614) l'évolution est inconnue et le TANAKAN a une imputabilité bibliographique supérieure au MEDIATOR.

- 3 notifications de vascularite aigue leucocytoclasique:
  - dans 1 cas, l'évolution est favorable à l'arrêt du MEDIATOR (RE9420042)
  - dans 1 cas, l'évolution est favorable sans arrêt du MEDIATOR , mais avec un traitement corticoïde (lorsque la corticothérapie est arrêtée, 4 mois plus tard, survient un érythème polymorphe :MA9700957)
  - dans le troisième cas (MP9700134), l'évolution n'est pas complète malgré l'arrêt du MEDIATOR et une corticothérapie.

- 3 cas de purpura:
  - purpura des membres inférieurs avec un oedème apparu une semaine après le début du traitement par MEDIATOR (PP8990384)
  - purpura des membres inférieurs, s'étendant aux membres supérieurs, disparaissant 1 semaine après l'arrêt du traitement (CF9200106)
  - purpura rhumatoïde survenant après 2 semaines de traitement, l' évolution est inconnue (PO9700410)

25

Annexe 3-9

[illegible] ont été rapportées, 50 par les CRPV [illegible]

Elles concernent 23 hommes (Age moyen : 53,9 ans) , 25 femmes (Age moyen : 58,8 ans)

1. Asthénie, Somnolence, Impuissance :

Dans certaines observations:

- soit le délai de survenue semble long : 2ans (LM8600219) ou inconnu (DJ8800131)
- soit le traitement associé peut être responsable de tels effets: PROZAC, GLUCOPHAGE...

Asthénie et somnolence sont mentionnés dans les RCP.

Annexe 3-9

Elles concernent 16 hommes (âge moyen : 53,2 ans) et 14 femmes (âge moyen : 50,4 ans).

Les troubles psychiatriques sont divers : agressivité, nervosité, confusion, délire

La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue

3 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise d'1 cp de MEDIATOR

- 10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 j. Une réadministration ultérieure a été positive. (traitement associé : KERLONE et MOGADON)

- PA97355052 : syndrome de sevrage avec excitation, chez un homme de 27 ans, sportif, qui avait pris 9 cp/j de MEDIATOR, comme « dopant ».

5 cas sont imputés « plausible » :

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR, pendant 6 j. Disparition des symptômes 12 h après l'arrêt du MEDIATOR.

- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2h après avoir ingéré 4 cp de MEDIATOR.

- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR, HALDOL, SERESTA, ZESTRIL, CATAPRESSAN, PRAXILENE, SERMION. L'évolution est favorable à l'arrêt de tous les médicaments.

19 ont été imputés « douteux » : (8 C1,S1, 10 C2,S1, 1 C1,S2)

Annexe 3-9

Il s'agit de patients agés, en général, avec une pathologie lourde : diabète, HTA, insuffisance cardiaque pontage coronarien, cirrhose ...

6 cas rapportés par le CRPV de BORDEAUX ont été à l'origine d'une nouvelle mise au point des effets indésirables du MEDIATOR lors du Comité Technique du 30 avril 1998.

- BX9701040 : chez un homme de 74 ans, apparition d'une difficulté à la marche pendant un traitement de 4 semaines par MEDIATOR, les troubles sont apparus au bout de 3 semaines.
ATCD et terrain :HTA, DNID, double pontage coronarien
Traitement associé : PREVISCAN, DAONIL, CAPTOLANE, GLUCOPHAGE
Evolution favorable à l'arrêt de MEDIATOR

- BX9701041 : chez un homme de 78 ans, apparition d'un trouble de l'équilibre pendant un traitement de 10 j par MEDIATOR.
ATCD et terrain : DNID, Infarctus du myocarde,3 pontages coronariens, gastrectomie, anévrisme de l'aorte abdominale, ACFA
Traitement associé : DAONIL, CORDARONE, ASPEGIC, GLUCOR
Evolution favorable à l'arrêt de MEDIATOR

- BX9701023 : chez une femme de 63 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 9 semaines par MEDIATOR, les symptômes sont apparus au bout de 8 semaines
ATCD et terrain : DNID, cirrhose hépatique alcoolique, HTA, exérèse basocellulaire, neuropathie diabétique
Traitement associé : AVLOCARDYL, DAFLON, DAONIL, LASILIX, GLUCOR, TRANXENE, IMOVANE
Evolution favorable à l'arrêt de MEDIATOR

- BX 9700381 : chez un homme de 63 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 4 semaines par MEDIATOR,
ATCD et terrain : DNID, cirrhose, HTA, neuropathie périphérique avec paresthésie des extrémités
Traitement associé : DAONIL
Evolution favorable à l'arrêt de MEDIATOR

- BX9700301 : chez un homme de 71 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 6 semaines par MEDIATOR,
ATCD et terrain : DNID, infarctus du myocarde, pontage coronarien,artérite des membres inférieurs, OAP,
Traitement associé :LOPRIL, CORDARONE, VASTAREL, PRAXILENE, EUGLUCAN
Franche amélioration à l'arrêt de MEDIATOR

- BX9701022 : chez une femme de 74 ans, apparition de trouble de la marche pendant un traitement de 7 mois par MEDIATOR, les symptômes sont apparus au bout de 4 semaines
Traitement associé : DIAMICRON, MOPRAL, TILDIEM, ALDACTAZINE, LYSANXIA
ATCD et terrain : DNID, angor
Evolution favorable à l'arrêt de MEDIATOR

Cet effet indésirable est mentionné dans les RCP

ANALYSE COMPARATIVE DES PV DES CT de PHARMACOVIGILANCE du 10/09/1998 et 17/12/1998 RELATIF AUX DONNEES DE PHARMACOCINETIQUE ET DU METABOLISME

Le PV du 10/09/1998 (19 lignes) fournit des données incomplètes et n'indique pas en préambule la méthodologie analytique utilisée, ni la dose administrée.
Les paramètres de pharmacocinétiques manquants sont :
- la concentration maximale (Cmax)
- l'aire sous la courbe (AUC)
-et les ½ vies (T1/2)
du médicament et des ses métabolites (pour évaluer leur devenir dans l'organisme).
Concernant le métabolisme, le PV indique bien que la norfenfluramine (métabolite commun au benfluorex et fenfluramine) est retrouvée à un taux plasmatique identique après prise de benfluorex ou après prise de fenfluramine (seule valeur exprimée normalement en ng/ml). Il ne mentionne pas qu'il s'agit du métabolite actif, lipophile du benfluorex dont la pharmacocinétique doit être évaluée avec des méthodes analytiques fiables en terme de sensibilité et de spécificité.
Les concentrations urinaires de norfenfluramine issues du benfluorex sont exprimées en pourcentage sans indication concernant la méthodologie utilisée.
La différence dans les pourcentages de norfenfluramine dans les urines de 24heures après prise de fenfluramine et benfluorex est une incohérence puisque les concentrations plasmatiques à l'équilibre sont les mêmes. Ces résultats n'ont aucun intérêt pour évaluer la pharmacocinétique du produit.
Le PV mentionne de fournir au rapporteur une analyse des aires sous la courbe.

Il aurait été judicieux d'exiger une étude sérieuse de pharmacocinétique avec des méthodes analytiques "HPLC-SM" afin de disposer des dosages précis du médicament et de ses métabolites et notamment une pharmacocinétique de la (d-l) norfenfluramine (qui par ailleurs est le métabolite principal de la fenfluramine).

Le PV du 17/12/1998 (9 lignes) ne présente aucune pertinence par rapport au précédent. Il mentionne cependant la norfenfluramine comme métabolite principal. Il prête à confusion dans la comparaison des taux circulants dans le sang de norfenfluramine puisqu'il indique un taux de 5% par rapport au métabolite principal (dérivé hydrophile) comparativement au taux de 30% de norfenfluramine issue de fenfluramine. Le point principal, soit la concentration sanguine de norfenfluramine n'est pas mentionné dans ce deuxième PV. Les données pharmacocinétiques urinaires sont répétées succinctement. Dans ce PV, aucune concentration du médicament et des métabolites n'est rapportée. Les données en pourcentage ne peuvent être qu'approximative car toutes issues de mesures de radioactivité globales et imprécises.

La conclusion d'ordre pharmacodynamique : "il parait peu probable que le benfluorex induise les mêmes effets que la fenfluramine" est sans lien avec les données de pharmacocinétiques fournies et présentées plus haut.

La présidence de la séance a été assurée par M. le Pr. RICHE à l'exception de la présentation des dossiers concernant les enquêtes officielles "dobésilate de calcium" et "anthracyclines" pour lesquels il était rapporteur ; celle-ci étant assurée par M. le Pr. BEGAUD.

I - ADOPTION DU PROCÈS-VERBAL DE LA SÉANCE DU 1er Juin 1999

Le procès verbal de la séance du 1er Juin 1999 a été adopté avec les modifications suivantes :

Page 6 : paragraphe "Maladies auto-immunes rapportées entre la date de commercialisation et le 31 mars 1999", 5ème ligne : remplacer "âgés de 15 ou moins" par "âgés de 15 ans au moins"

Page 9 : paragraphe 2. ; 3ème ligne : remplacer "inhibiteurs de l'A.D.N. mitochondrial nécessaire à la réplication" par "inhibiteurs de la γ-polymérase nécessaire à la réplication de l'A.D.N. mitochondrial".

II - EXAMEN DE L'ENQUETE OFFICIELLE SUR LES SYNDROMES HEMORRAGIQUES DES INHIBITEURS SELECTIFS DE LA RECAPTURE DE LA SEROTONINE. PROCEDURES NATIONALES.

Au cours de sa réunion du 10 Février 1999, la Commission Nationale de Pharmacovigilance a pris connaissance des résultats de l'enquête officielle sur les syndromes hémorragiques survenant sous traitement par inhibiteurs de la recapture de la sérotonine (IRS).

Cette enquête concernait 5 spécialités pharmaceutiques :

- **citalopram** (Séropram®),
- **fluoxétine** (Prozac®),
- **fluvoxamine** (Floxyfral®),
- **paroxétine** (Déroxat®),
- **sertraline** (Zoloft®).

Il avait été rappelé qu'une enquête européenne était en cours, pour laquelle la France était co-rapporteur et la Suède rapporteur.

Les membres de la Commission avaient souhaité une harmonisation des RCP des 5 spécialités concernées par l'enquête officielle, en proposant l'ajout dans la section "Effets indésirables" de l'intitulé suivant : "**rares ecchymoses, métrorragies et autres saignements cutanéo-muqueux**" *ainsi qu'être tenus informés de l'évolution de ce dossier.*

Au cours de sa réunion du 7 Juillet 1999, la Commission Nationale a pris connaissance des données actualisées, présentées par le Centre Régional de Pharmacovigilance (CRPV) d'Angers ainsi que des modifications proposées par le Groupe de Travail Européen de Pharmacovigilance les 10 et 11 Juin 1999, à la suite de la communication du rapport suédois.

Les données actualisées ont porté sur les informations suivantes :
- **Les propositions du Groupe de Travail Européen de Pharmacovigilance sont très proches de celles de la Commission Nationale de Pharmacovigilance.**
Seule la mention supplémentaire "hémorragie digestive" semble devoir être ajoutée dans l'intitulé proposé par la Commission Nationale ainsi qu'une information sur le risque hémorragique dans la section "Mises en garde et précautions d'emploi" du RCP.

- **Pour le Groupe de Travail "Thrombose" de l'AFSSAPS, une anomalie fonctionnelle plaquettaire** semble être l'hypothèse à privilégier pour expliquer le mécanisme physiopathologique des syndromes hémorragiques sous IRS;

- **La question du risque péri-opératoire,** soulevée à la suite de la notification au CRPV de Dijon par un chirurgien plasticien de la Côte d'Or, d'observations peu documentées d'hématomes et de petites hémorragies des plaies opératoires de patientes sous paroxétine (Deroxat®) ne semble pas nécessiter de mesures particulières actuellement;

- **La proposition de modifier la section "Interactions médicamenteuses"** à la suite de l'ajout de la mise en garde chez les patients traités par anticoagulants oraux **sera discutée par le Groupe de Travail "Interaction" de l'AFSSAPS puis par le Groupe de Travail Européen de Pharmacovigilance.**

III- EXAMEN DE L'ENQUETE OFFICIELLE SUR DOXIUM® (DOBESILATE DE CALCIUM) ET LA SURVENUE D'AGRANULOCYTOSES. PROCEDURE NATIONALE.

Le CRPV de Brest a présenté les résultats de l'enquête officielle concernant les effets indésirables de Doxium® (dobésilate de calcium). Cette enquête avait été décidée au vu de 6 cas d'agranulocytose mentionnés dans le dossier de demande de modification de l'information du produit.

11 cas d'agranulocytose et 49 cas de fièvre ont été rapportés dans le monde depuis le début de la commercialisation de Doxium®.
Sur les 11 observations d'agranulocytose, il y avait une réadministration positive du produit dans 2 cas. 5 d'entre-elles sont peu informatives (et 7 cas sur les 11 proviennent d'Espagne).
Par ailleurs, une étude cas-témoins[1] réalisée dans la région de Barcelone entre 1980 et 1998 cite 11 cas d'agranulocytose survenus en Espagne avec le dobésilate de calcium. Dans cette étude, l'Odds Ratio d'agranulocytose sous dobésilate de calcium est compris entre 16,7 et 26,3 (IC 95%).
Enfin, 4 nouvelles observations seraient en cours d'évaluation à Barcelone.

Compte tenu de la gravité des effets indésirables et malgré l'existence d'un éventuel biais d'alerte (7 cas espagnols / 11 mondiaux), de l'existence d'autres médicaments asociés à Doxium® dans toutes les observations et de l'absence d'informativité de la plupart de celles-ci, la Commission Nationale de Pharmacovigilance a proposé de modifier le RCP de Doxium® de la façon suivante :

	RCP actuel	RCP proposé
4.4 Mises en garde et précautions d'emploi	Ce produit contient des sulfites qui peuvent éventuellement entraîner ou aggraver des réactions de type anaphylactique.	Ce produit contient des sulfites qui peuvent éventuellement entraîner ou aggraver des réactions de type anaphylactique. Dans le cas de réactions cutanées, de fièvre, de douleurs articulaires ou de modification de la numération formule leucocytaire, le traitement doit être interrompu. Dans le cas de désordres gastro-intestinaux, réduire la posologie ou suspendre temporairement le traitement. Le dobésilate interfère avec le dosage colorimétrique de la créatinine. En conséquence, le taux de créatinine peut être faussement abaissé.

[1] *RISK OF AGRANULOCYTOSIS ASSOCIATED WITH METAMIZOLE. PROGRESS REPORT FOR THE SPANISH MEDICINES AGENCY. MAY 1999.*
L Ibanez, X Vidal, E Bellarin, D Capella, and J-R Laporte
Fundacio Institut Catala de Farmacologia. Universitat Autonoma de Barcelona - Institut Catala de la Salut CSU Vall d'Hebron - 08035 BARCELONA

4.8 Effets indésirables	Gastralgies ou nausées : ces troubles régressent à la diminution de la posologie utilisée et disparaissent totalement à l'arrêt du traitement.	Dans de rares cas, des désordres gastro-intestinaux incluant nausées et diarrhées, de la fièvre, des douleurs articulaires et dans de très rares cas, une agranulocytose ont été rapportés. Ces réactions sont en général spontanément réversibles après l'arrêt du traitement.

Par ailleurs, la Commission Nationale de Pharmacovigilance a estimé que le bénéfice du dobésilate de calcium devait être réévalué rapidement.

Les laboratoires Europhta ont accepté les modifications du RCP proposées en estimant néanmoins que celles-ci ne s'imposaient peut-être pas compte-tenu du caractère hypothétique de la survenue d'agranulocytoses sous Doxium® (ambiguité concernant 2 réadministrations positives).

Les laboratoires Europhta pourraient également proposer un changement de formulation du Doxium® (qui ne contiendrait pas de sulfites).

Enfin, une réévaluation du rapport bénéfice/risque de Doxium® pourrait éventuellement être décidée si les nouveaux cas d'agranulocytose, qui devraient être disponibles d'ici les mois de septembre-octobre 1999, étaient suffisamment informatifs.

IV - INTERVENTION DE M. BENAICHE SUR LES CONFLITS D'INTERETS.

Monsieur Lionel BENAICHE, responsable de la cellule de veille déontologique, a en charge les problèmes de déontologie relatifs aux personnels et aux membres des commissions et experts de l'AFSSAPS.
Le principal objectif de sa mission est de faire des propositions réglementaires et administratives dans le but d'améliorer et de renforcer la transparence des décisions prises par la commission qui est une instance consultative chargée de donner un avis au Directeur Général de l'Agence.

Une déclaration publique d'intérêts a été instituée dès la création de l'Agence du Médicament en 1994. Il s'agit d'un document administratif dans lequel est mentionné la nature précise des liens éventuels des membres des commissions au regard de l'industrie pharmaceutique.

Avant juillet 1998, certaines règles relatives aux déclarations d'intérêts étaient déjà mentionnées dans le Code de la Santé Publique mais aucune règle ne se rapportait à la procédure à suivre en séance.
La loi du 1er juillet 1998 énumère des mesures à suivre en séance et l'administration a l'obligation de les faire respecter. Un membre d'une commission ne peut prendre part au vote ou à la délibération s'il a un lien avec la firme dont le produit est examiné. Il en est de même pour un rapporteur ou un expert qui traite un dossier.

Les décisions rendues par la commission sont succeptibles de recours ou d'annulation en cas de non respect des règles relatives aux conflits d'intérêts.
Il incombe à l'administration de veiller au respect de la procédure en séance en lien étroit avec le président de la commission. Pour cela, des "secrétaires de séance" devront être spécialement formés.

Dans l'avenir, tous les membres des commissions pourront disposer sur table des déclarations publiques d'interêts.
Par ailleurs, un guide de fonctionnement des commissions, rédigé en collaboration avec les présidents de commissions, est en cours de finalisation.

Il s'agit d'un travail progressif qui ne pourra être achevé sans la révision du problème de la valorisation de l'expertise, à savoir le mode de rémunération des experts et leur statut au sein de l'Agence.
Monsieur BENAICHE étudie cet aspect du problème et devrait finaliser un dossier et faire des propositions au directeur général de l'AFSSAPS d'ici la fin de l'année 1999.

A l'issue de l'exposé de Monsieur BENAICHE, les membres de la commission nationale de pharmacovigilance ont posé le problème des relations amicales sans lien financier qui n'entrent pas dans le champ de la déclaration publique d'intérêts.

Par ailleurs, ils ont souhaité rappeler qu'actuellement, tout expert ou membre des commissions de l'Agence doit avancer ses frais de déplacement. Le remboursement de ces frais n'est effectué que plusieurs mois après le déplacement sans aucune vérification possible de la somme remboursée. Il existe donc un réel dysfonctionnement dans la chaîne de remboursement des frais.

Le problème de l'absence de dédommagement du temps passé pour l'expertise a également été soulevé.

V - EXAMEN DE L'ENQUETE OFFICIELLE SUR LES GROSSESSES SURVENUES CHEZ DES FEMMES EXPOSEES AU ROACCUTANE® (ISOTRETINOINE). PROCEDURE NATIONALE.

A la suite des modifications du RCP de Roaccutane® survenues en mars 1997 concernant les modalités de prescription chez les femmes en âge de procréer, le Centre Régional de Pharmacovigilance (CRPV) de Tours a évalué l'incidence des grossesses exposées au Roaccutane® capsule, médicament commercialisé par les laboratoires Produits Roche et l'application des nouvelles modalités de prescription.

A-Résultats de l'enquête:

1. Grossesses exposées au Roaccutane® capsule :

L'analyse porte sur 37 grossesses exposées à l'isotrétinoïne pendant la période de risque tératogène entre mars 1997 et décembre 1998. Ces notifications provenaient des CRPV, des laboratoires Produits Roche et du Centre de Renseignement des Agents tératogènes. La moyenne d'âge des patientes enceintes était de 27 ans.

Dans 11 cas, la prise de Roaccutane® a débuté alors que la patiente était enceinte, 18 grossesses ont débuté alors que les femmes étaient déjà traitées par l'antiacnéique (48%) et 8 grossesses ont débuté moins de 1 mois après l'arrêt du Roaccutane® (22%). Dans 8 cas, la prise de Roaccutane® a été une automédication dont 5 fois chez des femmes déjà enceintes.

Les circonstances connues de survenue des grossesses étaient dans 7 cas un échec de contraception (2 cas de prescription de Diane 35®), 9 cas de contraception mal prise, 4 cas de contraception arrêtée et 5 cas de contraception locale ou absente. Les issues des grossesses ont été les suivantes : 2 bébés nés sans aucune malformation (7%), 24 interruptions de grossesse dont 8 interruptions thérapeutiques (86%) et 2 cas de fausse couches spontanées (7%).

L'estimation de l'incidence des grossesses exposées au Roaccutane® pour la période de mars 1997 à décembre 1998 est de 0,6/1000 femmes en âge de procréer (IC 95% [0,4-0,8]), peu différente de celle estimée avant la modification des modalités de prescription.
La répartition des causes de survenue des grossesses entre les deux périodes étudiées est également similaire : échec de contraception (28% vs 25%), contraception mal prise ou arrêtée (52%vs 60%), contraception absente ou locale (20% vs 15%). Il en est de même pour les issues de grossesse qui restent en majorité des interruptions de grossesses (86% vs 81%).

2. Analyse des modalités de prescriptions de Roaccutane® capsule :

Une enquête auprès de 105 pharmacies réparties sur tout le territoire a été effectuée. 30 CRPV ont participé à l'enquête. Les pharmaciens étaient chargés de vérifier la conformité des prescriptions de Roaccutane® capsule chez les femmes et de les interroger sur leur mode de contraception.

Sur 169 ordonnances analysées, 32% ne comportaient pas toutes les mentions légales de prescription (réalisation d'un test de grossesse avant la prescription et lors des renouvellements, signature d'un formulaire d'accord de soin et de contraception, réalisation de l'évaluation du niveau de compréhension de la patiente).
16% des patientes n'ont pas eu de prescription de contraceptif, et seules 61% des prescriptions de

contraception sont conformes à l'AMM. De plus, 12% des patientes n'ont pas utilisé de méthode contraceptive pendant l'exposition au Roaccutane® capsule.

Bien que l'application des recommandations les plus importantes se soit améliorée depuis le renforcement des modalités de prescription, **seules 18% des patientes ont une ordonnance rédigée correctement avec une contraception conforme à l'AMM, une information correcte et comprise en matière de contraception et de risque tératogène.**

Contrairement à ce qui est demandé dans la notice patient, 94% des pharmaciens n'ont jamais eu de restitution de capsules restantes de Roaccutane®.

Les dermatologues ont été les principaux prescripteurs (84%), les généralistes représentant 11% des prescripteurs. L'évaluation de la conformité des ordonnances aux mentions légales en fonction du prescripteur a montré une conformité dans 80% des premières ordonnances de spécialistes et 69% des renouvellements. Aucune des premières ordonnnances de généralistes n'était conforme aux mentions légales, 42% l'étaient au cours des renouvellements.

B-Présentation des laboratoires Produits Roche

Les laboratoires Produits Roche ont présenté le statut actuel de prescription de Roaccutane® capsule dans d'autres pays européens et aux Etats-Unis :

- Le test de grossesse est nécessaire 15 jours avant le début du traitement dans les autres pays de la communauté européenne et une semaine avant aux USA. Celui-ci est exigé tous les mois pendant le traitement en Europe et aux Etats-Unis, contrairement à la France (tous les 2 mois) mais aucun test de grossesse n'est demandé dans le mois suivant l'arrêt du traitement.
- Une contraception efficace est nécessaire 1 mois avant le début du traitement, pendant le traitement et 1 mois après l'arrêt dans tous les pays européens et aux Etats-Unis.
- Aux Etats-Unis :

-il est recommandé en plus d'associer une 2 ème méthode de contraception (non hormonale);
-le traitement doit être débuté 3 jours après les règles.

Bien que des améliorations des modalités de prescription aient été constatées depuis 1997, des insuffisances subsistent en particulier concernant la prise d'une contraception efficace. Ainsi les laboratoires Produits Roche s'engagent à renforcer l'information des professionnels de santé, en particulier :

- les dermatologues par une information continue (visite médicale et délivrance de "fiches pratiques" d'information sur Roaccutane® et lors des réunions professionnelles régulières);

- les gynécologues lors des congrès sur les méthodes contraceptives sous Roaccutane® capsule et plus particulièrement sur le problème de prescription d'un contraceptif non adapté;

- les médecins généralistes et les pharmaciens à partir de septembre 1999 par une visite médicale d'information et de remise de documents relatifs à la délivrance de ce médicament.

Conclusion :

Après discussion et interrogation de ses membres, la Commission Nationale de Pharmacovigilance a rejeté la proposition de restreindre la prescription de Roaccutane® capsule aux dermatologues considérant qu'un médecin généraliste bien informé devrait être en mesure de prescrire ce médicament aussi bien qu'un dermatologue.
Concernant l'information des patientes, les membres de la Commission Nationale ont clairement admis que l'on ne pourra jamais obtenir une sécurité absolue en terme de survenue de grossesse sous Roaccutane® puisqu'il y aura toujours un pourcentage de femmes qui ne respecteront pas le contrat de soin et de contraception mais il convient de tout mettre en oeuvre pour minimiser ce pourcentage.

Les propositions retenues par la Commission Nationale de Pharmacovigilance sont :

1. Modification de la rubrique "Mises en garde et précaution d'emploi" du RCP de Roaccutane® en demandant que figure sur l'ordonnance la mention "test de grossesse négatif" au lieu de "réalisation récente du test de grossesse".

2. Renouvellement de l'information des médecins prescripteurs (spécialistes ou généralistes) sur le respect des modalités de prescriptions, en particulier sur la nécessité de prescrire une contraception efficace dans le cadre de l'AMM. Il a été rappelé que la contraception ne faisait pas partie des indications de Diane 35® (indice de Pearl non disponible).

3. Renforcement de l'information des pharmaciens sur les modalités de délivrance (vérification de la conformité de l'ordonnance en matière de contraception et refus de délivrance si ordonnance non conforme à l'AMM).

VI - EXAMEN DE L'ENQUETE OFFICIELLE SUR LES EFFETS INDESIRABLES DU LAMICTAL® (LAMOTRIGINE). PROCEDURE NATIONALE.

Le centre régional de pharmacovigilance de Nantes a présenté les résultats de l'enquête officielle sur les effets indésirables du Lamictal® (lamotrigine) médicament commercialisé par les laboratoires GlaxoWellcome et indiqué dans le traitement des épilepsies. Cette enquête fait le point sur l'ensemble des effets indésirables notifiés depuis 1995, date d'octroi de l'AMM, jusqu'au 23 septembre 1998.
Par ailleurs, le CRPV de Nantes a présenté ses conclusions sur la demande de modification du Résumé des Caractéristiques du Produit déposée le 10 février 1999 par les laboratoires GlaxoWellcome.

I/ L'enquête

Le CRPV de Nantes a analysé, outre les données internationales communiquées, 169 observations imputables au Lamictal® survenues en France, dont 69 effets graves :
3 notifications concernaient des enfants de moins de 2 ans, 24 notifications des enfants de 2 à 12 ans, 134 patients de 12 à 70 ans et 3 patients de plus de 70 ans.

- **Les effets dermatologiques et allergologiques** (69 notifications) :
20 cas graves sont rapportés parmi lesquels l'analyse de la prescription fait apparaitre 8 fois une posologie non respectée, soit dans la dose administrée, soit dans la chronologie de l'ascension des doses. Parmi ces cas graves, on retrouve 2 syndromes de Lyell, 2 syndromes de Stevens Johnson, 1 toxidermie bulleuse et 5 cas d'hypersensibilité.
Le Lamictal® est le plus souvent associé à d'autres antiépileptiques, principalement l'acide valproïque.

- **Les effets neurologiques** (51 notifications) :
24 cas graves sont rapportés dont 6 aggravations des crises/état de mal, 7 syndromes vertigineux, 5 réactions de confusion, de trouble mnésique et 3 agitations ou réaction d'agressivité.
Le Lamictal® est le plus souvent associé à d'autres antiépileptiques.

- **Les effets hématologiques** (18 notifications) :
8 cas graves lesquels concernent des femmes, toutefois aucune de ces notifications n'est suffisamment documentée pour établir une relation de causalité.

- **Les effets ophtalmologiques** (10 notifications non graves), **hépatologiques** (6 notifications) **gastro-entérologiques** (6 notifications), **néphrologiques** (2 notifications graves) :
1 cas grave d'augmentation des enzymes hépatiques, ainsi que 2 cas graves de pancréatite ont été analysés.

- **les autres effets** (19 notifications graves) sont variés tels un syndrome pseudo-grippal, une sueur profuse, un épisode d'hypoglycémie avec perte de poids.

Conclusion :

La majorité des effets indésirables est correctement signalé dans le RCP actuel et les indications sont respectées. Le risque de l'association avec l'acide valproïque apparaît confirmé, notamment le risque de survenue d'effets dermatologiques graves ou non (rash, éruption, syndrome de Lyell, hypersensibilité) et d'effets neurologiques, qui restent les plus fréquents.

La fréquence des effets indésirables a été difficile à évaluer en raison de l'adaptation progressive de la posologie et d'une durée de traitement variable. L'exposition est estimée à environ 14000 patients-années, sur la base des données de vente GERS fournies par le laboratoire, sur la base d'une posologie moyenne de 196 mg/j et d'une durée de traitement moyenne d'un an.
La fréquence des effets indésirables, tous effets confondus est de 1,45 effets pour 100 patients-années. Pour les effets dermatologiques et neurologiques, cette fréquence est respectivement de 0,49 et de 0,36 pour 100 patients-années.

Les résultats de l'enquête ne modifient pas le profil de tolérance du médicament et confirment les données dont les laboratoires GlaxoWellcome font état dans le RCP proposé.
Une sous-rubrique "effets neurologiques" pourrait être individualisée dans le RCP afin d'améliorer la lisibilité de la rubrique "Effets indésirables".

II/ Demande de modification de l'information

Les demandes de modification portent sur plusieurs rubriques du RCP qui sont les suivantes :

- Rubrique "Pharmacocinétique" : elles ont été évaluées par un expert pharmacocinéticien lors de la réunion du Groupe de Travail Thérapeutique de l'AFSSAPS le 18 février 1999. Un avis favorable a été donné à la modification des rubriques "pharmacocinétique" ainsi que sur l'utilisation chez le sujet âgé et l'insuffisant hépatique. Cependant, la mention chez les sujets âgés de plus de 65 ans *"aucune adaptation posologique n'est nécessaire"* a reçu un avis défavorable.

- Rubrique "Posologie et mode d'administration" : la Commission Nationale de Pharmacovigilance a émis un avis favorable.

- Rubrique "Contre-indications" : avis défavorable de la Commission Nationale de Pharmacovigilance sur la suppression de la contre-indication de l'allaitement (Cf rubrique "Grossesse et allaitement").

- Rubrique "Mises en garde et précautions particulières d'emploi" : avis favorable de la Commission Nationale de Pharmacovigilance sauf en ce qui concerne le risque d'éruption cutanée grave de 1 pour 1000 chez l'adulte. L'ajout "rapporté comme étant un syndrome de Stevens Johnson" est tendancieuse et ne se justifie donc pas .

- Rubrique "Interactions médicamenteuses" : la Commission Nationale de Pharmacovigilance a émis un avis favorable.

- Rubrique "Grossesse et allaitement" : les laboratoires GlaxoWellcome désiraient ne pas contre-indiquer l'allaitement mais mettre en avant le rapport bénéfice/risque de l'allaitement. La Commission Nationale de Pharmacovigilance souhaite laisser la contre-indication compte-tenu du passage important du médicament dans le lait et des risques conséquents.

- Rubrique "Effets indésirables" : la Commission Nationale de Pharmacovigilance a émis un avis favorable aux propositions des laboratoires GlaxoWellcome et propose en supplément le regroupement des effets neurologiques dans une sous-rubrique "Troubles neurologiques".

- Rubrique "Surdosage" : la Commission Nationale de Pharmacovigilance a émis un avis favorable.

VII - EXAMEN DE L'ENQUETE OFFICIELLE SUR LES LEUCEMIES SECONDAIRES LIEES A L'ADMINISTRATION DES ANTHRACYCLINES. PROCEDURES NATIONALES ET PROCEDURE EUROPEENNE CENTRALISEE.

Un bref rappel sur le risque leucémogène de la NOVANTRONE® a tout d'abord été fait par Monsieur le Professeur B. Bégaud (Cf Procès-verbal de la Commision Nationale de pharmacovigilance du 1er juin 1999)

La Commission Nationale de Pharmacovigilance a pris connaissance des résultats de l'enquête officielle de pharmacovigilance présentée par les CRPV de Brest et Toulouse portant sur le risque leucémogène des anthracyclines indiquées dans le traitement du cancer du sein.

Les spécialités concernées sont les suivantes :

- **épirubicine :** FARMORUBICINE® : laboratoires Pharmacia-Upjohn.

- **doxorubicine :** ADRIBLASTINE® : laboratoires Pharmacia-Upjohn.
  DOXORUBICINE PIERRE FABRE® : laboratoires Pierre Fabre.
  DOXORUBICINE DAKOTA PHARM® : laboratoires Dakota Pharm.
  CHLORHYDRATE DE DOXORUBICINE ASTA MEDICA® : laboratoires Asta Médica.

- **pirarubicine :** THEPRUBICINE® : laboratoires Rhône-Poulenc Rorer Bellon.

L'idarubicine, la daunorubicine et la zorubicine n'ont pas l'indication dans le cancer du sein.

Les données analysées proviennent des trois sources suivantes :
1/ Notifications individuelles (spontanées, sollicitées par les CRPV, cas de la Fédération Nationale des Centres de Lutte Contre le Cancer : FNCLCC)
2/ Données des registres de Côte d'Or.
3/ Epirubicin Secondary Leukemia Monitoring Plan.

I/ Notifications individuelles.

a/ Notifications françaises : 55 observations d'hémopathies malignes après traitement d'un cancer du sein par anthracyclines ont été recensées. Pour 5 observations, l'anthracycline n'était pas associée à un agent alkylant. On dénombre 34 cas avec l'épirubicine, 20 cas avec la doxorubicine et un cas avec la pirarubicine. Les hémopathies les plus fréquemment observées sont les leucémies aiguës myéloïdes (LAM) classées M4, M5, et M2 selon la classification FAB. Les myélodysplasies et les phases pré-leucémiques sont rares. La moyenne du délai d'apparition est de 3,6 ans pour l'épirubicine et de 5,6 ans pour la doxorubicine.

b/ Notifications internationales : 29 observations ont été communiquées par les laboratoires Pharmacia-Upjohn. Les spécialités concernées sont l'épirubicine et la doxorubicine. 8 cas de myélodysplasies ont été observés (4 sous épirubicine et 4 sous doxorubicine). Les leucémies les plus fréquemment rencontrées sont les LAM de type M4, M5 et M2. Le délai d'apparition des atteintes hématologiques est plus court par rapport aux notifications françaises (2 à 2,5 ans) et se rapproche plus du délai d'apparition moyen observé pour les leucémies secondaires après traitement par inhibiteurs des topoisomérases II.
Mais l'ensemble de ces observations est très hétérogène.

2/ Données des registres de Côte d'Or.

Le risque leucémogène a été estimé à partir des 351 femmes ayant eu une exposition aux anthracyclines sur la période de 1982-1996. Un seul cas de LAM a été rapporté.

3/ Epirubicin Secondary Leukemia Monitoring Plan.

L'Epirubicin Secondary Leukemia Monitoring Plan est une étude de surveillance qui a permis d'estimer le risque leucémogène sur une cohorte de 10687 patients inclus dans 27 essais cliniques randomisés.
19 cas de leucémies secondaires ont été notés : 16 cas de LAM (leucémie aiguë myéloïde) et 3 cas de LAL (leucémie aiguë lymphoïde).
Le risque de leucémie aiguë myéloïde pour toute la population de patientes traitées pour cancer du sein a été estimé a 0,058 pour 1000 patientes-mois, soit 16 cas pour 8725 patientes.
Le risque de leucémie aiguë myéloïde pour la population de patientes traitées par épirubicine pour cancer du sein a été estimé a 0,080 pour 1000 patientes-mois, soit 15 cas pour 6086 patientes.

Dans le cadre des traitements adjuvants de cancer du sein par épirubicine, au sein de cette cohorte:
- Chez des patientes ayant reçu un traitement adjuvant par épirubicine pour cancer du sein, le risque relatif de développer une leucémie aiguë myéloïde est d'environ 0,2% à 3 ans et de 0,8% à 5 ans.
- Le risque relatif sous épirubicine seule par rapport aux protocoles FEC/EC n'apparaît pas significativement différent.
- Le risque relatif de développer une leucémie aiguë myéloïde apparaît augmenté pour les protocoles épirubicine à "haute dose" (>25mg/m^2/semaine) versus épirubicine à dose standard (<ou =25mg/m^2/semaine) avec un risque relatif de 6,13 (p=0,0003).
- Le risque relatif de développer une leucémie aiguë myéloïde apparaît augmenté pour les protocoles épirubicine administrée de façon "intensifiée" dans les protocoles FEC ou EC (épirubicine >90mg/m^2/cycle) versus épirubicine administrée dans les protocoles FEC ou EC à dose standard (<ou =90mg/m^2/cycle) avec un risque relatif de 9,3 (p=0,0001).

L'ensemble des données suggère l'existence d'un risque de leucémie secondaire après exposition aux anthracyclines. Les caractéristiques de ces leucémies secondaires sont compatibles avec l'effet leucémogène des inhibiteurs des topoisomérases II : court délai d'apparition, translocations chromosomiques équilibrées, pronostic relativement favorable.

En conclusion :

a/ Compte-tenu de l'ensemble de ces données, la Commission Nationale de Pharmacovigilance propose que le risque leucémogène de la mitoxantrone, de l'épirubicine et de la doxorubicine soit mentionné à la rubrique "Effets indésirables" du RCP de chaque spécialité.
Un libellé identique est proposé pour les 3 spécialités.

"La survenue de leucémies aiguës myéloïdes secondaires, avec ou sans phase préleucémique, a été rapportée chez des patients traités par une association de (DCI du médicament) *et d'agents anticancéreux altérant l'ADN.*
Comme avec les agents radio-mimétiques, les autres inhibiteurs de la topoisomérase II et les intercalants, des syndromes myélodysplasiques et des leucémies aiguës myéloïdes ont été observés. Ils sont de mauvais pronostic car peu sensibles à la chimiothérapie.
Par ailleurs, a été rapporté un nombre plus élevé qu'attendu de leucémies secondaires se présentant comme des leucémies de novo LAM2, LAM3, LAM4. De telles formes peuvent présenter une courte

période de latence (de 1 à 3 ans). Ces formes sont de meilleur pronostic et justifient d'un diagnostic précoce et d'un traitement adapté à visée curative."

b/ Par ailleurs, le risque de leucémie aiguë myéloïde justifiant un diagnostic précoce, il est proposé de mentionner un libellé identique à la rubrique "Mises en garde et précautions particulières d'emploi" du RCP pour ces trois spécialités :

"Certaines leucémies secondaires aux agents anticancéreux (cf rubrique "Effets indésirables") peuvent être curables à condition d'une prise en charge précoce et adaptée. En conséquence, tout patient traité par (DCI du médicament) ***doit être surveillé et exploré en cas d'anomalies hématologiques"***

Autant le risque de leucémie secondaire peut être accepté au cours de cancers évolués chez des patientes lourdement pré-traitées, autant ce risque pèse dans le choix d'un agent anticancéreux et dans ses modalités d'administration chez des sujets jeunes, en cas de cancers curables et de traitements adjuvants.
C'est pourquoi, en cas de traitement adjuvant, le risque de leucémie secondaire doit être comparé au bénéfice attendu en survie.
Par conséquent, une réévaluation du rapport bénéfice/risque de l'épirubicine, de la doxorubicine et de la mitoxantrone dans le traitement adjuvant du cancer du sein a été demandée.
L'enquête reste ouverte concernant l'évaluation du bénéfice/risque dans les autres indications thérapeutiques de ces spécialités.

VIII - QUESTIONS DIVERSES.

- Le Dr Anne CASTOT, chef de l'Unité de pharmacovigilance de l'AFSSAPS a annoncé son prochain départ de l'Unité pour prendre en charge à partir du mois d'août 1999, au sein de la Direction de l'Evaluation des Médicaments et des Produits Biologiques (DEMEB), la coordination des vigilances. Le futur responsable de l'Unité de pharmacovigilance sera le Dr Carmen KREFT-JAÏS.

- Cisapride (PREPULSID®) :

Un point sur la demande de modification d'information de la spécialité Prépulsid® déposée le 2 juin 1999 par les laboratoires Janssen-Cilag, titulaire de l'A.M.M., a été présenté par le Dr J. Caron.

Prépulsid® (cisapride) est autorisé en France selon une procédure nationale depuis 1988 dans l'indication du traitement du reflux gastro-oesophagien, de l'oesophagite par reflux gastro-oesophagien et des troubles liés à un retard de l'évacuation gastrique (gastroparésie).

En juin 1998 : compte-tenu des effets arythmogènes du cisapride, la Food and Drug Administration (F.D.A.) a pris la décision de réserver l'utilisation du cisapride au traitement de 2ème intention du reflux gastro-oesophagien, en renforçant considérablement les rubriques "Contre-indications", "Mises en garde et précautions d'emploi" du Résumé des Caractéristiques du Produit (R.C.P.).

Parallèlement, les laboratoires Janssen-Cilag ont déposé *fin juin 1998* une demande de modification d'information dans tous les pays de l'Union européenne. Ce sujet a été abordé au Comité des Spécialités Pharmaceutiques (CSP) de l'Agence Européenne pour l'Evaluation des Médicaments (EMEA) réuni les *21 et 23 juillet 1998*. Ce dernier a exprimé la nécessité d'une réévaluation du rapport bénéfice/risque et d'une harmonisation du RCP au niveau européen.

En septembre 1998 : la France a soumis aux états membres de l'Union européenne un rapport d'évaluation relatif au risque et *en mars 1999* un rapport d'évaluation relatif à l'efficacité.

En février 1999 : les laboratoires Janssen-Cilag ont soumis les résultats d'une expertise clinique menée par des cardiologues américains sur tous les effets indésirables cardiaques rapportés depuis la mise sur le marché de Prépulsid®.

En mai 1999 : les laboratoires Janssen-Cilag ont soumis les résultats d'une étude d'interaction chez le volontaire sain qui met en évidence une augmentation de 50% de la biodisponibilité du cisapride lors de l'administration de 200 ml de jus de pamplemousse .

Le 5 mai 1999 : les laboratoires Janssen-Cilag ont informé l'AFSSAPS que le libellé du cisapride était en cours de révision au niveau de la F.D.A. afin d'introduire de nouvelles mises en garde et contre-indications notamment chez les patients ayant des antécédents familiaux connus de prolongation du QT et les patients ayant une bradycardie cliniquement significative ainsi que l'interaction avec le jus de pamplemousse. L'Unité de Pharmacovigilance de l'AFSSAPS a communiqué cette information le 26 mai 1999 à l'ensemble des états membres de l'Union européenne. Ces modifications ont donné lieu aux Etats-Unis à une lettre d'information des prescripteurs (*parue le 1er juin 1999* sur le site internet des laboratoires Janssen-Cilag/Etats-Unis et *le 10 juin 1999* sur le site de la F.D.A.).

Le *25 mai 1999*, un groupe d'experts a été réuni à l'AFSSAPS afin de réévaluer le rapport bénéfice/risque du cisapride chez l'adulte et l'enfant. Il a été proposé de renforcer les mises en garde

et précautions d'emploi et de restreindre les indications.

Le *2 juin 1999*, les laboratoires Janssen-Cilag ont déposé auprès de l'AFSSAPS et dans tous les états membres de l'Union européenne une demande de modification de l'information médicale.

Cette demande concerne les rubriques "Posologie et mode d'administration" ("ajout" du jus de pamplemousse), "Contre-indications" (renforcement de la rubrique en cas d'association avec des médicaments susceptibles d'allonger le QT, hypokaliémie, hypomagnésémie, bradycardie cliniquement significative, QT long congénital et antécédents familiaux de QT long congénital), "Mises en garde" (renforcement de la rubrique), "Interactions" (renforcement de la rubrique), "Effets indésirables", "Surdosage", "Propriétés pharmacodynamiques" et" Données de sécurité préclinique". Ce dossier a été présenté lors du Groupe de Travail Européen de Pharmacovigilance réuni les *10 et 11 juin 1999* à Londres. Le Groupe de travail a approuvé les modifications du R.C.P. proposées par les laboratoires Janssen-Cilag.

Selon le rapporteur la demande de modification de l'information médicale est acceptable sous réserve de quelques amendements. Le libellé proposé par le rapporteur a été distribué en séance. Une lettre d'information des prescripteurs devra être envoyée par les laboratoires Janssen-Cilag.

- **Métamizole / agranulocytose :**

A la demande du CSP de l'Agence Européenne pour l'Evaluation des Médicaments et à la suite de l'évaluation par la Suède du risque de survenue d'agranulocytoses, la France est chargée de réévaluer le rapport bénéfice/risque du métamizole pour la réunion du CSP prévue à la fin septembre 1999. A cet effet, un groupe *ad-hoc* de la Commission d'Autorisation de Mise sur le Marché est prévu le jeudi 9 septembre 1999 à 14h00. Ce groupe sera composé de membres de la Commission d'AMM et de membres de la Commission Nationale de Pharmacovigilance.

Une télécopie sera prochainement adressée à tous les membres de la Commission Nationale de Pharmacovigilance afin de savoir qui souhaite participer à ce groupe de travail.

Benfluorex (MEDIATOR®)

En France, le benfluorex a fait l'objet d'une enquête officieuse dès 1995 en raison de sa parentée structurale avec les anorexigènes amphétaminiques. Cette enquête est devenue officielle en mai 1998.

Depuis septembre 1998, à la demande des autorités sanitaires italiennes, le benfluorex fait également l'objet d'une évaluation au niveau du Groupe de Travail Européen de Pharmacovigilance (l'Italie et la France sont rapporteurs sur ce dossier). L'un des motifs de cette enquête est la métabolisation du benfluorex en 9 métabolites dont l'un des 3 principaux est la norfenfluramine qui est également le métabolite des spécialités pharmaceutiques appartenant à la classe des "fenfluramines".

Les données disponibles issues de l'enquête officielle de pharmacovigilance ne permettent pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex. Cependant, des doutes persistent concernant notamment le devenir de la norfenfluramine. La réalisation par les laboratoires SERVIER d'une étude de pharmacocinétique du benfluorex et de ses métabolites pourrait permettre de lever ces doutes.

Au courant du mois de juin 1999, un cas d'Hypertension Artérielle Pulmonaire (HTAP) d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans. Il s'agit du premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène. 11 cas avaient auparavant été rapportés lors d'un traitement associant le benfluorex à de la dexfenfluramine dans 10 cas et à de l'amfépramone et du clobenzorex dans 1 cas.

Cette observation est en cours de documentation et le service de Pneumologie de l'hôpital Antoine Béclère entreprend une interrogation de tous les patients ayant une HTAP à la recherche d'une prise antérieure de MEDIATOR®.

Ce dossier devrait être discuté à la prochaine réunion du Groupe de Travail Européen de Pharmacovigilance les 12 et 13 juillet 1999.

RE: Article 15 a referral

Dear Dr. La Mache,

with regards to the ongoing procedures on fenfluramine and anorectict we would like to call your attention on a medicinal product that could be included in the list of fenfluramine-containing drugs. It is MEDIAXAL by Servier, which containes Benfluorex. In Italy MEDIAXAL is intended for the treatment of obesity. This indication is based on its anti-hyperlipoproteinemic properties, not on some anorexic effect.
However, as shown in the two attachments the chemical structure of Benfluorex is strictly related to that of fenfluramine, which might be generated *in vivo* by metabolic degradation of Benfluorex. Therefore, we are wondering whether Benfluorex can be regarded as a fenfluramine-containing medicinal product.
Please, note that while MEDIAXAL is the only medicinal product containing Benfluorex on the market in Italy, other such products listed in the attachment may still be on the market in other countries.

Thank you for your kind attention.

Best regards,

Prof. Silvio Garattini

EPITT Reference: 20

Adpoted Minutes

At their meeting in October 1998, the CPMP considered a letter from Prof. Garattini concerning benfluorex which is an active substance used in the treatment of obesity because of its anti-hyperlipoproteinemic effect. It could possibly be metabolised to fenfluramine which is subject to an ongoing Article 15a Referral because of heart valve disorders. The CPMP agreed that the PhVWP should investigate if there is a safety issue with this active substance. Benfluorex containing products are authorised in France, Greece, Italy and Spain. A French investigation has not provided any evidence for a safety concern. In Italy, a problem of misuse might exist. The PhVWP agreed that Italy as Rapporteur will request data on metabolism and a safety update from the marketing authorisation holder. Italy will then prepare an Assessment Report for further discussion in February 1999. If necessary, a new Article 12 procedure could be initiated because benfluorex was not included in any of the previously initiated referral procedures.

Proposed Issues for Discussion

SUBJECT: ASSESSMENT REPORT FOR BENFLUOREX.

Dear dr. Castot,
I would be very grateful if you could send me a copy of the assessment report on the pharmacokinetics and metabolism of benfluorex that you performed in France. It should be very useful to carry out the Italian assessment on the possible inclusion of benfluorex in the anorectics group.
Thank you in advance for your kind accordance.

Annexe 3-15

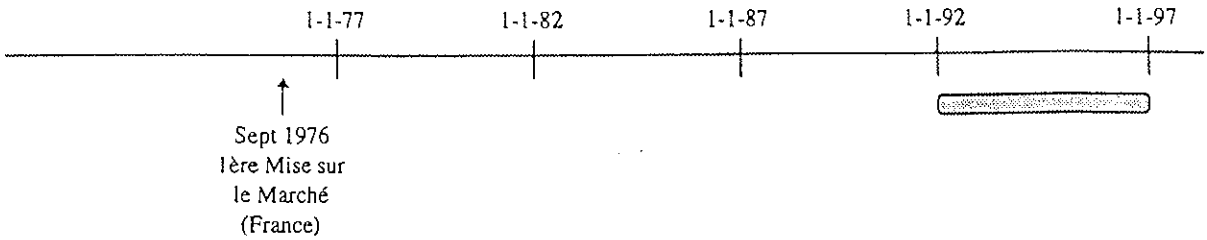
1. Introduction

Ce rapport périodique de pharmacovigilance est le premier d'une série de rapports quinquennaux établi conformément aux nouvelles directives de l'union européenne et aux recommandations ICH (International Conference on Harmonization). Il fait la synthèse des données de sécurité collectées par la Division Pharmacovigilance de l'Institut de Recherches Internationales Servier entre le 1er janvier 1992 et le 31 décembre 1996. Cette période se situe 16 à 20 ans après la 1ère mise sur le marché du Benfluorex.



Le Benfluorex est une molécule de synthèse [Chlorhydrate N-(2-benzoyloxyéthyl) N-(2-(3-trifluorométhylphényl) isopropyl) amine] possédant une double activité hypolipémiante et anti-hyperglycémiante, indiquée comme traitement adjuvant du régime dans les hypertriglycéridémies et en association au régime dans le diabète de type 2.
La posologie recommandée est de 3 comprimés, soit 450mg.

3. Actions engagées par la Compagnie ou par les Autorités de Santé pour des motifs de sécurité

Aucune action n'a été engagée au cours de la période de référence de ce rapport.

A noter cependant, en France, l'Arrêté Ministériel du 25 octobre 1995 portant interdiction d'exécution et de délivrance de certaines préparations magistrales incluant le Benfluorex ; mesure de principe destinée à bannir toutes les préparations magistrales à visée amaigrissante, suite à la présentation des résultats d'une étude prospective cas-témoins ayant démontré une association entre la prise de substances amaigrissantes en général et la survenue d'une hypertension pulmonaire primitive, et bien qu'à ce jour aucune observation n'ait été rapportée à l'utilisation du Benfluorex seul, c'est-à-dire non associé à un médicament anti-obésité.

Annexe 3-15

4. Données de prescription

Période Octobre 1991 - Septembre 1996

Estimation basée sur une posologie quotidienne moyenne à 2,4 comprimés ; mois de 30,4 jours

a) Pays de l'Union Européenne

Annexe 3-15

5. Observations de pharmacovigilance

Toutes les notifications spontanées d'effets indésirables reçues par la Division Pharmacovigilance de l'Institut de Recherches Internationales Servier, quel que soit le pays d'origine, entre le 1er janvier 1992 et le 31 décembre 1996 sont présentées en Annexe B. Les cas sont ordonnés par appareil ou système d'organe.

Au total, 35 observations ont été documentées au cours de la période de référence de ce rapport ; 34 sont d'origine française, 1 d'origine italienne.

Observations attendues, observations inattendues

Ces observations se répartissent, en fonction de leur caractère attendu ou inattendu, de la manière suivante :

Expected Reactions

Reactions	Total No of Reports	No of Serious Reports
Digestive system		
Dyspepsia, anorexia	1	-

Bladder pain	1	-

Intoxication aiguë

Une observation de surdosage accidentel a été rapporté chez un enfant de 2 ans et demi, sans aucune conséquence (Ref. No 540O22).

Imputabilité

L'imputabilité est douteuse dans 30 cas et plausible ou vraisemblable dans 5 cas de réactions cutanées (Ref. No 540989, 540S90, 540V73), augmentation des gamma GT (Ref No 120O39), toux (Ref No 541078).

Gravité

10 patients ont été hospitalisés

- Ref. No 540W55 : Palpitations sous Sotalol et Benfluorex (observation peu documentée, médicaments maintenus)
- Ref No 540V17 : Confusion mentale sous Amfépramone et Benfluorex
- Ref No 540O22 : Intoxication accidentelle chez un enfant de 2ans et demi, sans aucune conséquence médicale
- Ref No 541083 : Torsade de pointes sous Dextropropoxyphène, Benfluorex et Piroxicam (aucun facteur prédisposant apparent)
- Ref No 540930 : Ulcère gastrique sous Benfluorex, Metformine, Gemfibrozil, Lisinopril, Glibenclamide.
- Ref No 120i53 : Hépatopathie (augmentation modérée de la bilirubine et des transaminases), stéatose hépatique probable.
- Ref No 541259 : Agranulocytose sous Sulfasalazine, Fluoxetine, Benfluorex et Benazepril.
- Ref No 541175 : Augmentation des enzymes musculaires et des SGOT /SGPT sous Fenofibrate et Benfluorex.
- Ref No 120M85 : Malaises amnésiques et confusion chez un homme polyartériel (sténose carotidienne et anévrisme de l'aorte descendante opérés récemment).
- Ref No 541183 : Poussée d'insuffisance respiratoire aiguë chez une patiente atteinte de COPD et de cardiopathie hypertensive.

Dans tous ces cas, l'imputabilité du Benfluorex est douteuse.

Annexe 3-15

6. Etudes

Aucune étude nouvelle relative à la sécurité du Benfluorex n'a été analysée ou publiée au cours de la période de référence de ce rapport.

5 études cliniques ou de pharmacologie clinique ont cependant été réalisées dont les données d'acceptabilité peuvent être résumées de la façon suivante.

Ces études de 3 mois contrôlées contre placebo en parallèle ont comporté un total de 173 patients inclus dans les groupes benfluorex (n = 87) et placebo (n = 86).

- 4 patients du groupe placebo (4.7%) et 6 patients du groupe benfluorex (6,9%) ont arrêté l'étude pour événements indésirables (tableau).

Les effets indésirables rapportés sous benfluorex sont des diarrhées et des douleurs abdominales persistantes, et plus rarement, hypoglycémie, hyperglycémie, oedème palpébral avec prurit modéré.

Sous placebo, les patients se plaignaient d'asthénie et d'hypoglycémie, ainsi que de sécheresse buccale.

Evènements indésirables (incidence et symptômes) ayant entraîné l'arrêt du traitement (benfluorex/placebo) dans 5 études contrôlées (rapports internes Servier)

Etudes	Nombre d'inclus		Nombre d'arrêts de traitement		Evènements indésirables	
	PL	BF	PL	BF	Placebo	Benfluorex
Velussi, 1994	15	15	2	0	-sécheresse buccale -hospitalisation pour poussée arthritique	
Erkelens, 1994	10	10	0	0		
Pontiroli, 1994	14	16	0	0		
Louvet, 1995	13	12	0	1		-diarrhée et douleurs abdominales persistantes
Tomasi, 1996	34	34	2	5	-hypoglycémie -asthénie modérées	-hypoglycémie modérée -hyperglycémie sévère -diarrhée sévère -oedème palpébral avec prurit modéré -troubles digestifs modérés
	86	87	4 (4,7%)	6 (6,9%)		

Annexe 3-15

Les effets indésirables n'ayant pas entraîné d'arrêt de traitement sont rapportés dans le tableau ci-dessous. Aucune différence n'est observée entre les pourcentages d'effets indésirables sous placebo et sous Benfluorex (16%). Sous benfluorex, les effets indésirables le plus souvent rapportés sont toujours les troubles digestifs (diarrhées, gastrites, nausées, douleurs abdominales) et plus rarement des sensations vertigineuses, de la fatigue, un prurit modéré, une tendance oedémateuse, des bouffées de chaleur, une hypoglycémie.

Evènements indésirables (incidence et symptômes) n'ayant pas entraîné l'arrêt du traitement dans 5 études contrôlées (rapports internes Servier)

Etudes	Nombre d'inclus		Nombre d'arrêts de traitement		Evènements indésirables	
	PL	BF	PL	BF	Placebo	Benfluorex
Velussi, 1994	15	15	2	2	-sécheresse buccale -douleurs abdominales	- diarrhées - gastrites/diarrhées
Erkelens, 1994	10	10	3	6	-nausées (2) -sensations vertigineuses (1)	- nausées -diarrhées -sensations vertigineuses -fatigue -prurit modéré -tendance oedémateuse
Pontiroli, 1994	14	16	1	1	-céphalées	-hypotension quelques heures (hospitalisation)
Louvet, 1995	13	12	6 (T90)	4 (T90)	le plus souvent : douleurs abdominales et autres troubles digestifs, asthénie, bouffées de chaleur	
Tomasi, 1996	34	34	2	1	-vomissements -pharyngites	-hypoglycémie
	86	87	14 (16,3%)	14 (16%)		

Aucune relation causale entre évènement indésirable et benfluorex n'a été montrée, sauf pour le patient présentant des nausées dans l'étude d'Erkelens. Dans l'étude Louvet, une patiente est décédée d'un cancer vésiculaire métastasé un mois après l'arrêt de traitement sous placebo.

Aucune modification de pression artérielle et de fréquence cardiaque n'est observée sauf dans l'étude de Tomasi (la fréquence cardiaque couchée augmente significativement entre TO et T90 sous benfluorex). Dans l'étude d'Erkelens, un léger oedème des membres inférieurs, et des crépitants minimes des bases pulmonaires, respectivement chez deux patients sous placebo ont été rapportés.

Chez ces patients, l'observance a été bonne : Velussi (>80%), Erkelens (>90%), Pontiroli (proche de 100%), Louvet (benfluorex : 89,4% ; placebo : 94,7%), Tomasi (≥90%).

7. Evaluation globale de la sécurité

Aucun élément nouveau n'a été enregistré en matière de sécurité au cours de la période de référence de ce rapport.

Annexe A

Résumé des Caractéristiques du Produit

MEDIATOR ®

France, 21 avril 1992

Annexe 3-15

Résumé des Caractéristiques du Produit

I - DENOMINATION

MEDIATOR

II - COMPOSITION QUALITATIVE ET QUANTITATIVE

	p. comp.	p. boîte
Benfluorex (DCI) chlorhydrate	150mg	4,5g

Excipient : amidon de maïs, carboxyméthylcellulose sodique, cire d'abeille blanche, éthylcellulose, stéarate de magnésium, oléate de glycérol, polysorbate 80, polyvidone, silice colloïdale, saccharose, bicarbonate de sodium, talc, dioxyde de titane.

III- FORME PHARMACEUTIQUE

Comprimé enrobé (blanc) : Boîte de 30.

IV- DONNEES CLINIQUES

IV.1. Indications thérapeutiques

- Adjuvant du régime adapté dans les hypertriglycéridémies . La poursuite du régime est toujours indispensable.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

IV.2. Posologie et mode d'administration

3 comprimés par jour.

Cette posologie peut être prescrite d'emblée ou atteinte progressivement :

- 1 comprimé la première semaine au dîner,
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner,
- 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

Par la suite, la posologie peut être ramenée à 2, parfois 1 comprimé par jour, en fonction des résultats biologiques.

En association avec le régime, Médiator constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

IV.3. Contre-indications

- Pancréatites chroniques avérées.

Annexe 3-15

Mises en garde

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte.

La prescription de Médiator n'est donc pas justifiée chez l'enfant.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Précautions d'emploi :

Si, après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

IV.5. Interactions

IV.6. Grossesse et Allaitement

GROSSESSE : Les résultats des études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence de données dans l'espèce humaine, ces résultats expérimentaux ne permettent pas de préjuger un effet malformatif. Cependant par mesure de prudence, ne pas prescrire pendant la grossesse.

ALLAITEMENT : en l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

IV.7. Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

IV.8. Effets indésirables

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhées), asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.

IV.9. Surdosage

Conduite à tenir en cas d'absorption massive : le traitement sera purement symptomatique : lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

V - PROPRIETES

V.1. Propriétés pharmacodynamiques :

Hypolipémiant :

Il agit sur plusieurs facteurs liés au risque athérogène.

- *Actions de Médiator sur le métabolisme lipidique* :
- Médiator diminue l'absorption intestinale des triglycérides (rat). Cet effet, confirmé chez l'homme en pharmacologie clinique, repose sur la diminution d'activité de la lipase pancréatique.

Annexe 3-15

- Il réduit la synthèse hépatique des triglycérides et du cholestérol in vitro et in vivo (rat).
- Il diminue la stéatose hépatique induite par des régimes riches en lipides, en glucides chez le rat obèse et au cours du diabète expérimental (rat).
- Il limite l'incorporation du cholestérol dans la paroi artérielle (lapin).

Ce mode d'action est susceptible d'expliquer la diminution du cholestérol et des triglycérides chez l'homme.

- *Actions de Médiator sur le métabolisme glucidique* :
- Il facilite la pénétration et l'utilisation cellulaires du glucose (rat).
- Il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'H.P.O chez le lapin.
- Dans le diabète asymptomatique chez les patients obèses, il entraîne une baisse de la glycémie post-prandiale et une amélioration de la courbe d'H.P.O. supérieure à celle qu'on obtient avec un régime identique associé à un placebo.

Médiator, n'ayant pas d'action sur l'insulino-sécrétion, ne peut pas provoquer d'hypoglycémie.

- *Effet complémentaire de Médiator* :

Chez des patients obèses hyperuricémiques traités par Médiator et régime, une baisse de l'uricémie d'environ 14% a été observée.

Aucune interférence indésirable de Médiator avec les traitements associés au cours des études n'a été constatée.

Médiator :

- ne potentialise pas les anticoagulants,
- ne provoque pas d'hypoglycémie,
- n'interfère pas avec la fonction thyroïdienne.

V.2. Propriétés pharmacocinétiques

- Absorption gastro-intestinale rapide et totale avec un pic maximal survenant entre 1 et 2 heures après l'administration.
- Elimination rapide et totale par voie urinaire : en 8 heures, une excrétion moyenne d'environ 74 % de la dose administrée est constatée.

L'élimination se fait en 2 phases :

- une première phase rapide (60% en 3 ou 4 heures),
- une deuxième phase lente, se terminant en 36 heures environ.

VI- DONNEES PHARMACEUTIQUES

SUBJECT / OBJET : Benfluorex

Dear colleague,

Further to your request, please find enclosed the french assessment report on the pharmacokinetics, metabolism and safety of benfluorex.

I apologize for the delay of my response.
Don't hesitate to contact us if you need more information.

Best regards.

Le Chef de l'unité de Pharmacovigilance

MEDIATOR (benfluorex)

ENQUETE OFFICIELLE

Comité Technique du 17 Décembre 1998

Confidentiel

M.DAVID-LAROCHE
P.BECHTEL

Annexe 3-16

Le MEDIATOR (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par le laboratoire BIOPHARMA, sous forme de comprimés, dosés à 150 mgL
La posologie recommandée est de 3 comprimés par jour.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène.
(Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Une enquête officieuse a été ouverte, suite à la première mise au point des effets indésirables du benfluorex, présentée lors du Comité Technique du 11 juillet 1995.
Deux mises au point ont été faites :
-le 30 Avril 1998 sur les effets indésiirables du benfluorex, rapportés aux CRPV
-le 10 Septembre 1998 sur le métabolisme et les chiffres de vente du benfluorex.

<u>Les effets indésirables rapportés dans les RCP sont :</u>

- effets digestifs : nausées, vomissements, gastralgies, diarrhée
- asthénie
- somnolence
- état vertigineux

Annexe 3-16

DONNEES PHARMACOCINETIQUES ET METABOLIQUES CHLORHYDRATE DE BENFLUOREX

I- Pharmacocinétique.

L'absorption gastro-intestinale du chlorhydrate de benfluforex est complète et rapide, le Tmax est compris entre 1h et 2h.
Le volume de distribution est de 0.37+/- 0.03l/kg chez l'homme.
Chez le rat il est de 1.4l/kg.
Chez le chien de 1.6l/kg.
Chez le singe de 0.36l/kg.
Chez le babouin de 0.31l/kg

On notera que le volume de distribution est identique chez les primates et chez l'homme.

II. Métabolisme.

Le benfluorex est rapidement métabolisé au niveau du foie. Il produit au moins 9 métabolites. (Fig 1). Des données récentes utilisant notamment des méthodes de détection spécifiques et sensibles ont permis de montrer qu'il existait deux métabolites principaux (fig 2) :

- le 1-(3 trifluorométhylphényl)-2N-2-(carboxymethyl)amino propane (S1475)
- la norfenfluramine (S 585)

Une étude réalisée chez 6 volontaires sains qui ont reçu pendant 14 jours une dose quotidienne de 3fois 150mg de benfluorex, a montré que :

- l'état stationnaire était atteint en 4 à 5 jours
- au bout des 14 jours la concentration plasmatique de benfluorex était très faible, autour de 10ng/ml, la concentration plasmatique du métabolite S1475 était très importante, aux alentours de 200ng/ml, la concentration plasmatique du norfenfluramine ne dépassait pas 30ng/ml (fig 3).

Il est très intéressant de comparer les métabolites produits par la biotransformation de benfluorex à ceux produits par la biotransformation de la fenfluramine (fig 4). La norfenfluramine représente la voie principale du métabolisme de la fenfluramine avec des concentrations urinaires de 7,4% de la dose pour la forme libre et de 50,7% pour la forme conjuguée à l'acide glucuronique.

Sans qu'il y ait d'explications à partir de la fenfluramine il semble que la norfenfluramine produite ne subit aucune biotransformation supplémentaire, alors que la norfenfluramine produite à partir de benfluorex est transformée en 3-trifluorométhylphényl-1-hydroxypropanone-2. Ce qui explique qu'on ne trouve pas plus de 2% de norfenfluramine dans l'urine.

Dans une étude où pendant 15 jours un groupe de 8 volontaires a reçu une dose journalière de trois fois 20mg de fenfluramine, la concentration sanguine de fenfluramine au bout de cette période était d'environ 120 ng/ml et celle de norfenfluramine d'environ 50ng/ml (fig 5).

En comparant les deux études :

- après fenfluramine le taux circulant de norfenfluramine représente 30% du taux circulant de fenfluramine

- après benfluorex la norfenfluramine représente 5% du taux circulant du métabolite principal S1475.

Il est impossible d'exclure la possibilité de passage de la barrière hémato-cérébrale de la norfenfluramine produite par le métabolisme de benfluorex.
Il faut toutefois noter qu'après administration de fenfluramine la quantité circulante de norfenfluramine vient s'additionner à celle de la fenfluramine et donc renforcer son action centrale anorexigène.

Nous rappelerons que malgré la production de norfenfluramine, la propriété pharmacodynamique d'anorexigène n'a jamais été attribuée à benfluorex.

A. BILAN GLOBAL

265 notifications validées ont été rapportées :

163 aux Centres Régionaux de Pharmacovigilance, 105 au laboratoire.(dont 3 doublons)

Elles concernent 93 hommes et 171 femmes (1 sexe non précisé), dont l'age moyen est de :

- 56,9 ans pour les hommes
- 55,9 ans pour les femmes

Répartition par classe-organe des effets indésirables notifiés :

APPAREIL	Nombre de Notifications CRPV	Nombre de Notifications Laboratoire	TOTAL	Nombre de doublons
FOIE	17	9	25	1
APP. DIGESTIF (sauf foie)	16	5	21	-
HEMATOLOGIE	8	6	14	-
APPAREIL RESPIRATOIRE	10	11	20	1
CARDIO-VASCULAIRE	12	6	18	-
APPAREIL URINAIRE	9	4	13	-
PEAU - ALLERGIE	41	23	64	-
NEURO-PSYCHIATRIE	30	18	48	-
VERTIGES	16	5	20	1
METABOLISME	3	18	21	-
APPAREIL SENSORIEL	1	-	-	-
TOTAL	163	105	265	3

N.B : les nouvelles notifications par rapport à la mise au point de Juillet 1995, sont imprimées **«en gras »** dans les tableaux suivants.
Dans la colonne, « traitement associé », le médicament est souligné, lorsque l'imputabilité bibliographique est supérieure au MEDIATOR.

Annexe 3-16

23 cas d'hépatites ou de perturbations de la biologie hépatique ont été notifiés : (le benfluorex est le seul suspect ou d'imputabilité égale ou supérieure aux médicaments associés)

-15 aux CRPV, 9 au laboratoire (dont 1 doublon) .

Elles concernent 15 femmes (âge moyen : 55,1 ans) et 8 hommes (âge moyen (58,6 ans)

Dans 7 cas le benfluorex a une imputation plausible:

DJ9300271 : Femme de 50 ans , traité pendant 2 semaines par MEDIATOR, une préparation d'aubépine, 200mg, et amfépramone 35 mg ,citrarginine, Veinobiase et depuis 1 mois et demi par AXONYL.
ALAT = 625 UI/L, ASAT : 303 UI/L, γGT: 656 UI/L, Ph.Alc. : 198 UI/L.
Evolution favorable 2 semaines après l'arrêt du traitement ,sauf les γGT qui sont encore à 171 UI/L

NY8804047=060K94 (doublon) : homme de 47 ans, traité par MEDIATOR, pendant 6 mois, puis 3 mois (après un arrêt de 3 mois)
ALAT : 375 UI/L , ASAT : 105 UI/L, γGT : 182 UI/L
L'évolution est lentement favorable dans un délai de 2 mois.

DJ9100164 : homme de 61 ans, éthylique chronique, traité depuis 4 ans par RENITEC, DOGMATIL, LASILIX, depuis 1 an par RYTHMODAN et depuis 3 ans par MEDIATOR.
ALAT : 1350 UI/L, ASAT : 410 UI/L, γGT : 280 UI/L
La régression de l'hépatite est partielle à l'arrêt de toutes les thérapeutiques, chez ce patient éthylique.

NC9600020 :Femme de 39 ans, traité par MEDIATOR depuis 8 mois.
ALAT: 205 UI/L (4N), ASAT : 89 UI/L (2N), γGT: 134 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

NY9608618 : Femme de 36 ans, traité par MEDIATOR, pour cure d'amaigrissement pendant 4 mois.
ALAT : 126 UI/L, ASAT : 41UI/L, γGT : 110 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

BX9700024 : Femme de 59 ans, apparition d'un ictère avec prurit, après 4 semaines de traitement par MEDIATOR. (LOXEN et ACUILIX sont pris au long cours)
ALAT: 1017 UI/L (30N), ASAT : 391 UI/L (10N), γGT : 1042 UI/L, Ph. alc. : 907 UI/L (4N)

10010325 : Homme de 42 ans présentant une cytolyse modére et une cholestase discrète 3 semaines après le début d'un traitement par MEDIATOR, pour hypertriglycéridémie et diabète modéré.
L'évolution est favorable à l'arrêt du MEDIATOR.

Dans 1 cas, l'imputation est vraisemblable :

Observation 120O39 : observation très succinte du laboratoire, concernant une augmentation des γGT (169 UI/L) , chez une femme de 70 ans, qui était traitée par ailleurs par Diamicron, Icaz et Hypérium. La réintroduction a été positive.

Dans 15 cas, l'imputation est douteuse : dont 10 C2,S1, 5 C1,S1

Conclusion : Plusieurs cas d' augmentations de transaminases et/ou de γGT ont été rapportés.
La plupart du temps, le MEDIATOR est en association avec d'autres médicaments qui ont la même imputabilité.
Dans quelques cas, le MEDIATOR est le seul médicament pris par le ou la patiente.
Dans la majorité des dossiers, le délai de survenue est de ≅ 3 mois.

Cet effet indésirable n'est pas mentionné dans les RCP

Annexe 3-16

- AUTRES ATTEINTES HEPATIQUES

2 observations d'imputabilité douteuse ont été rapportées:

- BX88003099, patient de 53 ans, éthylique, traité depuis 13 ans par MEDIATOR, ZYLORIC et VISKEN . L'évolution n'est pas connue.

-LY9500598 , femme de 59 ans, hospitalisée pour tentative d'autolyse, traitée par de nombreux médicaments: évolution inconnue, dossier très succinct.

II. AUTRES ATTEINTES DIGESTIVES :

Elles concernent 14 femmes (âge moyen : 60,6 ans) et 7 hommes (âge moyen : 61,7 ans)

- Dans les 14 cas de diarrhée rapportés, (10 femmes et 4 hommes), le MEDIATOR est utilisé en monothérapie, ou son imputabilité est supérieure aux médicaments associés.

Cet effet indésirable est mentionné dans les RCP.

- 3 cas d'ulcères ont été rapportés par le laboratoire:

- 10060052 : homme de 74 ans, reçoit MEDIATOR, depuis 6 à 8 mois, LIPANTHYL depuis 10 ans , TANAKAN et des AINS. Une fibroscopie montre des ulcères multiples qui nécessitent non seulement l'arrêt des AINS mais de toute thérapeutique.
L'évolution est favorable après prescription d'antiulcéreux. (C1,S1)

- 10540930 : Femme de 64 ans, hospitalisée pour ulcère gastrique, après 3 mois de traitement par MEDIATOR et après 1 an de GLUCOPHAGE RETARD, EUGLUCAN, ZESTRIL, LIPUR.
Le MEDIATOR est arrêté.
L'évolution est favorable après traitement par anti-acide, pansement gastrique et perfusion. (C1,S1)

-10060587 : Femme de 72 ans, avec diabète, HTA, traitée par MODURETIC et ALDOMET depuis plusieurs années et MEDIATOR depuis 3 jours. Apparition de gastralgies intenses après prise de MEDIATOR, avec réadministration positive. (C3,S1)
L'évolution est favorable à l'arrêt du MEDIATOR.
Une fibroscopie ultérieure met en évidence un ulcère duodénal.

- 1 cas de rectocolite hémorragique : (1054P69) chez une femme de 46 ans traitée au long cours par DAONIL, GLUCOPHAGE RETARD, INSULINE, LEVOTHYROX et ELISOR, apparition d'une diarrhée aigue, sanglante et colite inflammatoire ressemblant à une colite hémorragique après 1 cp de MEDIATOR.

L'évolution est favorable après administration de PENTASA. (C2,S1)

II - A - TROUBLES HEMATOLOGIQUES

14 observations (8 CRPV, 6 laboratoire) ont été rapportées.

Elles concernent 5 hommes (âge moyen : 62,2 ans) et 9 femmes (âge moyen : 57 ans) .

- Aucun nouveau cas n'a été rapporté depuis la mise au point de Juillet 1995

- L'imputabilité est douteuse dans tous les cas : 11 C1,S1
3 C2,S1

Dans la plupart des observations, il existe un traitement associé, qui peut être responsable de l'effet indésirable

-Dans l'observation 10050F09 : (C2,S1) il s'agit d'1 femme de 70 ans, avec HTA, hyperlipémie, angor et antécédents d'ulcère gastrique, traitée par MEDIATOR depuis 3 semaines:
apparition de purpura et d'hémorragie digestive : plaquettes<5000/mm3 et hémoglobine à 9g/l
La recherche d'anticorps antiplaquettes est positive.
L'évolution est favorable après arrêt du MEDIATOR

IV. ATTEINTES RESPIRATOIRES :

20 notifications (10 CRPV et 11 laboratoire) dont 1 doublon ont été rapportées, concernant

- 11 hypertensions pulmonaires: 9 dossiers ont été expertisés par le Professeur WEITZENBLUM , 6 ont été classés en HTA P d'allure primitive lors de l'enquête « anorexigènes et HTAPP», 3 en hypertensions pulmonaires post-embolique(1) et post-capillaire(2).
Elles concernent 9 femmes (âge moyen : 54,8 ans) et 2 hommes (âge moyen : 48 ans)

Le MEDIATOR n'est jamais prescrit seul : il est présent en association à un ou plusieurs anorexigènes (ISOMERIDE : 10 fois, PONDERAL : 2 fois)
Ces cas font partie de l'enquête concernant les anorexigènes

La durée de traitement par MEDIATOR est imprécise dans 5 cas sur 11.
Dans les 6 autres cas, la durée de traitement va de plusieurs mois à 4 ans.

La prise de MEDIATOR et d'anorexigènes est concommitante dans 5 cas, antérieure dans 2 cas, postérieure dans 3 cas, imprécise dans 1 cas.

– 5 cas de toux, après des traitements allant de 8 à 34 mois. L'évolution est inconnue dans 2 cas.

Dans 1 observation (541078), dont l'imputabilité est vraisemblable, chez une femme de 70 ans, traitée par MEDIATOR pour un diabète et AMLOR pour HTA depuis 2 mois, apparition d'une toux sèche qui disparait à l'arrêt du MEDIATOR.
Les dates de prise de MEDIATOR ne sont pas précisées: seul un rechallenge positif est noté. (C3,S1),

- des cas de syndrome hémorragique intra-alvéolaire (MP9500482), tuberculome (SE9400175), pneumopathies interstitielles (LM9800297 et NT9800036) ont tous une imputabilité douteuse: soit une autre étiologie est fortement évoquée, soit l'évolution est inconnue.

V. ATTEINTES CARDIOVASCULAIRES :

18 notifications ont été rapportées : 12 par les CRPV, 6 par le laboratoire

Elles concernent 3 hommes (âge moyen : 51 ans) et 14 femmes (âge moyen : 48,3 ans)

- 3 cas d'hypertension artérielle : dont une observation plausible :

NC9100093 : chez une femme de 51 ans, hypertendue traitée par LOPRESSOR depuis 5 ans, la tension est montée progressivement de 150/90 à 180/110 après introduction de MEDIATOR, malgré l'ajout de RENITEC. La tension a diminué lorsque le MEDIATOR a été arrêté.

Annexe 3-16

NC8900097 : chez une patiente de 60 ans, qui a pris 3 comprimés de MEDIATOR, le soir. Apparition 3 heures plus tard de vertiges, puis d'angoisse, tachycardie et prurit généralisé. L'évolution est favorable.

- une fibrillation auriculaire (C2,S2) chez une femme de 25 ans après 9 mois de MEDIATOR, CANOL et TEALINE et 6 mois de MODERATAN. Evolution favorable à l'arrêt de tout le traitement.

- 3 syndromes de Raynaud dont un plausible C2,S2 et 2 douteux (C2,S1 et C1,S1)

- les autres notifications sont isolées et d'imputabilité douteuse

ATTEINTES RENALES

13 notifications ont été rapportées , 9 par les CRPV et 4 par le laboratoire

Elles concernent 5 hommes (âge moyen : 66,6 ans) et 8 femmes (âge moyen : 55,2 ans)

-3 cas de dysurie, d'imputation :
C3,S1 : réadministration positive mais durée de traitement inconnu
C2,S2 : apparition après 5 mois de MEDIATOR, évolution favorable à l'arrêt de celui-ci
C2,S1 : apparition après 48 h de traitement par MEDIATOR (cystite concommitante)

- 4 cas de pollakurie :
- en début de traitement 1j,2j et 16j
- ou réadministration positive après 4 mois de traitement

-1 cas de cystalgie (C2,S1) chez une femme de 33 ans après 8 jours de traitement.
L'évolution est favorable à l'arrêt de MEDIATOR

- les autres dossiers ont tous une imputabilité douteuse:
- anurie (MA8900044)
- glomérulonéphrite (LY8700356),
- syndrome néphrotique (BX9700689),
- créatininémie augmentée(10060463)
- soit le dossier est succinct
- soit l'évolution est inconnue ou l'évolution n'est pas favorable à l'arrêt du traitement:
- soit une autre étiologie est possible

VII. ATTEINTES METABOLIQUES :

21 Notifications ont été rapportées , 18 par le laboratoire, 3 par les CRPV.

Elles concernent 11 hommes (âge moyen : 58,7 ans) et 10 femmes (âge moyen : 56,7 ans)

Dans 13 cas, c'est 1 effet lié à aux propriétés pharmacologiques du médicament lui-même:

- hypoglycémie : 6 cas
- malaise hypoglycémique : 1 cas
- hyperglycémie : 2 cas

- hyperlipémie : 2 cas
- augmentation des triglycérides : 2 cas

-3 cas de lactacidémie d'imputabilité douteuse

-dans 1 cas (10060F73), chez un homme de 68 ans, la lactacidémie est à 4.13mmol/l (normale 0.55-2.20) après un traitement de 37 jours par MEDIATOR. Un mois après de MEDIATOR, elle est de 2.27mmol/l.

-2 dossiers succincts: pas de précision sur l'arrêt du MEDIATOR (10060683)
évolution inconnue (10060356)

- 2 cas de goutte chez 2 hommes de 61 et 71 ans (LASILIX est associé dans les 2 cas : C3,S2,B3 et C1,S1,B3)

- 2 cas d 'amaigrissement déclaré par un médecin au laboratoire (10060446 et 10060447) : perte de 5 Kg chez un homme de 36 ans après 1 mois de traitement, perte de 8 Kg chez une femme de 67 ans après 2 mois de traitement pour hypercholestérolémie.

Annexe 3-16

IX. ATTEINTES CUTANEES et REACTIONS ALLERGIQUES

Elles concernent 20 hommes (Age moyen = 51,5 ans) et 44 femmes (Age moyen = 51,4 ans)

1 . Allergie, eczema :

Parmi les 27 réactions allergiques, on note:

- 14 cas d'urticaire dont 5 cas d'urticaires géantes ou généralisées
- 4 oedèmes de Quincke ou oedème laryngé
- 6 chocs anaphylactiques
- 3 allergies cutanées

Le délai de survenue est le plus souvent très rapide (1 jour), l'imputation sera donc souvent vraisemblable (15 fois) ou plausible (3 fois).
Elle est douteuse dans les cas où il y a eu un traitement correcteur : 9 fois

Parmi les 6 cas d'eczéma, d'imputabilité douteuse, l'évolution est favorable dans 4 cas.
L'eczéma n'est pas guéri dans 2 cas. (NC9300394 etNY9809751)
Dans l'observation 540W61, le délai d'apparition est long (2 ans) et la crème cosmétique semble être en cause.

2. Eruption, vascularite, purpura

30 notifications ont été rapportées : 20 par les CRPV, 10 par le laboratoire

Elles concernent 18 femmes agées de 47,7 ans et 12 hommes agés de 52,6 ans

Les éruptions cutanées sont variées:

- 16 cas de prurit, d' éruptions érythèmateuse, maculeuse, papuleuse ou maculopapuleuse dont 6 cas d'imputabilité vraisemblable (réadministration positive)

- 3 cas d'érythème polymorphe, avec une évolution favorable à l'arrêt du MEDIATOR, chez 2 hommes agés de 60 et 68 ans. Le délai d'apparition est respectivement de 15 jours et de 6 mois (!).
Dans le 3° cas, (MA9700614) l'évolution est inconnue et le TANAKAN a une imputabilité bibliographique supérieure au MEDIATOR.

- 3 notifications de vascularite aigue leucocytoclasique:
  - dans 1 cas, l'évolution est favorable à l'arrêt du MEDIATOR (RE9420042)
  - dans 1 cas, l'évolution est favorable sans arrêt du MEDIATOR , mais avec un traitement corticoïde (lorsque la corticothérapie est arrêtée, 4 mois plus tard, survient un érythème polymorphe :MA9700957)
  - dans le troisième cas (MP9700134), l'évolution n'est pas complète malgré l'arrêt du MEDIATOR et une corticothérapie.

- 3 cas de purpura:
  - purpura des membres inférieurs avec un oedème apparu une semaine après le début du traitement par MEDIATOR (PP8990384)
  - purpura des membres inférieurs, s'étendant aux membres supérieurs, disparaissant 1 semaine après l'arrêt du traitement (CF9200106)
  - purpura rhumatoïde survenant après 2 semaines de traitement, l' évolution est inconnue (PO9700410)

Annexe 3-16

48 notifications ont été rapportées, 30 par les CRPV, 18 par le laboratoire :

Elles concernent 23 hommes (Age moyen : 53,9 ans) , 25 femmes (Age moyen : 58,8 ans)

1. Asthénie, Somnolence, Impuissance :

Dans certaines observations:
- soit le délai de survenue semble long : 2ans (LM8600219) ou inconnu (DJ8800131)
- soit le traitement associé peut être responsable de tels effets: PROZAC, GLUCOPHAGE...

Asthénie et somnolence sont mentionnés dans les RCP.

Annexe 3-16

Elles concernent 13 hommes (âge moyen :53,2 ans) et 14 femmes (âge moyen : 60,4 ans)

Les troubles psychiatriques sont divers : agressivité, nervosité, confusion, délire

La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue

3 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise d'1 cp de MEDIATOR

- 10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 j. Une réadministration ultérieure a été positive. (traitement associé : KERLONE et MOGADON)

- PA97355052 : syndrome de sevrage avec excitation, chez un homme de 27 ans, sportif, qui avait pris 9 cp/j de MEDIATOR, comme « dopant ».

5 cas sont imputés « plausible » :

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR, pendant 6 j. Disparition des symptômes 12 h après l'arrêt du MEDIATOR.

- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2h après avoir ingéré 4 cp de MEDIATOR.

- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR, HALDOL, SERESTA, ZESTRIL, CATAPRESSAN, PRAXILENE, SERMION. L'évolution est favorable à l'arrêt de tous les médicaments.

19 ont été imputés « douteux » : (8 C1,S1, 10 C2,S1, 1 C1,S2)

Dear colleague,

I don't forget you. First I would like to review each case report discussed in your draft, especially those related to a possible cardiovascular and pulmonary toxicity of benfluorex. For this purpose, I am waiting for the narratives.

Best regards.

SUBJECT / OBJET : Benfluorex

Dear colleague,

I don't forget you. First I would like to review each case report discussed in your draft, especially those related to a possible cardiovascular and pulmonary toxicity of benfluorex. For this purpose, I am waiting for the narratives.

Best regards.

Dr Anne CASTOT

ITALIA

SUBJECT / OBJET : Benfluorex

Dear colleague,

Further to my fax dated 9th February 1999, please find enclosed a line-listing with CIOMS forms concerning serious adverse drug reactions reported with benfluorex (MEDIATOR) in France.

Some CIOMS forms are not translated in English : these cases have been classified not related to benfluorex by the rapporteur of the French national inquiry (Pr. Bechtel).

Moreover, I send you a CIOMS form for a new serious case reported last week to a French Regional Center for Pharmacovigilance. This is a case of aortic insufficiency reported with benfluorex, without previous nor concomitant anorectic drug.

Best regards.

Le Chef de l'unité de Pharmacovigilance
P.

Dr Anne CASTOT

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIAL	1a.. COUNTRY	2. DATE OF BIRTH			2a. AGE Years	3. SEX	4-6 REACTION ONSET			8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
		Day	Month	Year			Day	Month	Year	
	France	28	10	1955	43	M	17	10	1998	

7-13 DESCRIBE REACTION(S) (including test/lab data)

Event : AORTIC INSUFFICIENCY

Comment :
This case involves a 43 year- old male patient (167 centimeters, 72 kg) with a history of smoking, hypercholesterolemia.
January 1992 : lower myocardial infarction not complicated. Coronarography : anterior interventricular lesion 50 %, minor mitral insufficiency, no aortic insufficiency detected.

The patient had been treated with benfluorex (300 MG / Day) from July 1992 to October 1998 (indications : overweight, hypercholesterolemia, hypoglycemic symptoms) and with pravastatine, atenolol and DL lysine acetylsalicylate since 1992.

**This form is for expedited reporting of serious adverse events following the use of a drug/vaccine. Temporal relationship does not mean causality*

Annexe 3-18

Describe reaction (continuation) :

In October 1998, during a systematic clinical examination, a diastolic murmur, easy to discern, evocating an aortic insufficiency was discovered.
Systolic murmur (mitral insufficiency could be related to the ischemic sequella of myocardial infarction ?).
No functional sign.
Echocardiography (17th October 1998) : aortic insufficiency with"large jet", minor mitral insufficiency.

There is no argument for a chronic endocarditis.
No previous intake of anorectic drugs.

The aortic insufficiency did not exist in 1992. No murmur was detected at the clinical examination in March and April 1993. Stress test in June 1993 : no abnormality.

Outcome : in January 1999, aortic insufficiency well clinically tolerated.

BENFLUOREX

Spontaneous Reports of Serious Adverse Reactions

FRANCE

The following table is a listing of all the serious adverse reactions reported in France with Benfluorex (Mediator®), including :

- all serious reactions reported directly to the French Regional Centres for Pharmacovigilance (CRPV) in patients who had received Benfluorex (suspected drug or associated drug). After review (Pr P. Bechtel & Coll.), a number of them (marked with an asterisk – * – on the table) have been classified not related to Benfluorex (associated to other suspected drug(s)).
- all serious reactions reported to the Company.

CIOMS forms are provided for all reactions with Benfluorex considered as a suspected drug.

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
	FRANCE	Day Month Year	Years 25	F	Year Month Day 97/10/21	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data)
Paroxystic ATRIAL FIBRILLATION while patient treated with Mediator, Moderatan to lose weight. In the same time prescription of Canol and Tealine . Recovery without sequelae.

II. SUSPECT DRUG(S) INFORMATION

14. SUSPECT DRUG(S) (include generic name)
MEDIATOR (BENFLUOREX)

20 DID REACTION ABATE AFTER STOPPING DRUG ? ■ YES ☐ NO ☐ NA

15. DAILY DOSE(S)	16. ROUTE(S) OF ADMINISTRATION	20 DID REACTION REAPPEAR AFTER REINTRODUCTION ?
U	ORAL	☐ YES ☐ NO ■ NA

17. INDICATION(S) FOR USE

18. THERAPY DATES (from/to)	19. THERAPY DURATION
from 02.01.97 to 20.10.97	9M

III. CONCOMITANT DRUG(S) AND HISTORY

22. CONCOMITANT DRUG(S) AND DATES OF ADMINISTRATION (exclude those used to treat reaction)
CANOL FROM 02/01/97 TO 20/10/97, MODERATAN (AMFEPRAMONE) FROM 01/04/97 TO 20/10/97, TEALINE (GREEN TEA, ORTHOSIPHON) 02/01/97 20/10/97

23. OTHER RELEVANT HISTORY (e.g. diagnostics, allergics, pregnancy with last month of period, etc.)
Obesity, nevrotic depression.

IV. MANUFACTURER INFORMATION

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
G-L	FRANCE	Day Month Year 26-Apr-53	Years 37	F	Year Month Day 90/03/06	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

Treatment prescribed on 07-Mar-90: amfepramone 100mg/d, boldine 6mg/d, passiflore 200mg/d, aubepine 200mg/d as a magistral preparation; Lumitens 20-30mg/d, MEDIATOR 1 tab/d then 2 & 3tabs/d; Ribomunyl; Ginkor Fort. Ten days later, on 16-Mar-90: brief LOSS OF CONSCIOUSNESS (twice) requiring hospitalization. EKG: ventricular hyperexcitability, prolonged QT 0.48 (N=0.37): possible torsade de pointes. HYPOKALEMIA (K: 3.1 mEq/L).
Treatment stopped. Holter monitor (at 48th hr): polymorphic ventricular hyperexcitability. EKG normal three days after stopping the drugs.
Tx: heparin, potassium, magnesium. Neurological exam: negative.

Indication

COMMENTAIRES

Survenue de torsades de pointe et d'un arrêt circulatoire, le 8 octobre 1995 chez une femme de 59 ans à la suite de la prise de Di-Antalvic*, Oligosol*, Médiator* et Féldène*. La kaliémie était normale et la patiente ne présentait pas, a priori, d'allongement de QT long congénital ou acquis. Arrêt du Médiator à l'entrée. L'arrêt de l'administration de Di-Antalvic* a permis la régression des troubles malgré la poursuite de l'administration des autres produits.

BENFLUOREX - Spontaneous Reports of Serious Adverse Reactions - FRANCE *(Cont'd)*

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
	FRANCE	Day Month Year	Years 69	M	Year Month Day 97/08/15	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data)

Recent dyspnea worsened rapidely for 1 month resulting in hospitalisation at the beginning of Sep-97.
Etiologic research: no infectious pathology, nor immun, nor professional (the patient was refrigerist then worked in farm-produce industry). PULMONARY INTERSTITIAL FIBROSIS, DIFFUSE INTERSTITIAL PNEUMOPATHY. Treatment with steroids and Endoxan. In Dec-97, the patient seems to be stable.
Add inf (7-Apr-98): In Mar-98, still no improvement . Pt's HP noted that the Pt's general status was slowly worsening. The Pt is incharged in a private centre.

II. SUSPECT DRUG(S) INFORMATION

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET
Z-B	FRANCE	Day Month Year 28-Sep-48	Years 46	F	Year Month Day 94/04/??

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

Apr-94 : chest pain. CXR on 14-Apr-94 showed evidence of diffuse widespread images.
Lung CT-scan (5-May-94) : presence of about 10 nodules (diameter 0.5 to 2cm).
Bronchoscopy (18-May-94): inflammatory mucosae of benign aspect; purulent sputum (PNEUMOPATHY).
Bronchial biopsy (19-May-94): suacute inflammation of mucosae.
Thoracoscopy : no suspect lesions.
Biology (26-May-94): Fbg 4.99 (N 2.5-4.5), SGPT 33 (N<30), GGT 50 (N<40).
Pleural biopsy (27-May-94): slight congestive and macrophagic alveolitis.
No BK (31-May-94).
Mediator, Dinintel and Isomeride (?) were stopped on 16-May-94.
Tx with Rimifon, Rifadine and Pirilene since 10-Jun-94.
Recovery within 1 month.

COMMENTAIRES

Observation recueillie dans le cadre de l'étude EURONET.
Patient aux antécédents de DNID, d'adénome prostatique, de diarrhée chronique, revient le 14 mai d'un voyage aux USA de 15 jours. Dans le nuit du 14 au 15 mai, température à 39-39,5°. La numération réalisée le 18 mai montre des globules blancs (GB) à 700/mm3 et des neutrophiles à 56/mm3 (la dernière numération du 20 mars était normale : GB : 6300/mm3, PNN à 4851/mm3). La numération se normalise le 2 juin. GB : 5200/mm3 ; PNN : 2444/mm3. La ponction sternale du 29 mai évoque une origine toxique. Son hospitalisation met, par ailleurs, en évidence : une pneumopathie lobaire droite hypoxomiante, un adénome de la prostate, une tumeur carcinoïde duodénale.
Autres médicaments utilisés : MOPRAL, DAONIL, LIPANOR, ZYLORIC, PERMIXON, PRAZINIL, OSSOPAN, NORMISSON.

COMMENTAIRES

Annexe 3-18

Début octobre 96 : asthénie + anorexie -> numération formule sanguine normale. Visite mensuelle chez son médecin traitant le 03/01/97. NFS : globules blancs à 2900/mm3, neutrophile à 493/mm3.
LASILIX remplacé par ALDACTONE le 16/01/97.
Arrêt du LIPANTHYL, MEDIATOR puis du LASILIX et VASTAREL. La ponction sternale du 08/01/97 montre une hyperéosinophilie marquée (signe d'irritation médullaire) snas véritable signe de toxicité médullaire.
Persistance de l'agranulocytose : le 26/01/97 : GB : 2100/mm3, neutrophile : 294/mm3, le 19/03/97 : GB : 2190/mm3.
Prenait de plus du LOPRIL 2cp/jour depuis 1991 et du STILNOX 2 cp/jour depuis 07/95 (non arrêtés).

COMMENTAIRES

Thrombopénie découverte vers le 08 01 98 environ 30 000/mm3
le 14 01 : 35 000 arrêt du MEDIATOR vers le 10 01
le 19 01 : 90 000 mais le 26 01 : 33 000

Dossier peu documenté contradiction entre la patiente et ses médecins.
en attente exploration.

Mai 98 :
Rien de plus le 04 05 98 n'a pas reconsulté et nie tout en bloc selon le médecin généraliste : a entendu parler du MEDIATOR (confond sans doute avec 'SURVECTOR' car s'est faché et a déclaré ne pas être une toxico !!!)

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

A few days after starting Mediator, Fucus and an unspecified diuretic, onset of ANAPHYLACTIC SHOCK.
Hospitalization for 24 hours.
All drugs were stopped : recovery.
Afterwards, in 1994, reintake of 1 tablet of Mediator at 8AM.
At 8.30AM, eyelids edema and watering eyes. Recovery following injection of Soludecadron.

COMMENTAIRES

Patiente hospitalisée le 13/03/98 pour des lésions macérées des pieds et ulcération malléolaire gauche. Eruption erythèmatosquameuse prurigineuse du décolleté apparue, au cours de l'hospitalisation. L'erythème avait disparu lors d'une consultation du 17/04/98.
Traitement des lésions par DIPROSONE crème, 1 application/j jusqu'au 24/03/98, puis 1j/2 pendant une semaine.
Tests trés positifs au baume du Perou, au fragrance mix et au Wool Alcohols. Tests positifs pour Neomycine sulfate, Paraphenyldiamine, colophane.

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET
A-C	FRANCE	Day Month Year 02-Jun-30	Years 61	M	Year Month Day 91/07/27

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

Hospitalized on 27-Jul-91 for violent abdominal pain, icterus then somnolence. HEPATITIS was diagnosed :

	27-07	28-07	29-07	01-08	02-08	04-08	05-08
SGOT	410	210	135		30	64	79
SGPT	1350	904	620		210	104	106
GGT	280	262	240		119		82
Alk Ph	98	104	113		125		132
amylasemia	19	12					
lipasemia	336	328					
Bili T	150	160	182		293	260	260
Bili C	123	125	138		213	212	200
TP		25%	30	48	53	56	57

Serology negative for hepatitis A,B,C. Asterixis. Moreover gynecomatia. Mediator, Dogmatil, Lasilix, Hepacholine and Natirose were stopped on 27-Jul-91. Renitec and Rythmodan were stopped on 28-Jul-91. Improvement of liver function tests. Then onset of a purulent orchiepididymitis with septicemia (Staphylococcus aureus) and kidney failure. Death.

8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION

- ■ Patient died

?-R	FRANCE	Day Month Year	Years 61	M	Year Month Day 88/11/21

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

Long-standing treatment with Myocoril for 10y, Mediator for 3y and Phosphalugel.
Mid Oct-87 : LL edema. Proteinuria 0.35G/24h.
Hospitalized on 21-Nov-88 for investigations. Good general status, no fever. No LL edema. Urine cultures negative.
Biological testing : proteinuria <0.10G/l (twice); hypoalbuminemia 34g/L, creatininemia 135mcmol/L, thrombocytopenia 98,000 on 21-Nov and 131,000 on 22, protides electrophoresis WNL,slight cytolisis and cholestasis (LIVER FUNCTION ABNORMAL).
Liver echography : no biliary duct dilation.
Mediator was stopped and liver function tests were normalized.
Discharged on 25-Nov-88 (tx : Myocoril, Phosphalugel).
20-Dec-88 : Alk Ph slightly increased, GGT high. Myocoril was stopped.

COMMENTAIRES

Edité le : 18/02/1999

Femme de 49 ans. ATCD d'appendicectomie en 1970, de césarienne en 1989, pas de prise d'alcool, tabagisme et hypercholestérolémie diagnostiqués en Décembre 1997, mise sous Maxépa*, Stagid*, Agréal*, Médiator*, Lipanthyl*.

A partir du mois de Janvier 1998, prise de Tisane Copaltra pour maigrir, 4 fois par semaine, 6 cuillères à café dans un litre et demi d'eau.

Le 01 / 04 / 98, apparition d'un ictère conjonctival, perturbation du bilan hépatique avec élévation des transaminases, ASAT à 96 N, ALAT à 97 N, bilirubine à 22 N à prédominance conjuguée.

Hospitalisation le 03 / 04 / 98. Arrêt des prises médicamenteuses et de la tisane, remplacé par l'Insuline.

Bilan effectué, évolution durant l'hospitalisation :

- Echographie : hépatomégalie modérée, homogène, avec épaississement de la paroi vésiculaire, sans lithiase, sans dilatation des voies biliaires.
- Fibroscopie : RAS:.
- Bilan hépatique :
  - ASAT oscillant aux alentours de 80 N du 06 au 16 / 04, à 43 N le 18 / 04 / 98, à 42 N le 20 / 04, à 36 N le 22 / 04, à 26 N le 27 / 04 / 98.
  - ALAT entre 80 et 90 N du 06 / 04 au 16 / 04, à 62 N le 18 / 04, à 53 N le 20 / 04, à 46 N le 22 / 04, à 34 N le 24 / 04, à 28 N le 27 / 04.
  - BT de 20 à 31 N du 06 / 04 au 20 / 04, à 22 N le 27 / 04.
- Coagulation : TP à 85 % à l'entrée, à 58 % le 16 / 04; facteur V à 100%, fibrinogène normal, chute des facteurs VII et X à 50%.(mise sous vitamine K, remontée du TP à 100%).
- Sérologies A et C négatives, Ac anti- HBS positif 18 UI (début de vaccination), HIV négatives, sérologies EBV, CMV, herpès, en faveur d'une immunité ancienne, sérologie des mycoplasmes positive au 1/16, de la toxoplasmose positive pour les IgG.
- Recherche d'auto-Ac : anti-nucléaires, anti-ADN natifs, anti-mitochondries, anti-microsomes, négative. Recherche d'Ac anti-muscles lisses positive à 1/20.
- PBF (prélevé le 27 / 04 / 98) : aspect d'hépatite aigue commune résolutive.

Sortie du CH le 29 / 04 / 98, conclusion du dossier : hépatite toxique probablement au Lipanthyl*, possiblement à la tisane.

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
E-C	FRANCE	Day Month Year 06-Dec-14	Years 79	F	Year Month Day 93/09/20	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

FIXED ERUPTION .
Nov-92 : pigmentary lesions on forearms , then subaxillar , on groin , between buttocks , sub mammar and on shoulders (at that time ,patient received Lipanthyl , catapressan , Natisedine , Nitriderm) .
Natisedine , Lipanthyl & Nitriderm stopped . Skin biopsy (31-Dec-92) : superficial dermatitis with lin like aspect of interface and pigmentary incontinence .
Compatible with toxiderma (aspect between fixed eruption and lichen like toxiderma). Abdominal echography : nl. Apr-93 : treatment for 8d with Oroken and Mucomyst for bronchitis .
Hospitalisation on 20-Sep-93 for persistent cutaneous lesions .
Brown cyclic maculae on forarms and rachis ; maculae with clear centers , confluent , polycyclic on armpits , inguinal , buttocks , submammar folds . Normal biological examination (electrolytes , liver , electrophoresis proteins , FBC , hemoastasis) . Glucose tolerance test: no diabetes mellitus .
Skin biopsy (21-Sep-93) : persistency of infiltrates . Suggestive of fixed eruption .Discharge on 23-Sep-93 on Mediator 450mg/d , Isoptine , Catapressan .

II. SUSPECT DRUG(S) INFORMATION

14. SUSPECT DRUG(S) (include generic name)		20 DID REACTION ABATE AFTER STOPPING DRUG ?
MEDIATOR (BENFLUOREX)		☐ YES ☐ NO ■ NA
15. DAILY DOSE(S) 450MG	16. ROUTE(S) OF ADMINISTRATION ORAL	20 DID REACTION REAPPEAR AFTER REINTRODUCTION ? ☐ YES ☐ NO ■ NA
17. INDICATION(S) FOR USE		
18. THERAPY DATES (from/to) from 02.93 to CONTINUED	19. THERAPY DURATION >9M	

III. CONCOMITANT DRUG(S) AND HISTORY

22. CONCOMITANT DRUG(S) AND DATES OF ADMINISTRATION (exclude those used to treat reaction)
ISOPTINE (VERAPAMIL) from FEB-93
CATAPRESSAN (CLONIDINE) from 1991

23. OTHER RELEVANT HISTORY (e.g. diagnostics, allergics, pregnancy with last month of period, etc.)
Eczema 30 years ago. Diabetes diagnosed 3 months ago.

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH	2a. AGE	3. SEX	4-6 REACTION ONSET	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
A-C	FRANCE	Day Month Year	Years 61	M	Year Month Day 84/06/12	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data

On 12-Jun-84 , hospitalisation for FEVER (38°) , DEHYDRATION , CONFUSION with disorientation in time and space without meningeal syndrome .
EEG : polymorphous symetrical activity with diffuse paroxysm .
Wright serodiagnosis was negative (neutropenia) and normal ammoniemia .
Mediator has been stopped . Favourable outcome after rehydration .
Normalisation of EEG within 3days .

II. SUSPECT DRUG(S) INFORMATION

14. SUSPECT DRUG(S) (include generic name)
MEDIATOR

20 DID REACTION ABATE AFTER STOPPING DRUG ? ☐ YES ☐ NO ☐ NA

15. DAILY DOSE(S)
U

16. ROUTE(S) OF ADMINISTRATION

17. INDICATION(S) FOR USE

20 DID REACTION REAPPEAR AFTER REINTRODUCTION ? ☐ YES ☐ NO ☐ NA

18. THERAPY DATES (from/to)
from U to U

19. THERAPY DURATION
U

III. CONCOMITANT DRUG(S) AND HISTORY

22. CONCOMITANT DRUG(S) AND DATES OF ADMINISTRATION (exclude those used to treat reaction)
FONZYLANE (BUFLOMEDIL) , SINTROM (ACENOCOUMAROL)

23. OTHER RELEVANT HISTORY (e.g. diagnostics, allergics, pregnancy with last month of period, etc.)
History of lung embolism and phlebitis .

IV. MANUFACTURER INFORMATION

24a. NAME AND ADDRESS OF MANUFACTURER
Les Laboratoires Servier
F-92200 Neuilly-sur-Seine

SUSPECT ADVERSE REACTION REPORT

I. REACTION INFORMATION

1. PATIENT INITIALS (first - last)	1a. COUNTRY	2. DATE OF BIRTH (Day Month Year)	2a. AGE (Years)	3. SEX	4-6 REACTION ONSET (Year Month Day)	8-12 CHECK ALL APPROPRIATE TO ADVERSE REACTION
	FRANCE		71	F	97/06/18	☐ Patient died ■ Involved or prolonged inpatient hospitalisation ☐ Involved persistence or significant disability or incapacity ☐ Life threatening ☐ Important medical event

7 + 13 DESCRIBE REACTION(S) (including relevant tests/lab data)

Hospitalisation for lower limbs edema for 3 months and ascite for 2 months. Vein echodoppler (7-May-97): superficial vein insufficiency, no vein thrombosis or phlebitis sequelae. On 19-Jun-97, proteinuria 3.3g/l (N<0.10g/l), slight hematuria. Urea 7mmol/l (N 3.5-7). On 20-Jun proteinuria (24h) 7.5g/l, urin volume 2100ml, hematuria, microalbuminuria 42.2mg/l (N<20). NEPHROTIC SYNDROME. In Dec-96, there was no albuminuria. Favourable outcome for edema of lower limbs. Patient improved. Persistency of proteinuria on 30-Jun. Other possible etiology: NIDDM.

BENFLUOREX

Spontaneous Reports of Serious Adverse Reactions

FRANCE

The following table is a listing of all the serious adverse reactions reported in France with Benfluorex (Mediator®), including :

- all serious reactions reported directly to the French Regional Centres for Pharmacovigilance (CRPV) in patients who had received Benfluorex (suspected drug or associated drug). After review (Pr P. Bechtel & Coll.), a number of them (marked with an asterisk – * – on the table) have been classified not related to Benfluorex (associated to other suspected drug(s)).
- all serious reactions reported to the Company.

CIOMS forms are provided for all reactions with Benfluorex considered as a suspected drug.

Investigation of possible safety issue (i.e. structure-related toxicity similar to fenfluramine which is subject to Article 15a Referral) (IT)

EPITT Reference: 20

Adpoted Minutes

The Italian Member presented their Assessment Report. Marketing authorisations for benfluorex containing medicinal products exist in France, Greece, Italy, Luxembourg, Portugal and Spain, with highest consumption in France where the authorised indication is hyperlipidaemia. The PhVWP agreed that there was no major benefit-risk concern for benfluorex containing medicinal products. Italy is considering to withdraw the indication of obesity and to update the section on undesirable effects in their Summary of Product Characteristics with regard to potential cardiotoxicity. For June 1999, the Italian Member, in co-operation with the French colleagues, will circulate a revised Assessment Report taking into account the individual case safety reports submitted to the French authorities.

ASSESSMENT REPORT

RELEVANCE OF METABOLIC PATHWAYS OF BENFLUOREX TO NORFENFLURAMINE

Medicinal products: Mediaxal®, Balans®

Manufacturing Authorisation Holder: Laboratoires Servier

Active constituent: benfluorex

Originating Member State: Italy

Assessors: Dr. Giuseppe Pimpinella, Dr. Renato Bertini Malgarini

Contact point: Italian Ministry of Health

Pharmacovigilance Unit

TEL: 0039 06 5994 3212

FAX: 0039 06 5994 3554

1. INTRODUCTION

Benfluorex is indicated in the treatment of hyperlipidaemias that cannot be adequately controlled by diet alone. Adjuvant therapy in obesity associated to disorders of glyco-lipidic metabolism.

The hypolipemic action is currently attributed to impairment of intestinal absorption of triglycerides due to inhibition of pancreatic lipase activity. It reduces hepatic synthesis of cholesterol and triglycerides in the liver and increases cellular uptake and utilisation of glucose. It is unknown if benfluorex is effective in long-term prevention of atherosclerotic processes.

The matter of concern is that the pharmacological activities of benfluorex might depend on the metabolic biotransformation to norfenfluramine leading to an anorectic effect of the drug. Based on this hypothesis, and considering the actual referral of fenfluramine under art. 15a procedure, Prof. Garattini sent a letter to EMEA to consider the referral of benfluorex to CPMP according to art. 12 procedure.

2. REGULATORY HISTORY

Benfluorex is currently marketed in the following EU Countries through national procedures: FRANCE, LUXEMBOURG, PORTUGAL, SPAIN, GREECE, ITALY. It is authorised in other non EU countries including SWITZERLAND.

Proposals from MAH

The Company proposes to delete the wording related to obesity treatment in the indications.

3. METABOLIC PATHWAYS

Benfluorex is rapidly absorbed by the gastrointestinal tract and only 0,5% is found in faeces. Within the first 24 hours, 90% of the administered dose is eliminated in urine as metabolites.

Benfluorex is extensively metabolised in man so that the parent compound cannot be detected in body fluid. In humans (fig. 1), benfluorex is totally and rapidly hydrolysed by plasma esterases to the corresponding alcohol (S422). The alcohol deriving by complete hydrolysis of the ester is partially transformed to norfenfluramine that is an active metabolite of fenfluramine.

The percentage of norfenfluramine detected in urine is only 2%, but this percentage could not account for the real amount of norfenfluramine that is generated in the body. This is because norfenfluramine is metabolised to trifluoromethylketone that is further transformed into other demolition and/or conjugation compounds.

For this reason, the data obtained in urine analysis are not relevant to know the exact kinetic of norfenfluramine.

The results of the detection of plasma concentration of norfenfluramine in man after repeated doses administration of benfluorex is much more significant.

This level is of about 50 ng/ml (fig.2) and it is in the same magnitude order observed in plasma of patients receiving normal doses of fenfluramine.

4. PUBLISHED LITERATURE ON FENFLURAMINE PHARMACOKINETICS

After the administration of 20 mg of fenfluramine thrice in day, plasma levels of fenfluramine varying in the 40-120 ng/ml range have been described.

Another study, carried out in 41 subjects, describes plasma levels of fenfluramine and norfenfluramine after repeated doses of fenfluramine. Daily dose was decreased or increased to a maximum of 160 mg/die according to individual response. The mean fenfluramine intake was 142 ± 29 (23-107) mg/day. The mean of mean plasma fenfluramine was 158 ± 70 (35-299) ng/ml and the mean of mean plasma norfenfluramine was 72± 29 (22-144) ng/ml. In 13/41 subjects with a mean fenfluramine intake of 135 ± 33 mg/day the values of the above mentioned parameters were 78 ± 22 ng/ml for fenfluramine and 44 ± 17 for norfenfluramine.

5. TOXICOLOGICAL DATA FOR NORFENFLURAMINE

Fenfluramine and norfenfluramine are both neurotoxic in experiment animals, causing reduction in the serotonin axonal markers. Doses of fenfluramine found to be effective in this respect are in the same order of those utilised to achieve the anorectic effect in man, if corrected for body mass and pharmacokinetic differences.

Furthermore, the neurotoxic potential of norfenfluramine seems to be higher than for the parent compound.

6. PHARMACOVIGILANCE DATA

The PSURs covering the period since 1st of January 1992 to 15th December 1998 were considered.

Nervous system and cerebral circulation.

Two cases of cerebrovascular accident have been described:

Annexe 3-19

124B09	France	72	F	450	2y	**Cerebrovascular accident, ischemia of internal capsula.**

After analysis of complete case narratives provided by Agence du Medicament it must be pointed out that the causality assessment is complicated by the concomitant therapies and by the pre-existing conditions. In the case of the 39 years old patient, spironolactone was the drug indicated as suspected by the reporter and there is no clear indication of concomitant pathologies.

For the 72 years old patient case, there were underlying diabetes and unstable hypertension.

The following reports from the Company can be related to nervous system toxicity too:

(after analysis of French case narratives the following confounding factors have been added into brackets)

Company ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
540J08	France	68	M	450	1m	**Polyneuropathy** (pre-existing diabetes)
540V17	France	59	F	450	2m	**Delirium, agitation, disorientation** (Concomitant amfepramone)
541173	France	45	F	300	8d	**Hallucination, aggressiveness** (no complete case narrative available)
120M52	France	60	M	150	2d	**Somnolence, personality disorder** (no complete case narrative

Three cases of agranulocytosis, one of thrombocytopenia, one of neutropenia have been described.

Allergic reactions

Several cases of allergic reactions and three cases of anaphylactic shock have been reported. The Company proposes to add the allergic reactions in the undesirable effects section

Liver and biliary tract

Three cases of hepatopathy and one of hepatitis.

Respiratory system

One case of respiratory failure and two of pneumonitis have been reported, but there are too many confounding factors.

7. Patient exposure

8. DISCUSSION

The first element to be considered in the overall safety evaluation of benfluorex is that it cannot be ruled out that norfenfluramine is the responsible for the nervous system and cardiovascular adverse reactions reported in patients assuming benfluorex. It must be pointed out that these reactions have been described also for fenfluramine. It's well known that norfenfluramine is neurotoxic in animals and it's very likely it is also in humans.

Furthermore, adverse reactions such as cardiac arrhytmias, agranulocytosis, anaphylactic shock, hepatopathy have been reported several times and are not included in the Summary of Product Characteristics.

CONCLUSION

It is reasonable that, as proposed by Prof. Garattini, benfluorex is referred to CPMP under art. 12 procedure for complete risk/benefit reassessment.

In this respect, it should be asked to the Company to provide:

- complete case-reports for cerebrovascular, nervous, pulmonary and cardiac adverse reactions;
- confidence limits of norfenfluramine plasma levels after repeated doses of benfluorex
- further data on long-term efficacy of benfluorex therapy.

Dr. Renato Bertini Malgarini **Dr. Giuseppe Pimpinella**

Annexe 3-20

1. INTRODUCTION

This is the revised version of the assessment report on benfluorex following the discussion at the Pharmacovigilance Working Party held on 3-4 March 1999 and the analysis of complete case reports provided by Agence du Medicament.

Benfluorex is indicated in the treatment of hyperlipidaemias that cannot be adequately controlled by diet alone and for adjuvant therapy in obesity associated to disorders of glyco-lipidic metabolism.

The hypolipemic action is currently attributed to impairment of intestinal absorption of triglycerides due to inhibition of pancreatic lipase activity. It reduces hepatic synthesis of cholesterol and triglycerides in the liver and increases cellular uptake and utilisation of glucose. It is unknown if benfluorex is effective in long-term prevention of atherosclerotic processes.

The matter of concern is that the pharmacological activities of benfluorex might depend on the metabolic biotransformation to norfenfluramine leading to an anorectic effect of the drug. Based on this hypothesis, and considering the actual referral of fenfluramine under art. 15a procedure, Prof. Garattini sent a letter to EMEA to consider the referral of benfluorex to CPMP according to art. 12 procedure.

2. REGULATORY HISTORY

Benfluorex is currently marketed in the following EU Countries through national procedures: FRANCE, LUXEMBOURG, PORTUGAL, SPAIN, GREECE, ITALY. It is authorised in other non EU countries including SWITZERLAND.

Proposals from MAH

In the PSUR, the Company proposes to delete the wording related to obesity treatment in the indications.

Annexe 3-20

It must be pointed out that drugs indicated in the management of obesity should comply with the CPMP Guideline on drugs used in weight control (CPMP/EWP/281/96).

3. METABOLIC PATHWAYS

Benfluorex is rapidly absorbed by the gastrointestinal tract and only 0,5% is found in faeces.. Within the first 24 hours, 90% of the administered dose is eliminated in urine as metabolites.

Benfluorex is extensively metabolised in man so that the parent compound cannot be detected in body fluids. In humans (fig. 1), benfluorex is totally and rapidly hydrolysed by plasma esterases to the corresponding alcohol (S422). The alcohol deriving by complete hydrolysis of the ester is partially transformed to norfenfluramine (S585) that is an active metabolite of fenfluramine.

The percentage of norfenfluramine detected in urine is only 2%, but this percentage could not account for the real amount of norfenfluramine that is generated in the body. This is because norfenfluramine is metabolised to trifluoromethylketone that is further transformed into other demolition and/or conjugation compounds.

In fact, after the administration of d-fenfluramine in man, only 6-10% of the dose is excreted as d-fenfluramine, and 5.8-8.8% of dose is excreted as norfenfluramine (1).

For this reason, the data obtained in urine analysis are not relevant to know the exact kinetic of norfenfluramine (1).

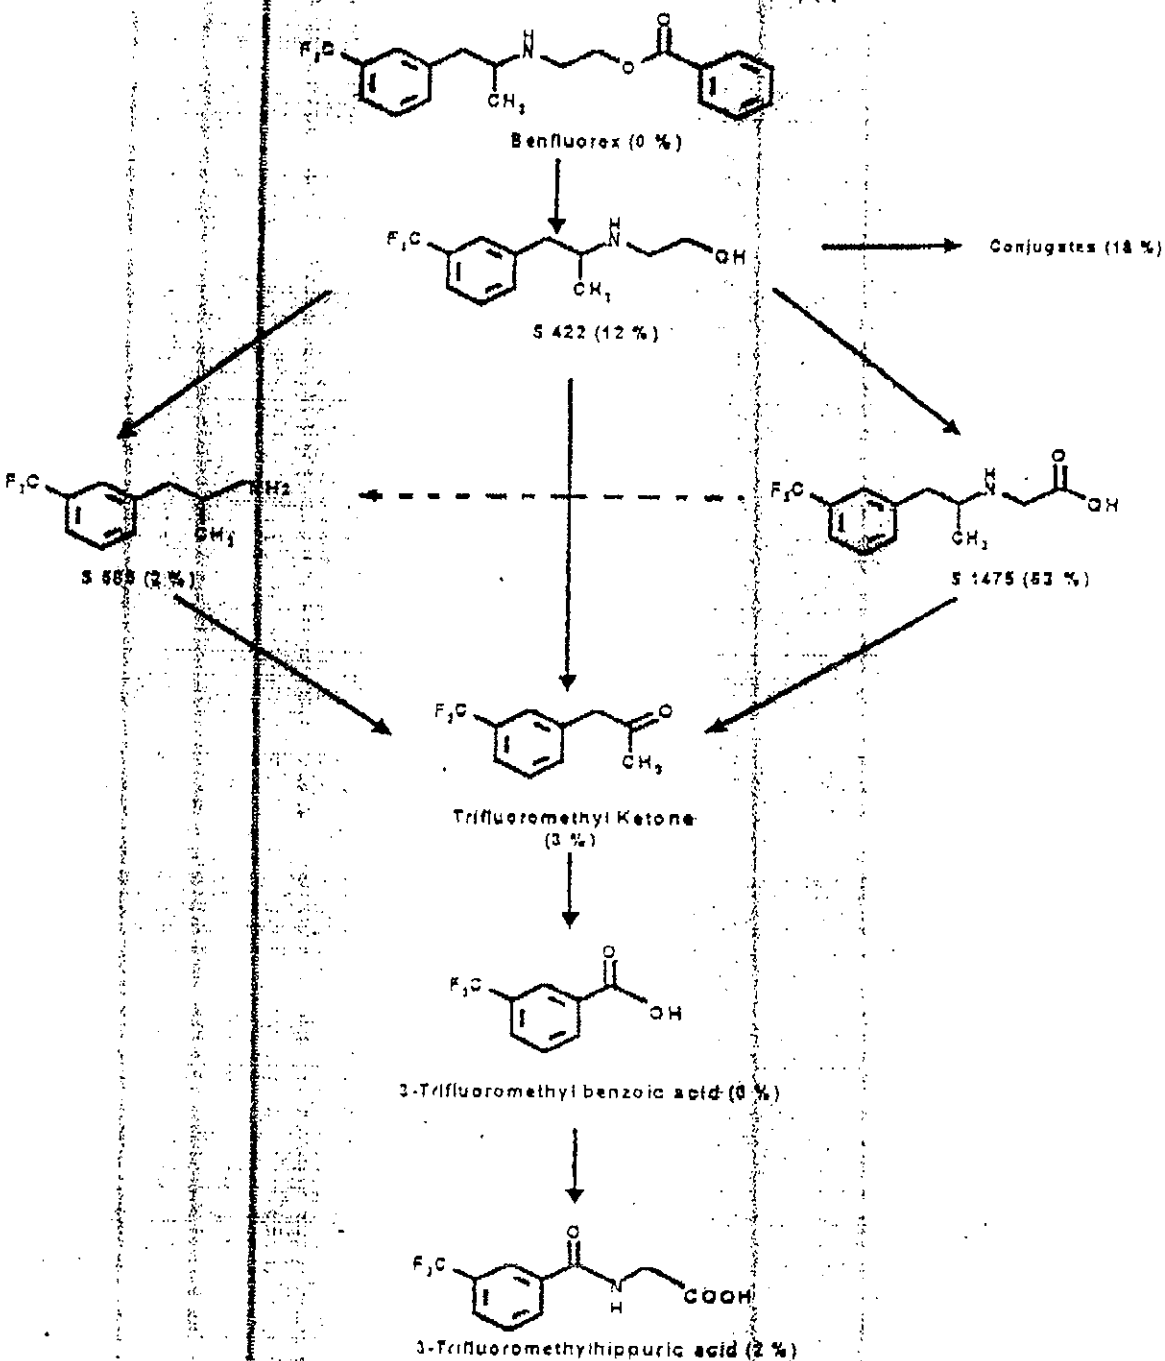
The results of the detection of plasma concentration of norfenfluramine in man after repeated doses administration of benfluorex is much more significant.

This level is of about 50 ng/ml (fig.2) and it is in the same magnitude order observed in plasma of patients receiving normal doses of fenfluramine.

4. PUBLISHED LITERATURE ON FENFLURAMINE PHARMACOKINETICS

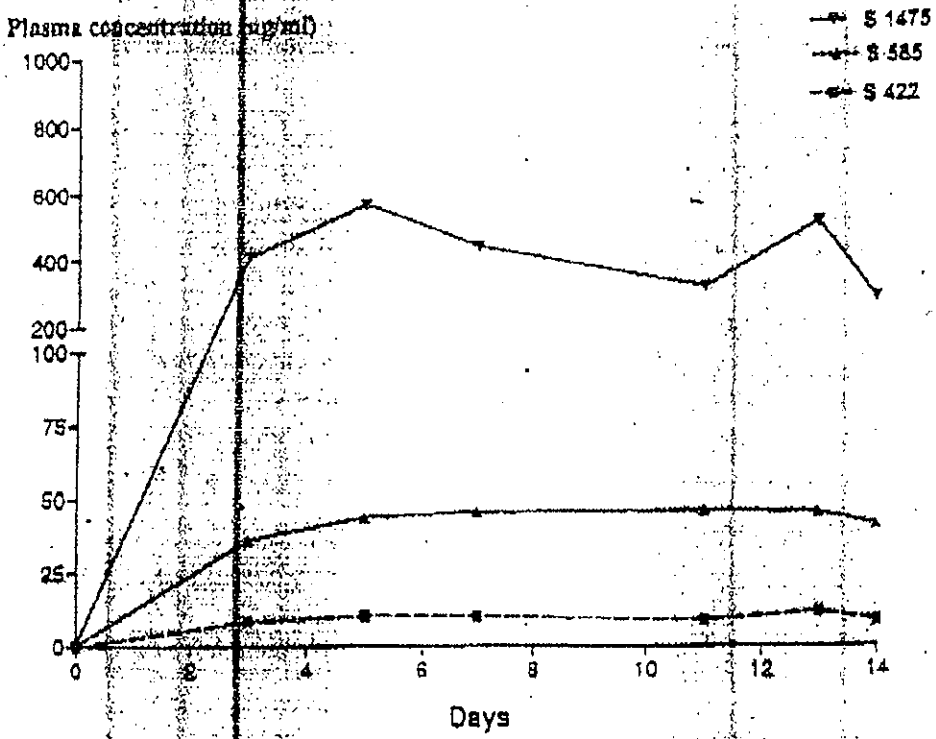
Annexe 3-20

Metabolic pathways suggested for benfluorex in humans
(% of the dose eliminated between 0 and 24 hours) (1)



Annexe 3-20

Mean plasma concentrations of metabolites of benfluorex after the administration of 3 x 150 mg of benfluorex tablets over a period of 14 days (n = 6)



Annexe 3-20

After the administration of 20 mg of fenfluramine thrice in day, plasma levels of fenfluramine varying in the 40-120 ng/ml range have been described (2).

Another study (3), carried out in 41 subjects, describes plasma levels of fenfluramine and norfenfluramine after repeated doses of fenfluramine. Daily dose was decreased or increased to a maximum of 160 mg/day according to individual response. The mean fenfluramine intake was 142 ± 29 (23-107) mg/day. The mean of mean plasma fenfluramine was 158 ± 70 (35-299) ng/ml and the mean of mean plasma norfenfluramine was 72± 29 (22-144) ng/ml. In 13/41 subjects with a mean fenfluramine intake of 135 ± 33 mg/day the values of the above mentioned parameters were 78 ± 22 ng/ml for fenfluramine and 44 ± 17 for norfenfluramine.

5. TOXICOLOGICAL DATA FOR NORFENFLURAMINE

Fenfluramine and norfenfluramine are both neurotoxic in experiment animals, causing reduction in the serotonin axonal markers (4). Doses of fenfluramine found to be effective in this respect are in the same order of those utilised to achieve the anorectic effect in man, if corrected for body mass and pharmacokinetic differences (5).

Furthermore, the neurotoxic potential of norfenfluramine seems to be higher than for the parent compound (4).

6. PHARMACOVIGILANCE DATA

The PSURs covering the period since 1st of January 1992 to 15th December 1998, the assessment and case narratives from French Authorities were considered.

Nervous system and cerebral circulation in the PSUR.

Two cases of cerebrovascular accident have been described:

Company ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
123 F41	France	39	F	450	3m	**Cerebrovascular accident, cerebellar infarction**

C2S1

Annexe 3-20

124B09	France	72	F	450	2y	**Cerebrovascular accident, ischemia of internal capsula.**

After analysis of complete case narratives provided by Agence du Medicament it must be pointed out that the causality assessment is complicated by the concomitant therapies and by the pre-existing conditions. In the case of the 39 years old patient, spironolactone was the drug indicated as suspected by the reporter and there is no clear indication of concomitant pathologies.

For the 72 years old patient case, there were underlying diabetes and unstable hypertension.

The following reports from the Company can be related to nervous system toxicity too:

(after analysis of French case narratives the following confounding factors have been added into brackets)

Company ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
540J08	France	68	M	450	1m	**Polyneuropathy** (pre-existing diabetes)

Annexe 3-20

CF90001 37	France	79	F			Disorientation. Recovery on suspension o benfluorex and of other concomitant drugs.

16 Further cases of psychiatric reactions not included in the PSUR and classified as doubtful by French assessors have been reported, including one further case of delirium, one of stupor and one of withdrawal symptoms.

In France **20 cases of impaired balance** have been reported, and in six of such cases, patients recovered on suspension of benfluorex therapy.

Moreover, two cases of **convulsions** have been reported to French Authorities but no complete case narratives are available.

Cardiovascular system

No cases of primary pulmonary hypertension has been included in the PSUR by the Company.

French Authorities have provided 11 cases of pulmonary hypertension, but the patients also assumed fenfluramine or dexfenfluramine and/or other anorectic agents. Three cases of arterial hypertension have been described, one of which considered related by Agence du Medicament experts. Also one case of tachycardia and one case of atrial fibrillation were considered likely related.

One case of aortic insufficiency has been reported to French Authorities but the patient had previous myocardial infarction and mitral insufficiency.

It must be pointed out that norfenfluramine inhibits serotonin re-uptake and all serotonergic agents, including ergotamine and methysergide can cause valve lesions (Wong et al. *Cleveland Journal of Medicine* 1998 65 (1):35-41).

Furthermore, one case of syncope with respiratory insufficiency, one case of shock with ventricular tachycardia and one of torsade de pointes in a patient with no predisposing factors, have been included in the PSUR but no complete case reports are available.

Annexe 3-20

Haemopoietic system

Three cases of agranulocytosis, 5 of thrombocytopenia, 2 of leucopenia, 2 of lymphopenia 3 of neutropenia plus thrombocytopenia have been described in France. No complete case reports available.

Allergic reactions

Several cases of allergic reactions and six cases of anaphylactic shock have been reported. The Company proposes to add the allergic reactions in the undesirable effects section of the SPC.

Liver and biliary tract

23 cases of hepatitis have been provided from French Authorities, with 7 cases probably related and a possibly related one.

Respiratory system

Two cases of interstitial pneumonitis have been reported in France, but French assessors have pointed out several confounding factors.

7. Patient exposure

The Company has provided the following estimates of patients-months based on a mean daily dosage of 2,4 tablets, for a month of 30.4 days.

COUNTRY	N. patients-months OCT 96 - SEP 98
France	4,657,495
Luxembourg	2,130
Portugal	24,619
Greece	1,502

Annexe 3-20

Italy	235.612	
Spain		10.215
TOTAL		4,931,573

8. DISCUSSION

The first element to be considered in the overall safety evaluation of benfluorex is that it cannot be ruled out that norfenfluramine is responsible for the nervous system and cardiovascular adverse reactions reported in patients assuming benfluorex. It must be pointed out that these reactions have been described also for fenfluramine. It's well known that norfenfluramine is neurotoxic in animals and it's very likely it is also in humans.

Furthermore, adverse reactions such as psychiatric disorders, blood dyschrasias, anaphylactic shock, hepatitis and cardiovascular effects have been reported several times and are not included in the Summary of Product Characteristics.

CONCLUSION

We agree with French Colleagues that on the basis of the data deriving from spontaneous monitoring there is no definitive evidence of neurotoxicity and cardiotoxicity of benfluorex in humans, but there are elements of suspicion to require that precautions are adopted to further monitor this issue, especially to prevent long term adverse effects.

The following actions are possible:

- Referral of benfluorex to CPMP by Italy and France;
- Request the Company to provide preclinical and clinical studies on cardiovascular effects of repeated doses of benfluorex and toxicological studies about its neurotoxicity, further elements for cerebrovascular, nervous, pulmonary and cardiac adverse reactions if available, confidence limits of norfenfluramine plasma levels after repeated doses of benfluorex, further data on long-term efficacy of benfluorex therapy.

Annexe 3-20

- Reduction of indications of benfluorex containing medicinal products, updating of adverse effects, contraindications and special warnings sections of SPC, with particular regard to cardiac function monitoring, possibly by echocardiography for long term use and contraindication in case of pre-existing hypertension or cardiovascular and/or cerebrovascular diseases.

Rome, 06 May 1999

SUBJECT / OBJET : Benfluorex / comments on revised assessment report

Dear colleague,

Our French expert (Pr Bechtel) has globally endorsed your revised assessment report. However we would like to remind you that the French spontaneous case reports do not allow an accurate evaluation of the neurotoxicity and cardiotoxicity.

Please note that :

- Page 6 : the ref. N° of the first case of nervous system reaction considered as likely related is NC9500171 instead of MA8900523.

- Page 7 : in the case of atrial fibrillation and the case of syncope with respiratory insufficiency, the patients were treated concomitantly by amfepramone.

In addition, we consider that it should be appropriate to ask the company to perform a pharmacokinetic study on benfluorex and its metabolites, especially norfenfluramine after a single dose and after several days of treatment.

Best regards.

Le Chef de l'unité de Pharmacovigilance

Dr Anne CASTOT

B.6 Vigabatrin: Risk/benefit balance, visual field defects – Article 12 Referral (FI & UK) ❑

The PhVWP was informed that the CPMP discussed vigabatrin in February 1999 and adopted a List of Questions and a draft Summary of Product Characteristics to be sent to the marketing authorisation holders. The CPMP included the risk-benefit of vigabatrin in pregnancy and lactation as an item of the List of Questions. The Oral Explanation will take place at the CPMP in March 1999 and the Opinion is scheduled for April 1999.

B.7 Benfluorex: Investigation of possible safety issue (i.e. structure-related toxicity similar to fenfluramine which is subject to Article 15a Referral) (IT) ❑

The Italian Member presented their Assessment Report. Marketing authorisations for benfluorex containing medicinal products exist in France, Greece, Italy, Luxembourg, Portugal and Spain, with highest consumption in France where the authorised indication is hyperlipidaemia. The PhVWP agreed that there was no major benefit-risk concern for benfluorex containing medicinal products. Italy is considering to withdraw the indication of obesity and to update the section on undesirable effects in their Summary of Product Characteristics with regard to potential cardiotoxicity. For June 1999, the Italian Member, in co-operation with the French colleagues, will circulate a revised Assessment Report taking into account the individual case safety reports submitted to the French authorities.

B.8 Selective serotonin reuptake inhibitors (SSRIs): Withdrawal reactions, dependency and long-term use ✣ ❑

The German Member circulated their comments on the Assessment Report prepared by the UK on the issues raised by C Medawar in his note "SSRIs, EMEA and the CPMP". The UK will prepare a draft response letter to the European Commission and recommendations on wordings for the Summaries of Product Characteristics (SPCs) for discussion and agreement by the PhVWP in April 1999. The agreed draft letter and the recommendations on SPC wordings will be forwarded to the CPMP in April 1999.

C. ENQUIRIES ON REQUEST OF NATIONAL AUTHORITIES

C.1 Alendronate sodium (FOSAMAX®): Oesophageal and upper gastrointestinal safety (UK) ❑

For discussion in April 1999, the UK will circulate an Assessment Report on results from a clinical trial, an epidemiological study performed in the US and from a Prescription Event Monitoring (PEM) study which were submitted by the marketing authorisation holder. The marketing authorisation authorisation holder was also requested to provide proposals for the Summary of Product Characteristics (SPC) and a report on possible reformulation.

In addition, Member States sent their SPCs and Package Leaflets to the UK for investigation of instructions for use. The results of this investigation will also be presented in April 1999.

Germany contacted their marketing authorisation holder with regard to concerns over reporting compliance. The response of the marketing authorisation holder will be circulated to the PhVWP.

Pharmacovigilance Unit

TEL: 0039 06 5994 3212

FAX: 0039 06 5994 3554

1. INTRODUCTION

This is the revised version of the assessment report on benfluorex following the discussion at the Pharmacovigilance Working Party held on 3-4 March 1999 and the analysis of complete case reports provided by Agence du Medicament.

Benfluorex is indicated in the treatment of hyperlipidaemias that cannot be adequately controlled by diet alone and for adjuvant therapy in obesity associated to disorders of glyco-lipidic metabolism.

The hypolipemic action is currently attributed to impairment of intestinal absorption of triglycerides due to inhibition of pancreatic lipase activity. It reduces hepatic synthesis of cholesterol and triglycerides in the liver and increases cellular uptake and utilisation of glucose. It is unknown if benfluorex is effective in long-term prevention of atherosclerotic processes.

The matter of concern is that the pharmacological activities of benfluorex might depend on the metabolic biotransformation to norfenfluramine leading to an anorectic effect of the drug. Based on this hypothesis, and considering the actual referral of fenfluramine under art. 15a procedure, Prof. Garattini sent a letter to EMEA to consider the referral of benfluorex to CPMP according to art. 12 procedure.

2. REGULATORY HISTORY

Benfluorex is currently marketed in the following EU Countries through national procedures: FRANCE, LUXEMBOURG, PORTUGAL, SPAIN, GREECE, ITALY. It is authorised in other non EU countries including SWITZERLAND.

Proposals from MAH

In the PSUR, the Company proposes to delete the wording related to obesity treatment in the indications.

It must be pointed out that drugs indicated in the management of obesity should comply with the CPMP Guideline on drugs used in weight control (CPMP/EWP/281/96).

3. METABOLIC PATHWAYS

Benfluorex is rapidly absorbed by the gastrointestinal tract and only 0,5% is found in faeces. Within the first 24 hours, 90% of the administered dose is eliminated in urine as metabolites.

Benfluorex is extensively metabolised in man so that the parent compound cannot be detected in body fluids. In humans (fig. 1), benfluorex is totally and rapidly hydrolysed by plasma esterases to the corresponding alcohol (S422). The alcohol deriving by complete hydrolysis of the ester is partially transformed to norfenfluramine (S585) that is an active metabolite of fenfluramine.

The percentage of norfenfluramine detected in urine is only 2%, but this percentage could not account for the real amount of norfenfluramine that is generated in the body. This is because norfenfluramine is metabolised to trifluoromethylketone that is further transformed into other demolition and/or conjugation compounds.

In fact, after the administration of d-fenfluramine in man, only 6-10% of the dose is excreted as d-fenfluramine, and 5.8-8.8% of dose is excreted as norfenfluramine (1).

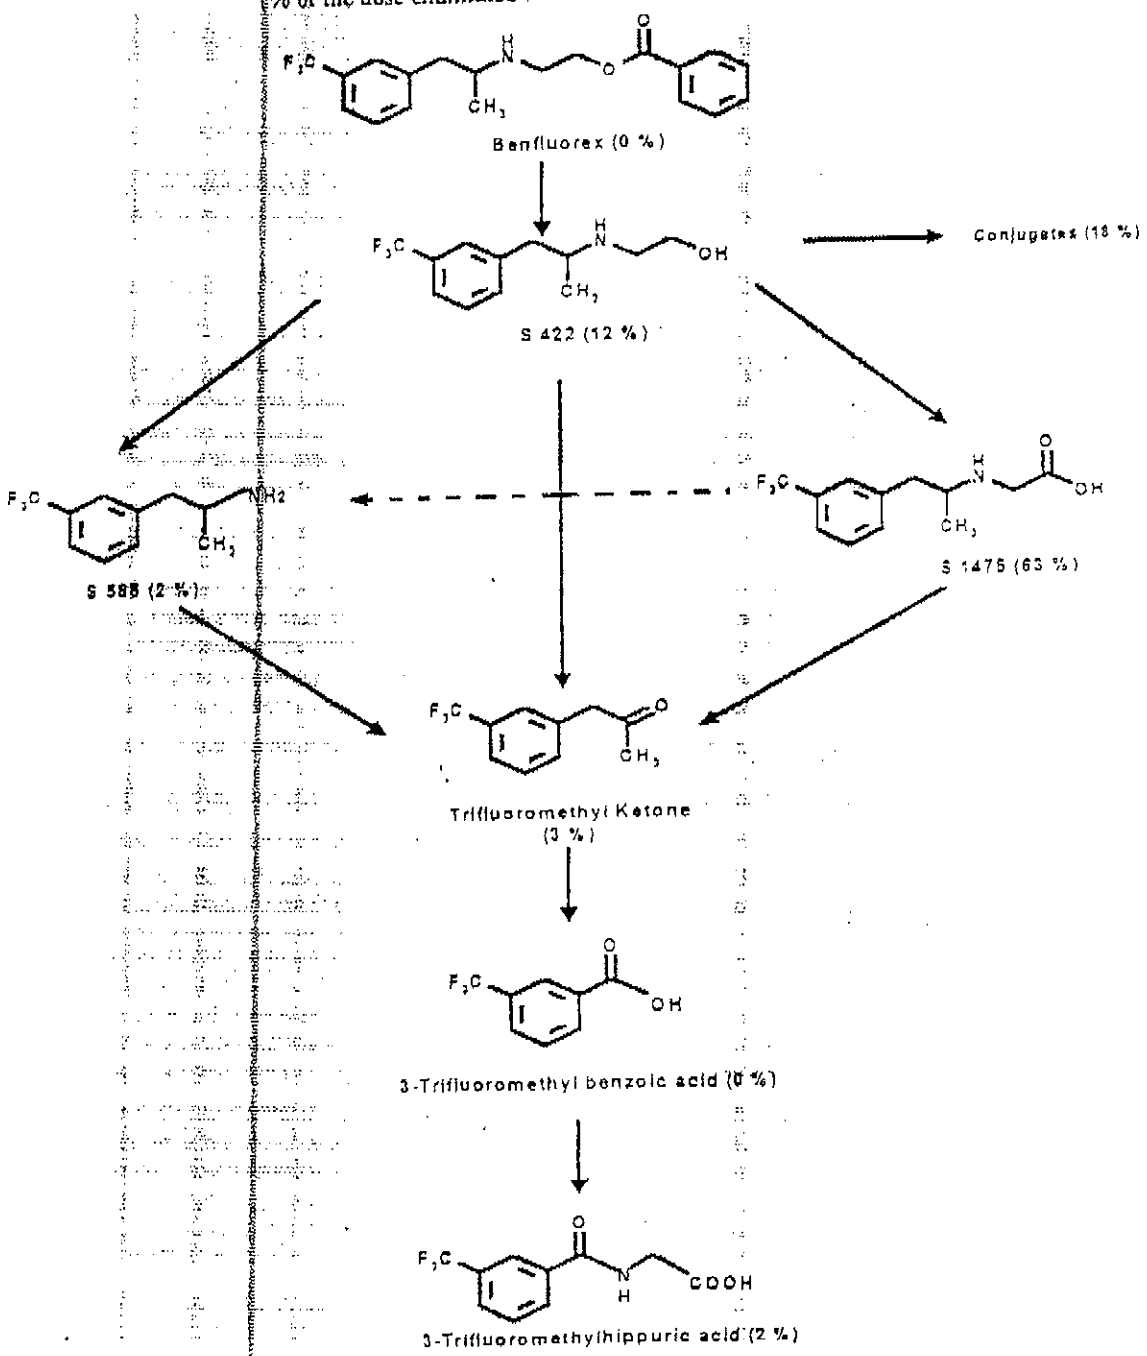
For this reason, the data obtained in urine analysis are not relevant to know the exact kinetic of norfenfluramine (1).

The results of the detection of plasma concentration of norfenfluramine in man after repeated doses administration of benfluorex is much more significant.

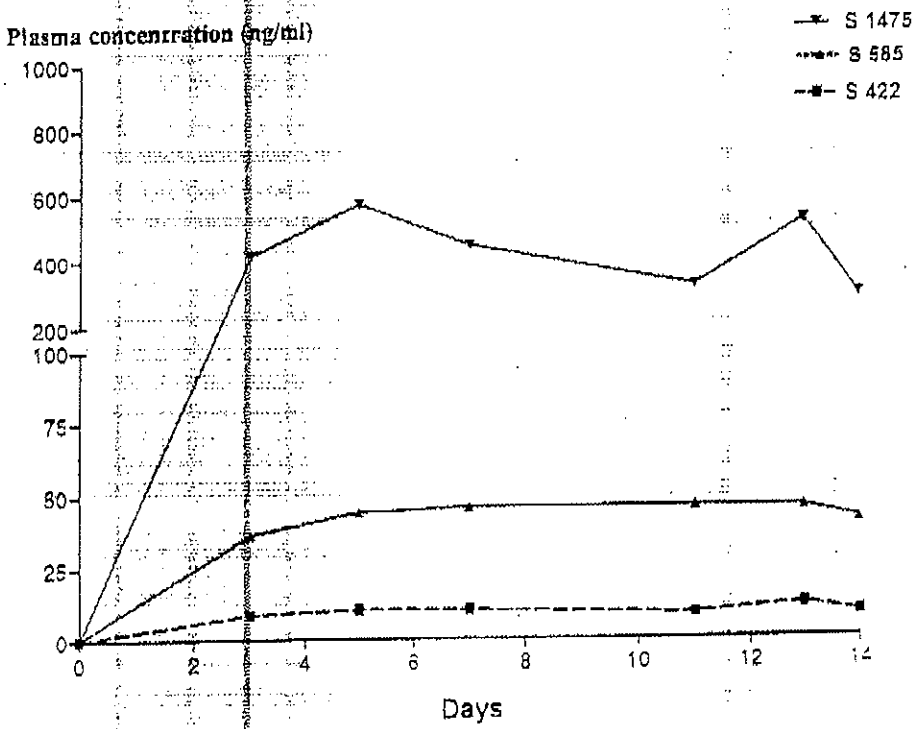
This level is of about 50 ng/ml (fig.2) and it is in the same magnitude order observed in plasma of patients receiving normal doses of fenfluramine.

4. PUBLISHED LITERATURE ON FENFLURAMINE PHARMACOKINETICS

Metabolic pathways suggested for benfluorex in humans
(% of the dose eliminated between 0 and 24 hours) (1)



Mean plasma concentrations of metabolites of benfluorex after the administration of 3 x 150 mg of benfluorex tablets over a period of 14 days (n = 6)



After the administration of 20 mg of fenfluramine thrice in day, plasma levels of fenfluramine varying in the 40-120 ng/ml range have been described (2).

Another study (3), carried out in 41 subjects, describes plasma levels of fenfluramine and norfenfluramine after repeated doses of fenfluramine. Daily dose was decreased or increased to a maximum of 160 mg/day according to individual response. The mean fenfluramine intake was 142 ± 29 (23-107) mg/day. The mean of mean plasma fenfluramine was 158 ± 70 (35-299) ng/ml and the mean of mean plasma norfenfluramine was 72± 29 (22-144) ng/ml. In 13/41 subjects with a mean fenfluramine intake of 135 ± 33 mg/day the values of the above mentioned parameters were 78 ± 22 ng/ml for fenfluramine and 44 ± 17 for norfenfluramine.

5. TOXICOLOGICAL DATA FOR NORFENFLURAMINE

Fenfluramine and norfenfluramine are both neurotoxic in experiment animals, causing reduction in the serotonin axonal markers (4). Doses of fenfluramine found to be effective in this respect are in the same order of those utilised to achieve the anorectic effect in man, if corrected for body mass and pharmacokinetic differences (5).

Furthermore, the neurotoxic potential of norfenfluramine seems to be higher than for the parent compound (4).

6. PHARMACOVIGILANCE DATA

The PSURs covering the period since 1st of January 1992 to 15th December 1998, the assessment and case narratives from French Authorities were considered.

Nervous system and cerebral circulation in the PSUR.

Two cases of cerebrovascular accident have been described:

Company ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
123 F41	France	39	F	450	3m	**Cerebrovascular accident, cerebellar infarction**

124B09	France	72	F	450	2y	**Cerebrovascular accident, ischemia of internal capsula.**

After analysis of complete case narratives provided by Agence du Medicament it must be pointed out that the causality assessment is complicated by the concomitant therapies and by the pre-existing conditions. In the case of the 39 years old patient, spironolactone was the drug indicated as suspected by the reporter and there is no clear indication of concomitant pathologies.

For the 72 years old patient case, there were underlying diabetes and unstable hypertension.

The following reports from the Company can be related to nervous system toxicity too:

(after analysis of French case narratives the following confounding factors have been added into brackets)

Company ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
540J08	France	68	M	450	1m	**Polyneuropathy** (pre-existing diabetes)
540V17	France	59	F	450	2m	**Delirium, agitation, disorientation** (Concomitant amfepramone)
541173	France	45	F	300	8d	**Hallucination, aggressiveness** (no complete case narrative available)
120M52	France	60	M	150	2d	**Somnolence, personality disorder** (no complete case narrative

						available)
120M85	France	70	M	300	11d	**Amnesia, confusion** (no complete case narrative available)

Cases of nervous system reactions from Agence du Medicament:

Considered as likely related from French assessors:

ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
NC95001 71	France	50	F	1cp		**Nervousness.** Onset 1 -2 h after the first dose
10010345	France	80	F		13 D	**Obnubilation, disorientation.** Positive rechallenge
123S98	France	27	M	1350	6 M	**Drug abuse, headache, manic reaction, mydriasis on withdrawal**

Considered as possibly related from French assessors

ref. No	Country	Age	Sex	Dose (mg/day)	treatment duration	reaction
NC97000 94	France	74	F		6 D	**Aggressiveness.** Recovered on suspension of treatment.
NC93003 47	France	39	M		11 M	**Irritability.** Recovered on suspension of treatment
NC93003 49	France	50	M		9 M	**Depression.** Recovered on suspension of treatment
MA9100 069	France	40	M	4 cp	1D	**Palpitation, anguish.** Onset 2h after the first dose

CF90001 37	France	79	F			**Disorientation**. Recovery on suspension o benfluorex and of other concomitant drugs.

16 Further cases of psychiatric reactions not included in the PSUR and classified as doubtful by French assessors have been reported, including one further case of delirium, one of stupor and one of withdrawal symptoms.

In France **20 cases of impaired balance** have been reported, and in six of such cases, patients recovered on suspension of benfluorex therapy.

Moreover, two cases of **convulsions** have been reported to French Authorities but no complete case narratives are available.

Cardiovascular system

No cases of primary pulmonary hypertension has been included in the PSUR by the Company.

French Authorities have provided 11 cases of pulmonary hypertension, but the patients also assumed fenfluramine or dexfenfluramine and/or other anorectic agents. Three cases of arterial hypertension have been described, one of which considered related by Agence du Medicament experts. Also one case of tachycardia and one case of atrial fibrillation were considered likely related.

One case of aortic insufficiency has been reported to French Authorities but the patient had previous myocardial infarction and mitral insufficiency.

It must be pointed out that norfenfluramine inhibits serotonin re-uptake and all serotonergic agents, including ergotamine and methysergide can cause valve lesions (Wong et al. *Cleveland Journal of Medicine* 1998 65 (1):35-41).

One case of syncope with respiratory insufficiency has been reported but there was concomitant amfepramone.

Furthermore, one case of shock with ventricular tachycardia and one of torsade de pointes in a patient with no predisposing factors, have been included in the PSUR but no complete case reports are available.

Haemopoietic system

Three cases of agranulocytosis, 5 of thrombocytopenia, 2 of leucopenia, 2 of lymphopenia 3 of neutropenia plus thrombocytopenia have been described in France. No complete case reports available.

Allergic reactions

Several cases of allergic reactions and six cases of anaphylactic shock have been reported. The Company proposes to add the allergic reactions in the undesirable effects section of the SPC.

Liver and biliary tract

23 cases of hepatitis have been provided from French Authorities, with 7 cases probably related and a possibly related one.

Respiratory system

Two cases of interstitial pneumonitis have been reported in France, but French assessors have pointed out several confounding factors.

7. Patient exposure

The Company has provided the following estimates of patients-months based on a mean daily dosage of 2,4 tablets, for a month of 30.4 days.

COUNTRY	N. patients-months OCT 96 - SEP 98
France	4,657,495

Luxembourg	2,130
Portugal	24,619
Greece	1,502
Italy	235,612
Spain	10,215
TOTAL	4,931,573

8. DISCUSSION

The first element to be considered in the overall safety evaluation of benfluorex is that it cannot be ruled out that norfenfluramine is responsible for the nervous system and cardiovascular adverse reactions reported in patients assuming benfluorex. It must be pointed out that these reactions have been described also for fenfluramine. It's well known that norfenfluramine is neurotoxic in animals and it's very likely it is also in humans.

Furthermore, adverse reactions such as psychiatric disorders, blood dyschrasias, anaphylactic shock, hepatitis and cardiovascular effects have been reported several times and are not included in the Summary of Product Characteristics.

CONCLUSION

We agree with French Colleagues that on the basis of the data deriving from spontaneous monitoring there is no definitive evidence of neurotoxicity and cardiotoxicity of benfluorex in humans, but there are elements of suspicion to require that precautions are adopted to further monitor the issue, especially to prevent long term adverse effects.

The following actions are possible:

- Referral of benfluorex to CPMP by Italy and France;
- Request the Company to provide preclinical and clinical studies on cardiovascular effects of repeated doses of benfluorex and toxicological studies about its neurotoxicity, further elements for cerebrovascular, nervous, pulmonary and cardiac adverse reactions if available, confidence limits of

norfenfluramine plasma levels after repeated doses of benfluorex, further data on long-term efficacy of benfluorex therapy.

- Ask the Company to perform, as suggested by French Colleagues, a pharmacokinetic study on benfluorex and its metabolites, especially norfenfluramine after a single dose and after several days of treatment.
- Reduction of indications of benfluorex containing medicinal products, updating of adverse effects, contraindications and special warnings sections of SPC, with particular regard to cardiac function monitoring, possibly by echocardiography for long term use and contraindication in case of pre-existing hypertension or cardiovascular and/or cerebrovascular diseases.

SUBJECT / OBJET : **Benfluorex (MEDIATOR®)**

Annexe 3-24

MESSAGE :

A case of pulmonary hypertension (PH) in a woman treated with benfluorex has recently been reported to the French pharmacovigilance system.
This case is currently under review. The patient was treated with benfluorex alone for 4 years (treatment dates unknown). In December 1998, the patient experienced dyspnea. In March 1999, the worsening of symptoms led to diagnose a primary pulmonary hypertension (PAPS = 91 mmHg). A chronic thromboembolic process has been excluded by pulmonary scintigraphy.

Up to now, except this new case, 11 cases of PH have been reported with benfluorex. In 10 cases, benfluorex was concomitantly used with dexfenfluramine and in 1 case with amfepramone and clobenzorex.
Hence, this new case is the first case of PH reported with benfluorex used in monotherapy.

As agreed at the June Pharmacovigilance Working-Party, Italy and France proposed to send a list of questions to the MAH and to revise the SPCs of benfluorex. This issue should be discussed in September.
This new case raises a great concern.
Therefore, we are proposing the following actions :

1 - The French Agency will ask the MAH to submit before the end of June :
- an update on safety data,
- all pharmacological and pharmacokinetic data available on benfluorex and its metabolites and a comparison of these data to those known with fenfluramine / dexfenfluramine and its metabolites.

2 - This issue will be reviewed by our experts at the beginning of July. You will be informed of any recommended action.

VI - POINT SUR LA PHARMACOVIGILANCE EUROPEENNE.

Compte-rendu du groupe de travail européen de pharmacovigilance des 10 et 11 juin 1999.

- Inhibiteurs de la protéase / lipodystrophies :
Un groupe d'experts comprenant des membres du Comité des Spécialités Pharmaceutiques (CSP), des membres du groupe de travail de pharmacovigilance (Suède, Espagne et Belgique) et des experts cliniciens a été mis en place pour évaluer le risque des lipodystrophies et ses conséquences. Une première réunion a eu lieu le 28 mai 1999. La réunion suivante est programmée le 29 juin 1999. Les recommandations finales de ce groupe sont attendues pour septembre 1999.

- Association de lamivudine et zidovudine : atteintes mitochondriales et complications cérébrales chez l'enfant :
Les Etats membres ont été informés des conclusions de la réunion d'experts organisée en France le 31 mai 1999. La France doit proposer les principaux éléments d'une lettre d'information aux prescripteurs lors du groupe du travail de juillet 1999 pour adoption par le CSP de manière à ce qu'une information commune soit diffusée en Europe.

- Rituximab (MABTHERA®) :
Cet anticorps monoclonal indiqué dans les lymphomes de stade IV fait l'objet d'une surveillance renforcée depuis la survenue de plusieurs cas de réactions liées à la perfusion de rituximab (signes pulmonaires). Les données concernant les autopsies des patients décédés n'apportent aucun élément nouveau. Un protocole d'étude clinique sera discuté durant l'été.
Par ailleurs, 6 observations de réactions cutanées graves (syndrome de Lyell, pemphigoïde bulleuse) ont été rapportées. Une demande de variation de type II (demande de modification de l'information médicale) relative à ces observations est en cours d'évaluation.

- Sildénafil (VIAGRA®) :
Le protocole de l'étude de surveillance post-commercialisation doit être prochainement rediscuté avec les laboratoires PFIZER.
A la suite de plusieurs notifications d'atteintes hépatiques survenues en dehors de l'Union européenne, les effets indésirables hépatiques font également l'objet d'une surveillance.
L'ajout d'une interaction médicamenteuse concernant le ritonavir et le saquinavir a été adopté par le CSP.

- Anorexigènes (article 15 de la Directive 75/319/CEE):
La plupart des laboratoires ont fait appel à l'opinion du CSP rendue en avril 99. De nouveaux pays rapporteurs et co-rapporteurs ont été nommés :
- Angleterre et Pays-Bas pour la fenfluramine, dexfenfluramine,
- Italie et Espagne pour la phentermine, amfépramone,
- Belgique et Portugal pour les autres anorexigènes.

L'opinion définitive du CSP est attendue pour fin juillet 1999.

- **Sertindole (article 15 de la Directive 75/319/CEE) / morts subites :**
Les rapporteurs concluent à un rapport bénéfice-risque négatif.
L'opinion du CSP est attendue pour fin juin 1999.

- **Vigabatrin (article 12 de la Directive 75/319/CEE) / restrictions du champ visuel :**
A la suite de l'opinion du CSP (mai 1999) modifiant les indications et les mises en garde du vigabatrin, les laboratoires ont préparé un nouveau RCP, une lettre d'information aux prescripteurs et un projet d'études cliniques.

- **Inhibiteurs sélectifs de recapture de la sérotonine / syndrome de sevrage et dépendance :**
Les éléments suivants apparaîtront dans la section "Effets indésirables" des RCP des produits de la classe :
- des syndromes de sevrage peuvent survenir à l'arrêt du traitement,
- liste de symptômes associés au syndrome de sevrage,
- une diminution progressive de la dose est recommandée pour tous les traitements excepté pour la fluoxétine (car longue demi-vie). Les RCP de la venlafaxine et de la paroxétine devront être plus détaillés quant aux modalités de diminution de la dose en fin de traitement car des syndromes de sevrage ont été rapportés plus souvent avec ces deux médicaments.
- il n'y a pas de données cliniques permettant d'exclure un risque de pharmacodépendance.

- **Benfluorex / métabolisation en norfenfluramine :**
le rapport rédigé par l'Italie en collaboration avec la France a été distribué aux Etats membres.
Les données disponibles ne permettant pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex, le groupe de travail a souhaité que les pays rapporteurs (France et Italie) proposent des modifications de RCP et adressent une liste de questions au laboratoire en demandant une mise à jour des données de tolérance et la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites.

Par ailleurs, mi-juin 1999, un cas d'HTAP d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans. Il s'agit du premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène. 11 cas avaient auparavant été rapportés lors d'un traitement associant le benfluorex à de la dexfenfluramine dans 10 cas et à de l'amfépramone et du ciobenzorex dans 1 cas.

Compte-tenu de ce nouveau cas, l'Agence a adressé un courrier aux laboratoires SERVIER leur demandant de verser, avant le 28 juin 1999, une mise à jour des données de tolérance ainsi que les données de pharmacologie et pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines. Un infofax a par ailleurs été envoyé à tous les Etats membres.

- **Thiomersal / sensibilisation :**
Un groupe de travail a été mis en place par le CSP pour étudier l'éventuelle toxicité de cet excipient présent dans certains vaccins, collutoires, collyres et gouttes nasales. L'OMS soulève le risque de neurotoxicité et néphrotoxicité du thiomersal, notamment chez l'enfant.

SUBJECT: ASSESSMENT REPORT FOR BENFLUOREX.

Dear Dr. Castot and Dr. Fosset,

We agree with your comments. It's preferable to leave the discussion on indications and pharmacodynamics to national level and eventually discuss it later.
Would you be so kind to send the letter to the Company. We are available to examine the answer and prepare a joint assessment report.
We enclose also a revised version of the assessment report that if you agree we could circulate.
Thank you for the collaboration.
Best regards.

REVISED ASSESSMENT REPORT

RELEVANCE OF METABOLIC PATHWAYS OF BENFLUOREX TO NORFENFLURAMINE

Medicinal product: Mediaxal®

Manufacturing Authorisation Holder: Laboratoires Servier

Active constituent: benfluorex

Originating Member States: Italy, France

Assessors: Dr. Giuseppe Pimpinella, Dr. Renato Bertini Malgarini

Contact point: Italian Ministry of Health

Pharmacovigilance Unit

TEL: 0039 06 5994 3212

FAX: 0039 06 5994 3554

Confidential

1. BACKGROUND

Following the report of a case of pulmonary hypertension occurred in France, the Colleagues of Agence du Medicament asked the Laboratoires Servier to provide further documentation for safety, efficacy and pharmacokinetic profile of benfluorex compared to those of fenfluramine and dexfenfluramine.

The French experts have also provided to Italian Ministry of Health the Documentation from the Laboratoires Servier and a joint assessment has been carried out.

2. DATA ANALYSIS

Pharmacokinetic parameters after 14 days treatment.

		AUC 24	Cmin (24h)	Cmax
			(ng ml-1)	(ng ml-1)
Benfluorex 3x 150 mg	dl-norfenfluramine	1149 ± 286	43 ± 8	59 ± 15
Dexfenfluramine 2x 15 mg	d-fenfluramine	1060 ± 316	34 ± 7	70 ± 15
	d-norfenfluramine	527 ± 281	18 ± 10	26 ± 13
Fenfluramine 60 mg	d-fenfluramine	1014 ± 445	33 ± 12	65 ± 26
	l-fenfluramine	1581 ± 778	54 ± 24	97 ± 47
	d-norfenfluramine	377 ± 136	14 ± 5	21 ± 8
	l-norfenfluramine	586 ± 210	21 ± 9	32 ± 13

From the data in the table, we can derive that an exposition to 450 mg/day of benfluorex (only metabolised to norfenfluramine) leads to a norfenfluramine level that is in the same magnitude order of that observed after a 60 mg/day dose of fenfluramine (the contribution of dl-fenfluramine and dl-norfenfluramine has been taken into account).

Annexe 3-26

2.1 Clinical trial

Only one long term (29 weeks) trial in obese patients with type II diabetes has been carried out. In this study benfluorex was compared to placebo and to metformin. The considered parameters were weight loss and glycosylated haemoglobin.

Weight loss was not significant among the three groups.

Glycosylated haemoglobin showed a significant decrease in benfluorex treated patients with respect to placebo (HbA1c -0,6% and +0,5% respectively).

However, benfluorex was less effective of metformin (-0,6 % and -1% respectively).

It must be pointed out that this study is an unpublished internal report and confidence intervals were not available.

Concerning the indication in hyperlipidaemia, there are no data for therapy duration longer than 1 month and numerous therapeutic alternatives are available.

Furthermore, for these short term studies no quantitative data for serum lipids reduction are provided have been provided by the Company.

3. Pharmacovigilance data.

A part from the case of pulmonary hypertension that is still under evaluation, no new significant data have been submitted.

5. Conclusions

As previously concluded, there are suspicions that patients treated with benfluorex are exposed to a potentially toxic level of norfenfluramine. The drug is less effective than metformin in the management of obese patients with type II diabetes. No data on safety and efficacy of the drug for therapy periods longer than six months have been provided.

Psychiatric reactions (confusion), anaphylactic shock, hepatitis, blood disorders and cardiovascular adverse effects are not listed in the SPC.

Annexe 3-26

The final proposal has been decided together with French Colleagues that will address them to Servier:

- The following questions will be addressed to the Company:
  - What are the values of pharmacokinetic parameters in animals and in humans after long term (more than six months) administration of benfluorex?
  - Have the cardiovascular and neurological effects of benfluorex in animals and in humans been assessed after long-term (more than six months) exposure to benfluorex?
  - Has long term efficacy in lowering serum lipids assessed in controlled studies and compared to currently available therapeutic alternatives (fibrates, statins, etc.)?
  - Has long term efficacy in controlling glycaemic parameters assessed in controlled studies?

- If the above data are not available, the Company should carry out a long term study (more than one year) with periodic echocardiographic, glycaemic, serum lipids level controls and measurement of pharmacokinetic parameters.
- SPC revision as follows:

No data supporting the indication hypetriglyceridaemia were included. This indication as the others are currently under review by National French Authorities. We suggest to wait for the conclusion of such review and to discuss the efficacy and pharmacodynamics issues at national level if deemed necessary.

Section 4.3 Contraindications

...Hypersensitivity to the drug or to any other component of the formulation.

Chronic pancreatitis...

Section 4.4 Special warnings

... In case of hepatic enzymes elevations the treatment should be discontinued.

Use with caution in case of pre-existing hepatic disorders and cardiovascular disease.

Annexe 3-26

The clinical [illegible] after such a period the continuation of the treatment should be re-evaluate (in the French SPC a similar statement is already present in special warnings section)....

Section 4.8 **Adverse effects**

...Cases of hepatitis, allergic reactions including anaphylactic shock, blood disorders, hypertension, palpitations and confusion have been reported...

Rome, 12 October 1999

Commentaires sur le "revised AR" des Italiens

Compte-tenu des données disponibles, il est difficile de démontrer qu'il n'y a pas de risque surtout si l'on regarde les paramètres cinétiques (AUC) de Benfluorex, DeF et Fenfluramine.

Le Propositions des Italiens concernant étude clinique au long cours est satisfaisante. Il paraît difficile de faire autrement. (L'étude de cinétique évoquée précédemment ne serait pas utile compte-tenu des AUC disponibles).

Le fait de demander cette étude au long cours permettra au labo de se positionner : peut-être préférera-t-il retirer le produit plutôt que de mettre en place l'étude ?

Saint-Denis, le 2 2 NOV 1999

**Monsieur le Pharmacien Responsable
Laboratoires SERVIER
22, rue Garnier
92200 NEUILLY SUR SEINE**

Objet : MEDIATOR® (benfluorex)

Monsieur,

En septembre 1998, les autorités de santé italiennes ont demandé au Comité des Spécialités Pharmaceutiques (CSP) de réévaluer le profil de sécurité d'emploi du benfluorex, considérant que l'un de ses métabolites, la norfenfluramine, pouvait être à l'origine de la survenue d'hypertension artérielle pulmonaire ou d'atteinte des valves cardiaques.
Le CSP a chargé le groupe de travail de pharmacovigilance de cette réévaluation qui est conduite par l'Italie et la France.

Les données de pharmacovigilance analysées en commun soulèvent un certain nombre de questions auxquelles nous vous remercions de bien vouloir répondre.

- Quels sont les paramètres pharmacocinétiques chez l'animal et chez l'homme après administration de benfluorex au long cours (plus de 6 mois) ?
- Les effets cardio-vasculaires et neurologiques du benfluorex ont-ils été évalués chez l'animal et chez l'homme après administration au long cours (plus de 6 mois) ?
- L'efficacité au long cours du benfluorex sur la diminution des lipides sériques a-t-elle été évaluée par des essais cliniques contrôlés et a-t-elle été comparée aux traitements actuellement disponibles (fibrates, statines...)?
- L'efficacité au long cours du benfluorex dans le contrôle de la glycémie a-t-elle été évaluée par des essais cliniques contrôlés ?

En l'absence de données au long cours, envisagez-vous de mettre en place une étude clinique de plus de 12 mois avec contrôle périodique de la glycémie et des lipides sériques, échocardiographies et mesure des paramètres pharmacocinétiques ?

Il paraît, par ailleurs, souhaitable de soumettre dans les plus brefs délais, une demande de modification de l'information dans les pays de l'Union Européenne où le benfluorex est autorisé, afin de compléter et d'harmoniser le Résumé des Caractéristiques du produit.
Ces modifications concernent les rubriques 4.3 « contre-indications », 4.4 « mises en garde et précautions d'emploi » et 4.8 « effets indésirables » :

- *4.3 Contre-indications* :
  ajout de « Hypersensibilité au benfluorex ou à l'un des constituants ».
- *4.4 Mises en garde et précautions d'emploi* :
  Ajout de « Le traitement devra être interrompu en cas d'élévation des enzymes hépatiques » et « le benfluorex devra être utilisé avec précautions en cas d'atteintes hépatiques ou de maladies cardio-vasculaires pré-existantes. ».
- *4.8 Effets indésirables* :
  Ajout de « atteintes hépatiques, réactions allergiques incluant des cas de choc anaphylactique, atteintes hématologiques, hypertension, palpitations et confusions ».

Nous sommes à votre disposition si vous souhaitez de plus amples informations.

Nous vous prions d'agréer, Monsieur, l'assurance de notre considération distinguée.

XI -POINT SUR LA PHARMACOVIGILANGE EUROPENNE (GROUPE DE TRAVAIL DES 23 ET 24 NOVEMBRE 1999).

- Antiprotéases / rhabdomyolyse :

La possibilité d'une interaction entre les antiprotéases et les inhibiteurs de la HMG-COA réductase avec apparition d'une rhabdomyolyse est toujours en discussion.
En janvier 2000, le groupe de travail européen de pharmacovigilance fera le point pour déterminer si cet effet indésirable est plutôt « un effet de classe » ou bien s'il apparaît uniquement avec certaines statines.

- Halothane / arythmies cardiaques graves et fatales chez des enfants :

Une étude randomisée publiée dans le Lancet a montré que l'incidence de survenue d'arythmie cardiaque est six fois plus élevée avec l'halothane qu'avec le sévofurane chez des enfants ayant subi une anesthésie en chirurgie dentaire.
A la suite de cet article, le Royaume-Uni a décidé de contre-indiquer l'utilisation extra-hospitalière de l'halothane en chirurgie dentaire chez les patients âgés de moins de dix-huit ans.

- Phosphénytoïne (PRODILANTIN®) / effets cardio-vasculaires :

Ce médicament est autorisé selon une procédure de reconnaissance mutuelle et commercialisé en France depuis mai 1995. Le pays rapporteur (le Royaume-Uni) a rapporté 3 décès et 52 effets cardiovasculaires. Devant la gravité de ces cas, le Royaume-Uni a demandé au laboratoire de fournir une revue analytique des effets cardiaques au plan international pour le 23 décembre 1999. Le problème évoqué serait un débit de perfusion trop rapide. L'adaptation posologique s'avère également difficile.
Un essai clinique est en cours en France, incluant en particulier des enfants de moins de cinq ans. Une lettre d'information aux investigateurs a été finalisée au plan national. Ce courrier insiste sur la nécessité d'effectuer un monitoring cardio-respiratoire et sur le respect du débit de perfusion. (cf. annexe 2)

- Ropinirole / accès de sommeil d'apparition soudaine :

Depuis l'envoi d'une lettre d'information aux prescripteurs et aux pharmaciens par la firme entre le 10 et le 15 novembre 1999 relatant la possibilité de survenue d'accès de sommeil d'apparition soudaine sous Requip®, des nouveaux cas ont été notifiés notamment en Allemagne et en France. (1 cas en [illegible])
Un rectificatif d'AMM a été effectué le 9 novembre 1999 mentionnant les nouvelles mises en garde insistant sur la nécessité de ne pas conduire.
Pour mise en conformité avec l'AMM, de nouvelles notices vont être délivrées aux pharmacies [illegible] décembre 1999. De même, des stickers reproduisant le pictogramme obligatoire (une voiture dans un triangle rouge) devront être apposés sur le conditionnement.

- Benfluorex / hypertension pulmonaire primitive et valvulopathie :

Il a été demandé à la firme de réaliser une synthèse sur les données d'efficacité du médicament et sur la tolérance préclinique et clinique à long-terme et de déposer une demande de modification de l'information dans tous les pays où le produit est autorisé.

- Vigabatrin / restrictions du champ visuel :

Les mesures obligatoires de suivi des patients sous VIGABATRIN® ont été rediscutées (fiches d'observation recueillant les résultats de périmétrie). Les modalités d'application seront définies nationalement du fait d'une trop grande variabilité du nombre de patients traités par cette spécialité en fonction des pays européens (ex : 12 000 en France et 400 en Finlande).

Dossier VNL 10008

Monsieur,

J'ai bien reçu votre lettre en date du 22 novembre 1999 relative à la pharmacovigilance de notre spécialité MEDIATOR® et elle a, bien sûr, retenu toute mon attention.

La démonstration de l'efficacité antidiabétique et hypotriglycéridémiante de MEDIATOR® a été effectuée dans des études cliniques contrôlées versus placebo ou produits comparateurs.

L'indication de la spécialité dans le domaine des hypertriglycéridémies a été validée en 1987, et renouvelée sans aucune question à plusieurs reprises.

Le programme d'études à réaliser en vue de la validation de la spécialité dans l'indication diabète avait fait l'objet d'une concertation avec vous-même (votre courrier en date du 26 Janvier 1996). Le rapport de l'étude 6 mois démontrant l'efficacité de MEDIATOR® versus placebo et metformine chez le diabétique de type 2 mal contrôlé par le régime seul a bien été soumis en décembre 1997 puis en mai 1998 à l'Agence pour permettre d'obtenir la validation de la spécialité dans cette indication.

tel Pr Abadie

.../...

SERVIER

Nous serions tout à fait d'accord pour vous rencontrer afin de discuter des objectifs, des caractéristiques et des paramètres à inclure dans une future étude long terme qui pourrait permettre de conforter les données de pharmacocinétique, d'efficacité et d'acceptabilité de MEDIATOR®.

Il convient de souligner que les données de pharmacovigilance accumulées depuis 25 ans d'utilisation du médicament (plus de 25 millions de mois de traitement), apportent des données irremplaçables notamment pour la détection d'évènements indésirables sévères, en particulier ceux dont l'incidence dans la population générale est très faible.

Par ailleurs, la réévaluation du profil de sécurité d'emploi de MEDIATOR® est le sujet d'une enquête officielle de pharmacovigilance depuis le 11 mai 1998, confiée au Centre Régional de Pharmacovigilance de Besançon (Pr. P. Bechtel). Au cours de l'année 1998, nous avons mis à la disposition du rapporteur les informations demandées, et en particulier la totalité des observations d'effets indésirables collectées en France par notre laboratoire depuis 1976, année de mise à disposition de MEDIATOR® aux prescripteurs. Ces observations ainsi que celles recueillies par les Centres Régionaux de Pharmacovigilance ont été analysées par le rapporteur de l'enquête. Cependant, nous ne sommes pas informés des conclusions de l'enquête et nous ignorons si la Commission Nationale de Pharmacovigilance a évalué les données disponibles.

Les conclusions de cette Commission (ainsi que les données de pharmacovigilance « analysées en commun » dont vous faites mention) pourraient permettre d'argumenter d'éventuelles modifications du Résumé des Caractéristiques du Produit. Nous nous tenons à votre disposition pour revoir ces données avec vous.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Objet : MEDIATOR® (benfluorex) / votre courrier en date du 18 février 2000

Monsieur,

Pour faire suite à votre courrier en date du 18 février 2000, nous vous informons que le rapport d'évaluation relatif aux données de pharmacovigilance du benfluorex, présenté au groupe de travail de pharmacovigilance européen, a été rédigé par l'Italie.
En conséquence, si vous souhaitez obtenir de plus amples informations sur ce rapport d'évaluation en vue d'argumenter votre demande de modification du RCP, vous pouvez contacter l'unité de pharmacovigilance du Ministère de la Santé Italien. La personne chargée du dossier est Monsieur le Dr Giuseppe PIMPINELLA.

Nous vous prions d'agréer, Monsieur, l'assurance de notre considération distinguée.

Le Chef d'Unité de Pharmacovigilance

Objet : MEDIATOR® (benfluorex)

Monsieur,

A la demande du Comité des Spécialités Pharmaceutiques, le benfluorex fait l'objet d'une réévaluation par le groupe de travail de pharmacovigilance européen depuis septembre 1998. Cette réévaluation est conduite par l'Italie (pays rapporteur) et la France (pays co-rapporteur).

A la suite d'une première évaluation des données de pharmacovigilance, nous vous avons adressé, le 22 novembre 1999, un courrier soulevant un certain nombre de questions auxquelles nous aurions souhaité obtenir des réponses.

Devant l'absence de réponse, le groupe de travail de pharmacovigilance européen a proposé de faire le point sur ces questions à l'Agence Européenne du Médicament, en présence du titulaire de l'autorisation de mise sur le marché (AMM) du benfluorex et des rapporteurs italiens et français. L'objectif de cette réunion est de redéterminer les questions pour lesquelles les rapporteurs attendent une réponse du titulaire de l'AMM. Il ne s'agit en aucun cas d'une discussion scientifique du dossier.

Cette réunion se tiendra le :

Jeudi 30 novembre 2000 à 10 heures,

E.M.E.A. (European Agency for the Evaluation of Medicinal Products)
7 Westferry Circus, Canary Wharf
LONDON E14 4HB
UK

Nous vous prions d'agréer, Monsieur, l'assurance de notre considération distinguée.

Benfluorex

Compte-rendu de la réunion du 28 novembre 2000 en présence de M. Wagniart (laboratoires Servier), Mme Castot et Mme Fosset Martinetti

But de la réunion : faire le point sur l'état d'avancement du dossier en prévision de la réunion organisée à l'EMEA le 30 novembre 2000, en présence des laboratoires Servier et des rapporteurs italiens et français.

Le benfluorex est autorisé et commercialisé dans 6 pays de l'Union Européenne, la France représentant environ 85% des parts de marché. La grande majorité des observations de pharmacovigilance concerne la France.

En septembre 1998, les autorités de santé italiennes ont demandé au CSP de réévaluer le profil de sécurité d'emploi du benfluorex. Cette réévaluation est conduite par l'Italie et la France.

Après analyse des données de pharmacovigilance, un courrier a été adressé aux laboratoires Servier le 22 novembre 1999. Dans ce courrier, il était notamment demandé aux laboratoires :

« En l'absence de données au long cours, envisagez-vous de mettre en place une étude clinique de plus de 12 mois avec contrôle périodique de la glycémie et des lipides sériques, échocardiographies et mesure des paramètres pharmacocinétiques ?

Il paraît, par ailleurs, souhaitable de soumettre dans les plus brefs délais, une demande de modification de l'information dans les pays de l'Union Européenne où le benfluorex est autorisé, afin de compléter et d'harmoniser le Résumé des Caractéristiques du produit.
Ces modifications concernent les rubriques 4.3 « contre-indications », 4.4 « mises en garde et précautions d'emploi » et 4.8 « effets indésirables » :

- *4.3 Contre-indications :*
  ajout de « Hypersensibilité au benfluorex ou à l'un des constituants ».
- *4.4 Mises en garde et précautions d'emploi :*
  Ajout de « Le traitement devra être interrompu en cas d'élévation des enzymes hépatiques » et « le benfluorex devra être utilisé avec précautions en cas d'atteintes hépatiques ou de maladies cardio-vasculaires pré-existantes. ».
- *4.8 Effets indésirables :*
  Ajout de « atteintes hépatiques, réactions allergiques incluant des cas de choc anaphylactique, atteintes hématologiques, hypertension, palpitations et confusions ».

En mars 2000, une demande de modification de l'information relative aux réactions allergiques a été déposée en France et dans les autres pays de l'Union Européenne.

Annexe 3-34

M. Wagniart a rencontré récemment les autorités italiennes qui maintiennent leur souhait de mentionner dans le RCP les réactions allergiques, les atteintes hépatiques et les confusions.
En conséquences, les laboratoires Servier envisagent de déposer rapidement un complément à la demande de modification de mars 2000 en proposant l'ajout de « augmentation des enzymes hépatiques, très rares cas d'hépatites » et « confusion ».

Concernant l'étude clinique au long cours, les laboratoires Servier présenteront un projet d'étude lors de la réunion du 30 novembre à l'EMEA dont les principales caractéristiques sont les suivantes :

Etude comparative versus acarbose sur 12 mois, multicentrique (plusieurs pays : France, Italie et éventuellement Espagne). Association des deux traitements chez certains patients.
Sujets diabétiques avec surcharge pondérale : nouveaux diabétiques ou diabétiques sans traitement depuis plus de 12 mois.
Au cours de cette étude : plan de cinétique du benfluorex et de ses métabolites.
Les laboratoires Servier envisage d'utiliser les résultats de cette étude pour la réévaluation de l'ASMR prévue en France dans 3 ans.

En ce qui concerne l'échocardiographie, compte-tenu des critères d'inclusion et d'exclusion (BMI, echogénicité…), une seconde étude serait proposée : étude contrôlée sur 12 mois.

Les autorités espagnoles s'inquiètent depuis quelques mois de l'utilisation croissante de préparations magistrales à base de benfluorex. Il ne s'agirait pas de déconditionnement de la spécialité. La Commission de Pharmacovigilance espagnole se réunissait à ce sujet le 23 novembre.
Les laboratoires Servier sont prêts à proposer une DDL à l'attention des prescripteurs espagnols leur rappelant les indications du benfluorex.

Toutes ces propositions seront de nouveau exposées lors de la réunion du 30 novembre à l'EMEA.

Adpoted Minutes

G Pimpinella, C Fosset-Martinetti and A Castot hold a meeting with the marketing authorisation holder Servier on 30 November 2000 to discuss outstanding issues on this topic. G Pimpinella reported to the PhVWP that the marketing authorisation holder will submit in January 2001 to Italy and France the draft protocol on a study on efficacy in type II-diabetes in which periodic echocardiography will be foreseen to detect cardiotoxic effects. Italy and France will circulate this to Member States together with a preliminary Assessment Report for consideration, and discussion will take place at the PhVWP in March 2001. G Pimpinella further informed the PhVWP that the marketing authorisation holder intends to submit a Variation Application to change the Summary of Product Characteristics with regard to anaphylactic reactions, hepatotoxicity and confusion.

Proposed Issues for Discussion

BENFLUOREX - Therapeutic indications

France :

Since 1987 (validation of the marketing authorization) :

« - Adjuvant to adequate diet in hypertriglyceridemia. The follow-up of the diet is always requested.
- Adjuvant to diet in asymptomatic diabetes with overweight.
***Note* : the efficacy in primary and secondary prevention of the complications of atherosclerosis has not been proved. »**

In May 1998, the MAH asked an extention of therapeutic indication in type II diabetes.

In December 1999, the opinion of the French advisory board was unfavourable. After appeal procedure, the French advisory board of September 2000* maintains the unfavourable opinion :

« Considering the methodologic flaws of the clinical trial, no conclusion can be made on the hypoglycemic effect of benfluorex versus placebo and benfluorex versus metformin.
The therapeutic indication proposed is :
« - Adjuvant to adequate diet in hypertriglyceridemia.
- Adjuvant to diet in diabetes with overweight.
***Note* : the efficacy in primary and secondary prevention of the complications of atherosclerosis has not been proved. »»»**

****adoption of this draft opinion on 16 November 2000***

BENFLUOREX - Therapeutic indications

Luxembourg :

- **Adjuvant to adequate diet in hypertriglyceridemia. The follow-up of the diet is always requested.**
- **Adjuvant to diet in the symptomatic dibetes with overweight.**

Portugal :

- **In association to diet in the asymptomatic diabetes with overweight.**
- **Isolated or associated endogenous hypercholesterolemia and hypertriglyceridemia in adult.**

Spain :

- **Benfluorex has activity on several factors related to the atherogenic risk.**

1. **Action on the lipidic metabolism :**
   Hypertriglyceridemia, adult hypercholesterolemia, isolated or associated, when cannot be exclusively controlled with dietary measures.
2. **Action on the glucidic metabolism : coadjuvant of the diet in the asymptomatic diabetes with overweight.**
3. **As a complementary action, benfluorex in obese hyperuricemic patients, exerts a decrease in the uricemic levels.**

Italy :

Hyperlipidemia not repondent to the diet only. Adjuvant in the obesity associated with glyco-lipid metabolism modifications.

C. FOSSET MARTINETTI

Saint-Denis, le 14 décembre 2000

Minutes of the meeting on benfluorex
EMEA – 30 November 2000

Participants : France : Mrs A. CASTOT (vice-chairperson of the PhVWP)
Mrs C. FOSSET MARTINETTI

Italy : Mr G. PIMPINELLA

MAH : Servier : Mrs BESSAC
Mr WAGNIART

Conclusions :

- ***Draft protocol study :***

The MAH has agreed to submit before the end of January 2001, two draft protocols :

- a 12 months multi-center randomized controled study on benfluorex versus acarbose (with probably two groups of 300 patients).
The main criteria of efficacy will be glycosylated hemoglobin. The secondary criteria will be glycemia and serum lipids. In addition, the pharmacokinetic parameters of benfluorex and its main metabolites will be measured.
A measurement of hepatic parameters seems appropriate in both groups because of the risk of hepatotoxicity of acarbose and benfluorex.

- a 12 months study on benfluorex with periodic echocardiographic control (same number of patients as above, anyway, the same patients may be enrolled in both protocols).

These two protocols will be sent to French and Italian rapporteurs and first assessed at national level, before discussion within the PhVWP.

Following the results of the study, Italy intends to review the indications.

- ***Type II variation :***

The MAH has agreed to submit as soon as possible a variation type II in member states where benfluorex is marketed to add in the section 4.8. hepatic disorders, confusion and allergic reactions.

Study protocol on benfluorex :
« a one-year, multicentre, international, randomised, double-blind comparison of benfluorex and acarbose administered orally for the treatment of type 2 diabetic patients »
ASSESSMENT REPORT

Assessors :
Pr. P. BECHTEL
Dr. J. CARON

I- INTRODUCTION

The therapeutic indications of benfluorex are :
- adjuvant to adequate diet in hypertriglyceridemia,
- adjuvant to diet in diabetes with overweight.

In European Union, benfluorex is currently marketed in France, Luxembourg, Portugal, Spain, Italy and Greece (national procedures).

In September 1998, Italy requested to the CPMP an assessment on safety of benfluorex considering that the pharmacological activities of benfluorex might depend on the metabolic biotransformation to norfenfluramine (active metabolite of fenfluramine).

In November 1999, considering the lack of data, after long term administration (more than 6 months), on efficacy, pharmacokinetic parameters, cardiovascular and neurological effects of benfluorex, Italy (rapporteur) and France (co-rapporteur) requested to the MAH to carry out a long term study with periodic echocardiographic, glycaemic, serum lipids level controls and measurements of pharmacokinetic parameters.

Following a meeting dated 30th November 2000 at the EMEA, the MAH submitted in February 2001 a draft phase III study protocol.

II- PROTOCOL ANALYSIS

3 points are discussed in the introduction :
- risk of hypoglycaemia with sulfonylurea and lactic acidosis with metformin,
- benfluorex and alpha-glucosidase inhibitors have been safely used in clinical practice over several years,
- lack of long term data on the anti-hyperglycaemic efficacy and safety of benfluorex.

II.1- Objectives

The objectives of this phase III study are :

- to investigate the long term efficacy (1 year) of benfluorex versus acarbose in a multicentre, international double blind study. The primary efficacy variable is the evolution from inclusion to the end of the treatment period of glycated haemoglobin level (HbA1c), centrally measured by HPLC. The secondary efficacy variables are fasting plasma glucose levels, fasting serum insulin levels, fasting lipids levels.
- The safety of benfluorex and acarbose will be assessed throughout the 1-year double blind period.
- Population pharmacokinetics will be assessed.

II.2- Study plan

II.2.1- Baseline period (14 days) :

The patient will continue his usual anti-diabetic treatment (if any) until the inclusion visit.
Evaluation of the patient eligibility :
- physical examination and vital signs measurement,
- ECG,
- echocardiography,
- ophtalmologic examination,
- biological examination,
- general records.

II.2.2- Titration period (70 days) :

At D0 : all the patients receive the first randomised treatment.
Dose level 1 : benfluorex : daily dose of 150 mg
acarbose : daily dose of 50 mg

At D14 : all the patients receive dose level 2 : benfluorex : daily dose of 300 mg
acarbose : daily dose of 100 mg

At D28 : the dose level of benfluorex is increased to dose level 3 if fasting plasma glucose level is ≥7.8 mmol/L. All patients in the acarbose group will receive dose level 3.
Dose level 3 : benfluorex : daily dose of 450 mg
acarbose : daily dose of 150 mg

At D70 : the dose level is increased if HbA1c ≥ 6.5% :
dose level 4 : benfluorex : daily dose of 450 mg
acarbose : daily dose of 300 mg.

II.2.3- maintenance period (from D70 to M12) :

4 visits will be performed : M4, M6, M9 et M12.
If the HbA1c value is ≥ 6.5%, the dose level will be increased by one dose level (if the patient is not already receiving dose level 4).

In case of adverse events and/or repeated hypoglycaemic episodes, the dose level can be decreased.
From visit M6, if the patient is already receiving dose level 4 and HbA1c value is > 8%, an antidiabetic drug with a different mode of action can be added (to be discussed by Servier).

II.3- Study population

Type 2 diabetic patients aged ≥ 35 years inclusive, suboptimally controlled with diet or low to moderate doses of an oral hypoglycaemic agent in monotherapy. The dietary advice and the oral hypoglycaemic agent dosage should be unchanged since at least 2 months.

The non inclusion criteria and the inclusion criteria are detailed and seem complete. They allow to define an homogeneous patient group with exclusion of well known selection biais.

The criteria for premature discontinuation of treatment are well defined too.

II.4- Efficacy and safety criteria

II.4.1- efficacy :

All the measurements will be analysed by a central laboratory :
HbA1c,
fasting plasma glucose,
fasting serum insuline,
fasting C peptide,
fastmg serum lipids.

II.4.2- acceptability :

Adverse events will be recorded at each visit and must be subject to medical follow-up and suitably documented.
A full physical examination will be performed at baseline, M4 and M12.
An ECG and an echocardiography will be performed at baseline, M6 and M12.
Laboratory examination will be performed at baseline, D70, M6 and M12.

II.4.3- Pharmacokinetic parameters of benfluorex and metabolites (S422, S1475 and S585):

Measurement of plasma concentration of benfluorex and metabolites will be performed two times during the afternoon (14 :00 and 18 :00) at D28, D70, M4, M6, M9 and M12.
Moreover, two alternatives are proposed :
- a pharmacokinetic assessment performed over 24 hours at M6 in a subgroup of forty patients recruited in two to four centers,
or
- 24 hour pharmacokinetic assessment performed in a specific open label study carried out in parrallel in twenty patients treated with benfluorex.

A population pharmacokinetic analysis will be performed using the NONMEM software version 5.1.

II.5- Sample size

297 subjects per group are necessary to show a non-inferiority between groups if the real difference is null with a 90% power. Taking into account the number of tretaments groups and the rate of drope-out patients, the total sample size required for the study is 684 patients.

The total number has been set at 700 patients (two groups of 350 patients).

II.6- Appendices

The draft protocol encloses 5 appendices :
- diagnosis and classification of diabetes mellitus,
- chronic heart failure classification,
- concomitant treatments allowed and not allowed,
- Cockroft and Gault formula,
- echocardiography procedure.

III- ASSESSORS COMMENTS AND CONCLUSION

The assessors are agree with the MAH proposal. This protocol will probably help to answer to the following points :
- long term efficacy,
- long term security,
- pharmacokinetic parameters.

However, assessors have some comments :
- The pharmacokinetic study performed over 24 hours must be done two times (M6 and M12 for example) in the subgroup of forty patients included in the study. Such a study could allow to discover a link between adverse reactions reported and pharmacokinetic of benfluorex and metabolites. A specific open label pharmacokinetic study in parallel would be less informative.
- The three echocardiographic evaluation (baseline, M6 and M12) should be performed, for each patient, in a same center and, if possible, by a same evaluator. This point must be mentioned in the protocol study.

Objet : **MEDIATOR® 150 mg, comprimé enrobé**
Dossier VNL 10008

Madame,

Comme convenu lors de la réunion de pharmacovigilance à l'EMEA en date du 30 novembre 2000, nous vous adressons, ci-joint, pour notre spécialité **MEDIATOR® 150 mg**, comprimé enrobé, le synopsis du protocole d'étude intitulé :

« A one-year, multicentre, international, randomised, double-blind comparison of Benfluorex (150mg to 450mg daily) and Acarbose (150mg to 300mg daily) administered orally for the treatment of type 2 diabetic patients »

Ce synopsis de protocole d'étude d'efficacité de Benfluorex versus Acarbose sur 12 mois inclut également l'étude écho-cardiographique souhaitée.

Nous vous prions de croire, Madame, à l'expression de nos salutations distinguées.

Pierre MONTES

APPENDICES 19

3. INTRODUCTION

Type 2 diabetes mellitus is characterised by abnormalities of insulin secretion and reduced response to insulin in its target tissues.[1] The early pathogenetic events are still poorly understood. Several studies have however indicated that insulin resistance plays a role in impaired glucose tolerance and type 2 diabetes mellitus.[2-4] Therefore, a treatment that improves insulin action is part of a rationale therapy of type 2 diabetes, when dietary measures and exercise are not sufficient to provide adequate blood glucose control.

One of the major concerns in the treatment of diabetes is the risk of hypoglycaemia while attempting to control plasma glucose. This is particularly true in the elderly population: the main causes of drug-induced mortality in patients with diabetes mellitus are insulin- and/or sulfonylurea- induced hypoglycaemia,[5-6] and metformin associated lactic acidosis.[7]

Drugs which are not associated with hypoglycaemia and/or lactic acidosis, and which have been safely used in clinical practice over several years, are benfluorex and alpha-glucosidase inhibitors:

- Benfluorex is an agent that possesses both anti-hyperglycaemic and hypolipidaemic properties. Its main action in diabetic patients is to improve insulin sensitivity, as demonstrated in 3 double-blind, placebo-controlled studies using the euglycaemic [8,9] or the isoglycaemic [10] clamp technique. Its mode of action is different from that of metformin or thiazolidinediones. It encompasses a direct effect on the liver (decrease in the activity and gene expression of key enzymes involved in the hepatic metabolism of glucose and free fatty acids) and an indirect effect on the muscle through a decrease in triglycerides influx.[11-18]

- Alpha-glucosidase inhibitors (e.g. acarbose, miglitol) reduce or delay carbohydrate digestion by competitive enzyme inhibition at the ciliate border of the small intestine. Because of their mechanism of action, these drugs act mainly on the post-prandial hyperglycaemia and they do not induce hypoglycaemia. The most common adverse effect of these drugs is abdominal discomfort associated with flatulence and diarrhoea which occurs in approximately 50% of patients, but tend to recede over time.[19]

We currently lack long-term data on the anti-hyperglycaemic efficacy of benfluorex. Most data originate from double-blind placebo-controlled trials of 3-month duration in various populations of type 2 diabetic patients: as single oral antidiabetic therapy in newly-diagnosed patients,[20] and as combination therapy in patients poorly controlled with sulphonylurea or metformine alone [21-22] or with insulin.[23-25] A 6-month study was carried out in 722 type 2 diabetic patients still suboptimally controlled after 2 months of diet under the supervision of a dietician (benfluorex vs metformin vs placebo). It showed a significant decrease in HbA1c with benfluorex and metformin, whereas blood glucose control deteriorated in the placebo group. However, this study, which began in 1996, did not follow the recent recommendations for the treatment of type 2 diabetes, i.e. drug treatment when HbA1c is over 6.5%, and a part of the population was below this limit. Furthermore, it did not include elderly patients nor patients with impaired renal function, due to precautions regarding the use of metformin. Therefore, it is difficult to extend its conclusion to the general diabetic population.

The data should therefore be confirmed in a large population of type 2 diabetic patients over 1 year. The primary objective of the present phase III study is to investigate the **long-term efficacy** of benfluorex in a population of type 2 diabetic patients suboptimally controlled with diet alone or low to

moderate doses of oral hypoglycaemic agents, in comparison to acarbose. The current therapeutic recommendations for type 2 diabetes will be closely followed.

Another objective is to assess the **long term safety** of benfluorex. The other agents acting on the peripheral action of insulin have quite extensive precautions for use:

- Metformin is contra-indicated in situations associated with a risk of hypoxia (*e.g.* cardiac or respiratory insufficiency, recent myocardial infarction) and in patients with altered renal function (creatinine level ≥ 135 µmol/L in men and ≥ 110 µmol/L in women, or less in case of reduced muscle mass), both situations rather frequent in type 2 diabetic patients, notably in the elderly, who represent 35 to 50% of diabetic patients.[26, 27] They are linked to an increased risk of lactic acidosis.

- Thiazolidinediones are contraindicated in patients with any degree of cardiac failure or history of cardiac failure (NYHA stages I to IV) and in patients with hepatic impairment. They can cause fluid retention which may exacerbate or precipitate heart failure; this has been reported more frequently in patients with a history of heart failure, in elderly patients, and in patients with mild or moderate renal failure, and the risk of oedema is increased with concomitant administration of NSAID. Thiazolidinediones are also associated with a reduction of haemoglobin levels, with an increased risk of anaemia in patients with low haemoglobin levels. Finally, they are contraindicated in patients with hepatic impairment; there have been rare reports of hepatocellular dysfunction with the more recent thiazolidinediones.

Benfluorex has no contra-indication other than chronic pancreatitis. No specific safety concern has been raised in the clinical trials to date, nor in the periodic safety reports (since its market introduction, benfluorex has been used over more than 25 million patient-months). The aim of this study is to assess the long term safety of benfluorex in the context of a clinical trial, in a population representative of type 2 diabetic patients, including elderly patients and patients with altered renal function. A full assessment of the safety profile of benfluorex will be carried out, including echocardiography, in order to have a comprehensive dossier in a setting close to the reality of clinical practice.

Finally, population kinetics will be assessed in this population that should include patients of various age and degree of renal function, and with various patterns of concomitant treatment.

4. OBJECTIVES

The primary objective is to **assess the efficacy of benfluorex compared to acarbose**, both medications being administered in optimal dosages for the treatment of type 2 diabetic patients.
The secondary objective is to assess the safety of benfluorex compared to acarbose

- The primary efficacy variable is the evolution **from inclusion to the end of the treatment period of glycated haemoglobin level (HbA1c), centrally measured by HPLC.**

- Secondary efficacy variables are:
  1. fasting plasma glucose levels,
  2. fasting serum insulin levels,
  3. fasting lipids (total cholesterol, HDL- and calculated LDL-cholesterol, triglycerides) levels.

- The safety of benfluorex will be assessed in comparison with acarbose throughout the 1-year double blind period.

- Population pharmacokinetics will also be assessed.

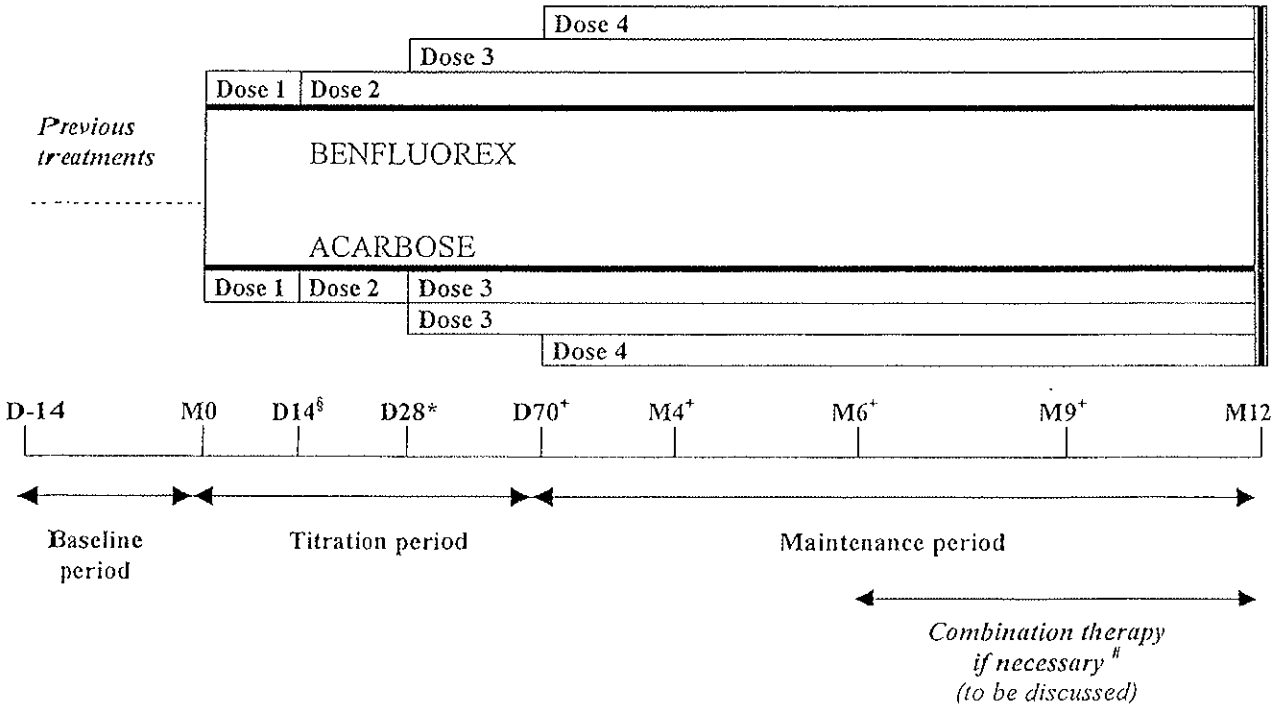
5. STUDY PLAN

5.1 Description of study plan

The study plan is shown in figure 1.

Figure 1: Study plan

Time unit: D =Day, M = Month.



§ dose level increase for all patients at D14.

* dose level increase by one step if FPG is ≥ 7,8 mmol/L at D28, all patients in the acarbose group will actually receive dose 3 whatever the FPG level (in a blinded manner: doses will not be identified on the treatment boxes).

\+ dose level increase by one step if HbA1c ≥ 6.5% from D70 (from M4: if the patient is not already receiving dose level 4).

\# *(from M6, possibility to add another agent if HbA1c > 8% and the study drug has been given at maximal dosage since at least 2 months : TO BE DISCUSSED)*

This is a prospective, multinational, multicentre, randomised, double blind comparative clinical phase III study with therapeutic benefit.

The study will be performed in **700 type 2 diabetic out patients** (350 patients in each group).

The following treatments will be given :

- **benfluorex** at the daily doses of 150 mg (dose level 1), 300 mg (dose level 2) and 450 mg (dose levels 3 and 4);
- **acarbose** at daily doses of 50 mg (dose level 1), 100 mg (dose level 2), 150 mg (dose level 3), and 300 mg (dose level 4).

If the eligibility is confirmed (inclusion = M0), the patient will start a **12-month double blind period** including a **70 day titration period** during which the doses of benfluorex and acarbose will be up-titrated to optimal dosage according to the fasting plasma glucose value value (at day 28) and the HbA1c level (starting from day 70). **The first titration step (from dose level 1 to dose level 2) will be carried out in all patients at day 14.**

A total of 8 clinical visits will be carried out for each patient during the study. The study will proceed as follows (see table 2 for the details of examinations):

- **the selection visit (D-14)** performed within 2 weeks (4 weeks as a maximum) prior to inclusion to inform the patient about the study (written informed consent to be signed) and evaluate his/her eligibility **before prescribing or performing** the examinations required for the study.
  - physical examination and vital signs measurement,
  - ECG 12-lead,
  - echocardiography,
  - ophthalmologic examination (if not performed within 1 year)
  - biological examination: including standard biology, HbA1c, fasting plasma glucose, fasting insulin, fasting lipids (triglycerides, total cholesterol, HDL-cholesterol, calculated LDL), creatinine level (clearance calculated with the Cockroft and Gault formula).
  - general records (demography, life style, medical history, concomitant medications).

  The patient will continue his/her usual anti-diabetic treatment (if any) until the inclusion visit.

- **the inclusion visit (M0)** to confirm the eligibility of the patients by checking all the clinical and biological data prescribed at the selection visit as well as the use of concomitant medications. The eligible patient will then have a baseline clinical assessment (physical examination, vital signs measurement). **All the patients will receive the first randomised treatment (dose level 1)** instead of their usual OHA (if any), concomitantly to reinforced advice on diet and physical exercise.

During the **titration period** 2 visits will be performed:

- **visit D28** will be performed 28 days after M0 [acceptable margin of days (-5; +8)]
- **visit D70** will be performed 70 days after M0 [acceptable margin of days (-7; +10)]

During the **maintenance period** 4 visits will be performed:

- **visit M4** will be performed 4 months after M0 [acceptable margin of days (-10; +14)]
- **visit M6** will be performed 6 months after M0 [acceptable margin of days (-14; +21)]
- **visit M9** will be performed 3 months after M6 [acceptable margin of days (-21; +21)]
- **visit M12** will be performed 6 months after M6 [acceptable margin of days (-21; +21)]

5.2 Definition of the study population

5.2.1 Selection criteria

Some of the examinations such as centrally analysed metabolic parameters, standard biology, echocardiography and the 12-lead ECG (and the ophthalmologic examination -if not performed within 1 year) will be prescribed at the selection visit. The results of these examinations must be available at the **inclusion visit in order to determine the eligibility of patients.**

The eligible patients will be **type 2 diabetic patients suboptimally controlled with diet or low to moderate doses of an oral hypoglycaemic agent.** The population will be stratified on the triglycerides level at baseline (≤ or > 2.3 mmol/L).

5.2.1.1 Demographic and ethnic characteristics

- patients **aged ≥ 35 years** inclusive,

5.2.1.2 Characteristics of type 2 diabetes

- Type 2 diabetes diagnosed as published by the WHO in 1999 (see appendix 1),
- Patients currently treated with either: **diet alone or OHA in monotherapy at low or moderate doses**, the dietary advice and the OHA dosage being unchanged since at least 2 months,
- Patients previously treated by the following daily OHA doses will be eligible in the study:

Previous treatment	Maximal admitted daily dosage at inclusion
Gliclazide	160 mg
Glibenclamide	10 mg
Glimepiride	4 mg
Glipizide	10 mg
Glipizide GITS	10 mg
Repaglinide	6 mg
Metformin	1000 mg

(thiazolidinediones and nateglinide will be added if become available before the start of the study)

Patients previously treated by alpha-glucosidase inhibitors or benfluorex at non-maximal dosage can be included:

Previous treatment	Maximal admitted daily dosage at inclusion
Acarbose	150 mg
Benfluorex	300 mg
Miglitol	150 mg

- with no severe diabetic complications (see non selection criteria).

5.2.1.3 Clinical examination

- in relative good health,
- BMI ≤ 37 kg/m^2,

5.2.1.4 Informed consent

- having freely given their written informed consent to participate in the study,
- agreeing to attend the scheduled examinations,

5.2.2 Non selection criteria

5.2.2.1 Related to diabetes

- type 1 diabetes,
- history of diabetes ketoacidosis, with or without coma,
- type 2 diabetes currently treated with more than 1 OHA or OHA at high doses,
- type 2 diabetes currently treated with insulin,
- any expected indication of chronic insulin treatment during the study,
- recent metabolic impairment due to an inter-current illness, an infection or surgery within the last 2 months.

5.2.2.2 Related to concomitant diseases

Any recent, unstable, uncontrolled concomitant pathology that could interfere with the conduct of the study or the pharmacodynamic evaluation:

- retinopathy with neo-vascularisation and/or sight-threatening macular oedema (fundus examination performed within 1 year),
- any unstable or recent macrovascular complications such as unstable angina, myocardial infarction or cerebral stroke within the last 6 months,
- any coronary re-vascularisation procedure (angioplasty, stent, bypass) within the last 6 months,
- high blood pressure levels: sitting systolic blood pressure ≥ 160 mm Hg and/or sitting diastolic blood pressure ≥ 100 mm Hg, with or without treatment. This is not a strict non selection criterion; it must be carefully checked at inclusion: if blood pressure levels are still over the limit, then the patient must not be included,
- chronic hepatic failure such as cirrhosis,
- acute or chronic conditions, apart from diabetes, that would compromise end-point evaluation into the long-term follow-up, e.g. all factors/diseases that interfere with the HbA1c analysis (serious anaemia, haemoglobinopathy, haemolysis, blood donor in the previous 12 weeks),
- any severe concurrent illness that would limit life expectancy or require prohibited treatments.

5.2.2.3 Related to the patient

- pregnancy, breastfeeding or possibility of becoming pregnant during the study without adeqaute contraception (intra-uterine device, oral contraception, barrier contraception could be acceptable if judged adequate by the investigator).
- drug and/or alcohol abuse,

- participation in another study at the same time or within 3 months prior to selection
- unlikely to cooperate in the study,

5.2.2.4 Related to benfluorex treatment

- known hypersensitivity to benfluorex or any of the excipients (the benfluorex monography will be available in the appendices),
- chronic pancreatitis,

5.2.2.5 Related to acarbose treatment

- known hypersensitivity to acarbose or any of the excipients (the acarbose monography will be available in the appendices),
- inflammatory bowel disease, colonic ulceration, partial intestinal obstruction or patient predisposed to intestinal obstruction, chronic intestinal diseases associated with marked disorders of digestion or absorption, patient who suffer from states which may deteriorate as a result of increased gas formation in the intestine, e.g. large hernias,
- creatinine clearance of <25ml/min/1.73 m^2.

5.2.2.6 Related to concomitant treatment (s)

- anticipated need of systemic treatment with corticosteroids for more than 15 days.

A list of authorised and non-authorised concomitant drugs is added in appendix 3.

5.2.2.7 Related to the echocardiography assessment

- poor echogenicity (at least 75% of the endocardial border of the left ventricle should be seen),
- severe chronic heart failure (grades III & IV of the New York Heart Association classification) (appendix 2),
- valvulopathy that may require surgical treatment during the course of the study (i.e. valve regurgitation ≥ step 3, aortic stenosis with peak gradient > 30 mm Hg or mitral stenosis with mean diastolic gradient > 8 mm Hg),
- chronic lung disease.

5.2.3 Inclusion criteria

The eligibility of the patients will be confirmed if:

- HbA1c value (analysed by the central laboratory) is as follows :

Previous treatment	HbA1c required at inclusion (HPLC method, normal range 4-6%)
Diet alone	≥ 7%
Monotherapy OHA	≤ 8.5 %

- The results of the clinical and biological investigations performed at the selection visit or during the pre-inclusion period are available to determine eligibility,

- The duration of the pre-inclusion period (between selection and inclusion) is not exceeding 1 month,

5.2.4 Non-inclusion criteria

- non-respect of the selection and non-selection criteria after the clinical and biological examinations performed since the selection visit,
- blood pressure above the upper limit (see 5.2.2.) at both the selection and the inclusion visit,
- abnormal liver function tests : serum transaminases > 3 times the upper normal laboratory value; any abnormality of other parameters such as bilirubine, γ glutamyl transferase, alkaline phosphatase could be acceptable for the study if complementary examinations do not indicate the presence of any hepatic pathology and if the abnormality is well documented and stable,
- retinopathy with neo-vascularisation and/or sight-threatening macular oedema (if fundus examination performed between selection and inclusion visit)
- related to acarbose treatment: chronic renal failure, with creatinine clearance < 25 ml/min/1.73 m^2 according to Cockroft and Gault formula (see appendix 4; upper limit value can be lowered if judged necessary by the investigator according to the physiological age of the patient and the muscular mass).

5.2.5 Premature discontinuation of treatment

5.2.5.1. Criteria for premature discontinuation of treatment

Treatment may be prematurely and definitively discontinued for a participant for one of the following reasons :

- **non medical reason** (withdrawal of consent…),
- **major deviation from protocol** (including pregnancy or lactation),
- in case of **major symptoms related to hyperglycaemia** such as rapid weight loss, polyuria – polydipsia, ketonuria, asthenia **confirmed by a fasting plasma glucose value > 15 mmol/l (2.7 g/l)** or, in the absence of symptoms, in case of FPG > 16.5 mmol/L on 2 measurements at least 2 days apart, in both cases **not explained by external factors** (intercurrent disease, modification of diet or physical activity, concomitant treatments). This will be considered as lack of efficacy if it occurs after at least 1 month of treatment at maximal dose level.
- **adverse event** or any condition incompatible with continuation of either treatment according to the investigator. This includes hyperglycaemia not qualified as lack of efficacy (see above).
- **lost to follow-up**: when the investigator has no news of the participant, he/she must make every effort to contact him/her, to establish the reason for the discontinuation of treatment, and to suggest the participant to come to an end-of-study visit. The investigator must document all the efforts made to contact the patient. If all these attempts to contact the participant fail, the investigator can declare the participant "lost to follow-up".

In cases corresponding to the above, the study treatment will be stopped and the investigator will be responsible to take all the appropriate therapeutic measures to ensure blood glucose control.

5.2.5.2. Procedure

(will be detailed in the final draft)

5.3 Study treatments

5.3.1 Treatments administered and treatment adaptation

The randomisation will be balanced (350 patients in each group) and global for all the participating countries.

Throughout the study the patients will receive one tablet 3 times a day immediately before each of the 3 main meals, with a matching placebo when necessary. The appearance of benfluorex, acarbose and placebo capsules, regardless of their contents, will be identical.

5.3.1.1 Identification of treatments administered

Benfluorex and acarbose active drug and their placebo will be given in three administrations per day: one tablet before each main meal (breakfast, lunch and dinner). During the titration period the doses will be adapted following the instructions described in the section "treatment adaptation".
For **benfluorex** the daily doses at the **4 dose levels** will be 150 mg, 300 mg and 450 mg (dose levels 3 and 4).
For **acarbose** the daily doses at the **4 dose levels** will be 50 mg, 100 mg, 150 mg. and 300 mg

Table 1 : Description of dose levels and administration schedule

	benfluorex			acarbose		
	Morning	Midday	Evening	Morning	Midday	Evening
Dose level 1	placebo	placebo	150 mg	placebo	placebo	50 mg
Dose level 2	150 mg	placebo	150 mg	50 mg	placebo	50 mg
Dose level 3	150 mg	150 mg	150 mg	50 mg	50 mg	50 mg
Dose level 4	150 mg	150 mg	150 mg	100 mg	100 mg	100 mg

5.3.1.2 Dose adaptation

The dose level will be titrated up in order to reach the optimal dosage for both medications.

The initial recommended dosage for acarbose is 50 mg tid. However, in order to avoid gastro-intestinal intolerance, this dosage can be gradually reached. In this study, the dosage of 50 mg tid of acarbose will be gradullay reached over 28 days; the dosage will then be increased to 100 mg tid according to blood glucose control after at least 6 weeks of treatment, as recommended in the monography (will be available in the appendices in the final version of the protocol).

It is recommended to begin treatment with benfluorex (the monography will be available in appendices in the final version of the protocol) at 150 mg per day at dinner, and to increase the dosage every week up to 450 mg per day, and then to decrease the dosage if necessary according to blood glucose control. The dose adaptation schedule recommended for acarbose can be applied to benfluorex, in the context of a 1-year study.

The dose level can also be decreased at any time during the study for tolerance reasons (judgement of the investigator).

- **Titration period (M0-M4)**

  All patients will start the study treatment with dose level 1.

If the overall tolerance is good (judgement of the investigator, mode of contact to be defined (TO BE DISCUSSED) at D+14, the dose level will be increased by one dose level (from dose level 1 to dose level 2).

If the **fasting plasma glucose level at visit D28 is ≥ 7,8 mmol/L**, the dose level will be increased by 1 dose level per visit (if the overall safety is good).

If the **glycated haemoglobin value is ≥ 6.5% at visit D70,** the dose level will be increased by 1 dose level per visit (if the overall safety is good).

- **Maintenance period (M4-M12)**
  If the **HbA1c value is > 6.5%** at the scheduled visits (M4, M6, M9), the dose level will be increased by one dose level (if the patient is not already receiving dose level 4). The dose level can be decreased in case of adverse events and/or repeated hypoglycaemic episodes (judgement of the investigator).
  From visit M6, if the patient is already receiving dose level 4 and HbA1c value is > 8%, an antidiabetic drug with a different mode of action (sulfonylurea?) can be added (TO BE DISCUSSED).

5.3.2 Diet and activities

All the patients will receive counselling about diabetes, nutrition and physical activity before the inclusion visit (M0). Dietary advice will also aim to avoiding as far as possible the gastro-intestinal side effects of acarbose.

5.4 Efficacy and safety criteria

5.4.1 Investigation schedule

The efficacy and safety measurements assessed during the study are described in Table 2.

Table 2: Investigation schedule

	Selection visit	Inclusion visit	Titration period			Maintenance period

Pharmacokinetics : + including 2 samples in the afternoon among the 6 determinations - § at M6, a subgroup of patients will be hospitalised for a 24h profile

°Lipid parameters= triglycerides, total cholesterol, HDL, calculated LDL. θ Standard biology = biochemistry (total proteins, creatinine, albumin, sodium, potassium, chloride, calcium, total bilirubin, ASAT, ALAT, γ-GT, alkaline phosphatase) & haematology with complete blood cell count.

5.4.2 Assessment of efficacy

All the efficacy laboratory measurements will be analysed by a central laboratory. Sampling must be done within 7 days prior to the visit. Sampling and shipment material will be provided by the central laboratory. The methods for sampling, handling and analysis will be specified in a separated document available prior to the start of the study. The normal laboratory values will be provided by the central laboratory prior to the start of the study and updated if needed during the study, on every laboratory report, normal laboratory ranges will be present.

5.4.3 Assessment of acceptability

At each visit, adverse events will be recorded in the CRF. They will be assessed by questioning the patient, and physical examination including vital signs (sitting systolic and diastolic blood pressure, weight and heart rate). A full physical examination will be performed at Baseline, M4 and M12.

An ECG 12-lead will be performed at Baseline, M6 and M12.

An echocardiography will be performed at Baseline, M6 and M12. The parameters to be measured are detailed in Appendix 5.

Laboratory examinations will be performed at Baseline, D70, M6 and M12.

5.4.4 Adverse events

All adverse events must be subject to medical follow-up and suitably documented.

5.4.5 Determination of plasma concentrations of the product and its major metabolites

Pharmacokinetic assessment will be performed in the patients receiving benfluorex during the titration period at D28 and D70 and during the maintenance period on M4, M6, M9 and M12. These measurements will include plasma concentration of benfluorex, S 422, S 1475 and S 585.

- Amongst the 6 visits, the patients will be asked to come at least two times during the afternoon (14:00-18:00). A single blood sample will be taken during each visit into one tube containing lithium heparin. The clock time of the four previous dosings and the sampling time will be entered into the case report form.
- In a subgroup of forty patients recruited in two to four centres (in order to have around twenty patients receiving benfluorex 2 or 3 times a day), pharmacokinetic assessment will be performed over 24 hours at M6. Patients will be asked to come to the investigation centre at 08:00, with their current therapeutic unit. They will receive their study treatment at approximately 09:00, 13:00 and 20.00. Blood samples will be collected pre-dose and at selected times up to 13 hours: 1, 2, 3, 5, 6, 7, 8, 9, 10, 12, and 13 h after the morning dose. [*An alternative – to be discussed – is to have the 24 hour pharmacokinetic assessment performed in a specific open label study carried out in parallel in twenty patients treated with benfluorex*].

In each case, plasma (2x1 ml) obtained after a 10 min centrifugation at 4°C will be stabilised by adding sodium fluoride and frozen at -20°C until shipment. Plasma samples (2 aliquots) will be sent frozen in dry ice on a regular basis from the centres to the central laboratory for storage and then to the Servier pharmacokinetic department (Servier Research and Development, Fulmer, UK) for analysis. **In order to allow bio-analyses during the study, the blind will be**

maintained by using a validated recording procedure. Methods for sampling, labelling, coding, storage and shipment of samples and assay methods will be given in more detail in an appendix of the final version of the study protocol.

PK parameters

The primary objective of the analysis is to estimate benfluorex, S 422, S 1475 and S 585 pharmacokinetic parameters in type 2 diabetic patients. A population pharmacokinetic analysis will be performed using the NONMEM software version 5.1. (Beal et al., 1992) under the responsibility of C. Laveille (IRIS).

5.5 *Determination of sample size*

The sample size is estimated on the final HbA1c value, for a non-inferiority research between benfluorex and acarbose groups. The sample size is calculated for a one-sided Student's t test at 2.5 % type I error (as an approximation of the model that will be defined in the section "statistical analysis" of the final draft).

For a 1.5 % standard deviation and a 0.4 % clinical equivalence limit, 297 subjects per group are necessary to show a non-inferiority between groups if the real difference is null with a 90% power.

For the research of superiority, the same power is obtained if the real difference is 0.4 % in favour of benfluorex.

Taking into account the number of treatment groups and the rate of dropped-out patients estimated at 15 %, the total sample size required for the study is 684 patients. As it is difficult to precisely estimate the gastro-intestinal intolerance with drugs that might induce withdrawals, the total number has been set at 700 patients.

This number is coherent with the size required to have a relevant evaluation of the safety over one year.

APPENDICES

Annexe 3-37

Appendix 1

Definition, diagnosis and classification of diabetes mellitus and its complications. Report of a WHO consultation Part 1: Diagnosis and classification of diabetes mellitus

World Health Organization
Department of Noncommunicable Disease Surveillance
Geneva
WHO/NCD/NCS/99.2

Values for diagnosis of diabetes mellitus and other categories of hyperglycaemia

	Glucose concentration, mmol l^{-1} (mg dl^{-1})		
	Whole blood		Plasma*
	Venous	Capillary	Venous
Diabetes Mellitus			
Fasting *or*	≥ 6.1 (≥ 110)	≥ 6.1 (≥ 110)	≥ 7.0 (≥ 126)
2-h post glucose load	≥ 10.0 (≥ 180)	≥ 11.1 (≥ 200)	≥ 11.1 (≥ 200)
Impaired Glucose Tolerance (IGT)			
Fasting (if measured) *and*	< 6.1 (< 110) and	< 6.1 (< 110) and	< 7.0 (< 126) and
2-h post glucose load	≥ 6.7 (≥ 120)	≥7.8 (≥ 140)	≥ 7.8 (≥ 140)
Impaired Fasting Glycaemia (IFG)			
Fasting	≥ 5.6 (≥ 100) and < 6.1 (< 110)	≥ 5.6 (≥ 100) and < 6.1 (< 110)	≥ 6.1 (≥ 110) and < 7.0 (< 126)
and (if measured)			
2-h post glucose load	< 6.7 (< 120)	< 7.8 (< 140)	< 7.8 (< 140)

* Corresponding values for capillary plasma are: for Diabetes Mellitus, fasting ≥ 7.0 (≥ 126), 2-h ≥ 12.2 (≥ 220); for Impaired Glucose Tolerance, fasting < 7.0 (< 126) and 2-h ≥ 8.9 (≥ 160) and < 12.2 (< 220); and for Impaired Fasting Glycaemia ≥ 6.1 (≥ 110) and < 7.0 (< 126) and if measured, 2-h < 8.9 (<160).

For epidemiological or population screening purposes, the fasting or 2- value after 75 g oral glucose may be used alone. **For clinical purposes, the diagnosis of diabetes should always be confirmed by repeating the test on another day unless there is unequivocal hyperglycaemia with acute metabolic decompensation or obvious symptoms.**

Glucose concentrations should not be determined on serum unless red cells are immediately removed, otherwise glycolysis will result in an unpredictable underestimation of the true concentrations. It should be stressed that glucose preservatives do not totally prevent glucolysis. If whole blood is used, the sample should be kept at 0-4 °C or centrifuged immediately, or assayed immediately.

Appendix 2

Chronic heart failure classification (NYHA)

The American Journal of Cardiology, January 21, 1999

Class I	Patients without symptoms or only at levels that would produce symptoms in normal individuals
Class II	Patients with symptoms on ordinary exertion
Class III	Patients with symptoms on less than ordinary exertion
Class IV	Patients with symptoms at rest

Appendix 3

Concomitant treatments

DRUGS NOT ALLOWED

- *Sulfonylureas (TO BE DISCUSSED after M6)*
- Short acting insulin secretagogues (such as repaglinide)
- Biguanides
- α-glucosidase inhibitors
- Thiaziolidinediones
- Anti bacterial sulfonamides
- Insulin (chronic treatment) / see "Drugs allowed in episodic case" below
- Corticosteroid (chronic treatment) / see "Drugs allowed in episodic case" below

DRUGS ONLY ALLOWED IN CHRONIC USE

Usual concomitant medications are authorized if resulting in a well controlled and stabilized pathology. Their dosage should remain stable throughout the study as far as possible.

DRUGS ONLY ALLOWED IN EPISODIC USE

Episodic use in exceptional cases

- Insulin for short term treatment (≤ 3 weeks – TO BE DISCUSSED) if the treatment takes place more than 1 month before the evaluation visits
- Oral and injected corticosteroids for short term treatment (≤ 2 weeks – TO BE DISCUSSED) if the treatment takes place more than 1 month before the evaluation visits

Appendix 4

Creatinine clearance (Cockroft and Gault formula).

$$C(ml/mm) = \frac{140\text{-age (years)} \times \text{weight (kg)} \times K}{\text{Creatinine } (\mu mol/l)}$$

K = 1,25 for man and 1 for woman.

Appendix 5

Echocardiography

(to be adapted and finalised by the centre in charge of central reading)

Measurements will be undertaken once the patient has been rested for 10 minutes in a supine position. For the echocardiography, patients will be placed in left lateral decubitus position.

The required views for recording are:
- parasternal long axis view,
- parasternal short axis view at the level of:
  - mitral valve,
  - papillary muscle,
  - apex,
- apical four-chamber view,
- apical two-chamber view.

In parasternal long axis view, M-mode recording should be performed with maximally perpendicular cursor position. It cannot exceed 20 degrees at time base run 50 mm/s.

In the apical four-chamber view, mitral flow will be recorded using Doppler pulse wave. The sample volume should be 5 mm.

All 2D echocardiograms, M-mode and Doppler records must contain 10 heart cycles. The M-mode and Doppler recordings should be recorded initially with D image monitoring (5 cycles) with the screen divided into 1/3 and 2/3, and then the 10 heart cycles of M-mode and Doppler in full-screen mode.

- Fractional shortening (M-mode recordings): the parasternal short axis window and the papillary muscle level short axis transthoracic view will be used to obtain end-diastolic left ventricular internal dimension (LVEDd) and end systolic left ventricular dimensions (LVEDs). The fractional shortening (FS) will be calculated as:

$$FS\ \% = [(LVEDd - LVEDs) / LVEDd \times 100\%]$$

- Ejection fraction (2D echo recordings): the apical window and the long axis transthoracic views will be used to obtain LV (left ventricle) images needed for LV volume calculations. Left ventricular end-diastolic volume (EDV) and end-systolic volume (ESV) will be calculated according to the modified Simpson's rule approach. Ejection fraction will be calculated as follows:

$$EF\ \% = SV / EDV \times 100\%$$

where stroke volume is $SV = EDV - ESV$

- Mitral regurgitation and aorte regurgitation will be quantified as follows:
  - Presence: color flow
  - Quantification: + to ++++

- Mitral inflow will be recorded using doppler pulse wave in the apical four-chamber view. The following parameters will be measured:
  - Maximal E wave velocity (m/s)
  - Maximal A wave velocity (m/s)
  - E/A wave velocity ratio
  - E wave deceleration time (m/s)
  - Isovolumic Relaxation Time

- Pulmonary artery pressure (PAP) will be recorded as follows:
  - Recording of tricuspid flow at the endapex
  - Calculation of PAP from regurgitant flow with the simplified Bernouilly formula:

$$PAPs = 10 + 4 \text{ TR velocity}^2 \text{ (mmHg)}$$

Adpoted Minutes

Following the update provided in November 2000, G Pimpinella informed the PhVWP that the marketing authorisation holder submitted the draft study protocol only recently and that the Assessment Report will be circulated for discussion in June 2001. A Castot explained that the circulation of an Assessment Report on the indications is not considered necessary since there will be no change to the indications authorised in France.

Proposed Issues for Discussion

Docteur Pierre BECHTEL

Professeur Emérite de Pharmacologie Clinique
Faculté de Médecine de Besançon

RAPPORT CONCERNANT LE PROTOCOLE S 780 (*Benfluorex*)

A one year, multicentre, international, randomised, double blind comparison of *Benfluorex* (150 mg to 450 mg daily) and *acarbose* (150 mg to 300 mg daily) administered orally for the treatment of type 2 diabetic patients.

Préparé et présenté par les Laboratoires SERVIER
(Dr L. BESSAC Directeur du Département de Recherche Thérapeutique).

Documents fournis :

- un protocole (présenté comme un avant projet)
- une lettre de l'AFSSAPS du 22 novembre 1999, N° 3597, adressée au pharmacien responsable des Laboratoires SERVIER.

ANALYSE DU PROTOCOLE

A- Dans l'introduction qui est un résumé des prérequis, l'accent est mis sur 3 points :

- les risques des antidiabétiques oraux usuels (hypoglycémie, acidose lactique) dans le traitement des diabètes de type 2.
- L'intérêt que pourrait présenter dans ces cas le *Benfluorex*., avec des propriétés hypolipémiantes associées à l'action anti-hyperglycémique
- L'absence de données sur l'utilisation au long cours de *Benfluorex* (activité thérapeutique et pharmacovigilance) sur une population présentant un diabète de type 2, comprenant des sujets jeunes, d'âges moyens, des sujets âgés, des sujets ayant des modifications de la fonction rénale.

B- <u>Objectifs de la recherche</u>

B1- Evaluer l'efficacité au long cours (1 an) de *Benfluorex* comparée à celle de l'*Acarbose* dans une étude en double insu, multicentrique, internationale.
Cette efficacité sera jugée sur l'évolution, de la phase d'inclusion à la fin de l'étude, du niveau de l'hémoglobine glyquée (HbA1C) mesurée de façon centralisée par CLHP.

Seront également vérifiés :

- la glycémie à jeun
- le niveau d'insulinémie à jeun
- le bilan lipidique à jeun (cholestérol total, LDL-cholestérol, triglycérides)

B2- La pharmacovigilance de *Benfluorex* et d'*Acarbose* sera suivie tout au long de l'étude.

B3-La pharmacocinétique de ***Benfluorex*** sera déterminée en utilisant la Pharmacocinétique de Population.

C- <u>Plan de l'étude</u>

3 périodes sont prévues :

C1- Période d'inclusion et d'évaluation de l'état de base des malades : 14 jours.

Le malade continue son traitement habituel au cours de visites comprenant :

- examen physique
- anamnèse
- ECG
- échocardiographie
- visite ophtalmologique
- biologie standard

permettent en fonction de critères d'inclusion et de non inclusion pertinents, de déclarer les malades éligibles ou non.

C2 - Période de titration (J0 - J70)

La randomisation faite, les présentations de *Benfluorex* - *Acarbose* et placébo étant identiques, tous les malades lors de la visite d'inclusion reçoivent à la place de leur traitement usuel, le traitement en évaluation : **Niveau 1** : *Benfluorex* : 150 mg par jour
Acarbose : 50 mg par jour.

A J14 tous les malades passent au **Niveau 2 :** *Benfluorex* : 300 mg par jour
Acarbose : 100 mg par jour.

A J28 une première visite permet en fonction du niveau de glycémie à jeun (> 7,8 mmole/L) d'augmenter la dose de *Benfluorex* d'un niveau : **Niveau 3** : 450 mg par jour, ou de rester au niveau 2.
Pour Acarbose, quel que soit le niveau de la glycémie à jeun, il reçoit le niveau 3 soit 150 mg/jour.
<u>Note</u> : Le double insu est prévu de telle façon que cette procédure puisse être suivie sans rupture du double insu.

A J70 si HbA1C ≥ 6,5 % , passage au **Niveau 4** soit : *Benfluorex* : 450 mg/jour
Acarbose : 300 mg/jour.

C3 - Période d'entretien M4 → M12

4 visites sont prévues durant cette période : M4 - M6 - M9 - M12.
Lors de ces visites, en fonction du niveau de l'HbA1C :

si ≥ 6,5 % on augmente la posologie d'1 niveau
si ≤ 6,5 % on baisse d'un niveau
si ≥ 8 % et que le malade reçoit le niveau 4, on peut ajouter un antidiabétique oral dont le choix n'est pas établi en l'état du protocole.

Note : Devant tout effet indésirable apparaissant au cours de l'essai, l'investigateur est laissé libre, sans rupture du double insu, de modifier le niveau du traitement.

D- Population étudiée

Malades de plus de 35 ans, présentant un diabète de type 2 contrôle de façon « suboptimale » par le régime ou des doses faibles à modérées d'un antidiabétique oral, utilisé en monothérapie , stable depuis 2 mois.

Les éléments permettant d'inclure dans ou d'exclure de l'étude les malades, sont détaillés et apparaissent complets. Ils permettent de définir un groupe de malades homogène avec élimination des biais de sélection connus.

Les conditions de retraits de l'étude en cours sont également bien définis.

E- Procédures

E1- Efficacité : les mesures biologiques seront effectuées dans un seul laboratoire.
E2 - Acceptabilité : sera évaluée lors de chaque visite .
l'ECG sera réalisé à M6 et M12
l'échocardiographie à M6 et M12.
E3 - Effets indésirables : tout au long de l'étude
E4 - Pharmacocinétique de *Benfluorex et des métabolites S 422, S 1475 et S 585 :*
A J 28, J 70, M 4, M6 , M 9, M 12. : une mesure des concentrations sanguines de *Benfluorex* et des métabolites cités, sera réalisée à 14 h et 18h.
Les conditions de l'étude proprement dite de Pharmacocinétique ne sont pas encore décidées (tout au moins, au moment où le protocole a été élaboré) :

- soit un sous groupe de 40 malades recrutés dans 2 à 4 centres, sera selectionné.
- soit une étude sur 24 heures sera réalisée sur un groupe de malades traités par *Benfluorex* mais ne participant pas à l'étude.

Note : L'analyse de population sera effectuée à l'aide du logiciel NONMEM version 5.1.

F - Taille de l'échantillon

Il est calculé selon les règles. Il comportera 700 malades soit 350 par groupe, en tenant compte des éventuelles sorties d'étude ou perdus de vue .

Annexe 3-39

G - Annexes
Concernent :

- le diagnostic de diabète type 2.
- la classification des défaillances cardiaques du NYHA.
- les traitements concomitants permis et non permis.
- La formule de Cokroft et Gault.
- La procédure d'Echocardiographie.

COMMENTAIRES ET CONCLUSIONS

Malgré les quelques détails qui étaient encore en discussion lorsque ce protocole a été soumis à l'AFSSAPS, il n'y a pas de critiques majeures à apporter. La question posée est claire, les moyens pour y répondre paraissent corrects.

Dans ces conditions ce protocole sera à même de répondre aux questions suivantes posées dans la lettre du 22 novembre 1999 :

- **Efficacité au long cours de *Benfluorex* sur le contrôle de la glycémie et de HbA1C, sur le niveau des lipides sériques.**
- **Effets cardiovasculaires de *Benfluorex* administré au long cours chez l'Homme (Echocardiographie et ECG répétés).**

Par contre, ce protocole ne permettra pas de répondre aux questions suivantes :

- **Effets neurologiques de *Benfluorex* (sauf apparition d'effets indésirables caractérisés et imputables au *Benfluorex*).**
- **Comparaison de l'effet hypolipémiant de *Benfluorex* par rapport aux hypolipémiants classiques (fibrates, statines ...).**
- **Les questions concernant les expérimentations animales.**

ENFIN IL SERAIT SOUHAITABLE QUE L'ETUDE PHARMACOCINETIQUE DE BENFLUOREX ET DES METABOLITES S 422, S 1475 et S 585 SOIT EFFECTUEE SUR UN ECHANTILLON DE 40 MALADES INCLUS DANS L'ETUDE AU MOINS 2 FOIS, PAR EXEMPLE A M6 ET M12, AFIN DE POUVOIR ETABLIR D'EVENTUELLES RELATIONS ENTRE EFFETS INDESIRABLES OBSERVES ET CINETIQUE DU MEDICAMENT ET DE SES METABOLITES. L'INFORMATION DONNEE PAR UNE ETUDE PHARMACOCINETIQUE MENEE SUR UN GROUPE DE MALADES NON INCLUS DANS L'ETUDE SERAIT CERTAINEMENT MOINS INFORMATIVE PAR RAPPORT AUX QUESTIONS POSEES EN TERME DE RISQUES CARDIAQUES ET NEUROLOGIQUES DU MEDICAMENT ET / OU DE SES METABOLITES.

NON-URGENT INFORMATION IN PHARMACOVIGILANCE

Reference:	N° of attachments: 1	Date: 3 October, 2003
FROM: Spain		
TO: FRANCE ITALY EMEA		

SUBJECT:

Brandname(s)[1]: **MODULATOR**

International Non-proprietary Name (INN) or Class[1]: **BENFLUOREX**

Marketing Authorisation Holder: **SERVIER**

REASONS FOR *NON-URGENT INFORMATION*:

This is to inform you about a case of cardiac valvulopathy associated with the use of benfluorex that has occurred in Spain and has been published (enclosed).

In Spain, the MAHolder (Servier) has requested the revocation of the marketing authorisation of modulator, the only medicinal product with benfluorex. Therefore, since april 2003, there is no medicinal product marketed in Spain containing benfluorex.

Best regards

Dr Dolores Montero

COPIA

SERVIER

Laboratorios Servier, S.A.

AGENCIA ESPAÑOLA DEL MEDICAMENTO
REGISTRO GENERAL
20 MAR 2003
ENTRADA N.º

AGENCIA ESPAÑOLA DEL MEDICAMENTO
Subdirección General de Medicamentos de Uso Humano
C/ Huertas 75

28014 MADRID

Madrid, 20 de Marzo de 2003

ASUNTO: **MODULATOR (Benfluorex) - Nº Reg.: 54.002**
Revalidación Quinquenal.-

Estimados Srs.:

MODULATOR se autorizó en España el 30 de Junio de 1978, por lo tanto, como es sabido, a esta especialidad le corresponde efectuar su Revalidación Quinquenal en el presente mes de Marzo de 2003.

Sin embargo, Laboratorios Servier no desea proceder a realizar dicha Revalidación Quinquenal y solicita la Extinción de la Autorización de Comercialización.

Las razones que han motivado esta decisión son la siguientes:

1 – BAJO CONSUMO: La demanda por parte de los pacientes de MODULATOR en España es muy baja. De hecho, los pacientes/año tratados con este producto son sólo 1.724.

2 – BAJO RENDIMIENTO INDUSTRIAL: La escasa producción anual de este producto consume demasiados recursos industriales, traduciéndose esto en un alto coste productivo. Además, este hecho dificulta la planificación productiva de nuestra planta farmacéutica de Madrid y la racionalización de la asignación de los recursos industriales de cara a la fabricación de los nuevos productos.

Estos son los motivos por los que MODULATOR carece actualmente de interés comercial. De hecho, sus ventas tan sólo han supuesto un 0,17% de la Cifra de Negocio de Laboratorios Servier en 2002.

En base a lo anteriormente expuesto y a la ausencia de laguna terapéutica por la existencia en el mercado de otras alternativas terapéuticas, como ya hemos explicado solicitamos la **no renovación y extinción de la Autorización de Comercialización** de MODULATOR.

Quedamos a la espera de sus noticias,

Muy atentamente,

Fdo.: PIERRE FARALDO

RESOLUCION POR LA QUE AUTORIZA LA ANULACION DE LA AUTORIZACION DE COMERCIALIZACION DE LA ESPECIALIDAD FARMACEUTICA MODULATOR, nº 54.002

EL DIRECTOR DE LA AGENCIA ESPAÑOLA DEL MEDICAMENTO

Estudiada la solicitud de anulación de autorización de comercialización de la especialidad farmacéutica MODULATOR, nº 54.002

Vistos los preceptos de la Ley 30/1992, de 26 de noviembre, de Régimen Jurídico de las Administraciones Públicas y del Procedimiento Administrativo Común, modificada por la Ley 4/1999, de 13 de enero; la Ley 25/1990, de 20 de diciembre, del Medicamento; el Real Decreto 767/1993, de 21 de mayo, por el que se regula la evaluación, autorización, registro y condiciones de dispensación de especialidades farmacéuticas y otros medicamentos de uso humano fabricados industrialmente; el Real Decreto 520/1999, de 26 de marzo, por el que se aprueba el Estatuto de la Agencia Española del Medicamento, y demás normas aplicables.

RESUELVE:

PRIMERA.- Conceder la anulación de la autorización de comercialización de la especialidad farmacéutica MODULATOR, nº 54.002, solicitada por el Laboratorio LABORATORIOS SERVIER, S.A., de conformidad con lo previsto en el apartado 1º del artículo 90 de la Ley 30/1992, de 26 de noviembre, de Régimen Jurídico de las Administraciones Públicas y del Procedimiento Administrativo Común

Oggetto: **Specialità medicinale MEDIAXAL – 30 confetti 150 mg – AIC n. 23356025**
Domanda di revoca su rinuncia

La *Servier Italia S.p.A.* con sede in Roma, Via Luca Passi, 85- Codice Fiscale 00701480584 / Partita Iva 00924251002, in persona del Direttore Generale Bernard MILLET, a nome e per conto di *Les Laboratoires Servier* – Neuilly sur Seine (Francia), titolare AIC della specialità medicinale in oggetto, registrata in data 13/12/1980

CHIEDE

la revoca su rinuncia della autorizzazione all'immissione in commercio della specialità medicinale MEDIAXAL 30 confetti 150 mg.
Tale richiesta scaturisce da motivazioni economiche e commerciali.

La scrivente chiede altresì un periodo di 120 giorni per lo smaltimento delle scorte dalla data di pubblicazione del relativo decreto nella G.U.

Con Osservanza.

il Direttore Generale
Dr Bernard MILLET

Note concernant le déroulement chronologique des différents comités techniques, commissions et autres évènements en relation avec le MEDIATOR®

Ma présidence a commencé en juillet 1998 pour se terminer en juillet 2001.

Document A-1
Le benfluorex faisait déjà l'objet d'un suivi intensif puisqu'au comité technique de pharmacovigilance du 30 avril 1998, il est rapporté dans le compte-rendu qu'il n'y a pas d'effet de type valvulopathie ou hypertension artérielle pulmonaire, imputable au seul Médiator®, mais compte tenu de la suspicion de détournement d'usage et de la formation, lors de la métabolisation, de norfenfluramine, le comité technique du 30 avril propose la mise en place d'une enquête officielle de pharmacovigilance.
Cette enquête est confiée au CRPV de Besançon et l'Observatoire de la prescription sera consulté, concernant l'usage du benfluorex.

Document A-2 – page 14
Comité technique de pharmacovigilance du 10 septembre 1998 :

Lors de ce comité technique, un point sur le benfluorex Médiator® est présenté par le Centre Régional de Pharmacovigilance de Besançon. Lors de cette présentation, deux aspects sont abordés :
- d'une part, l'évolution des chiffres de vente, avec toujours la suspicion de mésusage
- le problème de la métabolisation du benfluorex (un document en annexe à ce comité technique retrace le métabolisme du benfluorex tel que le laboratoire le décrit). Ce métabolisme fait apparaître la formation de norfenfluramine mais le commentaire (qui est fait à cette époque) est que la présentation ne permet pas d'avoir une idée correcte de ce métabolisme.

Bien que ce point n'apparaisse pas dans le compte rendu, rappelons qu'à cette période, il n'y a toujours pas d'effet indésirable de type valvulopathie ou hypertension artérielle pulmonaire imputable au seul benfluorex décrit.

Document D- 1
Lettre sans date d'émission mais du 21 septembre 1998 en réception, de l'Union Régionale des Caisses d'Assurance-Maladie de l'URCAM de Bourgogne :

Dans cette lettre, l'URCAM de Bourgogne attire l'attention du directeur de l'Agence sur le mésusage du Médiator®.

Document D- 2
Document émanant de la Direction des Etudes et de l'Information pharma-économique : note à l'attention de Jean-Michel Alexandre, Direction de l'Evaluation, concernant les prescriptions de Médiator®, courrier en date du 17 septembre 1998, avec une date de réception du 05 octobre 1998 :

Note : Bien que la date de ce document soit antérieure à celle du précédent il peut être considéré comme une réponse...
Ce document signé par le directeur des études de l'information pharmaco-économique (cf. Document A- 1) dit qu'en conclusion, « il apparaît que le détournement d'usage du Médiator®, s'il existe, ne pourrait être réévalué qu'à l'aide de données beaucoup plus fines et qui font actuellement défaut sur la prescription de ce médicament ».
La teneur globale du rapport tend à démontrer qu'il n'y a pas eu de report sur le Médiator® de la disparition du marché des anorexigènes

Document A-3 – page 19
Comité technique de pharmacovigilance du 22 octobre 1998 :

Ce document est important.

Page 19 : dans la rubrique « point sur la pharmacovigilance européenne » (qui est le compte rendu du groupe de travail de pharmacovigilance de l'Agence européenne des 07 et 08 octobre 1998), il est rapporté que dans le cadre d'un article 15-A, concernant les anorexigènes, l'objectif est la réévaluation du rapport bénéfice / risque d'un certain nombre d'anorexigènes de type amphétaminique. Il est signalé que l'Italie pose le problème du Médiator®, en raison de l'analogie structurale avec la fenfluramine et (l'Italie) craint la survenue de valvulopathie associée à l'utilisation de ce médicament. Ce problème sera discuté au prochain groupe de travail (de pharmacovigilance de l'Agence européenne) des 24 et 25 novembre 1998.

Document A- 4 – page 6
Comité technique de pharmacovigilance du 17 décembre 1998 :

Il est fait un compte-rendu du rapport concernant l'enquête officielle Médiator® présentée par le CRPV de Besançon : bilan des effets indésirables. Il n'est pas fait mention d'effet indésirable de type valvulopathie ou hypertension artérielle pulmonaire.
Concernant le métabolisme, on retrouve les données présentées dans le point fait au comité technique du 10 septembre 1998. Dans ce compte-rendu apparaît le fait que l'Italie propose que le benfluorex soit inclus dans l'article 15-A européen, relatif au fenfluramine, et il apparaît que l'Italie a en charge une enquête sur cette molécule. Le CRPV de Besançon doit d'ailleurs adresser une copie de son rapport à l'Agence italienne qui prépare un rapport pour le groupe de travail de pharmacovigilance européen de février 1999.
Dans le point « pharmacovigilance européenne » de ce même comité technique, il n'est pas fait mention de ce qui a été potentiellement discuté les 24 et 25 novembre 1998, au groupe de travail de pharmacovigilance européenne, tel que c'était annoncé dans le compte-rendu du comité technique du 22 octobre 1998.

Document A- 5 – page 3
Comité technique de pharmacovigilance du 23 février 1999 :

Sous la rubrique « tour de table des cas marquants », le CRPV de Marseille présente un cas d'insuffisance aortique découverte chez un homme de 43 ans, traité par benfluorex depuis six ans (aucune prise

d'anorexigène ou d'amphétamine). Un commentaire est ajouté disant que le « benfluorex qui se métabolise en norfenfluramine fait l'objet d'une discussion au groupe de travail de pharmacovigilance européen. L'Italie qui envisage de saisir le CSP, en vertu de l'article 12, rédige un rapport sur le métabolisme et les données de sécurité de ce produit en collaboration avec la France. Cette notion de prise en charge par l'Europe du problème du Médiator est confirmée par le type de présentation synthétique que l'on rencontre dans la fiche page 22 sous le numéro 99-176 à la date de survenue d'octobre 1988, apparaît pour le Médiator® un effet à type d'insuffisance aortique. Le commentaire, dernière colonne, mentionne : problème Europe - 1er cas.

Document A- 6 – pages 2 – 3 – 13
Comité technique de pharmacovigilance du 12 mai 1999 :

Dans le compte-rendu, présenté le 06 juillet 1999, Monsieur Riché est inscrit absent à la page 2. Il n'y a pas, sur la première page, le nom du président.
Page 3 – 1ère ligne : « la séance a été exceptionnellement présidée par Monsieur le Professeur Claude Larousse ; le professeur Riché était hospitalisé ce jour » (Réanimation cardiologique à Lariboisière pour infarctus).
Page 13, sous la rubrique « point sur la pharmacovigilance européenne » rapportant les travaux du groupe de travail européen de pharmacovigilance des 15 et 16 avril 1999, il existe un paragraphe « anorexigènes et atteinte des valves cardiaques - Article 15 de la Directive 75-319 CE ». Sous ce paragraphe, on rappelle que « l'opinion du CSP concernant les anorexigènes est attendue pour le 20 avril 1999 ». Ceci veut dire que la décision concernant les anorexigènes n'est toujours pas prise par l'Europe.
« Pour la fenfluramine dexfenfluramine, l'opinion sera probablement en faveur d'un retrait définitif des AMM de ces produits. » Il est également dit que « le CSP devrait considérer que les anorexigènes amphétaminiques dont les effets indésirables sont par ailleurs bien connus doivent être retirés du marché ».
Il n'est pas fait mention dans ce compte-rendu, de façon explicite du benfluorex.

Document A- 7 – pages 10 – 11
Comité technique de pharmacovigilance du 22 juin 1999 :

Sous l'intitulé « point sur la pharmacovigilance européenne », est rapporté un compte-rendu du groupe de travail européen de pharmacovigilance des 10 et 11 juin 1999.
Page 10, sous l'intitulé « anorexigènes, article 15 de la Directive 75/319/CEE », il est dit que « des laboratoires ont fait appel à l'opinion du CSP rendue en avril 1999. De ce fait, de nouveaux pays rapporteurs et co-rapporteurs ont été nommés et l'opinion définitive du CSP est attendue pour fin juillet 1999 ». En juin 1999, le problème du retrait définitif des AMM des anorexigènes amphétaminiques n'est toujours pas réglé.
Page 11, dans un paragraphe différent, est abordé le « benfluorex/métabolisation en norfenfluramine. Il est dit que le rapport rédigé par l'Italie, en collaboration avec la France, a été distribué aux Etats » (cette procédure est utilisée pour que les états puissent faire des remarques et apporter des améliorations, modifications au rapport initial).
Une idée est déjà donnée du contenu du rapport : « les données disponibles ne permettant pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex, le groupe de travail a souhaité que les pays rapporteurs (France et Italie) proposent des modifications de RCP et adressent une liste de questions aux laboratoires en demandant une mise à jour des données de tolérance et la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites.
Il est également indiqué qu'un cas d'HTAP, chez une femme de 51 ans, traitée par benfluorex, a été rapporté et qu'il s'agit du premier cas d'HTAP portée avec le benfluorex. (Il existait auparavant d'autres cas, mais toujours en association avec un anorexigène identifié).
Toujours dans le cadre de ce paragraphe relatif aux travaux de l'Agence européenne : il est dit que l'Agence (européenne) a adressé un courrier au Laboratoire Servier, leur demandant de verser avant le 28 juin 1999, une mise à jour des données de tolérance ainsi que les données de pharmacologie et de pharmacocinétique du benfluorex et de ses métabolites.

Document B- 1 – pages 18
Commission nationale de pharmacovigilance du mercredi 07 juillet 1999 : document B - 1 :

Sous la rubrique « questions diverses » sont abordés différents points organisationnels et également des points étudiés au groupe de travail européen.
Un paragraphe est consacré au benfluorex Médiator®. Il est rappelé que le benfluorex a fait l'objet d'une enquête officieuse dès 1995, devenue officielle en 1998 (la différence entre les deux : l'officieuse est un travail purement expertal fait par un Centre Régional de Pharmacovigilance à partir des données à la disposition de l'Agence du médicament ; une enquête officielle implique le laboratoire et impose un échange en respectant des procédures de transparence entre les données détenues par le laboratoire et les données que peut avoir connaissance l'Agence du médicament).
Après ce rappel, il est mentionné que « depuis septembre 1998, à la demande des autorités sanitaires italiennes, le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen ». La raison qui est rappelée c'est « la parenté supposée » encore à cette époque et qui sera démontrée justement dans le rapport italien et « entre le métabolisme du benfluorex et le métabolisme des autres fenfluramines ». Il est rappelé qu'au jour de cette commission, 07 juillet 1999, « les données disponibles issues de l'enquête officielle, ne permettent pas de conclure sur une possibilité de neurotoxicité ou de cardiotoxicité ». Il faut rappeler qu'à cette époque, il n'y a que l'observation de Marseille, de valvulopathie et l'observation d'hypertension artérielle pulmonaire qui vient juste d'être notifiée. Ce cas d'HTAP est d'ailleurs mentionné dans le compte-rendu. Le cas de valvulopathie n'est pas mentionné.
Enfin, en conclusion, il est rappelé que le dossier benfluorex doit être « discuté au groupe de travail européen de pharmacovigilance des 12 et 13 juillet 1999 ».

Commentaires : il faut rappeler que dès cette époque, l'opinion européenne et les actions européennes sont prépondérantes et qu'à partir du moment où un problème est saisi par l'Europe, c'est l'Europe qui pilote ce problème.
Bien que les informations de l'Europe soient partiellement retournées au niveau national, on peut considérer que l'Europe gère correctement ce dossier. Le rapport italien circule. Certes cette information n'est pas faite à la commission nationale mais le rapport est distribué aux états et conduira à une liste de questions, à la demande de réalisation d'un essai et en 2001 à la proposition d'un essai par les laboratoires Servier, essai qui, s'il a été réalisé ou s'il avait été réalisé, aurait vraisemblablement permis de mettre en évidence la faiblesse du bénéfice et le risque du benfluorex.

Document A- 8
Comité technique de pharmacovigilance du 07 septembre 1999 :

Ce compte-rendu est joint à la chronologie pour montrer qu'il n'y a, lors de ce comité technique, aucune information donnée sur le devenir du dossier européen.

Document B- 2
Commission nationale de pharmacovigilance du 21 septembre 1999 :

Lors de cette commission, il n'est pas fait mention, particulièrement du benfluorex mais sous la rubrique « questions diverses » qui retrace les travaux européens, une information extrêmement importante est portée à la connaissance de la commission disant que « le 31 août 1999, le CSP (Comité des Spécialités Pharmaceutiques) a considéré que le rapport bénéfice / risque de l'ensemble des médicaments anorexigènes était négatif et a recommandé leur retrait définitif du marché communautaire. Il est annoncé que cet avis devrait « conduire la commission européenne à prendre une décision de retrait d'AMM pour ces médicaments et que dans l'attente de cette décision, l'Afssaps va procéder, le 19 octobre, à une suspension des autorisations des anorexigènes amphétaminiques. »

Commentaires : si on rapproche l'avis du CSP (31 août 1999) et le délai logique entre l'avis et la décision de la commission européenne puisque c'est la commission qui décide, on voit que ce n'est que fin 1999, qu'une décision ferme est envisagée au niveau de l'Europe concernant les anorexigènes amphétaminiques.
Ceci est à rapprocher du travail effectué et présenté par les Italiens, le 12 octobre 1999, sur le benfluorex.

Dans ce contexte de retrait des anorexigènes amphétaminiques, l'ensemble des experts européens a considéré qu'il y avait lieu de s'interroger sur le bénéfice / risque de ce produit même si des suspicions lourdes pesaient puisque les Italiens apportaient la démonstration que le métabolisme du benfluorex conduisait - comme pour les fenfluraminiques – à la production de norfenfluramine en quantité équivalente. La faiblesse des signaux de pharmacovigilance, basée à cette époque uniquement sur la notification spontanée, l'incertitude sur une efficacité potentielle ont conduit les experts européens d'une part à poser des questions au Laboratoire et à lui demander de réaliser une étude de bénéfice / risque de façon à clarifier ce problème. Certes, a posteriori, on se rend compte que c'est surtout l'absence de signaux qui a retardé la prise de décision. C'est le principe même de la pharmacovigilance française et européenne basée essentiellement sur la signalisation par les praticiens de santé qui est mis en défaut. Ce n'est qu'en 2008, que l'utilisation d'une base de données et d'une interrogation à la fois par mots-clés mais surtout par reconnaissance de chaînes de caractères dans des dossiers qui permettra de faire émerger des observations.

Documents annexes E- 1 et E- 2 :

Pendant ma présidence, j'ai demandé régulièrement, que soit mis à jour un suivi des dossiers présentés en commission nationale de pharmacovigilance.

Lors de la commission nationale du 09 novembre 1999, le récapitulatif des données présentées à la commission nationale ne mentionne pas le benfluorex.

De même dans **la mise à jour du 15 mars 2000**, il n'est pas fait mention non plus du benfluorex.

Commentaires : On peut s'interroger pour savoir pourquoi le benfluorex est aussi peu évoqué dans les commissions nationales. Il est évoqué toujours dans le cadre du travail européen. Cette présentation aurait tendance à confirmer que le benfluorex était considéré comme un travail relevant de l'Europe ; le rôle de la France se limitant à recueillir des données de déclarations spontanées, système dont on peut dire, au vu des connaissances actuelles qu'il n'était pas adapté à ce type de problématique.

Document C- 1
Revised assessment report: Relevance of metabolic pathways of benfluorex to norfenfluramine - 12 octobre 1999

Ce document porte une date manuscrite du 12 octobre 1999. C'est a priori le document final du rapport italien sur le benfluorex.
Le premier point abordé est le métabolisme du benfluorex. Ce document démontre que le benfluorex est métabolisé en norfenfluramine et qu'il y a au moins autant de norfenfluramine circulante après 450 mg par jour de benfluorex qu'après 60 mg par jour de fenfluramine.
Le document rappelle également des données cliniques et que seule une diminution significative de l'hémoglobine glycosylée par rapport au placebo est observée. Les rapporteurs pointent d'ailleurs les insuffisances statistiques du dossier. Pour l'hyperlipidémie il n'y a pas de donnée pour des thérapeutiques supérieures à un mois.
En point 3, ce document parle de l'hypertension artérielle pulmonaire. Il est à faire remarquer qu'il n'est pas fait mention de la valvulopathie de Marseille (sans explication).
Dans les conclusions, les rapporteurs italiens pointent qu'il y a des suspicions que les patients traités sont exposés à un effet potentiellement toxique de norfenfluramine. Ils font remarquer que le produit est moins efficace que la metformine et que l'on manque de données.
Page 4 : il y a une série de questions. On retrouve là ce qui avait été annoncé précédemment. Cette série de questions est adressée au laboratoire.
Ailleurs, il « est demandé une étude supérieure à un an avec des échocardiographies et des suivis montrant l'activité thérapeutique et étudiant les paramètres pharmacocinétiques. De plus, est demandée une modification du RCP. Il est fait mention, dans ce rapport, que l'efficacité peut être discutée au niveau national par les états.

Commentaires sur ce rapport : ce rapport montre clairement l'existence de norfenfluramine. Il montre clairement que l'Europe gère le problème : il y a une liste de questions, les rapporteurs ne parlent pas de retrait mais demandent à la firme de modifier son RCP et surtout de réaliser une étude pour démontrer l'activité et l'innocuité cardiovasculaire du benfluorex en particulier en réalisant une étude échocardiographique.
Ce rapport n'a jamais été communiqué, ni à la commission nationale ni au comité technique.

Document A- 9
Comité technique de pharmacovigilance du 16 novembre 1999 :

Ce comité technique ne fait pas mention du devenir du benfluorex au niveau européen alors que le rapport italien a sûrement été discuté.

Document A- 10 – page 23
Comité technique de pharmacovigilance du 07 décembre 1999 :

Sous la rubrique « point sur la pharmacovigilance européenne – groupe de travail des 23 et 24 novembre 1999 », sous le chapitre « benfluorex – hypertension pulmonaire primitive et valvulopathie », est rapportée cette phrase « il a été demandé à la firme de réaliser une synthèse sur les données d'efficacité du médicament et sur la tolérance pré-clinique et clinique à long terme et de déposer une demande de modification de l'information dans tous les pays où le produit est autorisé.

Commentaires : cette phrase démontre que le problème est certes géré par l'Europe mais ce texte montre également qu'il y a un manque de communication entre la cellule Europe de l'Agence française et les personnes qui travaillent dans cette Agence au niveau national puisque les informations fondamentales contenues dans le rapport italien ne sont pas communiquées dans ce paragraphe qui retrace les travaux du groupe européen. Toutefois, on ne peut pas dire, à partir de ces textes, que ce manque de communication a des conséquences sur le travail des experts européens.

Document A- 11
Comité technique de pharmacovigilance du 19 décembre 2000 :

Ce document est mentionné dans la liste simplement pour montrer qu'à la date du 19 décembre 2000, aucune information sur le benfluorex n'est fournie, dans le paragraphe consacré à la pharmacovigilance européenne.

Document A- 12
Comité technique de pharmacovigilance du 09 janvier 2001 :

Ce document est fourni pour montrer qu'à la date du 09 janvier 2001, aucune information n'est donnée concernant l'étude du benfluorex à l'Europe.

Document C-2
Lettre du 1er février 2001 et protocole

Ce document émanant des laboratoires Servier est adressé à Madame le Docteur Anne Castot, Agence Française de Sécurité Sanitaire des Produits de Santé.
Ce document a été transmis par Madame Carole Fosset, par Madame Rey-Quinio et Monsieur Ropers.
Il est signé de Pierre Montes, directeur des affaires pharmaceutiques France, pharmacien responsable intérimaire.
Ce document est très important.
Il comprend une lettre de couverture et un protocole d'étude clinique.

Dans la lettre, on apprend qu'une réunion sur le Médiator® a eu lieu le 30 novembre 2000, à l'Agence Européenne (EMEA) vraisemblablement entre le Laboratoire Servier et les experts des différents pays européens. On peut déduire qu'était à l'ordre du jour la discussion d'un essai mais que lors de ce premier passage, les experts européens n'ont pas été satisfaits puisque le laboratoire mentionne « que ce synopsis de protocole d'étude d'efficacité du benfluorex versus acarbose inclut l'étude échocardiographique souhaitée ».
Ce document nous apprend également que cette étude est prévue pour une durée de 12 mois.
Lorsque l'on lit le protocole : il s'adresse à 700 patients ; 350 patients dans chaque bras. Il s'agit d'une étude comparative versus acarbose.

Commentaires : ce protocole pourrait être considéré comme l'aboutissement des discussions qui se sont produites à l'Europe suite à la liste de questions et à la demande italienne de réaliser une étude.
Ce protocole comporte 700 patients dont 350 sous Médiator®, certes avec des posologies variables (150 à 450 mg par jour) mais si l'on se rapporte aux données que l'on a, à partir de l'étude Regulate, ce protocole aurait sûrement permis, s'il avait été réalisé, de mettre en évidence d'une part la faible efficacité du produit et d'autre part les risques cardio-vasculaires puisqu'un volet échocardiographique était annexé à ce protocole.
Bien que le comité technique et la commission nationale de pharmacovigilance n'aient nullement été informées, de façon correcte, du déroulement des opérations d'évaluation du benfluorex à l'Europe, on peut considérer que la rédaction de ce protocole est, en février 2001, l'aboutissement des demandes des experts européens dans le but de montrer un bénéfice / risque acceptable pour ce produit. La durée de 12 mois laisse apparaître qu'en 2002 il est possible d'avoir les résultats et donc de prendre des décisions à partir de data d'essais thérapeutiques. En effet, à l'époque, il y a, en ce qui concerne la remontée spontanée des effets indésirables, une indigence importante puisqu'à ce moment-là, on ne dispose toujours que du cas de Marseille de valvulopathie et de l'hypertension artérielle pulmonaire déclarée par Saint-Antoine.

Document A- 13
Comité technique de pharmacovigilance du 13 février 2001 :

Ce document est joint à l'aspect chronologique d'une part pour montrer que sous la rubrique « pharmacovigilance européenne » il n'est pas fait mention du Médiator® alors qu'à l'Europe des discussions ont conduit à élaborer un protocole qui a été proposé le 1er février.
On retrouve par ailleurs, à ce comité du 13 février 2001, une question posée par le Centre Régional de Pharmacovigilance de Caen concernant le mésusage du Médiator® dans des préparations à visée amaigrissante, en contravention avec les décisions prises.

Commentaires : lorsque des faits de ce type (infraction à la réglementation) sont rapportés, l'administration fait une réponse. Il n'y a pas de trace de cette réponse dans les comptes-rendus, ce qui était la coutume.

Document A- 14
Comité technique de pharmacovigilance du 20 mars 2001 :

Ce document est fourni pour montrer que là non plus, sous la rubrique « pharmacovigilance européenne », il n'y a aucune mention concernant l'opinion du groupe de travail européen sur l'étude proposée par Servier.

Document A- 15
Comité technique de pharmacovigilance du 10 avril 2001 :

Ce compte rendu est mis en perspective pour montrer qu'il n'y a pas de mention de l'étude imposée par Servier.

Document A- 16
Comité technique de pharmacovigilance du 15 mai 2001 :

Dans le tour de table, mentionne le problème précédemment signalé par le CRPV de Caen. Il n'y a pas d'information européenne.

Document A- 17
Comité technique de pharmacovigilance du 05 juin 2001 :

Ce compte-rendu est mis en perspective pour montrer qu'il n'y a, là non plus, pas d'information concernant l'étude proposée par Servier.

Document B- 3
Commission Nationale de Pharmacovigilance du 29 novembre 2005 -

Point important :
En 2005, le produit n'est plus sur le marché italien et espagnol.

Ce document retrace l'historique et rappelle que le *benfluorex n'est pas classé parmi les anorexigènes*. Cependant, de façon un peu contradictoire, le benfluorex est inscrit sur la liste des substances interdites dans l'exécution de la délivrance des préparations magistrales en même temps que les anorexigènes dès le 10 mai 1995.

Rappelons que c'est lors de la réunion à l'EMEA du 30 novembre 2000 qu'avait été élaborée d'une part les modifications de RCP mais surtout (bien que nous n'ayons pas de document mais simplement la trace dans un courrier) qu'avait été vraisemblablement discuté un protocole qui est présenté aux instances européennes le 01 février 2001.

La commission nationale de pharmacovigilance du 29 novembre 2005, dans sa conclusion, demande une réévaluation du bénéfice / risque, avec une majorité relative (13 voix pour ; 10 voix contre ; 5 abstentions).

Document B- 4
Commission Nationale de Pharmacovigilance du 27 mars 2007

La conclusion de cette commission fait apparaître que des membres ont demandé que leur opinion se prononçant pour un rapport bénéfice / risque défavorable soit mentionnée.
Ce rapport, page 8, montre que la commission d'AMM a part contre maintenu l'indication « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».
Même si elle émet des réserves, la commission d'AMM dit qu' « aucun motif de protection de la santé publique ne s'oppose à ce que l'indication telle que libellée soit maintenue. »

Documents divers Div- 1: sous cette rubrique sont mentionnés un certain nombre d'échanges par mails entre le Docteur Dominique Carlhant-Kowalski, Madame Carmen Kreft-Jaïs et Madame Aurore Tricotel expliquant la méthodologie qui a permis d'extraire de la base de Brest des observations de valvulopathie lors de prises concomitantes de benfluorex Médiator®.

Documents divers Div- 2 : Ces documents regroupent des échanges de mails avec le laboratoire Servier sur d'une part les cas écrits dans un article publié par le groupe d'Irène Frachon en collaboration avec le docteur Kowalski du Centre Régional de Pharmacovigilance de Brest et sur la méthodologie utilisée pour mettre en évidence l'existence d'observations en utilisant des codes de PMSI mais également en travaillant sur les chaînes de caractère.

Il faut noter que les concentrations sanguines de buprénorphine, lorsque les dosages ont été réalisés, semblent être dans les limites des taux thérapeutiques et surtout moins élevées que les concentrations cérébrales. Ceci confirme les données de la littérature quant à la lipophilie de la buprénorphine et pourrait contribuer à la dépression respiratoire.
L'analyse de la littérature et les cas rapportés sont en faveur d'une cause de décès par dépression respiratoire, le risque dépresseur pouvant être augmenté par l'administration intraveineuse de la buprénorphine et majoré par l'association aux benzodiazépines.
Cependant, si la co-responsabilité des benzodiazépines ne peut être écartée, il existe des cas sans benzodiazépine associée (la recherche de benzodiazépines s'est avérée négative dans 3 cas de décès sur les 23 pour lesquels cette recherche avait pu être effectuée).

En conclusion :

Les données actualisées présentées ne remettent pas en cause le profil de sécurité de la buprénorphine, cependant une meilleure évaluation du risque de décès par dépression respiratoire serait souhaitable (études expérimentales, potentialisation par les benzodiazépines...).
Le Comité Technique souligne que la dispensation fractionnée de la buprénorphine, pour des durées ne pouvant excéder 7 jours, permettrait de limiter le risque d'utilisation détournée par voie intraveineuse.

Le Comité Technique souhaite par ailleurs que le développement de la spécialité associant buprénorphine et naloxone (SUBOXONE) par voie sublinguale se poursuive.
En effet la mise à disposition d'une telle spécialité limiterait le risque de mésusage et donc le risque de décès par dépression respiratoire de même que les risques infectieux liés à la pratique de la voie intraveineuse, et sans doute le "trafic" de la buprénorphine.

Le Dr Riché (CRPV de Brest) fera une présentation à un prochain Comité technique sur le potentiel d'interactions entre buprénorphine - benzodiazépines - méthadone.

V - POINT BENFLUOREX (MEDIATOR®)

Le Centre Régional de Pharmacovigilance de Besançon a effectué une mise au point concernant les effets

indésirables observés avec le benfluorex.

Le MEDIATOR® (chlorydrate de benfluorex) est commercialisé en France (depuis 1976) dans les indications suivantes :
- adjuvant du régime adapté dans les hypertriglycéridémies.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex est inscrit depuis le 10 mai 1995, comme les anorexigènes, sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales.

Sur les 291 notifications rapportées avec le benfluorex, 152 ont été retenues au 30 avril 1998 (lors de la précédente mise au point de juillet 1995, 101 notifications avaient été rapportées).

● Les atteintes hépatiques : 16 cas
Les cas les plus souvent rapportés sont des hépatites et des perturbations de la biologie hépatique : élévation des transaminases. Ces effets ne sont pas mentionnés dans le RCP.

● Les atteintes digestives : 16 cas
Les cas les plus souvent notifiés sont les diarrhées. Cet effet indésirable est mentionné dans le RCP.

● Les atteintes hématologiques : 8 cas
Les effets les plus fréquents sont les thrombopénies. Il n'y a pas eu de nouveaux cas rapportés depuis juillet 1995.

● Les atteintes respiratoires : 8 cas
Les cas rapportés sont principalement des toux et des hypertensions pulmonaires (dans les 2 cas rapportés, il existe un traitement anorexigène associé).

● Les atteintes cardiovasculaires : 11 cas
Des cas d'hypertension artérielle, de tachycardie, d'extrasystoles ventriculaires et de syndrome de Raynaud sont le plus souvent notifiés.

● Les atteintes rénales : 9 cas
Parmi lesquelles on observe le plus souvent des dysuries, des pollakiuries.

● Les atteintes métaboliques : 3 cas
Une hyperlipémie, une hypothyroïdie et une crise de goutte ont été rapportées.

● Les atteintes cutanées : 38 cas
Des urticaires, des chocs anaphylactiques, des eczémas, des vascularires, des érythèmes ainsi que des purpuras sont les effets les plus fréquents. Ces effets indésirables ne sont mentionnés pas dans le RCP.

● Les atteintes neuro-psychiatriques : 27 cas
Des cas d'asthénie ou de somnolence sont le plus souvent notifiés ; ceux-ci sont mentionnés dans le RCP. Parmi les troubles psychiatriques, on observe principalement des cas d'agressivité, d'agitation, de nervosité, ou de délire. Les paresthésies sont les troubles neurologiques les plus fréquents.

● Les troubles de l'équilibre, vertiges : 16 cas
Dans 16 cas (sur les 152 rapportés), le benfluorex est associé avec un anorexigène.
En 1995, le nombre de boîtes de MEDIATOR® vendues a été estimé à 5 millions/an.

Le nombre d'effets indésirables observés ne semble pas plus important depuis la dernière mise au point de juillet 1995. Cependant on ne peut écarter la possibilité d'une déviation de l'utilisation du benfluorex comme anorexigène étant donné que l'indication "adjuvant de régime..." entretient une certaine ambiguïté. De plus, la métabolisation du benfluorex dans l'organisme entraîne la formation de norfenfluramine, métabolite apparenté à la fenfluramine, elle-même impliquée dans l'apparition d'hypertensions pulmonaires graves.

Compte tenu de la suspicion de détournement d'usage et de la formation lors de la métabolisation de norfenfluramine, le Comité Technique propose la mise en place d'une enquête officielle de Pharmacovigilance qui permettra, entre autres, de récupérer les chiffres de vente, afin d'infirmer ou de confirmer un éventuel mésusage, et les données précliniques.

L'enquête nationale est confiée au CRPV de Besançon et l'Observatoire de la Prescription sera consulté.

IV - POINT SUR LE BENFLUOREX (MÉDIATOR ®)

Le Centre Régional de Pharmacovigilance de Besançon a présenté, à la demande de l'Agence du Médicament, des données sur les chiffres de ventes et des données de cinétique du Benfluorex. L'Agence est en effet régulièrement interrogée par des pharmaciens inspecteurs de la santé sur la possibilité d'usage détourné de ce produit.

- Evolution des chiffres de vente

Depuis 1991, les ventes progressent régulièrement. Aucun pic n'a été observé au cours des mois qui ont suivi les mesures prises à l'encontre des anorexigènes. Il est toutefois, à noter que les ventes de ce produit sont d'environ 5 millions de boîtes, ce qui est loin d'être négligeable.

Il est en fait, difficile au vu des seuls chiffres de ventes de mettre en évidence un mésusage du produit. Il est donc indispensable pour affiner l'analyse de :

- disposer des données Dorema
- de pouvoir distinguer les nouvelles prescriptions des renouvellements
- de saisir l'observatoire des prescriptions

- Données cinétiques et de métabolisme

Les concentrations plasmatiques du Benfluorex sont atteintes en 1 à 2 heures, l'absorption est complète et le volume de distribution est faible de 0,37 l/kg. La fixation plasmatique est de 77 %. Le métabolite majeur est le 1-(3-trifluoromethylphenyl)-2N-2-(carboxymethyl)aminopropane. L'élimination est rénale avec 75 % du produit éliminé dans les 8 premières heures. Le Benfluorex est totalement métabolisé.

La norfenfluramine, métabolite du Benfluorex est retrouvée en faible quantité (2 %) dans les urines.

Il est surprenant de constater que les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60 ng/ml). En effet, la Norfenfluramine formée à partir de la Fenfluramine, n'est plus transformée et se retrouve intacte dans les urines de 24 h à l'état d'équilibre à 7,4 % de la dose administrée. Alors que la norfenfluramine formée à partir du Benfluorex, est transformée en produit désaminé et oxydé.

Il n'y a aucune explication actuellement pour cette différence.

Le Comité Technique juge que ces informations sont insuffisantes et ne permettent pas d'être entièrement rassuré. En particuliers, le rapporteur devrait pouvoir disposer d'une analyse correcte des AUC.

Enfin, une question relative à la parenté chimique du Benfluorex avec les amphétaminiques est posée. Il a été rapporté qu'un patient âgé traité par MEDIATOR® avait présenté un test urinaire positif ; cette recherche avait été faite chez ce dernier dans le cadre d'une procédure judiciaire, son fils étant toxicomane. Les CEIP pourrait être interrogés à ce sujet.

Dans 7 cas, le **délai** entre la radiothérapie et la gemcitabine n'était pas documenté mais dans 11 cas sur 18, il existait une corrélation entre le délai radiothérapie et gemcitabine et le délai gemcitabine et apparition de l'effet indésirable.

Hormis les manifestations neurologiques chez les patients ayant reçu une radiothérapie cérébrale (5 cas), la **symptomatologie** est très homogène avec des manifestations cutanées à type de dermato-polymyosite. Elle est grave dans 19 cas sur 25.

Selon l'expert radiothérapeute, un mécanisme histopathologique possible serait l'existence d'une microartériopathie oblitérante inflammatoire induite par la gemcitabine.

L'**évolution** est favorable dans 10 cas sur 25 ; dans 12 cas, la symptomatologie a persisté ou s'est aggravée (fibrose pulmonaire, épaississement cutané avec douleurs persistantes) ; dans 3 cas, l'évolution était inconnue.

❒ **Gemcitabine puis radiothérapie**

Deux cas pouvant évoquer un **phénomène de radiosensibilisation** ont été rapportés.

Le rapporteur serait d'avis de **contre-indiquer l'association concomitante de la gemcitabine et de la radiothérapie à visée curative et palliative.**

Selon l'expert radiothérapeute, l'administration successive de la radiothérapie et de la gemcitabine pourrait être raisonnablement envisagé avec un délai d'un mois entre les deux thérapeutiques.

En conclusion, le Comité technique souhaite que les résultats de l'enquête officielle sur "gemcitabine et radiothérapie" et "gemcitabine et cardiotoxicité" soient présentés à la Commission Nationale de Pharmacovigilance du 22 septembre 1998.

MEDIATOR (benfluorex)

Mise au point

Comité Technique du 10 Septembre 1998

Confidentiel

M.DAVID-LAROCHE
P.BECHTEL

1) Le métabolisme du benfluorex et de la fenfluramine a été réévalué récemment avec des méthodes plus sensibles et plus spécifiques.

2) La différence essentielle qui est ressortie de ces études est la suivante :

- la norfenfluramine est bien un produit du métabolisme de la fenfluramine et du benfluorex. Les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60ng/ml). Mais à partir de la Fenfluramine, la Norfenfluramine produite n'est plus biotransformée et se retrouve dans les urines de 24h à l'état d'équilibre à 7,4% de la dose administrée. Par contre à partir de Benfluorex, la Norfenfluramine est transformée en un produit désaminé et oxydé. Le pourcentage de la dose excrétée dans les urines de 24h à l'état d'équilibre n'est que de 2%.

Il n'y a aucune explication actuellement pour cette différence.

- on ne peut pas exclure un passage à travers la barrière hémato-cérébrale de la Norfenfluramine produite à partir de Benfluorex.

Mais les études pharmacodynamiques n'ont jamais mis en évidence un effet anorexigène de Benfluorex.

3) Le 3-trifluorométhylphényl-1-hydroxypropanone-2 n'a pas été retrouvé en quantité détectable avec les nouvelles méthodes. Il est probable qu'une erreur d'interprétation analytique est à l'origine de l'attribution de ce métabolite au métabolisme de Benfluorex.

COURRIER ARRIVÉ LE :
NOM : JTLB
N° : 13736
TRANSMIS À :

DEV + DEI.PE

Mr Jean-René BRUNETIERE
Directeur Général
Agence du Médicament
143 - 147 Bd Anatole France
93285 SAINT-DENIS CEDEX

Objet : Prescription de MEDIATOR.

Monsieur le Directeur Général,

L'Union Régionale des Caisses d'Assurance Maladie (URCAM) de Bourgogne a réalisé une étude[1] portant sur les modalités d'utilisation de la spécialité MEDIATOR® (Benfluorex).

Il est constaté qu'un nombre important de cas (environ 1/3) correspond à des prescriptions médicales se situant hors du champ des indications thérapeutiques prévues par l'Autorisation de Mise sur le Marché (adjuvant du régime dans les hypertriglycéridémies ou traitement du diabète asymptomatique avec surcharge pondérale), notamment dans le cadre de traitements à visée amaigrissante.

En conséquence, il nous est apparu nécessaire de vous transmettre les résultats de cette étude même si, en l'absence de données issues du codage pharmacie, ceux-ci ne peuvent être exhaustifs.

Face aux constats établis par les praticiens conseils, il nous apparaîtrait particulièrement opportun de procéder à une réévaluation de l'utilité du MEDIATOR dans la stratégie thérapeutique de la maladie diabétique et dans celle des hyperlipidémies.

D'autre part, il nous semble également utile d'alerter l'Agence du médicament sur l'utilisation non contrôlée d'un produit de structure amphétaminique, dans un but anorexigène. Il est en effet assez paradoxal de constater que la prescription de MEDIATOR est tout à fait libre tandis que celle des médicaments du groupe des amphétamines est strictement encadrée depuis mai 1995.

[1] 2 documents joints en annexe.

ARRIVÉE LE 21 SEP. 1998

NOTE

- A l'attention de Monsieur Jean-Michel ALEXANDRE -

- Direction de l'Evaluation -

Objet : Evolution de la consommation et des prescriptions de MEDIATOR®

Les données dont dispose la DEIPE sur l'évolution des consommations et des prescriptions de MEDIATOR® au cours de ces dernières années ne permettent pas de mettre en évidence un détournement d'usage de ce médicament. Si MEDIATOR® a été - et est encore - prescrit comme anorexigène et, de façon plus large, comme médicament anti-obésité, la part des prescriptions dans ces indications hors AMM est modeste et - surtout - a décru au cours de la période étudiée. Ainsi, les prescriptions de ce médicament dans le traitement de l'obésité[1] étaient, selon le DOREMA, de 9 % en 1994 mais seulement de 5,1 % au cours de l'hiver 1997-1998.

Comme le montre le tableau joint en annexe, une tendance similaire peut être dégagée en ce qui concerne la prescription de MEDIATOR® comme amaigrissant ou comme anorexigène. En tout état de cause, si l'on admet que la rubrique "effets attendus" du DOREMA est correctement renseignée, les mesures prises en 1995 pour restreindre la prescription d'anorexigènes n'ont pas entraîné de reports en faveur de MEDIATOR®. Ce médicament demeure très largement prescrit comme hypocholestérolémiant et comme antidiabétique (80,2 % des prescriptions en 1997).

Quant à l'évolution globale du nombre de prescriptions de MEDIATOR®, si elle a été positive, elle est restée néanmoins modeste : + 5,6 % entre 1994 et 1997.

[1] Effet attendu : traitement de l'obésité

Il sera seulement noté que le nombre de boîtes vendues a augmenté de 16 % entre 1994 et 1997, soit une progression plus importante que celle de l'ensemble des spécialités remboursables (+ 2,9 %). Toutefois, cette progression aurait dû être encore beaucoup plus forte si les prescriptions d'anorexigènes s'étaient reportées de façon tangible sur MEDIATOR®. En effet, les ventes (en unités) d'anorexigènes s'élevaient en 1994 à 4,4 millions et, en 1995, à 2,8 millions.

Aussi, en conclusion, apparaît-il que le détournement d'usage de MEDIATOR®, s'il existe, ne pourrait être évalué qu'à l'aide de données beaucoup plus fines, et qui font actuellement défaut, sur la prescription de ce médicament.

Le Directeur des Etudes et de
L'Information Pharmaco-Economiques

Frédéric FLEURETTE

P.J. : Tableau sur l'évolution des ventes et des prescriptions de MEDIATOR®.

EVOLUTION DES VENTES ET DES PRESCRIPTIONS DE MEDIATOR

	1994	1995	1996	1997	Hiv. 97/98
Nbre de boîtes vendues (30 comp.)	4 809 905	5 159 845	5 283 371	5 588 203	
Nbre total de prescriptions	909 000	869 000	882 000	960 000	957 000
Nbre de prescriptions "anti-obésité"*	82 000	85 000	65 000	54 000	49 000
Part des prescriptions "anti-obésité"	9,02%	9,78%	7,37%	5,63%	5,12%

* Effet attendu

Parmi les prescriptions ayant pour effet attendu "Anti-obésité" :

	1994	1995	1996	1997	Hiv. 97/98
bre de prescriptions "amaigrissement"*	59 000	52 000	43 000	20 000	17000
art des prescriptions "amaigrissement"	1,23%	1,01%	0,81%	0,36%	
e de prescriptions "anorexigènes"*		19 000		17 000	15 000
art des prescriptions "anorexigènes"		2,19%		1,77%	1,57%

Effet attendu

urces : "Taxe sur les spécialités" pour les données sur les ventes
"Doréma -EPPM" pour les données de prescriptions (automne, sauf pour hiver 97/98)

VIII - POINT SUR LA PHARMACOVIGILANCE EUROPÉENNE.

Compte-rendu du groupe de travail de Pharmacovigilance de l'Agence Européenne des 7 et 8 octobre 1998.

- **Terfénadine (article 12)** : les décisions de la Commission Européenne doivent être appliquées par les Etats Membres avant le 22 octobre 1998. En France, la suspension de l'AMM est effective jusqu'au 11 février 1999.

- **Anorexigènes (article 15a)** :
- fenfluramine / dexfenfluramine et amfépramone / phentermine : Les réponses aux questions adressées aux firmes sont attendues pour le 1er mars 1999 au plus tard et seront examinées par le Comité des Spécialités Pharmaceutiques (CSP) de mars 1999, en présence des firmes. L'opinion du CSP est attendue pour le mois d'avril 1999.
- Clobenzorex, fenbutrazate, fenproporex, mazindol, méfénorex, norpseudoéphédrine, phendimétrazine, propylhexédrine : initiation d'un article 15a (Autriche rapporteur, France et Allemagne co-rapporteur) afin de réévaluer le rapport bénéfice / risque de tous ces anorexigènes amphétaminiques. Le rapport d'évaluation circulera parmi les Etats Membres à partir du 30 janvier 1999 et sera discuté au CSP du mois de février 1999. L'opinion du CSP est attendue pour le mois d'avril 1999.
  L'Italie pose le problème du MEDIATOR® (benfluorex) en raison de l'analogie structurale avec la fenfluramine et craint la survenue de valvulopathies associées à l'utilisation de ce médicament. Ce problème sera discuté au prochain groupe de travail des 24 et 25 novembre 1998.

- **Sparfloxacine (ZAGAM®) (article 12, France rapporteur)** : le rapport d'évaluation de la France concernant le protocole de l'étude d'efficacité a circulé parmi les Etats Membres pour information et sera discuté lors du CSP du mois d'octobre 1998.

- **Kétorolac (TORADOL®) / risque hémorragique et augmentation de la mortalité** : le Royaume-Uni a présenté son rapport d'évaluation. Deux études italiennes et une synthèse espagnole ont été distribuées. Le Royaume-Uni analyse et prépare ses commentaires sur les trois études publiées adressées par la firme. Ce sujet sera de nouveau discuté lors du groupe de travail du mois de novembre 1998.

- **Sildénafil (VIAGRA®)** : le groupe de travail a jugé nécessaire la réalisation d'une étude post-marketing par la firme. Par ailleurs, l'infofax de l'Allemagne concernant les interactions avec les nitrates sera discuté lors du Working Party du mois de novembre 1998.

- **Inhibiteurs des protéases / lipodystrophies, hyperlipidémies, altération du métabolisme du glucose, pancréatites, complications cardio-vasculaires** : un libellé commun pour la classe des inhibiteurs des protéases a été finalisé pour adoption lors du CSP du mois d'octobre 1998 où sera choisie la procédure à appliquer (mesure de restriction urgente ou variation de type II). Les prescripteurs seront informés par le biais d'une lettre d'information où d'un bulletin national selon les Etats Membres. Il a, par ailleurs, été jugé nécessaire que les firmes ré-analysent les données cliniques et mettent en place des études de tolérance. Désormais, les produits de cette classe seront revus ensembles.

- **Analogues nucléosidiques / lipodystrophies, acidoses lactiques, stéatoses hépatiques** : la révision du libellé commun concernant les acidoses lactiques a été jugées nécessaire. La Suède adressera sa proposition de libellé commun aux Etats-Membres avant le CSP du mois d'octobre 1998. Il a par ailleurs été demandé aux firmes de revoir le problème des lipodystrophies dans le prochain rapport périodique actualisé

Monsieur le Directeur Général de la Santé

Par ailleurs, un expert pneumologue sera chargé de revoir les cas d'effet pulmonaire pour faire la part entre un bronchospasme et une crise d'asthme.
Cette enquête officielle sera présentée en Commission Nationale le 10 Février 1999.

IX - ENQUÊTE OFFICIELLE MEDIATOR® (BENFLUOREX) : CRPV de Besançon

Le CRPV de Besançon a présenté les résultats de l'enquête officielle sur le MEDIATOR® (benfluorex) ainsi que les données sur le métabolisme de la molécule.

Bilan des effets indésirables :
Les effets cutanés et / ou allergiques pourraient être rajoutés dans le RCP.

Métabolisme :
La norfenfluramine produite à partir du benfluorex est retrouvée dans les urines avec une concentration de 2 % (contre 7,4 % pour la norfenfluramine produite à partir de la fenfluramine). Il est donc peu probable que le benfluorex induise les mêmes effets que la fenfluramine.

L'Italie qui propose que le benfluorex soit inclus dans l'article 15a européen relatif aux fenfluramines, a en charge une enquête sur cette molécule. Le CRPV de Besançon adressera une copie de son rapport à l'Agence Italienne qui prépare un rapport pour le groupe de travail de pharmacovigilance européen de février 1999.

X - POINT PHARMACOVIGILANCE EUROPEENNE

- Vigabatrin / rapport bénéfice risque / atteintes du champ visuel / article 12 :
Un article 12 a été initié avec la Finlande comme pays rapporteur et le Royaume-Uni comme pays co-rapporteur.
GABITRIL® : La France, en tant qu'Etat membre de référence pour la tiagabine (GABITRIL®) a fait part de son inquiétude quant aux troubles du champ visuel rapportés dans le 4ème PSUR de cette spécialité.
A ce sujet, une réunion à eu lieu à l'Agence du Médicament, en présence du CRPV de Toulouse (responsable de l'enquête officielle) et des laboratoires SANOFI. A l'issu de cette réunion, il a été proposé d'ajouter, dans le RCP de la tiagabine, une précaution d'emploi relative aux troubles du champ visuel.

- Sertindole / morts subites / article 15 :
Alors qu'un article 15 est en cours, la plupart des Etats membres ont suspendu l'autorisation de mise sur le marché du produit. Dans les Etats où il n'est pas autorisé, l'inclusion de patients dans les essais cliniques a été également suspendue.
La France n'est pas concernée par cette procédure de reconnaissance mutuelle.

- Kétorolac (TORADOL®) / risque hémorragique et augmentation de la mortalité :
Un concensus concernant les indications et les doses recommandées a été jugé nécessaire afin que chaque Etat membre concerné effectue ces modifications au niveau national. Le Toradol® n'est pas commercialisé en France.

- Inhibiteurs de protéases (indinavir, nelfinavir, ritonavir, saquinavir) / rhabdomyolyse :
Le libellé commun concernant les rhabdomyolyses, pour la classe des inhibiteurs de protéases sera soumis pour adoption au CSP de décembre 1998.

- Inhibiteurs de la cathécol O-méthyltransférase - Tolcapone (TASMAR®) / suspension de l'AMM -

AGENCE DU MEDICAMENT

RÉPUBLIQUE FRANÇAISE

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint Denis, le 03 DEC. 1998

Cher(e) Ami(e) et Collègue,

J'ai l'honneur de vous faire connaître que la prochaine réunion du Comité Technique de Pharmacovigilance aura lieu le :

Jeudi 17 décembre 1998 à 9 h 30
à l'Agence du Médicament - Salle de Réunions n° 1
143 -147 boulevard Anatole France
93200 SAINT DENIS
(Métro Carrefour Pleyel)

ORDRE DU JOUR

Matin

1°) Adoption des Procès-Verbaux des séances du 22 octobre 1998 et du 19 novembre 1998.

2°) Enquête officielle INNOHEP® (tinzaparine sodique) et accidents hémorragiques.

3°) Tour de table des cas marquants et de la littérature.

4°) Enquête officielle LAMICTAL® (lamotrigine).

5°) Point sur la pharmacovigilance européenne.

Après-midi

6°) Enquête officielle ZOLOFT® (sertraline).

7°) Enquête officielle sur les antigènes à visée immunostimulante : résultats préliminaires.

8°) Point sur les atteintes oesophagiennes avec les tétracyclines en comprimé.

9°) Enquête officielle ROACCUTANE® (isotrétinoïne).

10°) Enquête officielle MEDIATOR® (benfluorex).

11°) Questions diverses.

Le Chef de l'unité de Pharmacovigilance

Dr Anne CASTOT

II - TOUR DE TABLE DES CAS MARQUANTS

Seuls sont signalés les cas d'effets indésirables donnant suite à des mesures (mise en enquête, notes, ...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **CERVOXAN® (vinburnine), ZYLORIC® (allopurinol), ARICEPT® (donépezil) / CRPV de Nantes** : crise de porphyrie aiguë intermittente chez un homme de 86 ans.
Il n'existe aucune contre-indication pour les porphyries dans les RCP de ces spécialités.
Cette observation soulève le problème de l'absence d'une liste officielle et validée par l'Agence du Médicament, énumérant les médicaments contre-indiqués dans les porphyries.
Le problème est le même pour les médicaments contre-indiqués dans les déficits en G6PD.
→ Une note sera adressée à l'unité des Affaires Réglementaires de la Direction de l'Evaluation.

- **FRAXODI® (nadroparine calcique) / CRPV de Saint-Etienne** : hémorragie massive rétropéritonéale chez un homme de 73 ans après utilisation de FRAXODI® (0,8 ml x 2/j) au lieu de FRAXIPARINE® (0,8 ml x 2/j) initialement prescrite. Il n'existe pas d'équivalence d'activité anti-Xa entre les doses de ces deux spécialités de nadroparine calcique ce qui peut entraîner des confusions.
→ Un note sera adressée à l'attention de l'évaluateur de la classe des HBPM.

- **KETODERM crème 2% (kétoconazole) / CRPV de Caen** : eczéma aigü localisé chez une femme de 23 ans. Le libellé actuel de la rubrique "effets indésirables" du RCP est "1 cas d'eczéma de contact a été rapporté". Plusieurs cas sont rapportés dans la banque nationale ou décrits dans la littérature.
→ L'unité de pharmacovigilance adressera un courrier au laboratoire afin qu'il dépose une demande de modification de l'information.

- **LOPRIL® (captopril) / CRPV de Marseille** : augmentation de la lipase à 3,5 N (amylase normale) chez une femme de 71 ans. Cet effet est mentionné dans le RCP du captopril mais pas dans celui de l'énalapril alors que des cas sont décrits dans la littérature.
→ L'unité de pharmacovigilance adressera un courrier au laboratoire afin qu'il dépose une demande de modification de l'information.

- **MEDIATOR® (benfluorex), VASTEN® (pravastatine), ASPEGIC® (acétylsalicylate de DL lysine), TENORMINE® (aténolol) / CRPV de Marseille** : insuffisance aortique découverte chez un homme de 43 ans traité par benfluorex depuis 6 ans. Aucune prise d'anorexigènes ou d'amphétamines.
→ Le benfluorex qui se métabolise en norfenfluramine, fait l'objet d'une discussion au groupe de travail de pharmacovigilance européen. L'Italie qui envisage de saisir le CSP en vertu de l'article 12, rédige un rapport sur le métabolisme et les données de sécurité de ce produit en collaboration avec la France.

- **OESCLIM® (estradiol) / CRPV de Marseille** : eczéma chez une femme de 45 ans.
→ Cette spécialité est enregistrée selon une procédure de reconnaissance mutuelle (France Etat membre de référence). Dans le dernier RCP datant du mois d'octobre 1998, il est mentionné : "dermatite de contact allergique et démangeaisons". Cependant ce libellé n'apparaît pas au dictionnaire Vidal® 1999.

I - ADOPTION DU PROCÈS-VERBAL DE LA SÉANCE DU 30 MARS 1999

Le procès-verbal de la séance du 30 mars 1999 a été adopté avec les modifications suivantes :

Page 2 : Paragraphe III - CALCIDIA®
3 ème ligne : supprimer le "s" de "gardes".

Page 3 : Paragraphe III - NALADOR®
3 ème ligne : ajouter un "i" à "utilisation".

Paragraphe III - Acétylcystéine, carbocistéine
2 ème ligne et 6 ème ligne : remplacer "syndrome" par "réaction".

Page 7 : Paragraphe V-Enquête officielle LAMICTAL® : effets indésirables
2 ème rubrique : 2 ème ligne : remplacer le "P" majuscule de "Pharmacocinétique" par un "p" minuscule.
: 2 ème ligne : ajouter "également" après "ont été"
: 4 ème ligne : remplacer "suge" par "sujet"
: 5 ème ligne ajouter après "insuffisance hépatique" : "les rubriques "Mises en garde" et "Allaitement" doivent être également modifiées".

Page 8 : Paragraphe VIII - Point fibrates : photosensibilisation
2 ème ligne : ajouter un "s" à "Résumé".

Page 9 : Paragraphe VIII - Point fibrates : photosensibilisation
5 ème ligne : remplacer "un cas de réaction croisée" par "une réaction croisée"

Page 9 : Paragraphe IX-Point INNOHEP® : Priapisme
11 ème ligne : supprimer les termes "dans l'année" après "HBPM".

Page 10 : Paragraphe XI-Questions diverses/Association d'Aide Aux Victimes des Accidents des Médicaments
2 ème ligne : remplacer "utiliser" par "utilisée".

Page 5 : Paragraphe IV - Enquête officielle vaccination anti-hépatite B : effets indésirables/maladies auto-immunes : remplacer la partie consacrée aux maladies auto-immunes par le texte joint ci après.

VI POINT SUR LA PHARMACOVIGILANCE EUROPEENNE

Compte-rendu du groupe de travail européen de pharmacovigilance des 15 et 16 avril 1999

- Inhibiteurs de la protéase / lipodystrophies :
Un groupe d'experts comprenant des membres du Comité des Spécialités Pharmaceutiques (CSP) et des experts cliniciens a été mis en place pour évaluer le risque des lipodystrophies et ses conséquences.

- Inhibiteurs de la protéase / rhabdomyolyse :
Le pays rapporteur (Suède) a considéré que l'augmentation des CPK et la survenue de rhabdomyolyses étaient à rajouter dans le RCP de l'ensemble des produits de la classe. Les laboratoires ont fait appel. La proposition finale du groupe de pharmacovigilance est de mentionner ces effets en tant "qu'effets de classe" dans les RCP sans mentionner expressement le nom de la spécialité.

- Rituximab (MABTHERA®) :
Cet anticorps monoclonal indiqué dans les lymphômes de stade IV fait l'objet d'une surveillance renforcée depuis la survenue de plusieurs cas de réactions liées à la perfusion de rituximab (signes pulmonaires).
Par ailleurs, 6 observations de réactions cutanées graves (syndrome de Lyell, pemphygoïde bulleuse) ont été rapportées. Le laboratoire va déposer une demande de variation de type II (demande de modification de l'information).

- Sildénafil (VIAGRA®) :
La Variation de type II concernant l'interaction avec les inhibiteurs de la protéase est en cours d'évaluation. Le protocole de l'étude de surveillance post-commercialisation est toujours en cours d'élaboration.
Les atteintes hépatiques doivent également faire l'objet d'une surveillance.

- Anorexigènes et atteintes des valves cardiaques (article 15 de la Directive 75/319/CEE):
L'opinion du CSP concernant les anorexigènes est attendue pour le 20 avril 1999.
- Fenfluramine / dexfenfluramine : l'opinion sera probablement en faveur d'un retrait définitif des AMM de ces produits car le rapport bénéfice/risque reste négatif en raison des effets indésirables.
- Amphétaminiques : les nouveaux textes concernant les traitements de l'obésité recommandent des effets sur la perte de poids cliniquement significatifs et prolongés. Ces effets prolongés faisant défaut aux amphétaminiques, le CSP devrait considérer que les anorexigènes amphétaminiques dont les effets indésirables sont par ailleurs bien connus, doivent être retirés du marché.

- Sertindole (article 15 de la Directive 75/319/CEE) / morts subites :
L'évaluation dans le cadre de l'article 15 se poursuit. Les laboratoires doivent fournir les résultats de deux nouvelles études cliniques comparatives. L'opinion définitive du CSP est prévue pour le mois de juin 1999. Cet antipsychotique n'est pas autorisé en France.

VI - POINT SUR LA PHARMACOVIGILANCE EUROPEENNE.

Compte-rendu du groupe de travail européen de pharmacovigilance des 10 et 11 juin 1999.

- Inhibiteurs de la protéase / lipodystrophies :
Un groupe d'experts comprenant des membres du Comité des Spécialités Pharmaceutiques (CSP), des membres du groupe de travail de pharmacovigilance (Suède, Espagne et Belgique) et des experts cliniciens a été mis en place pour évaluer le risque des lipodystrophies et ses conséquences. Une première réunion a eu lieu le 28 mai 1999. La réunion suivante est programmée le 29 juin 1999. Les recommandations finales de ce groupe sont attendues pour septembre 1999.

- Association de lamivudine et zidovudine : atteintes mitochondriales et complications cérébrales chez l'enfant :
Les Etats membres ont été informés des conclusions de la réunion d'experts organisée en France le 31 mai 1999. La France doit proposer les principaux éléments d'une lettre d'information aux prescripteurs lors du groupe du travail de juillet 1999 pour adoption par le CSP de manière à ce qu'une information commune soit diffusée en Europe.

- Rituximab (MABTHERA®) :
Cet anticorps monoclonal indiqué dans les lymphomes de stade IV fait l'objet d'une surveillance renforcée depuis la survenue de plusieurs cas de réactions liées à la perfusion de rituximab (signes pulmonaires). Les données concernant les autopsies des patients décédés n'apportent aucun élément nouveau. Un protocole d'étude clinique sera discuté durant l'été.
Par ailleurs, 6 observations de réactions cutanées graves (syndrome de Lyell, pemphigoïde bulleuse) ont été rapportées. Une demande de variation de type II (demande de modification de l'information médicale) relative à ces observations est en cours d'évaluation.

- Sildénafil (VIAGRA®) :
Le protocole de l'étude de surveillance post-commercialisation doit être prochainement rediscuté. avec les laboratoires PFIZER.
A la suite de plusieurs notifications d'atteintes hépatiques survenues en dehors de l'Union européenne, les effets indésirables hépatiques font également l'objet d'une surveillance.
L'ajout d'une interaction médicamenteuse concernant le ritonavir et le saquinavir a été adopté par le CSP.

- Anorexigènes (article 15 de la Directive 75/319/CEE):
La plupart des laboratoires ont fait appel à l'opinion du CSP rendue en avril 99. De nouveaux pays rapporteurs et co-rapporteurs ont été nommés :
- Angleterre et Pays-Bas pour la fenfluramine, dexfenfluramine,
- Italie et Espagne pour la phentermine, amfépramone,
- Belgique et Portugal pour les autres anorexigènes.

L'opinion définitive du CSP est attendue pour fin juillet 1999.

- Sertindole (article 15 de la Directive 75/319/CEE) / morts subites :
Les rapporteurs concluent à un rapport bénéfice-risque négatif.
L'opinion du CSP est attendue pour fin juin 1999.

- Vigabatrin (article 12 de la Directive 75/319/CEE) / restrictions du champ visuel :
A la suite de l'opinion du CSP (mai 1999) modifiant les indications et les mises en garde du vigabatrin, les laboratoires ont préparé un nouveau RCP, une lettre d'information aux prescripteurs et un projet d'études cliniques.

- Inhibiteurs sélectifs de recapture de la sérotonine / syndrome de sevrage et dépendance :
Les éléments suivants apparaîtront dans la section "Effets indésirables" des RCP des produits de la classe :
- des syndromes de sevrage peuvent survenir à l'arrêt du traitement,
- liste de symptômes associés au syndrome de sevrage,
- une diminution progressive de la dose est recommandée pour tous les traitements excepté pour la fluoxétine (car longue demi-vie). Les RCP de la venlafaxine et de la paroxétine devront être plus détaillés quant aux modalités de diminution de la dose en fin de traitement car des syndromes de sevrage ont été rapportés plus souvent avec ces deux médicaments.
- il n'y a pas de données cliniques permettant d'exclure un risque de pharmacodépendance.

- Benfluorex / métabolisation en norfenfluramine :
le rapport rédigé par l'Italie en collaboration avec la France a été distribué aux Etats membres.
Les données disponibles ne permettant pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex, le groupe de travail a souhaité que les pays rapporteurs (France et Italie) proposent des modifications de RCP et adressent une liste de questions au laboratoire en demandant une mise à jour des données de tolérance et la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites.

Par ailleurs, mi-juin 1999, un cas d'HTAP d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans. Il s'agit du premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène. 11 cas avaient auparavant été rapportés lors d'un traitement associant le benfluorex à de la dexfenfluramine dans 10 cas et à de l'amfépramone et du clobenzorex dans 1 cas.

Compte-tenu de ce nouveau cas, l'Agence a adressé un courrier aux laboratoires SERVIER leur demandant de verser, avant le 28 juin 1999, une mise à jour des données de tolérance ainsi que les données de pharmacologie et pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines. Un infofax a par ailleurs été envoyé à tous les Etats membres.

- Thiomersal / sensibilisation :
Un groupe de travail a été mis en place par le CSP pour étudier l'éventuelle toxicité de cet excipient présent dans certains vaccins, collutoires, collyres et gouttes nasales. L'OMS soulève le risque de neurotoxicité et néphrotoxicité du thiomersal, notamment chez l'enfant.
Le groupe de travail de pharmacovigilance est chargé de rédiger une mise en garde commune pour

VIII - QUESTIONS DIVERSES.

- Le Dr Anne CASTOT, chef de l'Unité de pharmacovigilance de l'AFSSAPS a annoncé son prochain départ de l'Unité pour prendre en charge à partir du mois d'août 1999, au sein de la Direction de l'Evaluation des Médicaments et des Produits Biologiques (DEMEB), la coordination des vigilances. Le futur responsable de l'Unité de pharmacovigilance sera le Dr Carmen KREFT-JAÏS.

- Cisapride (PREPULSID®) :

Un point sur la demande de modification d'information de la spécialité Prépulsid® déposée le 2 juin 1999 par les laboratoires Janssen-Cilag, titulaire de l'A.M.M., a été présenté par le Dr J. Caron.

Prépulsid® (cisapride) est autorisé en France selon une procédure nationale depuis 1988 dans l'indication du traitement du reflux gastro-oesophagien, de l'oesophagite par reflux gastro-oesophagien et des troubles liés à un retard de l'évacuation gastrique (gastroparésie).

En juin 1998 : compte-tenu des effets arythmogènes du cisapride, la Food and Drug Administration (F.D.A.) a pris la décision de réserver l'utilisation du cisapride au traitement de 2ème intention du reflux gastro-oesophagien, en renforçant considérablement les rubriques "Contre-indications", "Mises en garde et précautions d'emploi" du Résumé des Caractéristiques du Produit (R.C.P.).

Parallèlement, les laboratoires Janssen-Cilag ont déposé *fin juin 1998* une demande de modification d'information dans tous les pays de l'Union européenne. Ce sujet a été abordé au Comité des Spécialités Pharmaceutiques (CSP) de l'Agence Européenne pour l'Evaluation des Médicaments (EMEA) réuni les *21 et 23 juillet 1998*. Ce dernier a exprimé la nécessité d'une réévaluation du rapport bénéfice/risque et d'une harmonisation du RCP au niveau européen.

En septembre 1998 : la France a soumis aux états membres de l'Union européenne un rapport d'évaluation relatif au risque et *en mars 1999* un rapport d'évaluation relatif à l'efficacité.

En février 1999 : les laboratoires Janssen-Cilag ont soumis les résultats d'une expertise clinique menée par des cardiologues américains sur tous les effets indésirables cardiaques rapportés depuis la mise sur le marché de Prépulsid®.

En mai 1999 : les laboratoires Janssen-Cilag ont soumis les résultats d'une étude d'interaction chez le volontaire sain qui met en évidence une augmentation de 50% de la biodisponibilité du cisapride lors de l'administration de 200 ml de jus de pamplemousse .

Le 5 mai 1999 : les laboratoires Janssen-Cilag ont informé l'AFSSAPS que le libellé du cisapride était en cours de révision au niveau de la F.D.A. afin d'introduire de nouvelles mises en garde et contre-indications notamment chez les patients ayant des antécédents familiaux connus de prolongation du QT et les patients ayant une bradycardie cliniquement significative ainsi que l'interaction avec le jus de pamplemousse. L'Unité de Pharmacovigilance de l'AFSSAPS a communiqué cette information le 26 mai 1999 à l'ensemble des états membres de l'Union européenne. Ces modifications ont donné lieu aux Etats-Unis à une lettre d'information des prescripteurs (*parue le 1er juin 1999* sur le site internet des laboratoires Janssen-Cilag/Etats-Unis et *le 10 juin 1999* sur le site de la F.D.A.).

Le *25 mai 1999*, un groupe d'experts a été réuni à l'AFSSAPS afin de réévaluer le rapport bénéfice/risque du cisapride chez l'adulte et l'enfant. Il a été proposé de renforcer les mises en garde

et précautions d'emploi et de restreindre les indications.

Le *2 juin 1999*, les laboratoires Janssen-Cilag ont déposé auprès de l'AFSSAPS et dans tous les états membres de l'Union européenne une demande de modification de l'information médicale.

Cette demande concerne les rubriques "Posologie et mode d'administration" ("ajout" du jus de pamplemousse), "Contre-indications" (renforcement de la rubrique en cas d'association avec des médicaments susceptibles d'allonger le QT, hypokaliémie, hypomagnésémie, bradycardie cliniquement significative, QT long congénital et antécédents familiaux de QT long congénital), "Mises en garde" (renforcement de la rubrique), "Interactions" (renforcement de la rubrique), "Effets indésirables", "Surdosage", "Propriétés pharmacodynamiques" et" Données de sécurité préclinique".
Ce dossier a été présenté lors du Groupe de Travail Européen de Pharmacovigilance réuni les *10 et 11 juin 1999* à Londres. Le Groupe de travail a approuvé les modifications du R.C.P. proposées par les laboratoires Janssen-Cilag.

Selon le rapporteur la demande de modification de l'information médicale est acceptable sous réserve de quelques amendements. Le libellé proposé par le rapporteur a été distribué en séance. Une lettre d'information des prescripteurs devra être envoyée par les laboratoires Janssen-Cilag.

- Métamizole / agranulocytose :

A la demande du CSP de l'Agence Européenne pour l'Evaluation des Médicaments et à la suite de l'évaluation par la Suède du risque de survenue d'agranulocytoses, la France est chargée de réévaluer le rapport bénéfice/risque du métamizole pour la réunion du CSP prévue à la fin septembre 1999.
A cet effet, un groupe *ad-hoc* de la Commission d'Autorisation de Mise sur le Marché est prévu le jeudi 9 septembre 1999 à 14h00. Ce groupe sera composé de membres de la Commission d'AMM et de membres de la Commission Nationale de Pharmacovigilance.

Une télécopie sera prochainement adressée à tous les membres de la Commission Nationale de Pharmacovigilance afin de savoir qui souhaite participer à ce groupe de travail.

- Benfluorex (MEDIATOR®) :

En France, le benfluorex a fait l'objet d'une enquête officieuse dès 1995 en raison de sa parentée structurale avec les anorexigènes amphétaminiques. Cette enquête est devenue officielle en mai 1998.

Depuis septembre 1998, à la demande des autorités sanitaires italiennes, le benfluorex fait également l'objet d'une évaluation au niveau du Groupe de Travail Européen de Pharmacovigilance (l'Italie et la France sont rapporteurs sur ce dossier). L'un des motifs de cette enquête est la métabolisation du benfluorex en 9 métabolites dont l'un des 3 principaux est la norfenfluramine qui est également le métabolite des spécialités pharmaceutiques appartenant à la classe des "fenfluramines".

Les données disponibles issues de l'enquête officielle de pharmacovigilance ne permettent pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex. Cependant, des doutes persistent concernant notamment le devenir de la norfenfluramine. La réalisation par les laboratoires SERVIER d'une étude de pharmacocinétique du benfluorex et de ses métabolites pourrait permettre de lever ces doutes.

Au courant du mois de juin 1999, un cas d'Hypertension Artérielle Pulmonaire (HTAP) d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans. Il s'agit du

premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène. 11 cas avaient auparavant été rapportés lors d'un traitement associant le benfluorex à de la dexfenfluramine dans 10 cas et à de l'amfépramone et du clobenzorex dans 1 cas.

Cette observation est en cours de documentation et le service de Pneumologie de l'hôpital Antoine Béclère entreprend une interrogation de tous les patients ayant une HTAP à la recherche d'une prise antérieure de MEDIATOR®.

Ce dossier devrait être discuté à la prochaine réunion du Groupe de Travail Européen de Pharmacovigilance les 12 et 13 juillet 1999.

VI - POINT SUR LA PHARMACOVIGILANCE EUROPEENNE

Compte-rendu du Groupe de travail européen de pharmacovigilance des 12 et 13 juillet 1999 :

■ Lamivudine (EPIVIR®, COMBIVIR®) et zidovudine (RETROVIR®) en combinaison thérapeutique / Atteintes mitochondriales et complications cérébrales chez l'enfant

La France a présenté la lettre aux prescripteurs diffusée sur son territoire concernant les modalités de traitement et de prévention de l'infection par le VIH pour le couple mère-enfant au vu des données actuellement disponibles et des risques potentiels de dysfonctionnement mitonchondrial. L'ensemble des états membres de l'Union européenne ont accepté les propositions françaises.

■ Pramipexole (DAQUIRAN®, MIRAPEXIN®, SIFROL®) / Attaques de sommeil

Le pramipexole est un nouvel antiparkinsonien enregistré aux Etats-Unis depuis juillet 1997 et en Europe depuis octobre 1997 selon la procédure centralisée. Dans l'Union européenne, ce médicament n'est commercialisé qu'en Allemagne, en Suède, au Danemark, en Espagne, en Finlande et aux Pays-Bas. Aux Etats-Unis, 19 cas d'attaque de sommeil ont été rapportés chez des patients traités par pramipexole. Dans 14 cas, cette attaque de sommeil est survenue pendant que le patient conduisait un véhicule ; 9 d'entre eux ont été victimes d'un accident de voiture. L'exposition au médicament est estimé à 100 000 patients-année. En Europe, une mesure de restriction urgente (modification du RCP en urgence) ainsi que l'envoi d'une lettre aux prescripteurs ont été décidées par l'Agence européenne pour l'évaluation des médicaments. Les laboratoires Pharmacia & Upjohn et Boehringer Ingelheim ont été entendus et le Groupe de travail européen de pharmacovigilance a finalisé les modifications à apporter au RCP. La France et l'Italie ont proposé que la conduite de véhicules soit contre-indiquée chez les patients traités par pramipexole. L'avis du Groupe a été transmis aux membres du Comité des spécialités pharmaceutiques (CSP) le 12 juillet 1999.

■ Sildénafil (VIAGRA®, PATREX®) / Etudes de post-marketing

Le protocole de l'étude de surveillance en post-marketing a été revu par les laboratoires PFIZER et sera finalisé lors de la réunion du Groupe de travail de pharmacovigilance en septembre 1999. Il sera ensuite transmis au CSP en octobre 1999. Des études supplémentaires ne paraissent pas nécessaires pour le moment.

■ Trovafloxacine, alatrofloxacine (TROVAN®, TURVEL®) / Evaluation du risque d'hépatotoxicité en comparaison avec les autres fluoroquinolones (ciprofloxacine, grepafloxacine, levofloxacine, norfloxacine, ofloxacine, pefloxacine, sparfloxacine, temafloxacine)

Plusieurs états membres ont en charge de rédiger un rapport contenant les cas rapportés d'hépatotoxicité et les données de consommation d'une fluoroquinolone. Ce rapport devra être adressé aux états rapporteur et co-rapporteur (Pays Bas et France) qui rédigeront un rapport comportant les données compilées de l'ensemble des fluoroquinolones afin de pouvoir comparer

leur hépatotoxicité.

■ Sertindole / Cardiotoxicité

Sertindole est un antipsychotique qui n'est pas autorisé en France mais a fait l'objet d'une procédure de reconnaissance mutuelle dans plusieurs états membres de l'Union européenne. En juin 1999, dans le cadre de la procédure d'arbitrage communautaire, le CSP a décidé de suspendre la commercialisation de cette spécialité pendant un an. Durant cette période, les résultats d'études cliniques portant sur l'efficacité et la tolérance du sertindole seront réévalués.

■ Métamizole / Agranulocytoses et anaphylaxie

Le Groupe de travail européen de pharmacovigilance a adopté les éléments d'information à apporter aux professionnels de santé et qui devraient figurer dans le RCP des spécialités concernées. Cependant, chaque état membre reste libre de l'information à délivrer. La France est chargée de réévaluer le rapport bénéfice-risque du métamizole.

■ Anti-histaminiques non sédatifs / Risques cardiovasculaires

Les laboratoires JANSSEN-CILAG ont arrêté la commercialisation au niveau international de leur spécialité HISMANAL® (astémizole). Le devenir des génériques de cette spécialité est un problème pour l'instant non résolu.
Les risques cardiovasculaires liés au traitement par féxofénadine (TELFAST®) feront l'objet d'un rapport rédigé par le Royaume-Uni qui sera diffusé en septembre 1999. Les effets indésirables gastro-intestinaux feront également l'objet d'une discussion.

■ Doxycycline / Atteintes oesophagiennes

La Suède a présenté son rapport sur les atteintes oesophagiennes liées à l'utilisation de leur spécialité Doryx® : gélule contenant des minigranules de doxycycline chlorydrate (ou hyclate). Elle envisageait de retirer du marché cette spécialité en considérant que ce sel d'hyclate était seul responsable des atteintes oesophagiennes : 8 cas ont été notifiés depuis la mise sur le marché en 1994 du Doryx® alors qu'il n'y avait aucun cas avec les autres sels de doxycycline (monohydrate ou carraghenate) depuis le retrait des comprimés et des gélules de doxycycline hyclate (Vibramycine®) en 1979 et 1983. La France considère que le problème est plus lié à la forme pharmaceutique (gélule) qu'à la présence d'hyclate dans la formulation. La Suède transmettra prochainement le texte de modification du RCP de la spécialité Doryx® renforcant l'information sur ce risque digestif.

■ Interféron α-2b / Ischémies périphériques, paralysies, atteintes pancréatiques, stéatoses hépatiques

Le Groupe de travail européen de pharmacovigilance a accepté que ces effets indésirables soient mentionnés dans le RCP des spécialités composées d'interféron alfa-2b (ALFATRONOL® et

VIRTRON®) dont la demande d'AMM selon la procédure centralisée est en cours d'évaluation. Concernant INTRONA® et VIRAFERON®, enregistrés selon la procédure de reconnaissance mutuelle, le Groupe de travail a proposé que ces modification interviennent lors du passage de ces spécialités en procédure centralisée plutôt que par le biais d'une variation de type II.

- Analgésiques contenant de la vitamine C / Décision des autorités sanitaires belges

Monsieur le docteur X. Kurz a informé le Groupe de travail européen de pharmacovigilance qu'en Belgique, l'acide ascorbique ne peut plus être intégré dans des spécialités en tant que principe actif. Cependant, son emploi est encore possible en tant qu'excipient.

- Nimésulide (NEXEN®) / Effets indésirables cutanés et hépatiques, syndromes de Reye

Le Groupe de travail européen a approuvé les propositions du Portugal datant du 8 juin 1999. Cependant, le RCP n'a pas été finalisé. La France ne souhaite pas attendre la proposition définitive pour modifier le RCP de la spécialité disponible en France dans le but d'avertir le plus rapidement possible les professionnels de santé des effets indésirables hépatiques observés avec le nimésulide.

VII- QUESTIONS DIVERSES

1) Anorexigènes :

Le 31 août 1999, le Comité des Spécialités Pharmaceutiques (CSP) a considéré que le rapport bénéfice-risque de l'ensemble des médicaments anorexigènes était négatif et a recommandé leur retrait définitif du marché communautaire.

Le rapport bénéfice-risque des fenfluramines est négatif en raison d'un profil de sécurité d'emploi défavorable (notamment survenue d'hypertension artérielle pulmonaire et atteinte des valves cardiaques). Ces médicaments ne sont plus commercialisés depuis septembre 1997.
Le rapport bénéfice-risque des amphétaminiques est négatif en raison d'un manque d'efficacité dans la prise en charge prolongée de l'obésité, d'autant que leur effet diminue progressivement au cours du temps et qu'ils peuvent entraîner une pharmacodépendance incompatible avec un traitement prolongé.

A la suite de l'avis du CSP, une décision concernant l'ensemble de ces médicaments sera prise prochainement par la Commission européenne.
Dans l'attente de cette décision, l'AFSSAPS va procéder, le 19 octobre prochain, à une suspension des autorisations de mise sur le marché des médicaments anorexigènes amphétaminiques disponibles en France.

2) ARAVA® (léflunomide) / procédure centralisée. Pays-Bas état rapporteur :

Cette spécialité, indiquée dans la polyarthrite rhumatoïde, a obtenu début septembre 1999 une autorisation de mise sur le marché selon une procédure européenne centralisée. Le léflunomide est autorisé aux Etats-Unis depuis 1 an. 70 000 patients ont déjà été traités et plusieurs observations de pancytopénie et de syndrome de Stevens-Johnson ont été rapportées. Ce dossier sera discuté à la prochaine réunion du CSP qui se tiendra le 23 septembre 1999.

REVISED ASSESSMENT REPORT

RELEVANCE OF METABOLIC PATHWAYS OF BENFLUOREX TO NORFENFLURAMINE

Medicinal product: Mediaxal®

Manufacturing Authorisation Holder: Laboratoires Servier

Active constituent: benfluorex

Originating Member States: Italy, France

Assessors: Dr. Giuseppe Pimpinella, Dr. Renato Bertini Malgarini

Contact point: Italian Ministry of Health

Pharmacovigilance Unit

TEL: 0039 06 5994 3212

FAX: 0039 06 5994 3554

Confidential

1. BACKGROUND

Following the report of a case of pulmonary hypertension occurred in France, the Colleagues of Agence du Medicament asked the Laboratoires Servier to provide further documentation for safety, efficacy and pharmacokinetic profile of benfluorex compared to those of fenfluramine and dexfenfluramine.

The French experts have also provided to Italian Ministry of Health the Documentation from the Laboratoires Servier and a joint assessment has been carried out.

2. DATA ANALYSIS

Pharmacokinetic parameters after 14 days treatment.

		AUC 24 (ng ml-1 h)	Cmin (24h) (ng ml-1)	Cmax (ng ml-1)
Benfluorex 3x 150 mg	dl -norfenfluramine	1149 ± 286	43 ± 8	59 ± 15
Dexfenfluramine 2x 15 mg	d-fenfluramine	1060 ± 316	34 ± 7	70 ± 15
	d-norfenfluramine	527 ± 281	18 ± 10	26 ± 13
Fenfluramine 60 mg	d-fenfluramine	1014 ± 445	33 ± 12	65 ± 26
	l-fenfluramine	1581 ± 778	54 ± 24	97 ± 47
	d-norfenfluramine	377 ± 136	14 ± 5	21 ± 8
	l-norfenfluramine	586 ± 210	21 ± 9	32 ± 13

From the data in the table, we can derive that an exposition to 450 mg/day of benfluorex (only metabolised to norfenfluramine) leads to a norfenfluramine level that is in the same magnitude order of that observed after a 60 mg/day dose of fenfluramine (the contribution of dl-fenfluramine and dl-norfenfluramine has been taken into account).

2.1 Clinical trials

Only one long term (29 weeks) trial in obese patients with type II diabetes has been carried out. In this study benfluorex was compared to placebo and to metformin. The considered parameters were weight loss and glycosylated haemoglobin.

Weight loss was not significant among the three groups.

Glycosylated haemoglobin showed a significant decrease in benfluorex treated patients with respect to placebo (HbA1c -0,6% and +0,5% respectively).

However, benfluorex was less effective of metformin (-0,6 % and -1% respectively).

It must be pointed out that this study is an unpublished internal report and confidence intervals were not available.

Concerning the indication in hyperlipidaemia, there are no data for therapy duration longer than 1 month and numerous therapeutic alternatives are available.

Furthermore, for these short term studies no quantitative data for serum lipids reduction are provided have been provided by the Company.

3. Pharmacovigilance data.

A part from the case of pulmonary hypertension that is still under evaluation, no new significant data have been submitted.

5. Conclusions

As previously concluded, there are suspicions that patients treated with benfluorex are exposed to a potentially toxic level of norfenfluramine. The drug is less effective than metformin in the management of obese patients with type II diabetes. No data on safety and efficacy of the drug for therapy periods longer than six months have been provided.

Psychiatric reactions (confusion), anaphylactic shock, hepatitis, blood disorders and cardiovascular adverse effects are not listed in the SPC.

The final proposals are the following. They have been decided together with the French Colleagues that will address them to Servier:

- The following questions will be addressed to the Company:
  - What are the values of pharmacokinetic parameters in animals and in humans after long term (more than six months) administration of benfluorex?
  - Have the cardiovascular and neurological effects of benfluorex in animals and in humans been assessed after long-term (more than six months) exposure to benfluorex?
  - Has long term efficacy in lowering serum lipids assessed in controlled studies and compared to currently available therapeutic alternatives (fibrates, statins, etc.)?
  - Has long term efficacy in controlling glycaemic parameters assessed in controlled studies?

- If the above data are not available, the Company should carry out a long term study (more than one year) with periodic echocardiographic, glycaemic, serum lipids level controls and measurement of pharmacokinetic parameters.
- SPC revision as follows:

No data supporting the indication hypetriglyceridaemia were included. This indication as the others are currently under review by National French Authorities. We suggest to wait for the conclusion of such review and to discuss the efficacy and pharmacodynamics issues at national level if deemed necessary.

Section 4.3 Contraindications

...Hypersensitivity to the drug or to any other component of the formulation.

Chronic pancreatitis...

Section 4.4 **Special warnings**

Saint-Denis, le 29 OCT. 1999

Cher(e) Ami(e) et Collègue,

J'ai l'honneur de vous faire connaître que la prochaine réunion du Comité Technique de Pharmacovigilance aura lieu le :

Mardi 16 Novembre 1999 de 9 h 30 à 17 h 30
à l'Agence Française de Sécurité Sanitaire des Produits de Santé
Salle de Réunions n° 1
143 -147 boulevard Anatole France
93200 SAINT-DENIS
(Métro Carrefour Pleyel)

ORDRE DU JOUR

Matin

1°) Adoption du Procès-Verbal de la séance du 12 octobre 1999.

2°) Tour de table des cas marquants et de la littérature.

3°) Elixir Parégorique : syndrome de sevrage chez le nourrisson.
Procédures nationales.
Point / CRPV de Paris St-Vincent de Paul et de Strasbourg.

4°) Colles biologiques (BIOCOL®, TISSUCOL®, BERIPLAST®) : réactions anaphylactiques.
Procédures nationales.
Enquête officielle / CRPV de Paris St-Vincent de Paul.

5°) Héparines de bas poids moléculaire : accidents hémorragiques.
Procédures nationales.
Enquête officielle / CRPV de Toulouse.

.../..

Après-midi

6°) Inhibiteurs de la cathécol-O-méthyltransférase (tolcapone : TASMAR® ; entacapone COMTAN®, COMTESS®) : syndrome sérotoninergique - syndrome malin des neuroleptiques.
Procédures européennes centralisées (IR & FI).
Point / CRPV de Limoges et de Toulouse.

7°) EFFEXOR® (venlafaxine) : effets indésirables.
Procédure nationale.
Enquête officielle / CRPV de Limoges.

8°) NITOMAN® (tétrabénazine) : morts subites.
Procédure nationale.
Point / CRPV de Strasbourg.

9°) VIAGRA® (sildénafil) : effets indésirables survenus en France.
Procédure européenne centralisée (NL).
Point / CRPV de Rouen.

10°) ADANCOR®, IKOREL® (nicorandil) : effets indésirables cutanéo-muqueux.
Procédures nationales.
Enquête officielle / CRPV de Paris Pitié Salpêtrière.

11°) Questions diverses.

XI -POINT SUR LA PHARMACOVIGILANGE EUROPENNE (GROUPE DE TRAVAIL DES 23 ET 24 NOVEMBRE 1999).

- Antiprotéases / rhabdomyolyse :

La possibilité d'une interaction entre les antiprotéases et les inhibiteurs de la HMG-COA réductase avec apparition d'une rhabdomyolyse est toujours en discussion.
En janvier 2000, le groupe de travail européen de pharmacovigilance fera le point pour déterminer si cet effet indésirable est plutôt « un effet de classe » ou bien s'il apparaît uniquement avec certaines statines.

- Halothane / arythmies cardiaques graves et fatales chez des enfants :

Une étude randomisée publiée dans le Lancet a montré que l'incidence de survenue d'arythmie cardiaque est six fois plus élevée avec l'halothane qu'avec le sévofurane chez des enfants ayant subi une anesthésie en chirurgie dentaire.
A la suite de cet article, le Royaume-Uni a décidé de contre-indiquer l'utilisation extra-hospitalière de l'halothane en chirurgie dentaire chez les patients âgés de moins de dix-huit ans.

- Phosphénytoïne (PRODILANTIN®) / effets cardio-vasculaires :

Ce médicament est autorisé selon une procédure de reconnaissance mutuelle et commercialisé en France depuis mai 1995. Le pays rapporteur (le Royaume-Uni) a rapporté 3 décès et 52 effets cardiovasculaires. Devant la gravité de ces cas, le Royaume-Uni a demandé au laboratoire de fournir une revue analytique des effets cardiaques au plan international pour le 23 décembre 1999. Le problème évoqué serait un débit de perfusion trop rapide. L'adaptation posologique s'avère également difficile.
Un essai clinique est en cours en France, incluant en particulier des enfants de moins de cinq ans. Une lettre d'information aux investigateurs a été finalisée au plan national. Ce courrier insiste sur la nécessité d'effectuer un monitoring cardio-respiratoire et sur le respect du débit de perfusion. (cf. annexe 4)

- Ropinirole / accès de sommeil d'apparition soudaine :

Depuis l'envoi d'une lettre d'information aux prescripteurs et aux pharmaciens par la firme entre le 10 et le 15 novembre 1999 relatant la possibilité de survenue d'accès de sommeil d'apparition soudaine sous Requip®, des nouveaux cas ont été notifiés notamment en Allemagne et en France. (11 cas)
Un rectificatif d'AMM a été effectué le 9 novembre 1999 mentionnant les nouvelles mises en garde insistant sur la nécessité de ne pas conduire.
Pour mise en conformité avec l'AMM, de nouvelles notices vont être délivrées aux pharmacies à la mi-décembre 1999. De même, des stickers reproduisant le pictogramme obligatoire (une voiture dans un triangle rouge) devront être apposés sur le conditionnement.

- Benfluorex / hypertension pulmonaire primitive et valvulopathie :

Il a été demandé à la firme de réaliser une synthèse sur les données d'efficacité du médicament et sur la tolérance préclinique et clinique à long-terme et de déposer une demande de modification de l'information dans tous les pays où le produit est autorisé.

- Vigabatrin / restrictions du champ visuel :

Les mesures obligatoires de suivi des patients sous VIGABATRIN® ont été rediscutées (fiches d'observation recueillant les résultats de périmétrie). Les modalités d'application seront définies nationalement du fait d'une trop grande variabilité du nombre de patients traités par cette spécialité en fonction des pays européens (ex : 12 000 en France et 400 en Finlande).

VIII - PHARMACOVIGILANCE EUROPEENNE (Groupe de Travail européen de pharmacovigilance des 29 et 30 novembre 2000) :

REMICADE® (infliximab) :

REMICADE® est un anti-TNF (facteur nécrosant des tumeurs) utilisé dans le traitement de la maladie de Crohn. Depuis le mois de juin 2000, son indication s'est étendue au traitement de la polyarthrite rhumatoïde résistante aux corticoïdes. Une mesure de restriction urgente a été envoyée le 8 décembre 2000 et concernait les cas de tuberculose sous REMICADE®.
28 cas de tuberculose milliaire et extra-pulmonaire ont été recensés depuis la mise sur le marché de REMICADE® (9 cas aux Etats-Unis et 19 en Europe). La rubrique « Contre-indications » mentionnera donc un message contre-indiquant le produit chez les patients ayant un sepsis ou une tuberculose. Les rubriques « Mises en garde et précautions d'emploi » et « Effets indésirables » seront également modifiées. Un communiqué de presse sera diffusé sur le site de l'EMEA dès le 10 décembre 2000.

ORLAAM® (lévacéthylméthadol) :

ORLAAM® est un produit de substitution utilisé après un échec du traitement par méthadone. Ce produit est commercialisé, par le laboratoire SIPACO, aux Etats-Unis depuis 1994 et en Europe depuis 1999 selon une procédure centralisée dont l'Etat membre de référence est la Belgique. Le laboratoire SIPACO a fait l'objet de 3 inspections afin de vérifier l'évaluation des données en raison du signalement de cas d'arythmies graves au cours des 2ème et 3ème rapports périodiques de pharmacovigilance. Actuellement, on dénombre 10 cas d'arythmies graves (pour environ 100 000 patients exposés) dont 3 cas de torsade de pointe et 2 cas de pose de Pace-Maker. Le laboratoire s'est engagé à ne pas commercialiser le produit dans d'autres pays européens. Une lettre destinées aux prescripteurs sera bientôt rédigée et un communiqué de presse sera diffusé sur le site de l'Agence européenne (EMEA) très prochainement.
M. LAGIER a précisé que lors de l'AMM, il avait été préconisé que les patients soient hospitalisés au moment de l'instauration du traitement afin d'éviter des effets tardifs tels que l'overdose.
Une révision du rapport bénéfice / risque sera réalisée au mois de janvier ou février 2001.

BENEFIX® (nonacog alpha) :

BENEFIX® est un facteur IX recombinant qui a présenté des problèmes d'agglutination lors de son injection. Le laboratoire WYETH-LEDERLE a été inspecté, à cet effet, et doit réaliser des modification de son produit.

Objet : **MEDIATOR® 150 mg, comprimé enrobé**
Dossier VNL 10008

Madame,

Comme convenu lors de la réunion de pharmacovigilance à l'EMEA en date du 30 novembre 2000, nous vous adressons, ci-joint, pour notre spécialité **MEDIATOR® 150 mg**, comprimé enrobé, le synopsis du protocole d'étude intitulé :

« A one-year, multicentre, international, randomised, double-blind comparison of Benfluorex (150mg to 450mg daily) and Acarbose (150mg to 300mg daily) administered orally for the treatment of type 2 diabetic patients »

Ce synopsis de protocole d'étude d'efficacité de Benfluorex versus Acarbose sur 12 mois inclut également l'étude écho-cardiographique souhaitée.

Nous vous prions de croire, Madame, à l'expression de nos salutations distinguées.

IX - PHARMACOVIGILANCE EUROPEENNE.

Stylos à Insuline et risque de contamination croisée :

Le CRPV de Saint-Etienne avait signalé un problème relatif aux cartouches d'insuline utilisées dans les stylos injecteurs à usage multiple. Ces cartouches sont utilisées dans les services cliniques pour différents patients, en changeant à chaque fois l'aiguille du stylo, mais il n'existe pas de système anti-reflux ce qui pose un problème de remontée de matière biologique avec un risque potentiel de contamination lors de l'échange de celle-ci entre les différents patients. Ce problème a été évoqué au Groupe de travail européen qui a proposé d'inclure dans le RCP des stylos à insuline une information relative au risque de contamination en cas d'utilisation de ces stylos par plusieurs patients différents.

DIPRIVAN® (propofol) et rhabdomyolyse / insuffisance cardiaque :

Un article du Lancet a montré des cas de rhabdomyolyse et d'insuffisance cardiaque, avec possibilité de décès, chez des patients à qui on avait administré du DIPRIVAN® en perfusion avec une posologie supérieure à 4 mg/kg/h pendant 48 heures. Il est rappelé que la posologie du DIPRIVAN® est inférieure à 4 mg/kg/h en France.
Une enquête officielle a été ouverte dont le responsable est le CRPV de Paris Saint-Antoine.

ZIAGEN® (abacavir) et syndrome d'hypersensibilité :

L'abacavir a fait l'objet de 3 mesures de restriction urgente dont la dernière relative au problème de réadministration chez des sujets sensibilisés, remonte au mois d'août 2000. Depuis cette mise en garde, il y a eu un cas grave supplémentaire en France dont l'évolution a été favorable. Ce patient présentait 2 symptômes décrits dans la mise en garde mais son infectiologue lui a dit de reprendre le ZIAGEN®. Le CRPV de Bordeaux a signalé que les infectiologues ne réintroduisaient plus le ZIAGEN® chez les patients ayant déjà fait un syndrome d'hypersensibilité.

X - QUESTION DIVERSES. 23

COMITE TECHNIQUE DU : 13 février 2001

CENTRE DE PHARMACOVIGILANCE DE CAEN BASSE-NORMANDIE

La Présidente du Conseil Régional de l'Ordre des Pharmaciens de Basse Normandie a attiré notre attention sur certaines ordonnances probablement à visée amaigrissante, comprenant des préparations à base de:

- Metformine 0,20
- Ovaire 0,10
- Thyroide 0,05

Associé à la prescription de Médiator® (3 cp/jour).

Certains pharmaciens continuent d'honorer ces prescriptions .

La question est: "faut-il accepter de délivrer ce type d'ordonnance?"
"Est t-il souhaitable et possible d'interdire l'exécution de ces préparations ?"

D'après le Code de Santé Publique, il est rappelé (article 5015-60) que le pharmacien peut refuser de dispenser un médicament lorsque l'intérêt de la santé du patient lui paraît l'exiger.

Par ailleurs, le décret n° 82-200 rappelle qu'il est interdit d'incorporer dans une même préparation magistrale du benfluorex (MEDIATOR®) et des hormones thyroïdiennes.

L'association de ces deux produits sur une même ordonnance est-elle considérée comme un contournement du décret ?.

Par ailleurs, la metformine est un anti diabétique oral et les Références Médicales Opposables concernant cette classe thérapeutique précisent qu'"il n'y a pas lieu de commencer un traitement médicamenteux en l'absence de critères de diagnostic suffisants (glycémie)."

VIII - PHARMACOVIGILANCE EUROPEENNE

Point sur les agonistes dopaminergiques et attaque de sommeil :

Ce dossier a été discuté au Comité des Spécialités Pharmaceutiques (CSP) du 1er mars 2001.

Une attaque de sommeil est un épisode abrupt d'endormissement survenant au cours d'une activité journalière. Cet épisode peut être ou non précédé d'un état de somnolence et peut durer de quelques minutes à quelques heures.
Les molécules concernées sont les suivantes :
bromocriptine, cabergoline, levodopa, pergolide, pramipexole, ropinirole.

Les conclusions du groupe de travail européen de pharmacovigilance, transmises au CSP, ont été les suivantes :

- Les troubles du sommeil peuvent être une composante de la maladie de Parkinson.
- Tous les agonistes dopaminergiques peuvent être associés à une somnolence, l'effet pouvant être accentué en cas d'association médicamenteuse.
- Parmi la notification spontanée, de rares cas d'attaque de sommeil, d'intensité variable, sont rapportés avec l'ensemble des agonistes dopaminergiques. Ces épisodes sont plus fréquemment rapportés avec le ropinirole, le pramipexole et la cabergoline.

Propositions de modification du RCP :

Section 4.4 (mises en garde et précautions d'emploi) **et 4.7** (effets sur l'aptitude à conduire des véhicules et à utiliser des machines) :

Patients being treated with *(TRADENAME)* should be warned that somnolence or sudden sleep onset episodes may occur particularly when therapy is started and during the titration period. Caution therefore should be exercised if patients are to drive or engage in other activities where impaired alertness could put themselves at risk of serious injury or death (e.g. operating machines). Patients being treated with *(TRADENAME)* and already presenting with somnolence or sudden sleep onset episodes must be informed to refrain from driving or engaging in other activities where impaired alertness could put themselves or others at risk of serious injury or death (e.g . operating machines) until such episodes have resolved. (To be cross referenced to section 4.4 and 4.7)

Section 4.8 (effets indésirables) :

- Based on post-marketing data, extreme somnolence, occasionally when the patient was driving, has been reported rarely with dopamine agonists.
- *Additional wording for bromocriptine and pergolide* :

With () there are isolated reports of sudden onset of sleep.

- *Additional wording for pramipexole, ropinirole and cabergoline* :

With () there are very rare reports of sudden onset of sleep.

- Patients experiencing this phenomenon cannot resist the urge to sleep, and on waking may be unaware of any tiredness prior to the sleep.

Le CSP a souhaité une réflexion au niveau de chaque Etat membre concernant les implications médico-légales de telles mentions. Le dossier sera de nouveau discuté au CSP des 26 - 28 mars 2001.

Etant donné que le lisuride n'est pas inclus dans ces mesures, le CRPV de Toulouse prend en charge l'enquête officielle relative au lisuride et « somnolence excessive ou accès de sommeil soudain ».

III - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Seuls sont signalés les cas d'effets indésirables donnant lieu à des mesures (mise en enquête, notes...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **Interaction médicamenteuse NORVIR® (ritonavir) / SINTROM® (acénocoumarol) / CRPV de Paris-Pompidou :**

Survenue d'une interaction médicamenteuse entre NORVIR® et SINTROM® aboutissant à une diminution de l'effet thérapeutique du NORVIR® et une augmentation de l'effet anticoagulant. Deux cas similaires figurent dans la banque nationale de pharmacovigilance et 3 autres cas dans la littérature.
→Une note sera adressée au groupe interaction médicamenteuse.

- **DONORMYL® (sulprostone) / CRPV de Paris-Pompidou :**

Survenue d'une rhabdomyolyse avec malaise et somnolence à la suite d'un surdosage en DONORMYL® chez une jeune fille de 14 ans.
→Un point sera demandé aux CAP (Centres antipoison) et à la DGS (Direction Générale de la Santé).

EXOLYSE® (thé vert) / CRPV de Caen :

Survenue d'une hépatite subfulminante nécessitant une transplantation hépatique chez une femme de 49 ans traitée par EXOLYSE®, SERMION® (nicercoline), TRIVASTAL® (piribédil) et SOLUPRED®. Un produit « pour bronzer » avait également été pris. Un cas similaire figure dans la banque et un cas au niveau du laboratoire.

MEDIATOR® (benfluorex) et mésusage / CRPV de Caen :

La présidente du Conseil de l'Ordre des pharmaciens de Basse Normandie a de nouveau attiré l'attention sur certaines ordonnances à visée amaigrissante associée à la prescription de MEDIATOR®.

NEXEN® (nimésulide) / CRPV de Lyon :

Survenue d'une hépatite fulminante nécessitant une transplantation hépatique en urgence chez un patient de 51 ans traité par NEXEN®. Le patient n'est pas encore rétabli.
→Cet effet figure déjà dans le RCP du NEXEN®.

Immunostimulants / CRPV d'Amiens :

Survenue d'une acrosyndactylie des mains et des pieds chez un nouveau-né à la naissance. Le diagnostic a été posé dès la 22ème semaine d'aménorrhée. Les seuls médicaments pris pendant la grossesse étaient IMOCUR® (fraction d'origine bactérienne), IRS 19® (lysats bactériens en suspension) et AUDISPRAY®.
→Une note sera envoyée à l'évaluateur en charge de cette classe thérapeutique.

LIPIOCIS® (huile d'oeillette)/ LIPIODOL® (huile d'oeillette) / CRPV de Rennes :

Survenue d'une pneumopathie avec détresse respiratoire chez 3 patients traités par LIPIOCIS® et LIPIODOL®. Deux cas ont été fatals, le 3ème patient n'est pas encore rétabli.
La moitié des patients sous par LIPIOCIS® sont traités à Rennes.
→Le CRPV de Rennes est chargé de l'enquête officielle sur les effets indésirables de LIPIOCIS® et LIPIODOL®.

Tisane Ernst RICHTER / CRPV de Paris Saint-Antoine :

II - ENQUETE OFFICIELLE RELATIVE AUX HYPERTENSIONS ARTERIELLES PULMONAIRES ET AUX TROUBLES NEURO-PSYCHIATRIQUES OBSERVES AVEC MEDIATOR® (BENFLUOREX).

Lors du Comité Technique de Pharmacovigilance du 7 décembre 2004, plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique ont été rapportées avec MEDIATOR® (benfluorex). Une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité pharmaceutique a alors été décidée. Par la suite, du fait d'une notification d'un cas d'hypertension artérielle pulmonaire associée à la prise de MEDIATOR® rapportée lors du Comité Technique du 8 mars 2005, l'enquête menée par le CRPV de BESANCON a été étendue aux hypertensions artérielles pulmonaires.
MEDIATOR® est commercialisé en France depuis 1976 par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés dosés à 150 mg.
Ses indications sont :
- adjuvant du régime adapté dans les hypertriglycéridémies ;
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

HISTORIQUE

Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le Comité Technique de Pharmacovigilance a craint une dérive de l'utilisation du benfluorex comme anorexigène. Ainsi, le benfluorex a été inscrit sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes le 10 mai 1995.

Le dossier relatif aux effets indésirables du benfluorex a été présenté lors de différentes réunions du Comité Technique de Pharmacovigilance en 1998 et au groupe de travail européen de Pharmacovigilance le 30 novembre 2000, entraînant les modifications de la rubrique « effets indésirables » du Résumé des Caractéristiques du Produit (RCP) (ajout des effets indésirables en *italique* ci-dessous) :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, *confusion*, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles ;
- *très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke ;*
- *élévation des enzymes hépatiques, hépatite (très rare).*

RESULTATS DE L'ENQUETE

1.Troubles neuro-psychiatriques

A. Troubles psychiatriques pendant le traitement

Trente cinq cas ont été rapportés dont 10 déclarés depuis l'enquête présentée en juillet 1999. Ils concernent 18 hommes (âge moyen : 58,5 ans) et 17 femmes (âge moyen : 60 ans).

Les troubles psychiatriques sont variés :
- agressivité (4), nervosité (3), irritabilité (1) ;
- cauchemars (2), angoisse (1), stupeur (1), dépression (1) ;
- désorientation (7), confusion (5), aggravation des troubles cognitifs (1) ;
- agitation (3), troubles du comportement (3) ;
- délire (2), bouffées délirantes aiguës (1).

Les cas graves ayant nécessité une hospitalisation sont :
- 4 cas de confusion (dont un provenant de la littérature) chez des patients ayant des traitements associés ;
- 3 cas de désorientation temporo-spatiale ;
- 2 cas de bouffées délirantes aiguës, avec d'autres troubles associés, d'évolution rapidement favorable après traitement symptomatique par neuroleptiques.

B. Troubles psychiatriques au sevrage

Dix notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés. Ils concernent 2 hommes de 27 et 34 ans et 8 femmes de 30 à 65 ans (âge moyen : 45,25 ans).

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 mois, 6 mois ou 15 mois).
La durée de traitement par MEDIATOR® est très variable : de 1 mois à 8 ans.

Trois cas ont nécessité une hospitalisation chez des femmes ayant par ailleurs des antécédents de troubles psychiatriques. Une évolution favorable a été constatée dans un des cas après traitement symptomatique par neuroleptiques, les deux autres cas sont d'évolution inconnue.

C. Autres troubles neurologiques

Douze notifications ont été rapportées. Elles concernent 8 hommes et 4 femmes :
- 2 cas de convulsions d'évolution favorable ;
- 2 cas de neuropathie, chez deux patients diabétiques présentant de multiples autres étiologies possibles ;
- 7 cas de paresthésies, d'apparition rapide et d'évolution favorable en quelques heures, dont deux mésusages ;
- 1 cas de tremblement des mains.

D. Abus

Deux cas d'abus ont été rapportés :
- chez un homme augmentant les doses de MEDIATOR® à 10 comprimés par jour pendant 11 mois, sans effet indésirable associé ;
- chez un sportif, consommant (sur prescription médicale) des doses croissantes (1comprimé/semaine au début et jusqu'à 9 comprimés/jour) de MEDIATOR® comme « dopant » et présentant une excitation lors du sevrage.

2. Hypertension artérielle pulmonaire (HTAP) :

Dix-sept notifications dont 2 doublons ont été rapportées.

A. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«hypertension artérielle pulmonaire » avaient été rapportées (9 d'entre elles avaient été présentées lors de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » au Comité Technique du 28 avril 1995) :
- 7 ont été classées en HTAP idiopathique
- 3 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR® n'était jamais prescrit seul : il était associé à un ou plusieurs anorexigènes :
- ISOMERIDE® : 7 fois ;
- ISOMERIDE® + PONDERAL® : 2 fois ;
- ISOMERIDE ®+ FENPROPOREX® : 1 fois ;
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois ;

La durée de traitement par MEDIATOR® était précisée dans 7 cas sur 11 et allait de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® était :
- concomitante dans 5 cas ;
- antérieure dans 2 cas ;
- postérieure dans 3 cas ;
- imprécise dans 1 cas.

Sur les 3 cas où la prise de MEDIATOR® était postérieure à la prise d'anorexigènes, 2 cas présentaient une dyspnée avant la prise de MEDIATOR, et un cas une double atteinte valvulaire aortique et mitrale.

B. Notifications où MEDIATOR® n'est pas associé à la prise d'un anorexigène

Six notifications ont été rapportées chez des femmes (dont 2 présentaient une HTAP post capillaire sur valvulopathie et une autre une HTAP sur embolie pulmonaire) n'ayant pas de traitement anorexigène associé. Il est à noter que l'un des cas rapportés est très succinct et ne peut, dans ces conditions, être retenu.

C. Incidence des cas notifiés

Depuis le début de la commercialisation de MEDIATOR®, le nombre de boites de 30 comprimés vendues est de : 110 693 331, correspondant à 45 515 349 mois de traitement (estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés).

Après élimination des HTAP post-emboliques (2) et post-capillaires (5), il reste 10 cas d'HTAP idiopathique soit :
- 1 cas notifié pour 11 069 333 boîtes vendues ;
- ou 1 cas notifié pour 4 551 534 mois de traitement.

Si on considère uniquement les diagnostics d'hypertension artérielle pulmonaire idiopathique en excluant les cas associés aux anorexigènes et les antécédents d'embolie pulmonaire et de valvulopathie, il reste 2 cas soit une incidence très faible de :
- 1 cas notifié pour 55 346 666 boîtes vendues ;
- 1 cas notifié pour 22 757 675 mois de traitement.

Conclusion du rapporteur :

Troubles neuro-psychiatriques : cette enquête confirme la réalité du risque de survenue de « confusions » en présence de Médiator®. Il est proposé que cet effet, déjà mentionné dans le RCP soit détaillé comme suit :
« troubles des fonctions cognitives : désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception : hallucinations. »

Hypertensions artérielles pulmonaires : compte-tenu de l'incidence des HTAP idiopathiques (1 à 2 de cas par million et par an), le nombre de cas d'HTAP idiopathique rapportés dans l'enquête ne constitue pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardio-vasculaire.

DISCUSSION

Les ventes de MEDIATOR® en Europe sont réalisées en quasi totalité en France. Les données DOREMA d'avril 2005 montrent une utilisation dans 46,3% dans les dyslipidémies, dans 33,5% dans le diabète, dans 9,6% dans l'obésité, dans 2,3% dans la régulation métabolique et dans 8,3% dans d'autres indications. L'effet anorexigène du benfluorex n'a pas été démontré. Toutefois, les membres de la Commission nationale craignent un mésusage, en particulier dans l'obésité. Dans ce contexte, une étude d'utilisation/ de prescription serait utile.
Il est à noter que le renouvellement quinquennal du produit intervient dans 2 ans et que des données d'efficacité dans le diabète de type 2 existent mais restent limitées et mériteraient d'être réévaluées.

Le bilan de pharmacovigilance confirme les données de sécurité d'emploi du MEDIATOR® déjà connues. Les effets neuro-psychiatriques décrits actuellement dans le RCP sous le terme « confusion » doivent être détaillés. Il n'y a pas actuellement assez de données pour affirmer l'existence de syndrome de sevrage. Le faible nombre de cas décrits d'HTAP idiopathique associées au MEDIATOR® doit être interprété par rapport à la sous-notification habituelle en pharmacovigilance.

Afin d'évaluer au mieux les risques potentiels de l'utilisation de MEDIATOR®, la Commission nationale de pharmacovigilance a demandé la réalisation de :
- une étude d'utilisation / prescription de MEDIATOR® ;
- une étude expérimentale sur un modèle animal permettant d'évaluer le potentiel de MEDIATOR® à engendrer des HTAP ;

- une étude au niveau des Centres d'évaluation et d'information sur la pharmacodépendance (CEIP) afin d'évaluer un éventuel problème de pharmacodépendance. A ce titre, une saisine de la Commission nationale des stupéfiants et psychotropes sera effectuée.

Enfin, il a été proposé d'étudier la possibilité d'interroger les registres d'HTAP existant dans 17 centres, afin de rechercher, dans une étude rétrospective cas-témoins, le rôle éventuel du benfluorex.

CONCLUSION

Devant les différentes questions posées par l'enquête de pharmacovigilance, plusieurs membres de la commission ont souhaité un réévaluation du rapport bénéfice/risque du produit. La Commission s'est prononcée en faveur de cette réévaluation par 13 voix pour, 10 voix contre et 5 abstentions.

B-4

II –MEDIATOR® (CHLORHYDRATE DE BENFLUOREX) : MISE A JOUR DES DONNEES DE PHARMACOVIGILANCE, RESULTATS DE LA REEVALUATION DU BENEFICE/RISQUE ET RESULTATS DE L'ETUDE D'UTILISATION

1 – Introduction

Nom commercial	MEDIATOR®
DCI	Chlorhydrate de benfluorex
Formes pharmaceutiques	Comprimé pelliculé à 150 mg
Classe pharmacologique	Hypolipidémiant
Procédure d'enregistrement	Procédure nationale
Titulaire de l'AMM	Laboratoires Servier

Date de passage en Comité technique de pharmacovigilance : 13 mars 2007
Passage en Commission nationale de pharmacovigilance à la demande du Comité technique de pharmacovigilance
Nom du rapporteur : Centre Régional de pharmacovigilance (CRPV) de Besançon

MEDIATOR® (chlorhydrate de benfluorex) a obtenu une AMM lors d'une procédure nationale d'enregistrement en 1974, modifiée en 1987 et 1990. Les indications actuelles sont :
- adjuvant du régime adapté dans les hypertriglycéridémies ;
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Ce médicament est commercialisé en France depuis 1976.

2 – Contexte

En décembre 2004, la notification de plusieurs cas d'effets indésirables, pouvant évoquer un effet de type amphétaminique avec MEDIATOR®, a conduit à une actualisation des données relatives aux effets indésirables neuro-psychiatriques observés avec cette spécialité. Par ailleurs, la notification d'un cas d'hypertension artérielle pulmonaire, rapportée lors du Comité Technique du 8 mars 2005, a justifié une extension de l'enquête aux hypertensions artérielles pulmonaires (HTAP).

Les résultats de cette enquête officielle ont été présentés par le CRPV de Besançon au Comité Technique de Pharmacovigilance le 07 juin 2005 et à la Commission Nationale de Pharmacovigilance le 29 novembre 2005. La Commission avait demandé la réévaluation de la balance bénéfice/risque de Médiator®, une étude d'utilisation/prescription, une étude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à engendrer des HTAP et une étude au niveau des Centres d'Evaluation et d'Information sur la Pharmacodépendance (CEIP) afin d'identifier un éventuel problème de pharmacodépendance. La réalisation de cette dernière étude n'a pas été jugée immédiatement nécessaire à cette étape de l'évaluation du dossier en raison du fondement théorique de cette demande (substance de type amphétaminique) et de l'absence d'un signal clairement identifié dans les données notifiées.
Les données disponibles ont été présentées au Comité technique de pharmacovigilance du 13 mars 2007 puis à la Commission nationale de pharmacovigilance du 27 mars 2007.

3 - Actualisation de l'enquête de pharmacovigilance sur les HTAP et les troubles neuropsychiatriques

Le CRPV de Besançon a actualisé les données de pharmacovigilance du benfluorex concernant les HTAP et les effets indésirables neuropsychiatriques. Concernant les effets neuro-psychiatriques, 39 cas avaient été notifiés jusqu'à novembre 2005 auxquels s'ajoutent 4 nouveaux cas : 1 cas de dépression, 1 cas d'agitation et 2 cas de délire. Concernant les cas de délire, le premier concerne une femme de 33 ans sans antécédent psychiatrique, traitée par MEDIATOR® 3 comprimés par jour puis 2 comprimés par jour pendant 5 mois, qui a présenté sous traitement un délire de persécution avec confusion, traité par ZYPREXA®, TERCIAN® et XANAX®, d'imputabilité douteuse. Le deuxième cas de délire concerne un homme de 31 ans, avec psychose chronique, traité par MEDIATOR® 2 comprimés par jour pendant 3 ans, qui a présenté un délire avec agressivité, régressif à l'arrêt du traitement, d'imputabilité douteuse.

Concernant les HTAP, 3 nouveaux cas potentiels ont été notifiés et ont fait l'objet d'une expertise :

- Le premier cas concerne une femme de 50 ans avec un indice de masse corporelle (IMC) à 38kg/m2, un diabète de type 2, une hypothyroïdie et une HTA, traitée par MEDIATOR® 3 comprimés par jour de 2000 à 2003. En 2003, apparaît une dyspnée d'aggravation progressive. En octobre 2005, une HTAP pré-capillaire est mise en évidence et est jugée moyennement sévère avec une pression artérielle pulmonaire systolique (PAPs) à 79 mmHg. Une origine multifactorielle est évoquée car, à la prise de benfluorex, s'ajoutent une obésité et un déficit ventilatoire restrictif sur paralysie de la coupole diaphragmatique droite. L'expertise conclut à une HTAP idiopathique ;
- Le deuxième cas concerne une femme de 51 ans avec un IMC de 41 kg/m2, avec un syndrome d'apnée du sommeil, une BPCO post-tabagique, un diabète de type 2 et des antécédents de phlébite. Cette patiente, traitée par MEDIATOR® durant 3 mois 10 ans auparavant, présente en décembre 2006 une pression artérielle pulmonaire moyenne (PAPm) à 60 mmHg avec à la scintigraphie pulmonaire des séquelles minimes post-emboliques. L'expertise conclut à une possible HTAP idiopathique, mais, en l'état et compte tenu de la chronologie, les pathologies associées et les données sont insuffisantes pour retenir ce dossier.
- Le troisième cas concerne une femme de 58 ans avec un IMC à 49 kg/m2, un diabète de type 2 et une HTA. Cette patiente, traitée par MEDIATOR® pendant 10 ans, présente en décembre 2006 une PAPm à 46 mmHg. L'expertise considère que l'HTAP idiopathique est possible mais que le dossier est beaucoup trop succinct pour permettre de statuer.

Par ailleurs, un cas de valvulopathie a été notifié au CRPV de Toulouse.

Les conclusions de l'enquête concernant les troubles neuro-psychiatriques ne sont pas modifiées par les données additionnelles. Elles confirment la réalité de la survenue de confusions sous MEDIATOR® et la nécessité de détailler dans la rubrique « Effets indésirables » du RCP, le terme de confusion, comme cela a été proposé à la Commission nationale du 29 novembre 2005.
Le nombre de cas notifiés d'HTAP idiopathiques, après expertise et prise en compte des nouveaux cas d'HTAP rapportés depuis 2005, est de 3, soit 1 cas pour 41 841 426 boites vendues ou 1 cas pour 17 204 533 mois de traitement. L'incidence naturelle l'HTAP idiopathique est quant à elle de 1 à 2 cas par million et par an. Ainsi, selon l'avis du rapporteur et compte tenu de l'incidence naturelle des HTAP idiopathiques, le nombre de cas d'HTAP d'allure idiopathique retrouvés dans l'enquête ne constitue pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardiovasculaire.

4 - Etude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à engendrer des HTAP

Concernant le projet de modèle expérimental chez l'animal, le laboratoire a déposé un projet d'étude chez le rat Fawn-hooded, modèle génétique susceptible de développer spontanément une HTAP (accélérée par l'hypoxie). Après analyse de ce projet d'étude, les conclusions rendues par le groupe de travail préclinique de la Commission d'AMM ont été qu'il n'existe pas de modèle expérimental animal adapté à la question posée.

5 - Revue des données d'efficacité. Conclusion du groupe DEUG

Le Département de l'évaluation thérapeutique des demandes d'AMM de l'Afssaps a présenté aux membres de la Commission nationale de pharmacovigilance une revue des données d'efficacité de MEDIATOR®, reflet des conclusions du Groupe de Travail Diabétologie/ Endocrinologie/ Urologie/ Gynécologie (GT DEUG) de la Commission d'AMM.

L'AMM de MEDIATOR® a été octroyée en plusieurs étapes, en 1987 pour les hypertriglycéridémies et en 1990 pour le diabète.

Action hypolipémiante
Le mécanisme d'action sur les lipides est difficile à préciser malgré les données soumises. *In vitro*, le benfluorex inhiberait la synthèse des acides gras entraînant une baisse des triglycérides (TG). *In vivo* chez l'animal, le benfluorex inhiberait l'acyl-coenzyme A cholestérol : acyltranférase (ACAT), mais le retentissement clinique n'est pas démontré (pas de baisse du LDL-cholestérol) de même que l'effet indépendant de la prise alimentaire.
Dix études cliniques ont été soumises :

- six études versus placebo réalisées entre 1978 et 2006 (au total 394 patients), anciennes à l'exception de l'étude Moulin. Méthodologiquement, il y a un faible nombre de patients, une grande variabilité de la dyslipidémie selon les études et le LDL-cholestérol n'est pas toujours disponible. Dans l'étude Moulin, la plus récente, on observe une diminution de 7% des TG et de 6% du LDL-cholestérol ;

- quatre études versus produits de référence, les fibrates, comprenant au total 163 patients avec une dyslipidémie (IIa, IIb et IV).

Une méta-analyse de l'efficacité de MEDIATOR® sur les TG a été réalisée ; elle comporte 6 études (Louvet, Tomassi, Moulin, Velusi, Del Prato et Biancchi), d'effectif varié de 10 à 242 patients, contre placebo avec tirage au sort. L'efficacité du benfluorex est très modeste sur les TG et non démontrée sur les autres paramètres lipidiques.

Action hypoglycémiante

Plusieurs mécanismes d'action sont évoqués : effet insulino-sensibilisateur chez l'Homme avec effet sur les transporteurs de glucose, effet direct sur le foie et réduction du contenu musculaire en TG.

Les études analysées en 1990, lors de la validation de l'indication dans le diabète sont anciennes: 3 études *versus* placebo où l'on observe une diminution de l'HbA1c de 0,8% (Tomassi) sous régime seul, de 0,9% sous régime seul et sulfamide (Velussi) et de 1,7% (Louvet) sous MEDIATOR® et sulfamide versus placebo et sulfamide. Une étude plus récente (1998), l'étude de Del Prato *versus* placebo et *versus* metformine montre une baisse de 0,86% entre le groupe placebo et le groupe benfluorex mais la qualité de tous ces essais est médiocre.

Finalement, l'étude Moulin est la plus récente. Il s'agit d'une étude multicentrique, randomisée en double aveugle de 18 semaines qui étudie l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex *versus* placebo chez 325 patients diabétiques de type 2 en surpoids (IMC entre 25 et 40 kg/~~m2~~m^2) mal équilibrés (HbA1c entre 7 et 10%) par un sulfamide à dose maximale tolérée depuis au moins 2 mois et intolérants ou ayant une contre-indication à la metformine. Trois sous-groupes ont été définis : HbA1c>8%, âge >65 ans et clairance de la créatinine < 80 ml/min. Cette étude comporte 2 phases : une période en double aveugle de 18 semaines pour démontrer la supériorité du benfluorex *versus* placebo sur l'HbA1c et une période en ouvert de 16 semaines centrée sur le profil de sécurité à long terme en association à un sulfamide ou à l'acarbose.

Les résultats ont montré une diminution de l'HbA1c de 0,82% dans le groupe benfluorex par rapport à la valeur de base et de 1% par rapport au placebo ($p< 0,001$). Cette baisse est significative dès la quatrième semaine et est maintenue jusqu'à 6 mois. On observe également une diminution significative de la glycémie à jeun dès la quatrième semaine sous benfluorex par rapport au placebo. Il existe une perte de poids respectivement de 1,3 kg et de 0,7 kg sous benfluorex et placebo avec une efficacité sur l'HbA1c indépendante de l'évolution pondérale. La baisse de l'HbA1c sous benfluorex par rapport à la valeur de base est plus importante pour les patients dont l'HbA1c de base est > 8% par rapport aux patients dont l'HbA1c ≤ 8%. Lors de la phase en ouvert, l'effet est reproductible dans le groupe initialement traité par placebo.

Au total, l'étude est conforme aux recommandations pour le développement des antidiabétiques oraux (EMEA 2002), et l'effet hypoglycémiant est notable avec une diminution de l'HbA1c de 1% *versus* placebo. Ces résultats sont par ailleurs cohérents avec les études antérieures. L'efficacité en seconde intention en association à un sulfamide semble donc démontrée et ceci indépendamment de la perte de poids, mais les experts ont soulevé des réserves méthodologiques. Par ailleurs, l'efficacité en prévention primaire et secondaire des complications de l'athérosclérose n'est pas démontrée.

En conclusion, le GT DEUG de la Commission d'AMM propose le retrait de l'indication de MEDIATOR® dans les dyslipidémies par insuffisance d'efficacité avec maintien de l'indication « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » dans l'attente de la soumission de résultats complémentaires d'études en cours devant permettre de positionner plus précisément ce produit dans l'arsenal thérapeutique du diabète de type 2.

6 – Résultats de l'étude de prescription/utilisation

Les laboratoires Servier ont présenté aux membres de la Commission les résultats de l'étude de prescription basée sur l'exploitation de l'observatoire Thalès. Deux périodes de 1 an ont été analysées : mai 2004 à mai 2005 et mai 2005 à mai 2006. Il apparaît que 80,3% des prescriptions de MEDIATOR® en 2004-2005 et 80,5% en 2005-2006 sont réalisées dans le cadre de l'AMM chez des patients dyslipidémiques et/ou diabétiques et qu'environ 11% des prescriptions concernent des patients obèses, hors du cadre de l'AMM (11,5% en 2004-2005 et 10,7% en 2005-2006). Ces taux restent donc stables au cours du temps. Par ailleurs, il n'y a pas de saisonnalité des prescriptions, qu'elles soient destinées aux obèses seulement ou à l'ensemble des patients. Enfin, sur les deux périodes, le profil des patients concernés reste stable (âge, sexe, IMC).

7 - Discussions de la Commission nationale de pharmacovigilance

Les membres de la Commission considèrent que le libellé de l'indication retenue par le GT DEUG dans le diabète n'est ni clair, ni conforme aux données des études cliniques. Ils ont d'autre part tenu à souligner que les laboratoires SERVIER n'ont pas déposé de demande de renouvellement de l'AMM de benfluorex en Espagne et en Italie. Ils estiment par ailleurs nécessaire, par rapport à une efficacité du produit jugée modeste

par certains membres de la commission nationale, et établie sur un critère principal (baisse de l'HdA1c) dans la seule étude méthodologiquement acceptable (étude Moulin), de tenir compte dans la réévaluation du rapport bénéficie risque du MEDIATOR® : i) du métabolisme du benfluorex, conduisant à la formation d'un dérivé fenfluraminique, ii) de ses effets indésirables neuropsychiatriques, iii) des rares cas d'HTAP et de valvulopathies notifiés ou décrits pouvant faire évoquer un problème qualitatif similaire à celui ayant amené au retrait du marché des anorexigènes fenfluraminiques sérotoninergiques, iv) d'une utilisation du produit essentiellement en France (88% des ventes). Certains membres de la Commission nationale ont par ailleurs tenu à faire connaître leur opinion en se prononçant pour un rapport bénéfice/risque défavorable du MEDIATOR®. Ce dossier sera présenté en Commission d'AMM le 5 avril 2007.

Mise à disposition par l'Afssaps d'information complémentaire, disponible au moment de la publication de ce compte rendu :

La Commission d'autorisation de mise sur le marché réunie le 5 avril 2007 a émis les propositions suivantes :

1. Avis favorable à la mention des effets indésirables neuropsychiatriques tels que proposés par la Commission nationale de pharmacovigilance au niveau de la rubrique 4.8. "Effets indésirables" du RCP et de la notice : « troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations) ».

2. Avis DEFAVORABLE au maintien de l'indication : « Adjuvant au régime adapté dans les hypertriglycéridémies ». L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée, les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol.
Le maintien de cette indication pourrait conduire à une perte de chance pour les patients puisqu'il existe des hypolipémiants plus efficaces sur les paramètres lipidiques et en particulier les triglycérides, ces hypolipémiants ayant démontré par ailleurs une efficacité en termes de prévention cardiovasculaire.

3. Avis FAVORABLE au maintien de l'indication : « Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » dans son libellé actuel.
Néanmoins, aucune conclusion définitive ne peut être portée sur cette efficacité compte tenu de certaines réserves émises sur la méthodologie de l'étude MOULIN, étude pivot dans cette indication. De plus, dans l'attente des résultats d'une autre étude en cours sur les paramètres glucidiques (en association avec d'autres antidiabétiques oraux), aucun motif de protection de la santé publique ne s'oppose à ce que l'indication telle que libellée soit maintenue.

4. Compte tenu des éléments versés dans le dossier de réévaluation, proposition d' inspection de l'essai clinique MOULIN.

5. Les membres de la commission d'AMM souhaitent qu'une communication soit faite sur l'usage hors AMM de ce médicament.

En conséquence, dans la cadre de la procédure contradictoire, un projet de modification de l'AMM du médicament MEDIATOR® a été adressé aux laboratoires SERVIER.

Bonsoir Dominique,

Merci pour cette information qui confirme notre préoccupation sur le produit. En effet nous avons prévu la semaine dernière avec Besançon, de faire le point sur le sujet pour passage en CT au mois de mai. Nous avons aussi été contacté par le CRPV de Grenoble qui aurait 2 cas.

Bonne soirée,

Carmen

Bonjour,

Cet après-midi, j'avais rendez-vous avec Irène Frachon, pneumologue au CHU, référente sur l'Ouest pour l'hypertension artérielle pulmonaire. Nous sommes régulièrement en contact, notamment pour des points bibliographiques sur le benfluorex.

A Brest, les pneumologues et cardiologues sont sensibilisés aux effets indésirables du benfluorex et ont d'ailleurs été récemment auteurs de publications sur le sujet (Eur. Respir. J. mars 2009).

C'est à la suite du premier cas de valvulopathie après prise de benfluorex sur Brest en 2008 et qui apparaît dans la publication Eur.Respir.J mars 2009, que des cardiologues brestois ont contacté Irène Frachon au sujet de dossiers d'insuffisances valvulaires sur lesquels ils lui demandaient un avis.

Suite à ces nouveaux cas, Irène a interrogé le département d'information médicale du CHU de Brest :

- Par le biais des codages des maladies (diabète et valvulopathies), il a été possible de recenser 3 nouveaux cas de valvulopathies après prise de benfluorex à déclarer à la pharmacovigilance : en effet il s'agit d'une insuffisance mitrale non expliquée par le contexte clinique avec prise de benfluorex antérieure au diagnostic de valvulopathie.

- Une autre interrogation du département d'information médicale par mots-clés « médiator ou benfluorex » et codage « valvulopathies » a permis de trouver 10 cas d'insuffisances mitrales fuyantes compatibles avec une prise de benfluorex.

- Actuellement, Irène Frachon a entrepris une enquête de plus grande envergure au niveau du département d'information médicale en « screenant » les patients hospitalisés en cardiologie et chirurgie cardiovasculaire entre 2003 et 2009 à Brest, porteurs d'un diagnostic de valvulopathie « insuffisance mitrale de nature inexpliquée » pour lesquels, elle souhaiterait vérifier une éventuelle exposition au benfluorex. Cette dernière enquête est encore à un stade précoce.

Ce jour, nous avons pris contact avec le CRPV de Besançon pour les informer des cas à venir dans la Banque de PV.

Nous sommes à votre disposition pour tout autre renseignement. Irène Frachon serait d'accord pour participer à toute discussion sur ce sujet.

Cordialement

Bonjour,

En 2008, une publication a été faite par plusieurs équipes de pneumologues dont Brest sur les atteintes cardiaques avec le benfluorex.

Depuis, Irène Frachon, pneumologue référent de l'hypertension artérielle pulmonaire sur Brest, a été interrogée plusieurs fois par des cardiologues sur des valvulopathies chez des sujets exposés au benfluorex.

Irène Frachon a décidé de demander au PMSI de lui faire des requêtes (2000-2008) sur les services de cardiologie et de chirurgie cardiaque du CHU de Brest.

1. atteintes valvulaires et diabète comme diagnostic principal ou diagnostic associé significatif (soif ATCD actif ou problème en cours d'hospitalisation)

2. atteintes valvulaires comme diagnostic et benfluorex et mediator comme mots inscrits dans le résumé de sortie

Les codes des atteintes valvulaires correspondent aux codes : I. 05 ; I. 06 ; I 07 ; I. 08 ; I.09 ; I.09 ; I.34 ; I35 ; I.36 ; I.37 ; I38 ; I.39.

La requête la plus intéressante a été la numéro 2 pour laquelle le croisement a ramené 21 patients dont 10 cas qui ont fait l'objet d'une notification de pharmacovigilance comme cas graves.

Il y avait 2 autres cas (un dans la publication antérieure et un autre qu'un cardiologue lui avait mentionné).

Nous avons donc saisis en 2008-2009, à Brest, 12 cas d'atteintes valvulaires sous Médiator.

Actuellement Irène Frachon analyse une autre requête PMSI : sur la même période et dans les mêmes services « cardiologie et chirurgie cardiaque ».

Elle recherche dans les dossiers patients, voire après appel du médecin traitant, l'exposition au benfluorex, Médiator dans 2 populations :

1. les rétrécissements aortiques calcifiés

2. les valvulopathies autres mitrales et aortiques pour lesquelles il n'existe pas d'étiologie franche.

Dans le cadre de cette nouvelle étude nous avons saisi un nouveau cas dans la ANPV accompagné d'un autre cas qu'un confrère brestois lui a signalé.

Donc depuis le dernier comité technique nous avons saisi 2 autres cas d'atteintes valvulaires BR 20090142 et BR 20090143.

Nous avons également saisi 2 cas d'hypertension artérielle pulmonaire sous médiator.

Je sais qu'Irène fait une enquête auprès du réseau des pneumologues HTAP afin de recueillir d'autres cas. Je ne sais pas si elle a des réponses.

Je joins en annexe un article sur les valvulopathies médicamenteuses, une photo d'une des patientes de la série brestoises prise en mars 2009, la publication de l'année dernière des pneumologues, le dossier de Besançon présenté au CT du 5 mai 2009 qui incluent 12 des 14 cas brestois.

Les coordonnées d'Irène Frachon sont : irene.frachon@chu-brest.fr

En espérant vous avoir donné satisfaction

Cordialement

Dominique Carlhant-Kowalski

Doc 1

Bonjour Carmen,
Suite à ton appel, je te fais un récapitulatif du dossier brestois « Médiator ».

En 2008, une publication a été faite par plusieurs équipes de pneumologues dont Brest sur les atteintes cardiaques avec le benfluorex.
Depuis, Irène Frachon, pneumologue référent de l'hypertension artérielle pulmonaire sur Brest, a été interrogée plusieurs fois par des cardiologues sur des valvulopathies chez des sujets exposés au benfluorex.
Irène Frachon a décidé de demander au PMSI de lui faire des requêtes (2000-2008) sur les services de cardiologie et de chirurgie cardiaque du CHU de Brest.

1. atteintes valvulaires et diabète comme diagnostic principal ou diagnostic associé significatif (soif ATCD actif ou problème en cours d'hospitalisation)
2. atteintes valvulaires comme diagnostic et benfluorex et mediator comme mots inscrits dans le résumé de sortie

Les codes des atteintes valvulaires correspondent aux codes : I. 05 ; I. 06 ; I 07 ; I. 08 ; I.09 ; I.09 ; I.34 ; I35 ; I.36 ; I.37 ; I38 ; I.39.
La requête la plus intéressante a été la numéro 2 pour laquelle le croisement a ramené 21 patients dont 10 cas qui ont fait l'objet d'une notification de pharmacovigilance comme cas graves.
Il y avait 2 autres cas (un dans la publication antérieure et un autre qu'un cardiologue lui avait mentionné).

Nous avons donc saisis en 2008-2009, à Brest, 12 cas d'atteintes valvulaires sous Médiator. Je joins un tableau récapitulatif que j'avais fait au CRPV de Besançon en charge de l'enquête nationale de pharmacovigilance sur HTAP et Médiator.

Actuellement Irène analyse une autre requête PMSI : sur la même période et dans les mêmes services « cardiologie et chirurgie cardiaque ».
Elle recherche dans les dossiers patients, voire après appel du médecin traitant, l'exposition au benfluorex, mediator dans 2 populations :

1. les rétrécissements aortiques calcifiés
2. les valvulopathies autres mitrales et aortiques pour lesquelles il n'existe pas d'étiologie franche.

Dans le cadre de cette nouvelle étude nous avons saisi un nouveau cas dans la ANPV accompagné d'un autre cas qu'un confrère brestois lui a signalé.
Donc depuis le dernier comité technique nous avons saisi 2 autres cas d'atteintes valvulaires BR 20090142 et BR 20090143.
Nous avons également saisi 2 cas d'hypertension artérielle pulmonaire sous médiator.

Je sais qu'Irène fait une enquête auprès du réseau des pneumologues HTAP afin de recueillir d'autres cas. Je n'ai plus le questionnaire, Christian Riché te l'a remis au dernier comité technique. Je ne sais pas si elle a des réponses.

Je joins en annexe un article sur les valvulopathies médicamenteuses, une photo d'une des patientes de la série brestoises prise en mars 2009, la publication de l'année dernière des pneumologues, le tableau des cas brestois auquel il faut ajouter les derniers cas post comité technique.

Voici notre dossier sur le sujet.
~~En espérant avoir été assez claire~~.
Cordialement
Dominique

Irène souhaiterait avoir le rapport de Besançon pour en lui transmettre ses souhaits

Je sais qu'Irène fait une enquête auprès du réseau des pneumologues HTAP afin de recueillir d'autres cas. Je ne sais pas si elle a des réponses.

Je joins en annexe un article sur les valvulopathies médicamenteuses, une photo d'une des patientes de la série brestoises prise en mars 2009, la publication de l'année dernière des pneumologues, le dossier de Besançon présenté au CT du 5 mai 2009.

Les coordonnées d'Irène Frachon sont : irene.frachon@chu-brest.fr

En espérant vous avoir donné satisfaction
Cordialement
Dominique Carlhant-Kowalski

qui incluent 12 des 14 cas brestois —

Bonjour Carmen,
Suite à ton appel, je te fais un récapitulatif du dossier brestois « Médiator ».

En 2008, une publication a été faite par plusieurs équipes de pneumologues dont Brest sur les atteintes cardiaques avec le benfluorex.
Depuis, Irène Frachon, pneumologue référent de l'hypertension artérielle pulmonaire sur Brest, a été interrogée plusieurs fois par des cardiologues sur des valvulopathies chez des sujets exposés au benfluorex.
Irène Frachon a décidé de demander au PMSI de lui faire des requêtes (2000-2008) sur les services de cardiologie et de chirurgie cardiaque du CHU de Brest.

1. atteintes valvulaires et diabète comme diagnostic principal ou diagnostic associé significatif (soif ATCD actif ou problème en cours d'hospitalisation)
2. atteintes valvulaires comme diagnostic et benfluorex et mediator comme mots inscrits dans le résumé de sortie

Les codes des atteintes valvulaires correspondent aux codes : I. 05 ; I. 06 ; I 07 ; I. 08 ; I.09 ; I.09 ; I.34 ; I35 ; I.36 ; I.37 ; I38 ; I.39.
La requête la plus intéressante a été la numéro 2 pour laquelle le croisement a ramené 21 patients dont 10 cas qui ont fait l'objet d'une notification de pharmacovigilance comme cas graves.
Il y avait 2 autres cas (un dans la publication antérieure et un autre qu'un cardiologue lui avait mentionné).

Nous avons donc saisis en 2008-2009, à Brest, 12 cas d'atteintes valvulaires sous Médiator. Je joins un tableau récapitulatif que j'avais fait au CRPV de Besançon en charge de l'enquête nationale de pharmacovigilance sur HTAP et Médiator.

Actuellement Irène analyse une autre requête PMSI : sur la même période et dans les mêmes services « cardiologie et chirurgie cardiaque ».
Elle recherche dans les dossiers patients, voire après appel du médecin traitant, l'exposition au benfluorex, mediator dans 2 populations :

1. les rétrécissements aortiques calcifiés
2. les valvulopathies autres mitrales et aortiques pour lesquelles il n'existe pas d'étiologie franche.

Dans le cadre de cette nouvelle étude nous avons saisi un nouveau cas dans la ANPV accompagné d'un autre cas qu'un confrère brestois lui a signalé.
Donc depuis le dernier comité technique nous avons saisi 2 autres cas d'atteintes valvulaires BR 20090142 et BR 20090143.
Nous avons également saisi 2 cas d'hypertension artérielle pulmonaire sous médiator.

Je sais qu'Irène fait une enquête auprès du réseau des pneumologues HTAP afin de recueillir d'autres cas. Je n'ai plus le questionnaire, Christian Riché te l'a remis au dernier comité technique. Je ne sais pas si elle a des réponses.

Je joins en annexe un article sur les valvulopathies médicamenteuses, une photo d'une des patientes de la série brestoises prise en mars 2009, la publication de l'année dernière des pneumologues, le tableau des cas brestois auquel il faut ajouter les derniers cas post comité technique.

Voici notre dossier sur le sujet.
~~En espérant avoir été assez claire~~.
Cordialement
Dominique

Deux

Irène voudrait savoir si on l'a mis au courant de Besançon ?
Pour ~~le~~ les cas qui lui manquent ?
Souhaite

Chère Madame,

Suite à notre visite à Brest avec ma collègue P Lefeuvre, et pour répondre à votre question, je vous prie de trouver ci joint un document décrivant les relations chimiques entre 2 de nos spécialités.

J'espère que ces informations correspondent bien à votre demande.
Peut-être allez-vous à Clermont Ferrand cette semaine au congrès de pharmacologie et de pharmacovigilance? Si oui, je serais ravi de vous y rencontrer.

Bien cordialement

<<MEDIATOR 150 mg.doc>>

Div 2

DONNEES PHARMACOCINETIQUES ET METABOLIQUES CHLORHYDRATE DE BENFLUOREX

I- Pharmacocinétique.

L'absorption gastro-intestinale du chlorhydrate de benfluforex est complète et rapide, le Tmax est compris entre 1h et 2h.
Le volume de distribution est de 0.37+/- 0.03l/kg chez l'homme.
Chez le rat il est de 1.4l/kg.
Chez le chien de 1.6l/kg.
Chez le singe de 0.36l/kg.
Chez le babouin de 0.31l/kg

On notera que le volume de distribution est identique chez les primates et chez l'homme.

II. Métabolisme.

Le benfluorex est rapidement métabolisé au niveau du foie. Il produit au moins 9 métabolites. (Fig 1). Des données récentes utilisant notamment des méthodes de détection spécifiques et sensibles ont permis de montrer qu'il existait deux métabolites principaux (fig 2) :

- le 1-(3 trifluorométhylphényl)-2N-2-(carboxymethyl)amino propane (S1475)
- la norfenfluramine (S 585)

Une étude réalisée chez 6 volontaires sains qui ont reçu pendant 14 jours une dose quotidienne de 3fois 150mg de benfluorex, a montré que :

- l'état stationnaire était atteint en 4 à 5 jours
- au bout des 14 jours la concentration plasmatique de benfluorex était très faible, autour de 10ng/ml, la concentration plasmatique du métabolite S1475 était très importante, aux alentours de 200ng/ml, la concentration plasmatique du norfenfluramine ne dépassait pas 30ng/ml (fig 3).

Il est très intéressant de comparer les métabolites produits par la biotransformation de benfluorex à ceux produits par la biotransformation de la fenfluramine (fig 4). La norfenfluramine représente la voie principale du métabolisme de la fenfluramine avec des concentrations urinaires de 7,4% de la dose pour la forme libre et de 50,7% pour la forme conjuguée à l'acide glucuronique.

Sans qu'il y ait d'explications à partir de la fenfluramine il semble que la norfenfluramine produite ne subit aucune biotransformation supplémentaire, alors que la norfenfluramine produite à partir de benfluorex est transformée en 3-trifluorométhylphényl-1-hydroxypropanone-2. Ce qui explique qu'on ne trouve pas plus de 2% de norfenfluramine dans l'urine.

Dans une étude où pendant 15 jours un groupe de 8 volontaires a reçu une dose journalière de trois fois 20mg de fenfluramine, la concentration sanguine de fenfluramine au bout de cette période était d'environ 120 ng/ml et celle de norfenfluramine d'environ 50ng/ml (fig 5).

En comparant les deux études :

- après fenfluramine le taux circulant de norfenfluramine représente 30% du taux circulant de fenfluramine

- après benfluorex la norfenfluramine représente 5% du taux circulant du métabolite principal S1475.

Il est impossible d'exclure la possibilité de passage de la barrière hémato-cérébrale de la norfenfluramine produite par le métabolisme de benfluorex.
Il faut toutefois noter qu'après administration de fenfluramine la quantité circulante de norfenfluramine vient s'additionner à celle de la fenfluramine et donc renforcer son action centrale anorexigène.

Nous rappelerons que malgré la production de norfenfluramine, la propriété pharmacodynamique d'anorexigène n'a jamais été attribuée à benfluorex.

FIG 3.

MEDIATOR 150 mg et les fenfluramines empruntent des voies métaboliques bien distinctes qui expliquent des activités pharmacologiques radicalement différentes.

MEDIATOR 150 mg est rapidement métabolisé pour donner de nombreux métabolites. Les propriétés antidiabétiques de MEDIATOR 150 mg sont liées à deux métabolites actifs (S 1475 et S 422) qui représentent plus de 93 % de la totalité des composés circulants chez l'homme. Un troisième métabolite, dérivé fenfluraminique, ne représente que 2 % de la dose administrée.

A l'inverse, c'est essentiellement le produit parent la fenfluramine qui est retrouvé dans la circulation. Son métabolite principal, la norfenfluramine, représente 40 % du produit parent. L'activité anti-obésité des fenfluramines résulte essentiellement du profil pharmacologique du produit parent.

Enfin il faut souligner que le benfluorex et ses métabolites ne peuvent pas être biologiquement transformés en fenfluramine ou dexfenfluramine.

Ces différences de métabolisme s'expliquent par une structure chimique fondamentalement différente de MEDIATOR 150 mg et des fenfluramines. MEDIATOR 150 mg est un ester benzoïque d'un dérivé alcool alors que les fenfluramines appartiennent à la famille des alkylamines.

Ces particularités chimiques et métaboliques conduisent :

- à des effets cliniques différents : MEDIATOR 150 mg n' a pas d'effet sur la prise alimentaire ; la perte de poids observée chez des patients diabétiques obèses reste très modérée (de l'ordre de 2 kg pour la totalité du traitement) peut-être liée à l'amélioration de l'insulinosensibilité puisque l'activité antidiabétique est observée dès les premières semaines de traitement en l'absence de diminution pondérale ;

- à une tolérance différente : les effets indésirables les plus souvent rapportés avec MEDIATOR 150 mg sont des vertiges, des nausées et des troubles digestifs, une somnolence, ainsi que des réactions de nature allergique cutanée (rash, urticaire, prurit) ; ces événements sont peu ou pas rapportés avec les fenfluramines.

En conclusion, MEDIATOR 150 mg se distingue radicalement des fenfluramines tant en termes de structure chimique et de voies métaboliques que de profil d'efficacité et de tolérance.

Bonjour,

Je viens de lire la publication parue dans **l'European Respiratory Journal** du mois de Mars 2009 et nous avons pu identifier sans ambiguité les 6 observations:

La 1 (PAH) correspond à notre référence 126V79 (origine CRPV Paris Saint Antoine, Ref PS9900385);

La 2 (PAH) correspond à notre référence S02001877 (origine Hôpital Antoine-Béclère);

La 3 (PAH) correspond à notre référence S07001089 (origine CRPV Brest, Ref BR0700050);

La 4 (PAH) correspond à notre référence S07001172 (origine CRPV Brest, Ref BR0700051).

La 5 (PAH) correspond à notre référence S08005656 (origine CRPV Brest, Ref BR20080383);

La 6 (VHD) correspond à notre référence S08002916 (origine CRPV Brest, Ref BR20080051).

Au total seul le cas n° 2 n'a pas de n° de CRPV et nous ne l'avons pas reçu de l'Afssaps.

Bien cordialement.

Francis Wagniart

De : WAGNIART Francis IRIS
Envoyé : 16 December 2008 17:03

Objet : RE: Benfluorex (MEDIATOR)

Bonjour,

Petit rappel de notre conversation téléphonique de l'autre jour: le 26 novembre nous recevons le cas BR20080383 communiqué, me dites-vous, par Mme Frachon comme étant l'une des observations de la série.

Il nous restait à identifier seulement 2 cas de PAH: les numéros 2 et 3 de la série (cf précédent mail).

Or on ne peut pas dire que les informations du nouveau cas (BR20080383) coincident vaiment avec ces deux cas manquants de PAH:
- dans l'abstract, seuls les cas 5 (PAH) et 6 (VHD) ont une prise de fenfluramine,
- les ages ne vont pas,
- tous les cas de l'abstract ont un niveau de gravité NYHA III, à mettre en rapport avec une PAP moyenne à 28, relativement modérée (et sous réserve qu'on ne dispose que d'une seule mesure).

D'autre part, la présence des Prs Simonneau et Humbert parmi les auteurs laisse supposer que tous les cas ne viennent pas de Brest.

Bien cordialement.
Francis Wagniart

WAGNIART Francis IRIS
/oyé : 23 October 2008 15:57
. : 'dominique.kowalski@chu-brest.fr'
Objet : Benfluorex (MEDIATOR)

/ous trouverez ci-joint l'abstract de la communication à l'ERS (Berlin, 6 Octobre 2008).

A priori il y a 3 observations identifiables avec une quasi certitude:

.a 1 (PAH) correspond à notre référence 126V79 (origine CRPV Paris Saint Antoine, Ref PS9900385);

.a 4 (PAH) correspond à notre référence S07001089 (origine CRPV Brest, Ref BR0700050);

.a 5 (PAH) correspond à notre référence S07001172 (origine CRPV Brest, Ref BR0700051).

.a valvulopathie de Brest BR20080051 pourrait correspondre avec un peu d'imagination mais il y a une différence d'age (date le naissance le 14 Septembre 1956 qui ne va pas avec un age de 62 ans au moment du diagnostic 2007); il y a bien eu de Isomeride 20 ans auparavant et 6 ans de Médiator au lieu de 5 dans la publication.

Bien entendu nous sommes intéressés par une confirmation de la correspondance des cas de la publication et les détails des cas que nous n'avons pas.

Merci d'avance. Bien cordialement.

Objet : RE: Benfluorex (MEDIATOR)

Bonjour,

Petit rappel de notre conversation téléphonique de l'autre jour: le 26 novembre nous recevons le cas BR20080383 communiqué, me dites-vous, par Mme Frachon comme étant l'une des observations de la série.

Il nous restait à identifier seulement 2 cas de PAH: les numéros 2 et 3 de la série (cf précédent mail).

Or on ne peut pas dire que les informations du nouveau cas (BR20080383) coincident vaiment avec ces deux cas manquants de PAH:
- dans l'abstract, seuls les cas 5 (PAH) et 6 (VHD) ont une prise de fenfluramine,
- les ages ne vont pas,
- tous les cas de l'abstract ont un niveau de gravité NYHA III, à mettre en rapport avec une PAP moyenne à 28, relativement modérée (et sous réserve qu'on ne dispose que d'une seule mesure).

D'autre part, la présence des Prs Simonneau et Humbert parmi les auteurs laisse supposer que tous les cas ne viennent pas de Brest.

Bien cordialement.
Francis Wagniart

Objet : Benfluorex (MEDIATOR)

/ous trouverez ci-joint l'abstract de la communication à l'ERS (Berlin, 6 Octobre 2008).

A priori il y a 3 observations identifiables avec une quasi certitude:

.a 1 (PAH) correspond à notre référence 126V79 (origine CRPV Paris Saint Antoine, Ref PS9900385);

.a 4 (PAH) correspond à notre référence S07001089 (origine CRPV Brest, Ref BR0700050);

.a 5 (PAH) correspond à notre référence S07001172 (origine CRPV Brest, Ref BR0700051).

.a valvulopathie de Brest BR20080051 pourrait correspondre avec un peu d'imagination mais il y a une différence d'age (date le naissance le 14 Septembre 1956 qui ne va pas avec un age de 62 ans au moment du diagnostic 2007); il y a bien eu de Isoméride 20 ans auparavant et 6 ans de Médiator au lieu de 5 dans la publication.

Bien entendu nous sommes intéressés par une confirmation de la correspondance des cas de la publication et les détails des :as que nous n'avons pas.

Merci d'avance. Bien cordialement.

Objet : Valvulopathie / exposition benfluorex

Bonjour,
Voici la méthodologie qui a permis de recenser les cas brestois de « valvulopathie » après exposition au benfluorex :
En 2008, une publication a été faite par plusieurs équipes de pneumologues dont Brest sur les atteintes cardiaques avec le benfluorex.

Depuis, Irène Frachon, pneumologue référent de l'hypertension artérielle pulmonaire sur Brest, a été interrogée plusieurs fois par des cardiologues sur des valvulopathies chez des sujets exposés au benfluorex.

Irène Frachon a décidé de demander au PMSI de lui faire des requêtes (2000-2008) sur les services de cardiologie et de chirurgie cardiaque du CHU de Brest.

1. atteintes valvulaires et diabète comme diagnostic principal ou diagnostic associé significatif (soif ATCD actif ou problème en cours d'hospitalisation)
2. atteintes valvulaires comme diagnostic et benfluorex et mediator comme mots inscrits dans le résumé de sortie

Les codes des atteintes valvulaires correspondent aux codes : I. 05 ; I. 06 ; I 07 ; I. 08 ; I.09 ; I.09 ; I.34 ; I35 ; I.36 ; I.37 ; I38 ; I.39.
La requête la plus intéressante a été la numéro 2 pour laquelle le croisement a ramené 21 patients dont 10 cas qui ont fait l'objet d'une notification de pharmacovigilance comme cas graves.

Actuellement Irène Frachon analyse une autre requête PMSI : sur la même période et dans les mêmes services « cardiologie et chirurgie cardiaque ».
Elle recherche dans les dossiers patients, voire après appel du médecin traitant, l'exposition au benfluorex, Médiator dans 2 populations :

1. les rétrécissements aortiques calcifiés
2. les valvulopathies autres mitrales et aortiques pour lesquelles il n'existe pas d'étiologie franche.

Cordialement

I - ADOPTION DU PROCES-VERBAL DES SEANCES DU MARDI 19 DECEMBRE 2000 ET DU MARDI 9 JANVIER 2001.

- ADOPTION DU PROCÈS-VERBAL DE LA SÉANCE DU 19 DECEMBRE 2000.

Le procès-verbal de la séance du 19 décembre 2000 a été adopté avec les corrections suivantes :

Annexe 3-43

Page 6 : **Paragraphe II - Tour de table des cas marquants et de la littérature** :

- Thé amaigrissant chinois KANCURA / CRPV de Besançon :
Remplacer « Ce produit avait été acheté sur un site internet. » par « Ce produit avait été acheté dans une boutique à Besançon mais peut être acheté sur internet. »

Page 8 : **Paragraphe III - Point sur les effets indésirables de Ritaline® (méthylphénidate) :**

- ligne 5 : supprimer « THADA »
- ligne 8 : remplacer « Ce médicament est inscrit sur la liste des stupéfiants et nécessite une prescription sur carnet à souches limitée à 28 jours » par « Ce médicament nécessite une prescription sur ordonnance sécurisée avec limitation à 28 jours. »
- 6ème paragraphe, 5ème ligne : remplacer « 22 cas de dépression » par « 22 cas de dépression ou d'état dépressif . »

Page 9 : ligne 12 : remplacer « diarrhées et douleurs abdominales » par « diarrhées et/ou douleurs abdominales. »

Page 12 : **Paragraphe V - Enquête officielle sur les effets indésirables cutanés et hépatiques du kétoprofène gel :**

- 3ème paragraphe, 5ème ligne: remplacer « 75 % des cas surviennent » par « 75 % de l'ensemble des cas survenant ».

- 3ème paragraphe, 8ème ligne : ajouter « Le rôle aggravant de la prise simultanée d'aspirine, d'autres anti-inflammatoires non stéroïdiens ou de fibrates a également été remarqué. ».

- 4ème paragraphe, 1ère ligne : remplacer « 4 cas de rémanence confirmés » par « 4 cas de photosensibilité recidivantes confirmés ».

- 5ème paragraphe, 3ème ligne : ajouter après prescripteurs «Il a proposé l'ajout dans la rubrique « Contre-indications » des phrases suivantes :

- *antécédents d'allergie au kétoprofène ou aux substances d'activité proche tel que l'acide tiaprofénique,*
- *antécédent de réaction cutanée allergique après utilisation d'un produit solaire ou de réaction allergique aux parfums,*
- *antécédent d'allergie à un médicament de la famille des fibrates (fénofibrate, gemfibrozil, bézafibrate...,*

la modification de l'ordre des précautions d'emploi et les ajouts suivants :

- *protéger les zones traitées par le port d'un vêtement durant toute la durée d'application du traitement et les deux semaines qui suivent l'arrêt du traitement,*
- *la prise simultanée d'un autre anti-inflammatoire non stéroïdien, par voie locale ou générale, est déconseillée,*
- *la prise simultanée d'un médicament de la famille des fibrates (fénofibrate, bezafibrate) est déconseillée.*

Page 16 : Paragraphe VI - Enquête officielle sur les effets indésirables de la NANBACINE® :

Remplacer:

NANBACINE® SUSPENSION BUVABLE	
< AVRIL 1997	> AVRIL 1997

Par :

NANBACINE® SUSPENSION BUVABLE	
< MAI 1997	> MAI 1997

Page 22 : Paragraphe IX – Questions diverses :

Allocation chômage / CRPV de Paris Saint-Vincent de Paul : remplacer « Le CRPV de Paris Saint-Vincent de Paul… ne sera pas suffisante » par « Le CRPV de Paris Saint-Vincent de Paul a signalé qu'au moment de la fusion Cochin/ St-Vincent de Paul, la prise en charge de la subvention du CRPV a été faite par des équipes de Cochin : depuis 1999-2000, à la suite de départ de Chefs de clinique et de médecins vacataires, l'hôpital a dû verser des allocations pertes d'emploi. Il a donc été demandé au CRPV de Paris St-Vincent de Paul de bloquer une somme de la subvention du Centre afin de prévoir la possibilité de régler l'allocation chômage des différentes personnes vacataires du Centre. »

- **ADOPTION DU PROCÈS-VERBAL DE LA SÉANCE DU 9 JANVIER 2001.**

Le procès-verbal de la séance du 9 janvier 2001 a été adopté avec les corrections suivantes :

Page 5 : Paragraphe III – Enquête officielle sur les effets indésirables du GEMZAR® :

Point 3, 1ère ligne : remplacer « Manifestations ischémiques artérielles et veineuses. » par « Manifestations ischémiques artérielles et musculaires. »

Page 6 : 2ème paragraphe, 8ème ligne : remplacer « manifestations ischémiques artérielles et veineuses » par « manifestations ischémiques artérielles et musculaires. »

Page 10 : **Paragraphe VI – Point sur les antirétroviraux et grossesse :**

- 1er paragraphe, 3ème ligne : remplacer « mitochondriales avec la zidovudine et la lamivudine.» par « mitochondriales au sein de l'essai ANRS 075, AZT + 3 TC à partir de 32 SA. »

- 2ème paragraphe, 2ème ligne : remplacer « L'EPF, qui a débuté en 86, inclut » par « L'EPF, qui a débuté en 86 (mère et enfant réunis), inclut ».

- 2ème paragraphe, 3ème ligne : remplacer « une analyse rétrospective des dossiers » par « une analyse rétrospective faite par l'EPF des dossiers ».

- 3ème paragraphe, dernière ligne : ajouter « Il n'existe pas actuellement de consensus international. »

- 4ème paragraphe, 4ème ligne : remplacer « sur une base spécifique grossesse » par « sur une base spécifique antirétroviraux et grossesse ».

- 4ème paragraphe, 9ème ligne : remplacer « 1 cas de mitochondriopathie établie… (inclus dans la cohorte) » par « Parmi ces dossiers, on retrouve 2 cas de mitochondriopathie dans la cohorte : 1 cas de mitochondiopathie établie et 1 cas de forte suspicion. »

- 4ème paragraphe, 11ème ligne : remplacer « 55 effets indésirables… nés en 2000. » par « 55 effets indésirables chez des nouveau-nés séronégatifs ont été analysés parmi les 71 bébés nés en 1999. 17 effets indésirables chez des nouveau-nés séronégatifs ont été analysé parmi les 71 bébés nés en 1999. »

Page 12 : **Paragraphe VII – Point sur les anticancéreux et grossesse :**

- 2ème paragraphe, dernière ligne : ajouter « Rappel sur les risques lors d'une exposition intra-utérine :
  - risque malformatif morphogenèse, exposition au 1er trimestre définition restrictive
  - risque fœtal et néonatal direct et indirect
  - risque retardé

- 3ème paragraphe, dernière ligne : remplacer « le risque fonctionnel » par « le risque fœtal et néonatal ».

- 4ème paragraphe, 4ème ligne : remplacer « des cas rapportés isolés…anthracyclines) . » par « des cas rapportés isolés d'atteintes hématologiques (atteintes isolées ou non des 3 lignées, aplasie), digestives, infectieuses, cardiaques (cardiomyopathies avec les anthracyclines). »

- 4ème paragraphe, 10ème ligne : ajouter « Certaines pathologies n'ont pas été publiés chez le nouveau-né exposé in utero, mais nécessitent la surveillance étant donné les informations des données adultes (ex : Holoxan® et rein, Asparginase et hémostase…) »

- 5ème paragraphe, 4ème ligne : remplacer « Il est donc recommandé de préconiser…progressive de l'alimentation » par « Il est donc recommandé de préconiser dans ces cas :

- une surveillance anténatale intensive avec des échographies fœtales répétées pour surveiller la croissance fœtale,
- des échographies cardiaques fœtales en cas d'exposition aux anthracyclines,
- en cas de menace d'accouchement prématuré, pratiquer une prévention de la maladie des membranes hyalines par l'administration de bétaméthasone,
- prévoir une naissance à distance de la dernière cure (minimum 3 à 4 semaines variable selon l'hématotoxicité des anticancéreux),
- pratiquer une surveillance clinique et biologique adaptée du nouveau-né (NFS, bilan infectieux, échographie cardiaque si exposition à risque) et la mise en route progressive de l'alimentation. »

Page 13 : -2ème paragraphe, 7ème ligne : remplacer « dans des pathologies « bénignes » » par « dans des pathologies non cancéreuses ».

Annexe 3-43

II - VACCINS CONTRE L'HEPATITE B : MISE A JOUR DES DONNEES DE PHARMACOVIGILANCE DEPUIS LA COMMERCIALISATION JUSQU'AU 31 DECEMBRE 2000.

Les centres régionaux de Pharmacovigilance chargés de l'enquête officielle sur les effets indésirables au cours d'une vaccination contre l'hépatite B ont présenté le suivi de l'enquête relative aux :

-Affections démyélinisantes centrales et périphériques pour le CRPV de Strasbourg,
-Maladies auto-immunes pour les CRPV de Strasbourg et Nancy,
-Atteintes hématologiques pour le CRPV de Brest,
-Atteintes auditives pour le CRPV de Paris-Pompidou.

Ce point fait état des observations rapportées depuis la date de commercialisation des vaccins contre l'hépatite B jusqu'au 31 décembre 2000.

1. ATTEINTES DEMYELINISANTES : 862 cas.

1)Atteintes démyélinisantes centrales

➢769 cas ont été retenus par les centres régionaux de pharmacovigilance. Cependant, toutes les observations n'ont pas encore été validées par les experts neurologues. Il s'agit de 560 cas de scléroses en plaque dont "415 SEP première poussée" et de 209 atteintes démyélinisantes du système nerveux central qui se répartissent en :

- ✓41 atteintes médullaires et/ou encéphaliques (dont 28 myélites, 6 encéphalomyélites, 6 encéphalites et 1 méningo-myélo-radiculonévrite),
- ✓ 59 cas d'atteintes ophtalmologiques (dont 47 névrites optiques rétrobulbaires, 10 papillites et 2 diplopies),
- ✓ 109 cas de symptômes divers (paresthésie, hémiparésie, dysesthésie,...).

Ces cas sont survenus chez 558 femmes (72,6 %) et 211 hommes. L'âge des patients varie de 2 à 66 ans. Le délai de survenue est inférieur ou égal à 2 mois dans 45,4 % des cas.

➢ Quarante-cinq (45) observations concernent des enfants de 15 ans ou moins. Il s'agit de 19 cas de sclérose en plaques dont 18 SEP "première poussée" et 26 atteintes démyélinisantes du système nerveux central qui se répartissent en :

- ✓ 9 cas d'atteinte médullaire ou encéphalique (dont 4 myélites, 2 encéphalomyélites et 3 encéphalites),
- ✓ 12 cas d'atteinte ophtalmologique (dont 6 névrites optiques rétrobulbaires, 5 papillites et 1 diplopie),
- ✓ 5 cas de symptômes divers (paresthésie, hémiparésie, dysesthésie,...).

Ces cas sont survenus chez 28 filles et 17 garçons. L'âge des patients varie de 2 à 15 ans. Le délai de survenue est inférieur ou égal à 2 mois dans 44,5 % des cas. Aucun cas n'a été rapporté chez les enfants 2 ans ou moins.

2)Atteintes démyélinisantes périphériques

➢93 cas ont été retenus par les centres régionaux de pharmacovigilance. Cependant, toutes les observations n'ont pas encore été validées par les experts neurologues. Il s'agit de 43 cas de syndrome de Guillain-Barré, 37 cas de syndrome de Parsonage-Turner, 8 cas de polyradiculonévrite chronique et 5 cas de neuropathie. Ces cas sont survenus chez 31

femmes et 62 hommes. L'âge des patients varie de 2 à 68 ans. Le délai de survenue est inférieur ou égal à 2 mois dans 78,5 % des cas. Quinze (15) observations ont été rapportés chez des enfants de 15 ans ou moins.

2. MALADIES AUTO-IMMUNES

L'ANALYSE A PORTE PLUS PARTICULIEREMENT SUR LES PATHOLOGIES SUIVANTES :

- **68 cas de maladie lupique** : Ces cas sont survenus chez 59 femmes et 9 hommes. L'âge moyen est de 28 ans (6 à 56 ans). Des antécédents familiaux de maladie auto-immune sont retrouvés dans 9 cas. Des antécédents personnels de lupus sont retrouvés dans 9 cas. Des antécédents personnels de maladie auto-immune sont retrouvés dans 4 cas. Le délai moyen de survenue est de 165 jours (1 jour à 4 ans). Douze observations ont été non retenues.

- **74 cas de polyarthrite rhumatoïde (PR)** : Ces cas sont survenus chez 50 femmes et 24 hommes dont 3 chez des enfants de 15 ans ou moins (2, 13 et 15 ans). L'âge moyen est de 39 ans (2 à 62 ans). Des antécédents familiaux de PR sont retrouvés dans 6 cas. Des antécédents personnels de PR sont retrouvés dans 5 cas. Des antécédents personnels de maladie auto-immune sont retrouvés dans 5 cas. Le délai moyen de survenue est d'environ 137 jours (1 jour à 5 ans).

- **32 cas de thyroïdites** : Ces cas sont survenus chez 30 femmes et 2 hommes d'âge moyen 36 ans (11 à 59 ans). Des antécédents familiaux de maladie auto-immune sont retrouvés dans 7 cas. Des antécédents personnels de disthyroïdie sont retrouvés dans 2 cas. Le délai moyen de survenue est de 221 jours (1 jour à 4 ans).

- **10 cas de polymyosite (PM) et dermatomyosite (DM)** : Ces cas sont survenus chez 9 femmes d'âge moyen 15 ans (2 à 48 ans). Des antécédents familiaux de maladie auto-immune sont retrouvés dans 1 seul cas. Le délai moyen de survenue est de127 jours (2 jours à 25 mois).

- **48 cas de diabète de type 1** : Pour les 20 cas supplémentaires rapportés en 1999 (11) et 2000 (9), il s'agit de 7 femmes et 13 hommes âgés de 12 à 55 ans. 4 dossiers concernent des enfants âgés de 15 ans ou moins (12, 13 et 14 ans). Des antécédents familiaux de diabète sont retrouvés dans 4 cas.

Plus d'une soixantaine d'observations concernent des enfants de 15 ans ou moins. Un cas d'évolution fatale chez un enfant âgé de 2 ans a été rapporté en 2000. Il s'agit d'une dermatomyosite Il n'y a aucune donnée dans la littérature concernant la survenue de ce type d'effet indésirable après administration d'un vaccin. Certains auteurs ont rapporté des taux de mortalité atteignant 25 % au cours de la dermatomyosite infantile. Le rapport de l'expert clinicien conclut à l'absence de lien entre la vaccination et la survenue de la dermatomyosite.

3. ATTEINTES HEMATOLOGIQUES

L'ANALYSE A PORTE PLUS PARTICULIEREMENT SUR LES PATHOLOGIES SUIVANTES :

- **14 cas d'APLASIE MEDULLAIRE DE TYPE IDIOPATHIQUE.** Sept cas chez l'enfant âgé de moins de 15 ans (3 filles et 4 garçons) et 3 décès chez 3 enfants (2 en post-greffe et 1 sans motif détaillé) ont été signalés. Le délai de survenue varie de 15 jours à 3 mois.

- **74 cas de THROMBOPENIE** dont 9 purpuras thrombopéniques auto-immuns (PTAI), 34 purpuras thrombopéniques idiopathiques (PTI) et 31 "autres thrombocytopénies".

Annexe 3-43

Parmi les PTAI, il a été dénombré 7 observations de thrombopénies sévères (< 30 G/L) avec signes hémorragiques associés présents dans 4 dossiers. 7 cas chez l'enfant de 15 ans ou moins (6 filles et 1 garçon) ont été signalés. Le délai de survenue varie de 27 jours à 1,5 ans. Pour les PTI, 22 cas chez l'enfant de 15 ans ou moins (12 filles et 10 garçons) ont été signalés. Le délai de survenue varie de 2 jours à 11 mois.
Enfin, parmi les "autres thrombocytopénies", 11 cas chez l'enfant de 15 ans ou moins ont été signalés. Le délai de survenue varie de 1 jour à 1,5 ans.

Huit (8) observations de thrombopénie ont été expertisées et retenus chez l'enfant de 2 ans ou moins. Il s'agit de 6 PTI et 2 autres thrombocytopénies.

4. ATTEINTES AUDITIVES

57 observations d'atteintes auditives ont été rapportées. Il s'agit notamment de 16 cas d'acouphène ou bourdonnements d'oreille, 31 cas de surdité, hypoacousie ou aggravation d'une surdité préexistante, 1 cas d'hyperacousie et 9 cas d'atteinte vestibulaire (dont 6 cas de vertiges et 3 cas de syndrome vestibulaire).

10 observations concernent des enfants de 15 ans ou moins. Chez le nourrisson, aucun cas d'atteinte auditive n'a été rapporté à la date d'aujourd'hui.

CONCLUSION

Ce bilan qui a porté, plus particulièrement, sur les atteintes démyélinisantes et les maladies auto-immunes, n'apporte pas de nouvelles données qui permettraient de remettre en cause le dernier bilan présenté à la Commission Nationale de Pharmacovigilance du 22 mars 2000.

Annexe 3-43

III - POINT SUR LES EFFETS GASTRO-INTESTINAUX DES INHIBITEURS DE LA CYCLO-OXYGENASE DE TYPE 2 : VIOXX® (ROFECOXIB) ET CELEBREX® (CELECOXIB), PROCEDURES DE RECONNAISSANCE MUTUELLE (UK, SE)/ CRPV DE CLERMONT-FERRAND .

Le Centre régional de pharmacovigilance de Clermont-Ferrand a présenté un point sur les effets gastro-intestinaux de VIOXX® (rofécoxib) commercialisé en France depuis avril 2000 par les laboratoires MSD et de CELEBREX® (célécoxib) commercialisé en France depuis novembre 2000 par les laboratoires Searle et Pfizer.
Ce point avait été décidé à la suite du rapport d'observations graves d'effets indésirables gastro-intestinaux par plusieurs centres régionaux de pharmacovigilance lors de précédents Comités techniques.

VIOXX® et CELEBREX® sont des médicaments anti-inflammatoires non stéroïdiens (AINS), inhibiteurs sélectifs de la cyclo-oxygénase-2 (COX-2). Ils bénéficient d'une autorisation de mise sur le marché européenne et sont enregistrés selon une procédure centralisée, France destinataire.
Ils sont tous les 2 indiqués dans le « soulagement des symptômes dans le traitement de l'arthrose ».
CELEBREX® est également indiqué dans le « soulagement des symptômes dans le traitement de la polyarthrite rhumatoïde ».

• Données internationales

791 cas d'effets indésirables gastro-intestinaux (dont 459 cas d'hémorragie digestive et 20 décès) ont été rapportés chez des patients (âge moyen : 70 ans) traités par VIOXX® pendant la période couverte par les 3 premiers rapports périodiques de pharmacovigilance.
290 cas (dont 274 cas d'hémorragie digestive et 4 décès) ont été rapportés pour CELEBREX® pendant une période équivalente, pour un nombre de patients traités plus important.
Dans la majorité des cas, les patients avaient des facteurs de risque (antécédents d'ulcère, de perforation, de saignement, traitements associés)
Le rapporteur s'est étonné du faible nombre d'observations concernant CELEBREX® (sous-notification ?)

• Données nationales

Aucun cas de décès n'a été rapporté en France à ce jour chez des patients traités par VIOXX® ou CELEBREX®.
Un total de 27 observations (ou 33 effets indésirables), dont 18 graves, ont été colligés avec ces 2 médicaments (18 observations concernent VIOXX® et 9 CELEBREX®). Il s'agit de 12 ulcères gastro-duodénaux, 18 hémorragies digestives et 3 perforations rapportés chez des patients d'âge moyen de 75 ans. Dans 18 cas sur 27, les patients avaient des facteurs de risque et la posologie était respectée dans presque tous les cas (25/27).
Le rapporteur a souligné la faiblesse du nombre d'observations françaises liée à la mise sur le marché récente de ces médicaments.

Au vu des données, le profil de ces effets indésirables de VIOXX® et CELEBREX® est identique à celui des autres AINS. Au vu des données disponibles depuis la commercialisation, ces médicaments semblent présenter un risque légèrement moindre de complications gastro-intestinales par rapport aux autres AINS ; cependant, ce bénéfice apparaît faible et disparaît lorsque ces médicaments sont associés à l'aspirine.
Les facteurs de risque étant les mêmes que ceux observés avec les autres AINS, le rapporteur a proposé que les RCP soient harmonisés.
Le rapporteur a également proposé que soit rajouté dans la rubrique « interactions médicamenteuses » le risque d'associer VIOXX® ou CELEBREX® à un autre AINS et que le risque d'associer VIOXX® à un médicament de la même famille que la warfarine soit mentionné dans cette rubrique, à l'image de ce qui est indiqué pour CELEBREX®.

Le Comité technique suit l'avis du rapporteur. Cependant, il souhaite également que les atteintes hépatiques, les pancréatites, les atteintes cutanés et les accidents thrombo-emboliques fassent l'objet d'un point supplémentaire lors d'un prochain Comité technique.
La rubrique « grossesse et allaitement » devra également être revue à cette occasion étant données les disparités existant entre les RCP de VIOXX® et de CELEBREX® (ce dernier étant contre-indiqué pendant toute la grossesse contrairement au premier).

Annexe 3-43

Annexe 3-43

IV – ENQUETE OFFICIELLE SUR LES EFFETS INDESIRABLES HEMATOLOGIQUES ET CARDIAQUES DU NORSET® (MIRTAZAPINE). PROCEDURE NATIONALE/ CRPV DE NICE.

Le CRPV de Nice a présenté les résultats de l'enquête officielle de pharmacovigilance portant sur les effets cardiologiques et hématologiques du Norset®.
Norset® (mirtazapine) est un antidépresseur de structure tétracyclique, commercialisé depuis le 1er Septembre 1999 par les laboratoires Riom-Cerm (désormais Azko Nobel), appartenant à la classe des pipérazinozépines. Le principe actif, la mirtazapine, est un dérivé 6-aza de la miansérine.
L'enquête couvre la période du 1/9/99 au 1/12/00.

RISQUE HEMATOLOGIQUE

Essais cliniques internationaux de phases II et III (2796 patients)
2 cas d'agranulocytoses et 1 cas de neutropénie sévère ont été enregistrés, avec un délai de survenue inférieur à 15 jours, tous d'évolution favorable. Le taux d'incidence a été estimé à 1/1000 mais l'échantillon était petit (2796 patients) et l'intervalle de confiance grand (3 cas/1000 à 2,2 cas pour 10000).

Notification spontanée (France)
7 notifications (1 neutropénie sévère, 4 neutropénies, 1 aggravation d'une leucopénie associée à une thrombopénie, 1 leucopénie) ont été rapportées entre le 1/9/99 et le 1/12/00. Le délai de survenue moyen était de 58 jours et l'évolution favorable dans 6 cas.
Pour une durée moyenne de prescription de 30 jours et une posologie quotidienne moyenne de 1,7 comprimé, le nombre de patients traités en médecine de ville, la 1ère année de commercialisation (entre le 1/9/99 et le 1/12/00), est de 155 000 patients dont 77 000 avec une 1ère prescription.

DONNEES INTERNATIONALES (DU 1/9/1997 AU 1/9/2000)

Pays	*Vente de mirtazapine (en 10^3 traitements)*	*Nb d'agranulocytose + Aplasie médullaire*	*Taux de notifications(en 10^6 traitements)*
Finlande	**106,76**	**2**	**18,77**
Allemagne	**660,76**	**2**	**3,03**
GB	**258,61**	**4**	**15,47**
Pays-Bas	**310,48**	**1**	**3,22**
Suède	**162,87**	**1**	**6,14**
USA	**2535,06**	**6**	**2,37**
Total	**5261,24**	**16**	**3,04**

Un traitement est défini comme une prise de 30 mg/jour de mirtazapine pendant 3 mois.
Une discordance a été mise en évidence entre l'incidence de survenue d'agranulocytose et de neutropénie sévère lors des essais cliniques et celle de la notification spontanée.
Il a été estimé que le petit nombre de patients traités en France (155 000) au cours de la 1 ère année de commercialisation ne permettait pas de conclure sur le risque hématologique. Les membres du Comité technique

de Pharmacovigilance ont souhaité que la firme fournisse le pourcentage d'anciens et nouveaux traitements pour les données internationales, en particulier celle de la Finlande et du Royaume-Uni.
L'information actuelle du RCP sur le risque hématologique a été jugé suffisante. L'avis de la prochaine Commission Nationale de Pharmacovigilance sera sollicité.

EFFETS CARDIOLOGIQUES
L'évaluation concerne les troubles du rythme : bradycardie, tachycardie, fibrillation auriculaire, arythmie et anomalies de l'ECG (allongement du QT, bloc de branche et onde Q) ainsi que l'insuffisance cardiaque, l'infarctus du myocarde et l'angor.

Essais cliniques internationaux de phases II et III
L'incidence des anomalies de l'ECG des 1221 patients ayant eu un enregistrement électrocardiographique est similaire dans le groupe traité (3,2%) et le groupe placebo (3,3%) sans autre précision. L'incidence des cas d'angor, infarctus du myocarde et bradycardie varie de 1/100 à 1/1000 patients. 1 cas de décès brutal d'un patient de 76 ans, probablement lié à un infarctus massif ou à des troubles du rythme à J7 d'un traitement par Norset®, a été notifié au cours d'une étude prospective multicentrique.

Notification spontanée (France)
Essais cliniques : un décès brutal chez un patient de 76 ans dans un contexte d'infarctus du myocarde ou de troubles du rythme à J7 d'un traitement par 30 mg de mirtazapine ».
3 cas de bradycardie (délai de survenue connu dans 1 cas (5j), évolution inconnue dans tous les cas) et 2 cas d'arythmies (délai de survenue J3 et J22, évolution favorable dans tous les cas) ont été enregistrés.

Données internationales
Essais cliniques (1600 patients)
1 cas de dyspnée avec bloc de branche, cardiomégalie et augmentation de poids chez un patient de 41 ans a été notifié. L'évolution a été favorable. L'imputabilité est plausible.

Notification spontanée
6 cas de bradycardie, parfois sévères, de délai de survenue inférieur à 2 jours dans 5 cas et d'évolution favorable dans 4 cas ont été enregistrés.
Ont été également notifiés : 9 cas de tachycardie d'évolution favorable dans 6 cas (imputabilité vraisemblable 1 fois avec rechallenge positif), 6 cas d'arythmies dont 2 décès, 4 cas de fibrillation auriculaire (imputabilité plausible 3 fois, évolution favorable dans tous les cas), 4 cas d'allongement de QT (imputabilité douteuse 2 fois et non déterminée 2 fois, évolution favorable 2 fois, inconnue 2 fois), 5 cas d'insuffisance cardiaque dont 2 décès, 7 cas d'infarctus du myocarde dont 6 décès, 3 cas d'angor dont 2 décès, 1 arrêt cardiaque après 8 jours de traitement, d'évolution favorable et d'imputabilité plausible.
Le RCP ne mentionne pas la survenue d'effets indésirables cardiaques. Le rapporteur propose l'ajout de "bradycardie ou tachycardie" à la rubrique "Effets indésirables".
Ce dossier sera présenté à la Commission Nationale du 13 mars 2001.

Annexe 3-43

V – POINT SUR LE REFERENTIEL.

M. MEYER, adjoint au directeur chargé des Affaires Médicales, a présenté un point sur le référentiel : ce point fait suite à une demande des CRPV relative à la possibilité de mise à disposition des informations sur le médicament (RCP, liste des spécialités…). M. MEYER a présenté Mme DIALLO, pharmacien, qui anime un groupe de 5 pharmaciens travaillant sur le référentiel. Celui-ci regroupera l'ensemble des RCP des différentes spécialités disposant d'une AMM. Les RCP sont rédigés au sein de l'Afssaps puis une édition papier (contenant les annexes I, II, III) est envoyée aux laboratoires pharmaceutiques concernés, à la Direction des Laboratoires et des Contrôles de l'Afssaps ainsi qu'à différentes bases de données dont le Dictionnaire Vidal. Cette copie papier du RCP est archivée à l'Afssaps mais également entrée dans la base de données interne à l'Afssaps, la base CODEX (anciennement base LIBRA) : celle-ci contient les données administratives de chaque spécialité pharmaceutique. Les RCP sont archivés sous forme de fichiers électroniques dans la base MOCATOR pour les RCP récents (depuis octobre 98). Les RCP plus anciens ont été scannés par une société extérieure, JOUVE, qui est interrogeable en interne grâce à une interface. Certains dossiers n'ont pas été scannés et ont été rangés dans un fichier « vrac » (dossiers « oubliés »).

L'interrogation au niveau interne de l'Afssaps se déroule donc comme suit :

- Interrogation de la base CODEX pour avoir le numéro de dossier puis :
  - ✓ Interrogation de la base MOCATOR pour les dossiers les plus récents
  - ✓ Interrogation de la base JOUVE pour les dossiers les plus anciens
  - ✓ Interrogation du fichier « vrac » pour les dossiers « oubliés »

L'idéal serait d'accéder directement à l'information mais tout ceci n'est pas encore réalisable. De plus, pour chaque AMM modifiée, le RCP n'est pas réédité en entier donc l'accès à ces informations par le public n'est pas encore prévu.

Dans le projet de financement de la Sécurité Sociale, il est prévu « d'ici janvier 2003, que l'Afssaps mette à disposition du public une base dont les modalités d'accès seront fixées par décret ».
Il reste encore plusieurs points à régler (un numéro de dossier unique, état de commercialisation, coordination européenne pour un langage informatique compatible…) mais les choses avancent.
Les membres du Comité technique souhaiteraient disposer de l'historique des compositions et de la mention des excipients.
Mme JOLLIET, Présidente de la Commission de Publicité, a rappelé qu'une charte avait été signée entre le Directeur Général de l'Afssaps et le SNIP à propos de l'information disponible sur le site internet des laboratoires pharmaceutiques concernant leurs spécialités : cette information pose de nombreux problèmes car ce n'est pas de la publicité donc elle ne répond pas à la réglementation relative à la publicité des spécialités pharmaceutiques. De plus, cette information provient souvent de la notice mais elle n'est pas complète et il n'existe encore aucune obligation de mise à jour des informations sur internet. Le référentiel permettrait sans doute régler ce problème.

Annexe 3-43

VI - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Seuls sont signalés les cas d'effets indésirables donnant lieu à des mesures (mise en enquête, notes...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **RIFADINE® (rifampicine) / CRPV de Strasbourg :**

Survenue d'un choc anaphylactique avec un oedème de Quincke chez une femme de 75 ans moins de 5 minutes après la perfusion de RIFADINE® pour un problème ostéo-articulaire. La patiente a été intubée pendant 24 heures et l'évolution a été favorable à l'arrêt du traitement. La rubrique « Effets indésirables » du RCP mentionne « des réactions cutanées modérées et peu étendues pouvant apparaître et ne semblant pas être des réactions d'hypersensibilité [...]. Des réactions d'hypersensibilité cutanées plus sérieuses peuvent apparaître mais ne sont pas fréquentes ».

⇨Une lettre sera adressée aux laboratoires afin qu'ils déposent une demande de modification de l'information.

- **Interférons alfa / CRPV de Marseille :**

Le CRPV de Marseille a signalé que les effets psychiatriques des interférons alfa étaient mal connus des psychiatres et peu pris en compte par les hépatologues. Le Centre souhaiterait que l'information soit renforcée et diffusée auprès des prescripteurs.

⇨ Le CRPV de Montpellier est chargé de l'enquête officielle sur les effets indésirables psychiatriques des interférons alfa.

- **COZAAR® (losartan) / CRPV de Dijon :**

Le CRPV de Dijon a signalé la survenue d'un malformation pulmonaire suivi d'un décès d'un enfant de 4 jour. La mère avait été traitée par COZAAR® pendant la grossesse. Cette mention ne figure pas dans le RCP.

Un cas similaire est survenu à Reims et un autre a été publié dans la littérature.

⇨ Une Note sera transmise au groupe grossesse afin d'ajouter eet effet indésirable dans le RCP.

- **AINS et grossesse / CRPV de Marseille :**

Le CRPV de Marseille a signalé qu'il y avait beaucoup de questions sur le risque des AINS en fin de grossesse. Il semblerait que le message ne soit toujours pas passé et qu'il faudrait peut être faire une information plus large incluant également le grand public

⇨Une réflexion sera envisagée avec le CRPV de Paris Saint-Vincent de Paul.

- **Préparations magistrales à base de metformine / CRPV de Caen et de Tours :**

La Présidente du Conseil Régional de l'Ordre des Pharmaciens de Basse Normandie a attiré l'attention sur des préparations magistrales à base de metformine, d'hormone thyroïdiennes et de MEDIATOR® (benfluorex).

Le CRPV de Tours a ajouté qu'il y avait beaucoup de préparations magistrales amaigrissantes à base de metformine et que la Pharmacie Centrale des Hôpitaux la délivrait en vrac.

⇨Une note sera adressée aux Affaires Réglementaires afin de leur signalé ce mésusage.

- **PRO-DAFALGAN® (propacétamol) / CRPV de Limoges :**

Survenue d'une hyperthermie une heure après une injection de PRO-DAFALGAN® par voie intra-veineuse rapide chez un homme de 62 ans. Le PRO-DAFALGAN® a été dilué dans 5 ml de sérum physiologique (au lieu de 100 ml). Au niveau de la rubrique « Modalités d'administration » il est mentionné que le produit doit être reconstitué dans une poche de 100 ml de sérum glucosé à 5 % ou de sérum physiologique à 9 ‰ et à administrer en perfusion de 15 minutes. Mais la présentation ne fournie pas cette poche de 100 ml.

⇨Une note sera adressée aux Affaires Réglementaires afin de modifier la présentation du produit.

- **LOVENOX® (énoxaparine) / CRPV de Rennes :**

Survenue de deux cas de thrombocytose chez un homme de 67 ans et un autre de 58 ans après administration de LOVENOX® 40 mg. L'évolution a été favorable dans les deux cas et les myélogrammes étaient normaux.

Cet effet indésirable ne figure pas à la rubrique « Effets indésirables » du RCP.

⇨ Le CRPV de Toulouse était chargé de l'enquête officielle sur les HBPM et parmi les effets indésirables figuraient les hémorragies et les thrombocytoses. Il a été précisé qu'une réflexion, dans le cadre du Comité de la

iatrogénie, avait débuté sur les héparines de bas poids moléculaires (HBPM). Le compte-rendu du Comité de la iatrogénie sera transmis aux CRPV afin de poursuivre la réflexion.

- ZERIT® (stavudine), VIDEX® (didanosine) et acidose lactique / CRPV de Paris Saint-Vincent de Paul :
Survenue d'une acidose lactique à 35 semaines d'aménorrhée chez une femme traitée par Zérit®, Videx® et Sustiva® (éfavirenz).
L'équipe de réanimation chirurgicale n'avait pas reçu la lettre d'information, envoyée aux CISIH et aux CRPV, à propos du risque d'acidose lactique avec l'association ZERIT® / SUSTIVA®.
➪Ce problème est en cours au niveau de l'Europe. Il avait été demandé aux CISIH de diffuser la lettre d'information.

- DHEA (déhydroépiandrostérone) / CRPV de Paris-F. WIDAL :
Le CRPV de Paris-F. WIDAL a signalé qu'il recevait des questions fréquentes à propos de la tolérance de la DHEA.
Ce produit n'a pas d'autorisation de mise sur le marché mais des essais cliniques et une réflexion à propos de ce produit sont en cours.
➪Une information sur le protocole d'essais clinique sera présentée lors d'un prochain Comité technique.

- Usage criminel des benzodiazépines / CRPV de Paris-F. WIDAL :
Le CRPV de F. WIDAL a parlé du dossier relatif à l'usage criminel de benzodiazépines. Cette information est parue dans la presse et une enquête sous la direction du CRPV de F. WIDAL est en cours. Le Centre fera très rapidement un rapport complet sur le sujet . Les observations colligées concernent les 3 réseaux CRPV, Centres antipoison (CAP) et Centres d'évaluation et d'information des pharmacodépendances CEIP). 149 dossiers ont été récupérés dont 146 sont parisiens : le CRPV de F. WIDAL souhaiterait récupérer les cas provenant de la province.

- Modification du tour de table :
Le Président de la Commission nationale de pharmacovigilance souhaite modifier le fonctionnement du tour de table des cas marquants : les cas marquants seront, dorénavant, transmis avant le Comité technique à Virginie BACQUET(unité de pharmacovigilance). Les observations seront ensuite distribuées aux évaluateurs concernés.

- EPITOMAX® (topiramate) / CRPV de Lyon :
Tentatives de suicide et suicide survenus chez un homme de 32 ans, sans antécédents psychiatriques, et traité par EPITOMAX® depuis 3 mois.
➪Cinq cas de suicide figure dans le dernier rapport périodique de pharmacovigilance dont 3 suicides violents survenus chez des patients sans antécédents.
L'unité de pharmacovigilance a demandé au laboratoire de fournir un bilan de tous les cas de suicide déclarés au niveau international.

- ARAVA® (léflunomide) / CRPV de Dijon :
Survenue d'une hypertension maligne chez un homme de 56 ans traité par ARAVA®. Cette hypertension a persisté pendant 3 semaines malgré l'administration de 3 comprimés par jour de LOXEN® (nicardipine).
➪Le CRPV de Dijon est chargé de faire un point sur les effets indésirables d'ARAVA®.
➪Le CRPV de Nice sera chargé de réaliser un point sur les effets indésirables du REMICADE®.

- DI-ANTALVIC® (dextropropoxyphène + paracétamol) / CRPV de Paris Saint-Antoine :
Le CRPV de Paris Saint-Antoine a signalé un cas de périnée en lambeaux chez une patiente traitée par DI-ANTALVIC® en suppositoire. Le Président du groupe hépato-gastrologie demande si la pharmacovigilance pouvait intervenir sur ce sujet.
➪L'unité de pharmacovigilance demandera à l'unité pharmaco-toxico-clinique si le bénéfice de cette forme galénique est toujours supérieur au risque.

- TAVANIC® (lévofloxacine) / CRPV de Saint-Etienne :
Survenue d'une rupture bilatérale du tendon d'Achille et d'une tendinite chez une femme de 67 ans et une autre de 66 ans traitées par TAVANIC®. Cinq autres cas similaires figurent dans la banque nationale de pharmacovigilance et un cas d'allongement de l'espace QT.

Annexe 3-43

⇨Le CRPV de Saint-Etienne est chargé de l'enquête officielle sur les effets indésirables du TAVANIC®.

Annexe 3-43

VII - POINT SUR LES EFFETS INDESIRABLES DE LA FLAMMAZINE® (SULFADIAZINE ARGENTIQUE)
PROCEDURE NATIONALE/ CRPV DE NANCY.

Le centre régional de pharmacovigilance de Nancy a présenté un point sur les effets indésirables de la Flammazine®. Ce point fait suite à la présentation par le CRPV de Nancy lors du Comité Technique du 12/09/2000 d'un cas de leuconeutropénie sévères chez un enfant traité par Flammazine® crème pour des brûlures au 2ème et 3ème degré sur 20 % de la surface corporelle.
40 cas d'effets indésirables ont été notifiés dans la base nationale de pharmacovigilance, 5 cas n'ont pas été analysés (imputabilité insuffisante). On dénombre :
- 27 effets cutanés dont 19 eczémas de contact, 2 réactions de photosensibilité, 2 toxidermies, 1 vascularite cutanée, 1 hypertrichose, 2 purpuras
- 3 cas d'argyrie dont 2 avec effets neurologiques (1 encéphalopathie, 1 convulsion)
- 2 effets rénaux : 2 syndromes néphrotiques impurs
- 3 effets hématologiques : 3 leuconeutropénies sévères (une patiente présente simultanément un syndrome néphrotique)
- 1 atteinte hépatique

Il s'agit de 21 femmes, d'âge moyen 46,5 ans et de 14 hommes d'âge moyen 52,5 ans.
L'évolution était favorable sans séquelle dans 24 cas sur 35. Le suivi était incomplet ou inexistant pour 10 patients et un patient est décédé d'une pathologie sans relation avec le traitement.

1. leucopénies :
Parmi les 3 cas, un seul s'est compliqué d'un syndrome infectieux, d'évolution favorable. Dans les 3 cas le myélogramme montre un aspect de blocage de la maturation médullaire. La récupération est spontanée dans 2 cas sur 3 à l'arrêt du traitement.
La revue de la littérature montre que les leucopénies surviennent généralement avant le cinquième jour chez 3 à 68% des patients traités. L'évolution est toujours favorable, avec ou sans interruption du traitement, en 3 à 5 jours, sans complication infectieuse imputable.

2. atteintes rénales :
Le diéthylène glycol présent dans certaines formulations de sulfadiazine argentique a été incriminé dans la survenue de plusieurs cas d'insuffisances rénales aiguës oligoanuriques avec évolution mortelle.

3. atteintes cutanées :
Elles représentent l'effet indésirable le plus souvent rapporté. La plupart des eczémas de contact sont dus au propylèneglycol contenu dans la préparation. Sa responsabilité a été démontrée par des tests cutanés de même que celle d'autres adjuvants : l'alcool cétylique et l'argent.

4. argyrie :
Si l'accumulation d'argent dans les tissus reste le plus souvent asymptomatique, elle peut entraîner des effets neurologiques graves même pour de faibles surfaces traitées. L'existence d'une insuffisance rénale associée majore ce risque.

En conclusion, le RCP devrait faire mention de la survenue de leucopénies en des termes tels que « ont été rapportés » et non « de rares cas » ; leur apparition se produisant dans les 5 premiers jours, il semble nécessaire de surveiller quotidiennement la numération de formule sanguine (NFS) pendant cette période. Enfin, l'accumulation d'argent dans les tissus devrait être signalée plus clairement et recherchée chez tout patient présentant des complications neurologiques ; le RCP doit attirer l'attention sur les risques dus aux doses cumulatives dans les traitements prolongés.
Le Comité Technique a souhaité l'ouverture d'une enquête officielle afin d'obtenir plus d'informations concernant les chiffres de vente, les données internationales et l'utilisation du produit.

Annexe 3-43

VIII - ENQUETE OFFICIELLE EFFETS INDESIRABLES DE L'ALMITRINE (DUXIL®, VECTARION®). PROCEDURE NATIONALE/ CRPV DE STRASBOURG.

Le centre régional de pharmacovigilance (CRPV) de Strasbourg a présenté les résultats de l'enquête officielle de pharmacovigilance portant sur les cas de neuropathies périphériques et/ou amaigrissement rapportés avec l'almitrine (Vectarion®, Duxil®).
Cette enquête fait suite à un courrier de particulier rapportant une neuropathie lors d'un traitement par Duxil®.

Actuellement, l'almitrine est commercialisée en France sous deux spécialités, chacune sous deux formes (Vectarion® comprimés 50 mg et injectable, Duxil® comprimé 30 mg et solution buvable).
Les indications de ces 2 spécialités sont :

Duxil® comprimé et suspension buvable :

- *traitement à visée symptomatique du déficit pathologique cognitif et neuro-sensoriel chronique du sujet âgé (à l'exclusion de la maladie d'Alzheimer et d'autres démences),*
- *traitement d'appoint des baisses d'acuité et troubles du champ visuel présumés d'origine vasculaire,*
- *traitement d'appoint des baisses d'acuité auditive et de certains syndromes vertigineux et/ou acouphènes présumés d'origine vasculaire.*

Vectarion® injectable :

- *hypoxémie et hypercapnie de l'hypoventilation alvéolaire,*
- *épisodes de décompensation respiratoire aiguë compliquant les bronchopneumopathies obstructives, sevrage de l'assistance respiratoire artificielle,*
- *dépression respiratoire musculaire induite par les analgésiques centraux, les neuroleptiques, le fluothane.*

Vectarion® comprimé :

Insuffisance respiratoire avec hypoxémie en rapport avec une bronchite chronique obstructive.

En 1985, une première présentation des données de l'enquête concernant Duxil® et Vectarion® révélait que 151 observations de neuropathie périphérique et/ou amaigrissement avaient été rapportées avec l'une ou l'autre des spécialités. Ces éléments avaient conduit à des modifications du RCP de Duxil® et Vectarion®.
Une nouvelle présentation fut effectuée en 1990 et révéla que la fréquence des neuropathies et/ou amaigrissements diminuait nettement, apparemment plus que les chiffres de vente, aussi bien pour Duxil® que pour Vectarion®.

La présente enquête couvre la période du 1er janvier 1990 au 31 décembre 1999 et regroupe toutes les observations de neuropathie et/ou amaigrissement notifiées aux CRPV et/ou aux laboratoires concernés.
Pour Duxil® comprimé et suspension buvable, 344 observations ont été colligées : 276 concernent des atteintes neurologiques périphériques dont 89 associées à une perte de poids et 68 concernent une perte de poids isolée.
Pour Vectarion® comprimé et injectable, 140 observations ont été colligées : 125 concernent des atteintes neurologiques périphériques dont 38 associées à une perte de poids et 15 concernent une perte de poids isolée. Parmi ces observations, seul 1 cas implique la voie injectable.
Les caractéristiques des observations sont résumées dans le tableau suivant :

	DUXIL®		VECTARION®	
	Atteintes neurologiques périphériques avec ou sans perte de poids	Perte de poids isolée	Atteintes neurologiques périphériques avec ou sans perte de poids	Perte de poids isolée
Nombre d'observations	276 (98 CRPV, 178 labo.)	68 (16 CRPV, 52 labo.)	125 (60 CRPV, 65 labo.)	15 (7 CRPV, 8 labo.)

EIs rapportés	73 paresthésies 36 anomalies neurologiques 167 neuropathies confirmées	perte de poids	37 paresthésies 19 anomalies neurologiques* 69 neuropathies confirmées	perte de poids
Age moyen (extrêmes)	70 ans (37-93 ans)	73 ans (37-92 ans)	67 ans (42-90 ans)	67 ans (46-91 ans)
Posologie moyenne (extrêmes)	62 mg/jour (30-120 mg/jour)	60 mg/jour (30-120 mg/jour)	94 mg/jour (50-150 mg/jour)	92 mg/jour (50-100 mg/jour)
Durée moyenne du traitement (extrêmes)	1 063 jours (2,9 an) (4-7 305 jours)	702 jours (1,9 an) (20-3 318 jours)	598 jours (1,6 an) (4-5 813 jours)	329 jours (7-911 jours)
Délai moyen de survenue (extrêmes)	860 jours (2,4 an) (4-7 305 jours)	648 jours (1,8 an) (20-3 287 jours)	574 jours (1,6 an) (3-4 579 jours)	282 jours (7-911 jours)
Avec perte de poids	89	-	38	-
Perte de poids moyenne (extrêmes)	7 kg (2-33 kg)	7 kg (2-17 kg)	10 kg (2-40 kg)	10 kg (3-25 kg)
Evolution	46 guérisons sans séquelle 184 non encore rétablis 44 non précisés 2 décès (non reliés)	23 guérisons sans séquelle 29 non encore rétablis 15 non précisés 1 décès (non relié)	14 guérisons sans séquelle 77 non encore rétablis 30 non précisés 4 décès (non reliés)	5 guérisons sans séquelle 8 non encore rétablis 2 non précisés

*définies par des signes objectifs : diminution de la sensibilité superficielle et/ou profonde, diminution ou abolition des réflexes ostéotendineux

En ce qui concerne les atteintes neurologiques, les observations graves sont moins fréquentes sous Vectarion® (18%) que sous Duxil® (23%). Par ailleurs, la posologie quotidienne recommandée est inférieure pour Duxil® par rapport à Vectarion® alors que la durée moyenne de traitement et le délai moyen de survenue sont plus courts pour Vectarion®.
Ces différences confortent la dose-dépendance habituelle des neuropathies médicamenteuses ainsi qu'une durée-dépendance évoquant la possibilité d'un effet cumulatif.
Ces différences pourraient aussi être expliquées par un effet additif du vieillissement ou des pathologies concomitantes telles que polyneuropathies au cours de l'insuffisance respiratoire chronique ou chez les personnes âgées.

CONCLUSION
La neuropathie à l'almitrine est une neuropathie axonale, tout comme la plupart des neuropathies médicamenteuses. Cette neurotoxicité est dose-dépendante ; il n'y a pas d'élément en faveur d'un facteur immuno-allergique. Lorqu'un diagnostic précoce permet l'arrêt du traitement, la neuropathie guérit sans séquelle.

Duxil® : l'efficacité de cette spécialité a été étudiée lors d'essais sur de petits nombres de patients et pendant des durées brèves ne permettant pas de saisir la neurotoxicité. Dans ces conditions, et malgré sa relative rareté, mais compte tenu de la gravité potentielle d'une neuropathie axonale, notamment lorsque le diagnostic n'est pas effectué précocément, une réévaluation du bénéfice du traitement semble devoir être envisagée.

Vectarion® comprimé: l'almitrine est une molécule originale qui ne peut être comparée à aucun médicament existant dans l'insuffisance respiratoire avec hypoxémie en rapport avec une bronchite chronique obstructive. La démonstration de l'efficacité du Vectarion® sur la morbidité chez les patients insuffisants respiratoires est faite.
La neuropathie périphérique est un effet indésirable rare du Vectarion®. Il est proposé qu'une nouvelle sensibilisation des prescripteurs et qu'une reformulation du RCP insistant notamment sur la nécessité impérative

Annexe 3-43

d'arrêter le traitement devant toute perte de poids inexpliquée (et non seulement lorsqu'elle est supérieure à 5%) et/ou devant l'existence de paresthésies des membres inférieurs soient effectuées.

Les résultats de cette enquête seront examinés par la Commission Nationale de pharmacovigilance du 13 mars 2001.

Annexe 3-43

IX - PHARMACOVIGILANCE EUROPEENNE.

Stylos à Insuline et risque de contamination croisée :

Le CRPV de Saint-Etienne avait signalé un problème relatif aux cartouches d'insuline utilisées dans les stylos injecteurs à usage multiple. Ces cartouches sont utilisées dans les services cliniques pour différents patients, en changeant à chaque fois l'aiguille du stylo, mais il n'existe pas de système anti-reflux ce qui pose un problème de remontée de matière biologique avec un risque potentiel de contamination lors de l'échange de celle-ci entre les différents patients. Ce problème a été évoqué au Groupe de travail européen qui a proposé d'inclure dans le RCP des stylos à insuline une information relative au risque de contamination en cas d'utilisation de ces stylos par plusieurs patients différents.

DIPRIVAN® (propofol) et rhabdomyolyse / insuffisance cardiaque :

Un article du Lancet a montré des cas de rhabdomyolyse et d'insuffisance cardiaque, avec possibilité de décès, chez des patients à qui on avait administré du DIPRIVAN® en perfusion avec une posologie supérieure à 4 mg/kg/h pendant 48 heures. Il est rappelé que la posologie du DIPRIVAN® est inférieure à 4 mg/kg/h en France. Une enquête officielle a été ouverte dont le responsable est le CRPV de Paris Saint-Antoine.

ZIAGEN® (abacavir) et syndrome d'hypersensibilité :

L'abacavir a fait l'objet de 3 mesures de restriction urgente dont la dernière relative au problème de réadministration chez des sujets sensibilisés, remonte au mois d'août 2000. Depuis cette mise en garde, il y a eu un cas grave supplémentaire en France dont l'évolution a été favorable. Ce patient présentait 2 symptômes décrits dans la mise en garde mais son infectiologue lui a dit de reprendre le ZIAGEN®. Le CRPV de Bordeaux a signalé que les infectiologues ne réintroduisaient plus le ZIAGEN® chez les patients ayant déjà fait un syndrome d'hypersensibilité.

Annexe 3-43

X - QUESTION DIVERSES.

1) Questions administratives

- **PRODILANTIN® (fosphénytoïne)** : Une mesure de restriction urgente avait été instaurée en mars 2000 pour modifier l'information sur le conditionnement afin d'éviter les surdosages. Cette mesure avait été accompagnée d'un rappel de lot (en mai 2000 et en septembre 2000). Un cas de surdosage avec une ancienne forme de PRODILANTIN® est survenu chez un enfant de 4 ans. Les parents ont porté plainte contre l'hôpital en raison de la gravité de l'effet et des séquelles neurologiques. Le Département Accident a diligenté une enquête auprès de la DRASS.

-ATRIUM® (fébarbamate, difébarbamate et phénobarbital) : la Commission d'AMM a réévalué le rapport bénéfice / risque de l'ATRIUM® en raison de la survenue d'atteintes hépatiques et cutanées parfois graves. Celui-ci s'est avéré être défavorable. Deux fax ont été envoyés à l'ensemble des CRPV pour leur notifier la suspension d'AMM de l'ATRIUM® à partir du 14 mars 2001.

- **DROLEPTAN® (dropéridol) :** en raison de troubles cardiaques graves, le rapport bénéfice / risque de la spécialité DROLEPTAN® a été réévalué et s'est avéré être négatif. Les laboratoires JANSSEN-CILAG ont décidé d'arrêter la commercialisation de leur produit à partir du 1er avril 2001. Cet arrêt de commercialisation s'accompagnera d'un retrait de lot de toutes les formes de DROLEPTAN® disponibles.

- **Phénobarbital :** en raison d'effets cutanés graves (syndromes de Lyell et de Stevens-Johnson) le bénéfice / risque des spécialités contenant du phénobarbital (hors indication anti-épileptique) a été réévalué par la Commission d'AMM et s'est avéré négatif. Une Commission mixte (AMM et pharmacovigilance) s'est réunie le 8 février 2001 et a décidé une inscription sur liste I de ces spécialités contenant du phénobarbital ainsi que la suspension de leur AMM à partir du 9 avril avec retrait des lots restant sur le marché. Un communiqué de presse sera très prochainement disponible sur le site de l'Afssaps (http://afssaps.sante.fr).

- **Ateliers de pharmacovigilance de la Baule :**
Plusieurs CRPV ont signalé que la prise en charge de l'hôtel lors de la prochaine réunion des ateliers de la Baule ne sera pas possible. Cette question sera soulevée lors de la prochaine réunion de l'association des Centres le 6 mars 2001.

2) Nouvelles enquêtes officieuses et officielles de pharmacovigilance :

- Enquête officielle sur les interférons alfa et effets indésirables psychiatriques / CRPV de Montpellier
- Enquête officielle sur le TAVANIC® et effets indésirables / CRPV de Saint-Etienne
- Point sur les effets indésirables rapportés avec ARAVA® (léflunomide) / CRPV de Dijon
- Point sur les effets indésirables rapportés avec REMICADE® (infliximab) / CRPV de Nice.

3) Documents distribués :

- Tableau de conclusion du WPPh des 31 et 1er février 2001
- RCP de VISYDINE® (vertéporfine)
- Tableau des DMI en cours
- Tableau VIH–PHARMACOVIGILANCE
- RCP de KALETRA® (lopinavir + ritonavir)
- Notes au Directeur Général de l'Afssaps sur le PRODILANTIN® (fosphénytoïne)

III - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Seuls sont signalés les cas d'effets indésirables donnant lieu à des mesures (mise en enquête, notes...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **Interaction médicamenteuse NORVIR® (ritonavir) / SINTROM® (acénocoumarol) / CRPV de Paris-Pompidou :**

Survenue d'une interaction médicamenteuse entre NORVIR® et SINTROM® aboutissant à une diminution de l'effet thérapeutique ~~du NORVIR® et une augmentation de l'effet~~ anticoagulant. Deux cas similaires figurent dans la banque nationale de pharmacovigilance et 3 autres cas dans la littérature.
→Une note sera adressée au groupe interaction médicamenteuse.

- **DONORMYL® (sulprostone) / CRPV de Paris-Pompidou :**

Survenue d'une rhabdomyolyse avec malaise et somnolence à la suite d'un surdosage en DONORMYL® chez une jeune fille de 14 ans.
→Un point sera demandé aux CAP (Centres antipoison) et à la DGS (Direction Générale de la Santé).

EXOLYSE® (thé vert) / CRPV de Caen :

Survenue d'une hépatite subfulminante nécessitant une transplantation hépatique chez une femme de 49 ans traitée par EXOLYSE®, SERMION® (nicergoline), TRIVASTAL® (piribédil) et SOLUPRED®. Un produit « pour bronzer » avait également été pris. Un cas similaire figure dans la banque et un cas au niveau du laboratoire.

MEDIATOR® (benfluorex) et mésusage / CRPV de Caen :

La présidente du Conseil de l'Ordre des pharmaciens de Basse Normandie a de nouveau attiré l'attention sur certaines ordonnances à visée amaigrissante associée à la prescription de MEDIATOR®.

NEXEN® (nimésulide) / CRPV de Lyon :

Survenue d'une hépatite fulminante nécessitant une transplantation hépatique en urgence chez un patient de 51 ans traité par NEXEN®. Le patient n'est pas encore rétabli.
→Cet effet figure déjà dans le RCP du NEXEN®.

Immunostimulants / CRPV d'Amiens :

Survenue d'une acrosyndactylie des mains et des pieds chez un nouveau-né à la naissance. Le diagnostic a été posé dès la 22ème semaine d'aménorrhée. Les seuls médicaments pris pendant la grossesse étaient IMOCUR® (fraction d'origine bactérienne), IRS 19® (lysats bactériens en suspension) et AUDISPRAY®.
→Une note sera envoyée à l'évaluateur en charge de cette classe thérapeutique.

LIPIOCIS® (huile d'oeillette)/ LIPIODOL® (huile d'oeillette) / CRPV de Rennes :

Survenue d'une pneumopathie avec détresse respiratoire chez 3 patients traités par LIPIOCIS® et LIPIODOL®. Deux cas ont été fatals, le 3ème patient n'est pas encore rétabli.
La moitié des patients sous par LIPIOCIS® sont traités à Rennes.
→Le CRPV de Rennes est chargé de l'enquête officielle sur les effets indésirables de LIPIOCIS® et LIPIODOL®.

Tisane Ernst RICHTER / CRPV de Paris Saint-Antoine :

VIII - Questions diverses 21

Annexe 3-45

I - ADOPTION DU PROCES-VERBAL DU 12/10/2004

Le procès-verbal de la séance du 12 octobre 2004 a été adopté avec les corrections suivantes :

Page 4 : II – Tour de table des cas marquants et de la littérature

- Ajouter après « 450 mg deux fois par jour de NEORAL » soit « 4 à 9 fois la dose usuelle ».

Page 7 : III – Bilan des données de pharmacovigilance des vaccins contre l'hépatite B au 31/12/2003

- Ligne 29 : supprimer « Enfin, le CRPV de Strasbourg suggère que l'incidence nationale des formes graves d'hépatopathies virales aiguës ou chroniques liées au virus de l'hépatite B fasse l'objet d'un suivi rigoureux durant les 10 années à venir. »

Page 9 : IV – Effets neuro-excitateurs de la morphine par voie générale

- Ligne 60 : remplacer « 3 par voie sous-cutanée, dont 2 représentaient une IR sévère» par « 3 par voie sous-cutanée (dans deux cas avec une dose de 10 mg/jour, dans un autre cas avec une dose non calculable) ».

Page 10 : IV – Effets neuro-excitateurs de la morphine par voie générale

- Ligne 1 : remplacer « 3 par voie intra-veineuse » par « 3 par voie intra-veineuse (dans un cas avec une dose de 500 mg/ jour, dans un cas avec une dose de 16 mg en 30 heures, et dans un dernier cas avec une dose inconnue mais probablement élevée chez un toxicomane) ».
- Ligne 6 : remplacer « Le remplacement, ou la diminution de la posologie de la morphine doivent être envisagés » par « La diminution de la posologie de la morphine ou sa substitution par un autre opiacé doivent être envisagés ».

Page 14 : V –Point sur les hyperkaliémies induites par l'association inhibiteurs de l'enzyme de conversion et spironolactone

- Ligne 13 : ajouter après « les notifications ne sont pas toutes spontanées » la phrase « comme en témoigne la répartition des observations en fonction du CRPV. En effet deux CRPV, Amiens et Angers, totalisent 46% des observations de la période post-RALES. Début 2003, le CRPV d'Angers a recueilli dans le cadre d'une enquête prospective une quarantaine de cas d'hyperkaliémie médicamenteuse. »
- Ligne 23 : remplacer « le taux de prescription de la SPIRO est passée de 34/1000 patients à 149/1000 » par « le taux de prescription de la SPIRO chez des patients hospitalisés sous IEC pour insuffisance cardiaque est passé de 34/1000 patients à 149/1000 ».
- Ligne 24 : remplacer « le taux d'hospitalisation pour hyperkaliémie est passé de 2,4/1000 patients à 11/1000 patients » par « le taux d'hospitalisation pour hyperkaliémie est passé de 2,4/1000 à 11/1000 chez ces mêmes patients ».

Page 15 : V –Point sur les hyperkaliémies induites par l'association inhibiteurs de l'enzyme de conversion et spironolactone

- Ligne 4 : rajouter « et la dose de spironolactone » aprés « essai ».

Annexe 3-45

Page 21 : VII – Questions diverses

- Ligne 19 : supprimer « significative ».

Page 22 : VII – Questions diverses

- Ligne 18 : remplacer « aucune valvulopathie chez les témoins » par « l'absence de signe de valvulopathie chez les témoins ».

Annexe 3-45

II - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Sont signalés les cas d'effets indésirables, de mésusages, d'erreurs et de manque de cohérence de l'information ainsi que les risques potentiels d'effets indésirables, pouvant donner lieu à des mesures (mises en enquête, notes...) ou pouvant faire l'objet d'une mise au point, dans le cadre de la prévention du risque médicamenteux.
La liste complète des cas est jointe en annexe 1.

Effets indésirables avérés :

Agénésie de la coupole diaphragmatique et hypoplasie pulmonaire bilatérale chez un nouveau-né de mère traitée par KEPPRA (lévétiracétam) pendant la grossesse/ CRPV de Clermont-Ferrand

Le CRPV de Clermont-Ferrand a signalé un cas d'hypoplasie pulmonaire bilatérale fatale chez un nourrisson né à 35 semaines d'aménorrhée d'une mère traitée par KEPPRA (lévétiracétam) et EPITOMAX (topiramate) pendant la grossesse.
→ Une note sera transmise à la cellule grossesse afin de signaler ce nouveau cas.

Oedèmes des membres inférieurs bilatéraux en présence de différents vaccins / CRPV de Clermont-Ferrand

Le CRPV de Clermont-Ferrand a signalé, à la suite de l'administration de différents vaccins, plusieurs observations d'oedèmes des membres inférieurs bilatéraux, nécessitant pour deux d'entre elles une hospitalisation (9 cas sous PENTACOQ®, 2 cas sous PENTAVAC®, 2 cas sous PREVENAR® associé à PENTAVAC® ou HBVaxPRO®). Le CRPV de Paris-HEGP a également signalé 4 cas sous PENTAVAC®.
→ Une enquête prospective des cas d'oedèmes survenant en présence de vaccins sera effectuée par les CRPV de Clermont-Ferrand, Dijon, Tours avec la collaboration des Centres de Protection Maternelle et Infantile.

TROXERUTINE MAZAL et choc anaphylactique / CRPV de Dijon

Le CRPV de Dijon a signalé un cas de choc anaphylactique sous TROXERUTINE MAZAL® sachet, qui est un générique de VEINAMITOL®.
→ Une note sera transmise au département pharmaceutique afin de connaître les excipients contenus dans la spécialité TROXERUTINE MAZAL® susceptibles d'être à l'origine d'un choc anaphylactique.

DEROXAT (paroxétine) et colite lymphocytaire / CRPV de Lyon

Le CRPV de Lyon a signalé un 10ème cas de colite lymphocytaire sous inhibiteurs sélectifs de la recapture de la sérotonine (DEROXAT®) avec normalisation aprés arrêt du traitement. Des cas de colites lymphocytaire sous paroxétine ont été rapportés dans une étude clinique rétrospective de 199 patients atteints de colites lymphocytaires publiés récemment dans Gut 2004 ; 53:536-541.
→ Une revue des données sur les colites lymphocytaires et les diarrhées chroniques sera demandée aux firmes commercialisant les inhibiteurs sélectifs de la recapture de la sérotonine (citalopram, escitalopram, fluoxétine, fluvoxamine, paroxétine, sertraline).

MIRENA (lévonorgestrel) et alopécie / CRPV Marseille

Le CRPV de Marseille a signalé un cas d'alopécie majeure 5 semaines après la pose de MIRENA (lévonorgestrel) chez une femme de 35 ans. 6 cas de chutes de cheveux ou d' alopécie sont signalés dans la base nationale de pharmacovigilance. Cet effet n'est pas mentionné dans le RCP de ce médicament. Dans la littérature, ce médicament semble entraîner plus d'alopécie que d'autres produits contraceptifs.
→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification d'information pour cette spécialité afin d'ajouter cet effet indésirable.

Intoxication au méthotrexate / CRPV de Marseille

Le CRPV de Marseille a signalé un cas d'intoxication au méthotrexate (20 fois le taux attendu) avec insuffisance rénale aiguë d'apparition retardée à la suite de l'administration de doses recommandées de DANTRIUM (dantrolène) et de méthotrexate à forte posologie. Le CRPV de Montpellier a fait état des nombreux surdosages en méthotrexate associé au développement d'une insuffisance rénale. Le seul antidote efficace est le carboxypeptidase G2, a priori seulement disponible en Allemagne

→ Un point sera effectué par le CRPV de Montpellier sur le sujet et en particulier les modalités du suivi thérapeutique des traitements par méthotrexate.

CHLORAMINOPHENE (chlorambucil) et neuropathie périphérique / CRPV de Marseille

Le CRPV de Marseille a signalé un cas de neuropathie sensitivo-motrice sous CHLORAMINOPHENE (chlorambucil) chez un homme de 48 ans. Cinq autres cas sont signalés dans la base nationale de pharmacovigilance et cet effet n'est pas mentionné dans le RCP de cette spécialité.

→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification d'information pour cette spécialité afin d'ajouter ce type d'effet indésirable.

BRONCHODERMINE et troubles du comportement / CRPV de Marseille

Le CRPV de Marseille a signalé le cas d'un enfant de 20 mois traité par ADVIL, OCTOFENE, BRONCHODERMINE suppositoires, BRONCHOKOD, CELESTENE, hospitalisé pour troubles du comportement pendant 12 heures avec somnolence, aréactivité et regard fixe. La spécialité BRONCHODERMINE (cinéole ou eucalyptol, gaïacol, huile essentielle de pin) contient un dérivé terpénique pouvant être à l'origine de ces effets indésirables. La forme suppositoire n'est pas contre-indiquée chez l'enfant de moins de 30 mois. Seules les formes en application cutanée ou nasale sont contre-indiquées chez l'enfant de moins de 30 mois suite à une décision de la Commission d'AMM en 1996. Le 3 décembre 2004, le baume Vicks BABYBALM, contenant deux dérivés terpéniques avait été retiré du marché et il était envisagé une révision des spécialités contenant des dérivés terpéniques.

→ Ce cas sera signalé au groupe de travail concerné pour suite à donner.

UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) et volume de délivrance inadapté aux nouveaux-nés / CRPV de Montpellier

Le CRPV de Montpellier a signalé trois cas de cyanose dont un avec hospitalisation, chez des nouveaux-nés à la suite de fausses routes lors de la prise d'UVESTEROL (vitamines A, D2, E, C). L'injection trop rapide du volume nécessaire de la pipette (1 ml) aurait entraîné ces fausses routes.

→ Un point sur l'utilisation de l'UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) chez les nouveaux-nés sera effectué par les CRPV de Nantes et de Paris – Saint-Vincent de Paul.

FUZEON (enfuvirtide) et pneumopathies bactériennes / CRPV de Paris – Henri-Mondor

Le CRPV de Paris – Henri-Mondor a signalé deux cas de pneumopathies bactériennes survenues deux à quatre semaines après le début d'un traitement par FUZEON (enfuvirtide) chez une femme de 38 ans et un homme de 41 ans, sans qu'il y ait de mise en garde dans le RCP sur ce risque.

→ L'unité pharmacovigilance vérifiera les données d'essais cliniques sur le risque de survenue d'infections bactériennes précoces.

Mode d'administration des collyres et information dans les notices / CRPV de Paris – Saint-Vincent de Paul

Le CRPV de Paris – Saint-Vincent de Paul a fait état d'un cas étranger de surdosage massif lié à l'utilisation du collyre SKIAKOL (cyclopentolate), avec état de mal et décès survenu chez un enfant de 4 ans. Les notices des collyres précisent mal leurs modalités pratiques d'administration de ces produits.

→ Un point sur l'informativité des notices quant aux modes d'administration des collyres sera réalisée par le CRPV de Paris - Saint-Vincent de Paul.

MEDIATOR (benfluorex) et bouffées délirantes / CRPV Toulouse
Le CRPV de Toulouse a signalé un cas de vision floue et malaise et un cas de bouffée délirante sous MEDIATOR (benfluorex), produit amphétaminique. Cette spécialité fait l'objet d'un large mésusage comme anorexigène.
→ Une mise à jour de l'enquête MEDIATOR sera effectuée par le CRPV de Besançon. Une relance sera effectué auprès de l'Italie sur ce sujet.

Effets indésirables potentiels

PROTOPIC (tacrolimus) et intolérance à l'alcool / CRPV Tours
Le CRPV de Tours a signalé deux cas d'érythèmes de la face sous PROTOPIC (tacrolimus) pommade, après la prise d'une boisson alcoolisée. Cet effet est mentionné en rubriques 4.4 et 4.8 du RCP de PROTOPIC pommade, alors qu'il n'est pas mentionné dans le RCP de PROGRAF gélule (tacrolimus).
→ L'unité de pharmacovigilance demandera l'avis du groupe de travail concerné.

Association MEXITIL® et CORDARONE® / CRPV Tours
A la suite d'une question posée au CRPV de Tours sur le RCP de MEXITIL (méxilétine), il a été observé une anomalie dans la rubrique « interaction médicamenteuse » puisque l'association avec l'amiodarone (CORDARONE®) est citée à deux niveaux : « contre-indiquée » et « nécessitant des précautions d'emploi » ce qui peut induire un risque de confusion.
→ Une note sera adressée à l'unitè interaction médicamenteuse afin de signaler ce risque de confusion.

ZOMETA (acide zolédronique) et ostéonécrose de la mâchoire / CRPV Lille
Le CRPV de Lille a signalé un cas d'osctéonécrose de la mâchoire chez un patient atteint de myélome et traité par ZOMETA. Ce problème, soulevé au niveau européen, a conduit à la modification de la rubrique « effets indésirables » du RCP de ZOMETA et à l'ajout de cet effet indésirable. Par ailleurs, une DMI d'AREDIA (acide pamidronique) devant intégrer cet effet indésirable est en cours de finalisation par le CRPV de Reims.
→ Une information relative aux ostéonécroses des mâchoires pouvant survenir lors de traitement par acide zolédronique ou acide pamidronique sera effectuée auprès des prescripteurs.

Trimétazidine et syndrome extrapyramidal / CRPV Toulouse
Le CRPV de Toulouse a évoqué la publication de 8 cas de syndromes parkinsoniens observés avec la trimétazidine. Une vingtaine d'observations de ce type sont par ailleurs retrouvées dans la base nationale de pharmacovigilance.
→ Un point sur les syndromes parkinsoniens observés sous trimétazidine sera effectué par la CRPV de Toulouse.

MICROPAKINE (acide valproïque) et hyponatrémie / CRPV Reims
Le CRPV de Reims a signalé un cas d'hyponatrémie ayant entraîné une hospitalisation chez une patiente de 77 ans traitée avec MICROPAKINE. Plusieurs observations de ce type avec ce médicament sont retrouvées dans la base nationale de pharmacovigilance et dans la littérature.
→ Une analyse de l'ensemble des cas d'hyponatrémie rapportés avec l'acide valproïque sera demandée à la firme par l'unité de pharmacovigilance.

Documents distribués :

- Lettres aux pharmaciens hospitaliers et neurologues relatives au rappel des conditions de prescriptions d'ELSEP® et de suivi des patients atteints de sclérose en plaque selon l'autorisation de mise sur le marché.

Nouvelles enquêtes officieuses et officielles de pharmacovigilance :
- Une enquête prospective des cas d'oedèmes survenant en présence de vaccins sera effectuée par les CRPV de Clermont-Ferrand, Dijon, Tours avec la collaboration des Centres de Protection Maternelle et Infantile.

Annexe 3-45

- Un point sera effectué par le CRPV de Montpellier sur le sujet et en particulier les modalités du suivi thérapeutique des traitements par méthotrexate.
- Un point sur l'utilisation de l'UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) chez les nouveaux-nés sera effectué par les CRPV de Rennes et de Paris – Saint-Vincent de Paul.
- Une mise à jour de l'enquête MEDIATOR sera effectuée par le CRPV de Besançon.
- Un point sur l'informativité des notices quant aux modes d'administration des collyres sera réalisée par le CRPV de Paris - Saint-Vincent de Paul.

III - ENQUETE OFFICIELLE RELATIVE AUX EFFETS INDESIRABLES GRAVES OBSERVES AVEC LA DESMOPRESSINE

Le Centre Régional de Pharmacovigilance (CRPV) de Caen a présenté l'enquête officielle relative aux effets indésirables graves observés avec la desmopressine.

Introduction

La desmopressine est un principe actif analogue de la vasopressine naturelle, aussi appelée hormone anti-diurétique (ADH). Cette dernière posséde deux actions principales : une action anti-diurétique et un effet vasopresseur puissant. La structure chimique de la desmopressine différe de celle de l'ADH, ce qui lui confère une demi-vie beaucoup plus longue et une forte diminution de l'effet vasopresseur au profit de l'effet anti-diurétique.

Statut

La desmopressine a obtenu une autorisation de mise sur le marché (AMM) en France le 22 janvier 1980. La spécialité Minirin®, commercialisée depuis 1982, existe sous 3 formes : Minirin® solution injectable 4µg/ml Intraveineuse (IV), Intramusculaire (IM) ou sous-cutanée (SC), Minirin® comprimé 0,1mg et 0,2mg (la forme sublinguale n'est pas encore disponible), Minirin® intranasal soit sous forme de Minirin® 0,1 mg/ml avec tube gradué (Rhinyle®) pour les posologies inférieures à 10 µg, soit Minirin® spray 10 µg/dose pour les posologies supérieures à 10 µg/dose.
Trois voies d'administration sont donc possibles, avec des indications distinctes :
Voie INTRA-NASALE :

- diabète insipide central pitresso-sensible ;
- traitement symptomatique de courte durée (3 mois) de l'énurésie nocturne de l'enfant de plus de 5 ans après élimination d'une pathologie organique sous-jacente ;
- étude du pouvoir de concentration du rein.

Voie ORALE :

- diabète insipide central pitresso-sensible ;
- traitement symptomatique de l'énurésie nocturne de l'enfant de plus de 6 ans après élimination d'une pathologie organique sous-jacente, la durée d'utilisation étant limitée à 6 mois ;
- depuis août 2003, extension des indications au traitement symptomatique de la nycturie chez l'adulte âgé de moins de 65 ans, lorsqu'elle est associée à une polyurie nocturne.

Voie INJECTABLE :

- traitement correcteur et préventif des accidents hémorragiques observés dans l'hémophilie A modérée et atténuée, maladie de Willebrand en dehors des formes sévères ou de type IIB, allongement inexpliqué du temps de saignement en particulier au cours de l'insuffisance rénale chronique ;
- traitement du diabète insipide central pitresso-sensible en particulier quand l'administration intra-nasale est malaisée ou impossible ;
- étude de pouvoir de concentration du rein.

Il existe une autre spécialité Octim® commercialisée en France depuis 1998, présente sous une seule forme à 150 µg/dose pour une administration intra-nasale, indiquée pour la prévention et la correction des accidents hémorragiques (tels que déjà définis ci-dessus).

Objectifs de l'enquête

- caractériser les effets indésirables (EI) les plus fréquents de la desmopressine et déterminer l'imputabilité du médicament ;
- comparer l'incidence des EI graves avec l'indication, l'âge des patients et la posologie ;
- évaluer les mesures préventives susceptibles de minimiser le risque.

Données de vente, données d'exposition

Le laboratoire Ferring titulaire de l'AMM de Minirin® et d'Octim® a transmis les données de vente pour la France et au niveau mondial.
Entre 1995 et 2003, **11,6 millions de patients** ont été traités par desmopressine dans le monde (11 millions par Minirin® et 600 000 par Octim®), ce qui représente 1,29 millions de patients traités par an.

En France, la voie intra-nasale est toujours la plus utilisée, même s'il apparaît que la voie orale prenne de plus en plus d'importance. Ainsi, en 1997, 10,4 fois plus de patients étaient traités par voie nasale que par voie orale, alors qu'en 2002 ce rapport n'est plus que de 1,9.
Au niveau mondial, depuis 2001 (et contrairement aux années 1996-2000), la desmopressine est plus souvent utilisée par voie orale que par voie intra-nasale, avec un rapport de 2,25 pour l'année 2003.

Analyse des cas notifiés en France
Les cas rapportés sont issus de la base nationale de pharmacovigilance et des cas enregistrés par le laboratoire Ferring.

La base nationale de pharmacovigilance contient 118 fiches d'effets indésirables (87 graves) en rapport avec la desmopressine dont 61 en relation avec une intoxication par l'eau. Il existe par ailleurs 29 autres observations en rapport avec une intoxication par l'eau dans la base du laboratoire. Au total 90 observations d'intoxication par l'eau ont été notifiées en France depuis la commercialisation.

- *Observations non liées à une intoxication par l'eau.*

Sur les 118 observations d'effets indésirables, 57 n'avaient pas de rapport avec une intoxication par l'eau. Sur les 57 observations, 29 concernent des effets indésirables graves. Dans 7 cas, l'imputabilité est vraisemblable. Il faut souligner la notification d'un décés par hépatite fulminante sur cirrhose (la desmopressine a une imputabilité douteuse).

- *Observations en rapport avec une intoxication par l'eau.*

Sur les 118 observations, 61 (dont 59 concernent des effets indésirables graves) concernent une intoxication par l'eau. Ces observations sont marquées par la survenue d'une hyponatrémie aiguë, associée ou non, en fonction de la gravité, aux signes cliniques suivants : asthénie, céphalées, nausées, vomissements, rétention hydrique, hypertension artérielle, œdème cérébral, troubles de l'humeur, confusion, coma, convulsions, détresse respiratoire.
L'imputabilité est vraisemblable dans 83,6% des cas.

Par ailleurs, le laboratoire Ferring a enregistré 29 observations françaises d'effets indésirables graves en rapport avec une intoxication par l'eau avec une imputabilité vraisemblable de la desmopressine.

La voie d'administration (connue dans 86/90 cas) se répartit en: **intra-nasale dans 77,9% (**67 cas), intra-veineuse dans 15,1% (13 cas) et orale dans 7% des cas (6 cas).
Les indications se répartissent en : **énurésie 53,3% (48 cas),** diabète insipide 13 cas, anomalies de la coagulation 12 cas, troubles mictionnels 11 cas, hypotension orthostatique 3 cas, test au Minirin® 1 cas, indication inconnue 1 cas.
L'âge des patients se répartit en : 58 cas concernent des enfants entre **0 et 15 ans, soit 64,4%.** Une majorité d'enfants est concernée par la voie d'administration intra-nasale qui représente les trois quarts des notifications, avec 86% de prescriptions dans l'indication énurésie. Pour la voie orale, la majorité des cas d'intoxication par l'eau concerne des adultes de plus de 65 ans (dans 2/3 des cas). En ce qui concerne la voie intra-veineuse, dans 12 cas sur 13, l'indication est en rapport avec un trouble hémorragique et les patients concernés sont des adultes de moins de 65 ans dans 62% des cas et des enfants de 0 à 16 ans dans 38% des cas.
La posologie par kilogramme de poids et par jour a été estimée dans 63 cas. Par voie intra-nasale la posologie moyenne est de **1,33 µg/kg/jour**, par voie intra-veineuse de **0,63 µg/kg/jour** et par voie orale, de **5,33 µg/kg/jour**. Une très grande disparité entre les valeurs extrêmes des posologies pour les formes intra-nasale et intra-veineuse, avec un rapport de 1 à 40 est mise en évidence. Pour la forme orale, il existe un rapport de 7,7 seulement entre les posologies les plus extrêmes.

Analyse des cas cliniques internationaux
Le laboratoire Ferring a reçu 1830 observations d'effets indésirables survenus sous desmopressine, dont 36,8% sont des cas graves (674). Sur ces 674 cas graves, 632 sont associés au Minirin® (dont 371 par voie intra-nasale) et 42 à Octim/Octostim®. Parmi les 1156 effets non graves, 1106 sont associés au Minirin® dont 766 lors d'une administration intra-nasale.

L'analyse des cas a porté sur les observations d'effets indésirables graves en rapport avec une intoxication par l'eau, ce qui représente **315 observations** issues de 25 pays. On observe que :

- dans plus de 2/3 des cas, il s'agit de formes intra-nasales (67,9%) ;
- l'indication la plus souvent retrouvée est l'énurésie (43,2%) ;
- l'âge est inférieur ou égal à 16 ans dans 52,7% des cas (dont 1 sur 3 inférieur à 5 ans), entre 17 et 64 ans dans 23,5%, supérieur à 65 ans dans 15,6%.

Indications	Voies d'administration				
	Intranasale	Intraveineuse	Orale	Inconnue	TOTAL
Enurésie	**127**	0	10	1	**138**
Diabète insipide	49	6	9	2	66
Troubles mictionnels	8	0	20	1	29
Troubles de la coagulation	13	38	0	2	53
Test au Minirin®	11	5	0	1	17
Inconnue	6	0	3	3	12
TOTAL	**214**	41	42	10	**315**

Répartition des observations internationales d'effets indésirables graves relatives à une intoxication par l'eau sous desmopressine, en fonction de l'indication et de la voie d'administration.

Indications	Age					
	< 5 ans	5 – 16 ans	17 – 64 ans	> 65 ans	Inconnu	TOTAL
Enurésie	6	**103**	17	4	8	**138**
Diabète insipide	18	6	25	5	12	66
Troubles mictionnels	0	0	2	27	0	29
Troubles de la coagulation	16	2	21	9	5	53
Test au Minirin®	13	0	3	1	0	17
Inconnue						12
TOTAL	53	**111**	68	46	25	**315**

Répartition des observations internationales d'effets indésirables graves relatives à une intoxication par l'eau sous desmopressine, en fonction de l'indication et de l'âge.

Il est à souligner que l'indication de la desmopressine dans l'**énurésie** est réservée aux enfants de plus de 5 ans, or 4,3% des observations rapportées dans cette indication concernent des enfants de **moins de 5 ans**. Par ailleurs, la restriction d'âge à moins de 65 ans dans l'indication de **nycturie** n'est pas présente dans tous les pays, ce qui peut expliquer que 27/29 cas d'intoxication par l'eau dans cette indication soient décrits chez des patients de **plus de 65 ans.**

Dans l'indication de **diabète insipide**, la répartition en fonction de l'âge des cas d'intoxication par l'eau est de 24 enfants (dont 18 concernent des enfants de moins de 5 ans) et 25 adultes de moins de 65 ans. Cette répartition entre enfants et adultes est beaucoup plus homogène que celle observée dans l'indication énurésie où 109 observations d'effets indésirables graves sur 138 concernent des enfants.

Les cas concernant les **troubles de coagulation** sont assez équilibrés quant à la répartition par âge avec une forte représentation des très jeunes enfants de moins de 5 ans (30% de l'ensemble des cas).

Synthèse et discussion

L'incidence globale des effets indésirables notifiés sous desmopressine est estimée à **1,63 pour 10000 patients traités**. La proportion de notifications d'effets indésirables en rapport avec une **intoxication par l'eau** est importante puisqu'elle représente **51,7% des cas de la base nationale** de pharmacovigilance (**67,8% des effets graves**) et **51% des effets graves rapportés à la firme**.

La forme intra-nasale est le plus souvent en cause et représente 77,9% des cas français et 67,9% des cas internationaux d'intoxication par l'eau. Entre 1997 et 2002 en France, 4 fois plus de patients ont été traités par voie intra-nasale que par voie orale.

L'indication la plus souvent retrouvée dans les cas d'intoxication par l'eau sous desmopressine est **l'énurésie** (53,3% des cas français et 43,2% des cas internationaux).

Les observations d'intoxication par l'eau concernent en majorité des **enfants** de 0 à 16 ans (64,4% des cas français et 52% des cas internationaux).
L'analyse des **posologies** par indication, âge et voie d'administration montre une grande disparité avec des fourchettes de dose extrêmement importantes, ce qui illustre que la posologie n'est pas le seul facteur en cause dans ces observations.

Propositions :

- définir, si cela s'avère possible, des posologies initiales particulières (en µg/kg) :
  - chez le nourrisson pour le traitement du diabète insipide,
  - chez l'enfant de moins de 25 kg pour le traitement de l'énurésie
- insister sur la nécessité en cas d'énurésie de ne pas instaurer de traitements en dessous de 5 ans ;
- insister sur l'information donnée aux patients et à leur famille telle que la restriction hydrique, avec un ordre de grandeur du volume de boissons autorisé, identifier les situations à risque de déséquilibre, savoir reconnaître les éventuels symptômes d'une intoxication à l'eau, et insister sur les associations médicamenteuses à risque ;
- favoriser l'usage de la voie orale par rapport à la voie intra-nasale. Une forme sublinguale (Minirin® melt) permettrait de remplacer la voie intra-nasale.
- insister sur les risques lors d'une utilisation hors AMM ;
- harmoniser les différents RCP. L'ajout d'un tableau d'équivalences posologiques entre les différentes présentations et en particulier entre les formes orales et les formes intra-nasales pourrait être utile.

Le Comité technique estime par ailleurs que la ré-évaluation du rapport bénéfice/risque pourrait se justifier dans l'indication « énurésie ». Une présentation de cette enquête par domaines d'indication est prévue en Commission nationale de pharmacovigilance.

IV - ENQUETE OFFICIELLE : MIRTAZAPINE ET ARTHRALGIES ET MYALGIES, MIANSERINE ET MYALGIES

Le CRPV de Nantes a présenté les résultats de l'enquête officielle concernant d'une part la mirtazapine et les myalgies – arthralgies et d'autre part la miansérine et les myalgies. Cette enquête recense les observations notifiées du 1er septembre 1999 au 31 décembre 2003.

1/ mirtazapine (NORSET®) et myalgies – arthralgies

NORSET® est autorisé en France depuis 1997 et commercialisé depuis le 1er septembre 1999 par les laboratoires Organon. Il est indiqué dans les épisodes dépressifs majeurs.

Données des Centres Régionaux de Pharmacovigilance (CRPV)

221 observations ont été recensées avec la mirtazapine dont 7 cas d'arthralgie, 9 cas de myalgie et 3 cas possédant les deux items, soit 13 notifications correspondant à 16 effets indésirables. Ces observations, le plus souvent non graves, concernent une population à légère prédominance féminine, âgée de 30 à 60 ans. Le délai de survenue est variable (de une heure à un an) et dans 4 cas, la mirtazapine était administrée en monothérapie. Ces effets indésirables sont tous survenus à la posologie recommandée. Aucune utilisation hors autorisation de mise sur le marché (AMM) n'a été relevée.

Il s'agit dans ces observations de polyarthralgies concernant essentiellement les petites articulations (mains, poignets, coudes) et pouvant être associées à des oedèmes (face, membres inférieurs, mains), une prise de poids, une asthénie. Ces effets indésirables ne semblent pas dose-dépendants. L'évolution a été favorable dans la grande majorité des cas à l'arrêt de la mirtazapine. Un cas de réadministration positive a été observé.

A noter que les arthralgies sont déjà signalées dans le Résumé des Caractéristiques du Produit (RCP) de la miansérine qui appartient, comme la mirtazapine, à la classe des pipérazinoazépines.

Données des laboratoires Organon

330 dossiers d'arthralgie - myalgie ont été colligés par le laboratoire sur un total de 6492 cas au niveau mondial. 16 cas, correspondant à 18 effets indésirables ont été rapportés en France. Ces observations sont superposables à celles notifiées aux CRPV.

Données des essais cliniques

Sur une population de 2521 patients, 46 cas d'arthralgie (soit 1,8%) et 51 cas de myalgie (soit 2%) ont été rapportés. Ces cas présentent les mêmes caractéristiques que ceux décrits après la mise sur le marché.

Au total, 29 cas d'arthralgie – myalgie ont été notifiés en France (330 dans le monde) avec la mirtazapine, d'où une fréquence de cas notifiés de l'ordre de $0{,}23.10^{-6}$ (le nombre de traitements vendus en France du 1er septembre 1999 au 31 décembre 2003 étant de 743306). Il est probable que ces effets indésirables fassent l'objet d'une sous-notification, en raison de l'absence de gravité de ces cas, de la chronologie variable et de la sémiologie banale. Cependant, l'information mérite d'apparaître dans le RCP afin d'éviter un traitement symptomatique par AINS.

Le rapporteur a suggéré d'intégrer dans la rubrique 4.8 du RCP de la mirtazapine :
« Dans de rares cas, les effets indésirables suivants ont également été rapportés : arthralgies, myalgies ».

2/ Miansérine (ATHYMIL® et molécules génériques) et myalgies

ATHYMIL® est un antidépresseur commercialisé depuis 1979 par les laboratoires Organon et indiqué dans les épisodes dépressifs majeurs. 14 médicaments génériques ont à ce jour une Autorisation de Mise sur le Marché (AMM) et 11 sont commercialisés.

Données des CRPV

1879 observations ont été recensées avec la miansérine dont 13 cas de myalgie. Ces observations, le plus souvent non graves, concernent une population à prédominance féminine, âgée de 34 à 80 ans. Le délai de survenue est variable (de 3 jours à 2 ans) et dans 2 cas, la miansérine était administrée en monothérapie.

Il s'agit dans ces observations de myalgies associées à d'autres effets indésirables tels que asthénie, anorexie, élévations des transaminases, diarrhées, nausées, vertiges, ou augmentation des CPK.
L'évolution a été favorable dans la grande majorité des cas à l'arrêt de la miansérine. Un cas de réadministration positive a été observé.

Données des laboratoires
13 observations de myalgie rapportés avec ATHYMIL®, présentant les mêmes caractéristiques que celles décrites plus haut, ont été transmis par le laboratoire Organon (sur 649 notifications françaises). 60 cas de myalgie ont été signalés dans le monde.
Un cas supplémentaire australien a été transmis par le laboratoire Merck générique et concerne la spécialité MIANSERINE MERCK®.

Données de la littérature
L'analyse de la littérature a permis de retrouver un article issu du bulletin de pharmacovigilance des autorités de santé australiennes, l'ADRAC (Australian Adverse Drug Reactions Bulletin) de février 1984, recensant 14 cas de douleurs musculaires et articulaires sous miansérine.

Le rapporteur a suggéré d'intégrer dans la rubrique « Effets indésirables » 4.8 du RCP de la miansérine :
« Ont été signalés : de rares cas de myalgies ».

Le Comité technique a suivi l'avis du rapporteur, mais a proposé le terme « arthromyalgies » en remplacement de « arthralgie, myalgie ».
Le dossier sera présenté lors de la Commission nationale de janvier 2005.

Annexe 3-45

V - POINT SUR LES EFFETS CORONAIRES DES TRIPTANS

Le Centre Régional de Pharmacovigilance de Toulouse a présenté un point sur les effets indésirables coronaires des triptans. Ce point a été demandé par le Comité technique suite à la notification de 2 cas d'infarctus du myocarde chez des sujets jeunes (35 et 36 ans).
Les triptans sont des agonistes des récepteurs sérotoninergiques 5HT1B et 5HT1D, présents sur les artères intracrâniennes mais également sur les artères périphériques, comme les artères coronaires. Ces récepteurs déterminent, quand ils sont activés par un agoniste, un effet vasoconstricteur. Par ailleurs, les triptans inhibent l'extravasation des protéines plasmatiques.

A ce jour, 5 triptans sont commercialisés en France :

- *sumatriptan* (IMIGRANE® : comprimés pelliculés, solution injectable, solution pour pulvérisation nasale et IMIJECT® : solution injectable)
- *zolmitriptan* ZOMIG® (comprimés pelliculés) et sous forme de comprimés orodispersibles sous le nom de ZOMIGORO®
- *naratriptan* NARAMIG® (comprimés pelliculés)
- *almotriptan* ALMOGRAN® (comprimés pelliculés)
- *élétriptan* RELPAX® (comprimés pelliculés)

Ils sont indiqués dans deux indications :

- *« Traitement de la phase céphalalgique de la crise avec ou sans aura ».* La forme injectable est réservée *« au traitement de la crise de migraine sévère lorsque les autres traitements de la crise de migraine n'ont pas été efficaces au cours des crises précédentes ».*
- *« Traitement de la crise d'algie vasculaire de la face »* pour IMIGRANE® solution injectable et IMIJECT® solution injectable.

Analyse de la Base nationale de Pharmacovigilance :
Une interrogation de la Base Nationale de Pharmacovigilance en juin 2004, avec les mots clés « triptans » et « collapsus cardiovasculaire, troubles cardiaques, angine de poitrine, angine de poitrine compliquée, coronaropathie » a révélé 11 observations. Ces observations concernent 7 hommes et 4 femmes (le ratio homme/femme dans la migraine est de 1/3).

Dans 3 cas sur 11, le tableau a été qualifié de « non grave ». il s'agit de :

- 2 cas de précordialgie,
- un trouble visuel conduisant à la découverte de troubles de la repolarisation avec susdécalage du segment ST,

Dans les 8 autres cas, le tableau été qualifié de grave. Il s'agit de :

- un arrêt circulatoire avec fibrillation ventriculaire,
- quatre infarctus
- un angor spastique,
- deux spasmes coronariens.

Des facteurs de risque cardiovasculaire ont étè noté dans 8 cas sur les 11 rapportés.
L'évolution a été favorable dans tous les cas sauf un. Il s'agit d'un cas concernant un homme de 36 ans ayant présenté un arrêt circulatoire avec fibrillation ventriculaire. L'évolution s'est faite vers un coma et une encéphalopathie post-anoxique avec décès ultérieur.

Concernant les triptans imputés, il s'agissait :

- dans 5 cas, du *zolmitriptan* comprimés,
- dans 3 cas, du *naratriptan*,
- dans 2 cas, du *sumatriptan* injectable (IMIJECT°)
- dans 1 cas de la prise successive à 1 heure d'intervalle de zolmitriptan puis de spray de *sumatriptan*.

L'imputabilité a été jugée :

- douteuse (I1) dans 7 cas,
- plausible (I2) dans 1 cas,
- vraisemblable (I3) dans 2 cas,
- très vraisemblable (I4) dans 1 cas.

Dans un cas, a été notée l'association a de l'oxymétazoline (ATURGYL®) aux propriétés alpha stimulantes pouvant potentialiser les effets coronaroconstricteurs des triptans.
Dans 5 cas (45,5 %), une notion de mésusage a été retrouvée. Il s'agit dans 2 cas, d'interaction médicamenteuse et dans 3 cas, de non respect des posologies recommandées.

Analyse de la littérature :
Les symptômes thoraciques représentés par une impression d'oppression thoracique avec parfois une symptomatologie algique et observés très classiquement sous triptans, ont été exclus de ce travail.
La revue de la littérature réalisée au 3 septembre 2004 a permis de retrouvé 41 articles.
Concernant les cas rapportés dans ces articles, on note :

- Une dizaine d'accidents ischémiques myocardiques, coliques et cérébraux
- Des cas d'infarctus du myocarde, essentiellement rapportés avec le sumatriptan injectable
- De façon très anecdotique, la survenue d'infarctus du myocarde chez des patients sans pathologie cardiovasculaire préexistante
- Deux observations d'effets indésirables coronaires aprés utilisation de sumatriptan par voie orale.

Le « Groupe d'Experts de Sécurité Cardiovasculaire des Triptans » a publié ses résultats en 2004 (Doddick et al, Headache 2004, 44, 414-425). Ce groupe, travaillant au nom de l'American Headache Society, a conduit une revue générale de l'ensemble des données scientifiques et cliniques sur le risque cardiovasculaire associé aux triptans. Le groupe d'experts conclut que : « le risque d'effets indésirables cardiovasculaires sous triptans apparaît très faible chez les patients respectant les critères d'inclusion ou d'exclusion des essais cliniques ou recevant les triptans selon les recommandations officielles ». Ainsi, « les triptans peuvent être prescrits en confiance sans bilan cardiovasculaire préalable ».

Conclusion :
Les accidents coronaires graves sous triptans surviennent dans presque 50 % des cas en dehors de tout mésusage et peuvent apparaître en l'absence de tout antécédent cardiovasculaire connu. Ces accidents graves concernent non seulement le sumatriptan (injectable ou administré par voie orale) mais également les autres triptans disponibles par voie orale. Ces données conduisent à rappeler qu'il faut, avant la prescription de tout triptan, évaluer le terrain coronaire par un interrogatoire sur les facteurs de risque cardiovasculaires et l'existence ou non d'un comportement addictif (ou d'une tendance addictive). L'évaluation du risque cardiovasculaire doit être dynamique dans le temps : il convient donc de la renouveler régulièrement car l'âge est un facteur de risque en soi et le risque augmente donc au cours du temps.
L'information présente dans les résumés des caractéristiques des produits (RCP) des différents triptans mériterait d'être mieux présentée et surtout d'être mieux connue des prescripteurs. Des propositions pourront être faites dans ce sens au niveau européen, pour les produits enregistrées selon des procédures européennes. Les RCP des produits enregistrés en procédure nationale (ZOMIG® et IMIGRAN® solution pour pulvérisation nasale, solution injectable et comprimés) pourront être modifiés.
Par ailleurs, l'ajout, dans les RCP, de l'interaction avec les alpha-stimulants qui ne sont pas des dérivés de l'ergot de seigle (comme l'oxymétazoline) devra être discutée.

Annexe 3-45

VI – POINT SUR LES CEPHALEES PAR ABUS MEDICAMENTEUX

1 - POINT SUR L'ABUS DES TRIPTANS ET MIGRAINES AGGRAVEES

Le Centre régional de Pharmacovigilance (CRPV) de Dijon a présenté un point sur les migraines aggravées induites par abus de triptans. Ce point a été réalisé conjointement par le CRPV de Dijon et le Centre d'Evaluation et d'Information sur les Pharmacodépendances (CEIP) de Toulouse.
Ce point ne concerne que la classe des triptans même si l'abus dans la migraine est le plus souvent plurimédicamenteux. Les triptans sont des agonistes sélectifs des récepteurs $5HT_{1B}$ et $5HT_{1D}$ vasculaires. Il sont indiqués dans le traitement de la crise de migraine, avec ou sans aura et ne doivent pas être utilisés en traitement prophylactique.
Cinq spécialités sont commercialisées en France, sous des formes orales, injectables ou inhalées.

Définitions :
En 2004, l'Agence Nationale d'Accréditation et d'Evaluation en Santé (ANAES) a publié des recommandations concernant le diagnostic, et a précisé le rôle de l'abus médicamenteux dans ces circonstances et la prise en charge **des céphalées chroniques quotidiennes (CCQ)**. Les CCQ y sont définies comme : « un ensemble hétérogène défini par la présence de céphalées plus de 15 jours par mois et plus de 4 heures par jour en l'absence de traitement, depuis plus de 3 mois, sans *substratum* lésionnel ou symptomatique. Il s'agit le plus souvent d'une céphalée initialement épisodique (migraine ou céphalée de tension) qui évolue vers une céphalée chronique, sous l'influence notamment d'un abus médicamenteux et de facteurs psychopathologiques.»
Selon l'International Headache Society (IHS), **l'abus médicamenteux** se définit comme un usage excessif intentionnel, persistant ou sporadique, de médicaments, accompagné de réactions physiques ou psychologiques nocives et caractérisé par une prise médicamenteuse régulière et qui dure depuis plus de 3 mois et qui est présente plus de 15 jours par mois pour les antalgiques non opioïdes (AINS, aspirine, paracétamol) et plus de 10 jours par mois pour les autres traitements de la crise (opioïdes ergotés, triptans, spécialités antalgiques associant plusieurs principes actifs). L'abus médicamenteux serait à l'origine d'un tiers des CCQ dans la population générale.

Les céphalées par abus médicamenteux (CAM) sont définies par les 3 critères suivants :
- la céphalée est présente plus de 15 jours par mois
- la céphalée se développe ou s'aggrave lors de la surconsommation médicamenteuse
- la céphalée disparaît ou revient à son état initial dans les deux mois après l'arrêt de la surconsommation médicamenteuse.

La CAM répond à des caractéristiques cliniques dépendant du type de substance consommée. En cas de CAM liée à une prise excessive de triptans, la céphalée secondaire doit être à prédominance unilatérale, et /ou de nature pulsatile, et/ou d'intensité modérée à sévère, et/ou aggravée par les activités physiques usuelles, et/ou associées soit à des nausées, des vomissements, soit à une phono- et photophobie. L'aggravation clinique se traduit souvent par une augmentation de la fréquence des crises.
Les **céphalées de sevrage** surviennent aprés l'utilisation d'une dose importante de substance pendant plus de 3 mois, apparaissent dans les heures suivant son arrêt, sont soulagées par une réadministration et disparaissent dans les 14 jours après l'arrêt total.

Analyse de la Base Nationale de Pharmacovigilance :
La recherche des observations enregistrées dans la Base Nationale de Pharmacovigilance a été réalisée, pour chaque molécule de triptan en recherchant les effets indésirables suivants : céphalée, migraine, céphalée par abus médicamenteux, céphalalgie, aggravation des céphalées, abus médicamenteux. Chaque observation a ensuite été revue et ont été sélectionnées comme abus toutes celles pour lesquelles les critères de l'IHS étaient retrouvés :
- céphalée par abus médicamenteux : céphalées durant plus de 15 jours par mois, s'aggravant avec la consommation de triptans, cédant à l'arrêt de la surconsommation,
- surconsommation : prise de triptans pendant plus de 15 jours par mois et pendant au moins 3 mois,
- nécessité d'un ou plusieurs sevrages,
- indication d'abus (terme préférentiel), ou présence d'éléments tels que la falsification d'ordonnance.

La recherche, menée en juillet 2004, a permis d'identifier 49 observations, enregistrées depuis 1992, année de mise sur le marché du premier triptan. Ces observations concernent 43 femmes et 6 hommes, d'âge moyen 48 ans.

Pour ces 49 observations, le diagnostic de céphalées par abus médicamenteux a été objectivé par :
- une amélioration des céphalées aprés sevrage en triptans : 35 observations,
- une fréquence de prise trop importante d'aprés les critéres de l'IHS : 8 observations,
- une falsification d'ordonnance dans 1 observation,
- une prise chronique dans 2 observations,
- un abus probable mais difficile à objectiver par manque de renseignements dans 2 observations.

Dans 20 % des observations, un syndrome dépressif associé est indiqué.
Les triptans imputés sont :
- Zolmitriptan dans 30 cas (58%),
- Naratriptan dans 15 cas (30,6%),
- Sumatriptan dans 10 cas (20,4%) voie orale 6 fois, voie SC 2 fois, voie inhalée 2 fois,
- Almotriptan dans 1 cas (2%).

Dans 7 observations, une association de plusieurs triptans a été constatée. Une association aux autres traitements de la crise a été notée dans 61,2% des cas et aux antalgiques simples dans 12% des cas.
Dans les cas avec abus objectivé selon les critéres de l'IHS, les consommations vont de 10 jours par mois (limite inférieure pour parler d'abus) à 6 comprimés par jour tous les jours au maximum.
Un sevrage médical a été nécessaire dans 37 cas, dont 24 en milieu hospitalier.

Données des CEIP :
Ces données ont été obtenues en utilisant les outils des CEIP à savoir OSIAP (Ordonnances Suspectes, Indicateur d'Abus et de Pharmacodépendance), NOTS (Notifications Spontanées) et OPPIDUM (Observation des Produits Psychotropes Illicites ou Détournés de leur Utilisation Médicamenteuse). Vingt-sept cas d'abus ont été recensés grâce à ces outils.
Dans 22 cas sur 27, le triptan était associé à d'autres médicaments. Il s'agissait notamment d'antalgiques, dans 15 cas, de caféine dans 9 cas. Dans 1 cas, il y avait également consommation de substances illicites (héroïne, ectasy).
Treize des 27 cas ont été identifiés comme étant des doublons des observations de la base nationale de Pharmacovigilance.

Analyse de la littérature
Les céphalées chroniques induites par abus médicamenteux ne semblent survenir que chez des patients qui sont déjà céphalalgiques, le plus souvent migraineux.
Une étude portant sur la consommation de sumatriptan par la population danoise en 1994 et 1995 a montré une prévalence d'utilisation en 1994 à 7,8/1000, avec un sexe ratio F/H à 3,8.
L'analyse des délivrances de médicaments par les pharmacies au Danemark en 1995, représentant 46 500 patients, a montré le caractère inapproprié de la consommation de sumatriptan dans la population : 5% des patients consomment 40% des triptans. Trois grands groupes de consommateurs ont été définis : importants (plus de 60 unités par mois), intermédiaires (entre 30 et 59), et modérés (moins de 30 unités /mois). Dans chaque groupe la proportion de céphalées induites a été estimée respectivement à 86 %, 47% et 14%.
Une étude israélienne visant à documenter la relation entre consommation de sumatriptan et changement de la nature des migraines, a montré chez tous les patients une recrudescence des crises 3-4 semaines après introduction, des modifications des caractéristiques des céphalées et une augmentation de leur durée.
Concernant la prise en charge, le sevrage médicamenteux est indispensable, mais les protocoles thérapeutiques sont actuellement très hétérogènes et mal évalués. Les moyens non médicamenteux sont parfois déterminants. L'éducation du patient céphalalgique et le suivi régulier sont primordiaux pour éviter les rechutes. Des facteurs pronostiques ont été mis en évidence mais ne seraient pas déterminants à long terme. Le taux de réussite, actuellement évalué à 60% à 5 ans, et les bénéfices d'une prise en charge adaptée encouragent à détecter précocement ces céphalées induites encore largement sous-diagnostiquées

Information contenue dans les Résumés de Caractéristiques du Produit (RCP)
Il a été signalé qu'une information concernant le risque de céphalées chroniques induites par abus est mentionnée en section Mises en garde et précautions d'emploi pour tous les triptans commercialisés excepté pour Naramig, pour lequel une procédure de variation européenne est en cours à ce sujet, et Zomig, enregistré selon une procédure nationale. Une information est présente dans la section concernant les effets indésirables que pour Zomig.

2 - POINT SUR LES CEPHALEES PAR ABUS D'ANTALGIQUES

A la suite d'une alerte rapportée par deux médecins du centre de la douleur et de traitement des céphalées du CHU de Saint-Etienne en juin 2004, le CRPV de Saint-Etienne a souhaité présenter un point sur les céphalées par abus médicamenteux (CAM). Ce point a été réalisé en collaboration avec la Société Française d'Etudes des Migraines (SFEMC).
Après avoir rappelé les définitions de la CAM et de la surconsommation médicamenteuse, les données de la SFEMC ainsi que les cas de la base nationale de pharmacovigilance ont été présentés.

Données de la SFECM
Depuis le 1er juin 2002, cette société a créé un registre multicentrique de patients céphalgiques reçus dans 13 centres hospitalo-universitaires spécialisés dans la prise en charge des douleurs chroniques et/ou des céphalées.
Au 31 mars 2004, 20 628 patients étaient dénombrés, les conclusions suivantes pouvaient être dégagées :

- 1544 (7,5%) patients ont été identifiés comme souffrant de CAM
- les médicaments responsables se répartissent comme suit :
  - antalgiques non opiacés : 38,2%
  - triptans : 29,3%
  - antalgiques opiacés : 22,3%
  - ergotamine : 3,2%
  - associations : 4,3%
  - autres (sans précision) : 2,7%.

Par ailleurs, à la suite de ces premiers résultats, la SFEMC a instauré une étude épidémiologique observationnelle, transversale, multicentrique, réalisée auprès des centres hospitalo-universitaires spécialisés dans la prise en charge de patients céphalalgiques. L'objectif de cette étude est de décrire les caractéristiques sémiologiques des patients souffrant de CAM. Elle a débuté en juillet 2004 et doit inclure 500 patients au total.

Données de la base nationale de pharmacovigilance
Le recueil des données de la base nationale a été effectué sur une période identique (du 1er juin 2002 au 31 mars 2004) à celle de la SFEMC, afin de permettre une comparaison des résultats.
La recherche croisée de céphalalgie / migraine / abus de médicament / pharmacodépendance avec tous les principes actifs antalgiques ou antimigraineux appartenant aux listes « antalgiques » et « neurologie, antimigraineux, traitement de la crise » extraits du classement des médicaments par famille pharmacothèrapeutique (section jaune du Dictionnaire Vidal 2004), a permis de colliger 44 observations, contre 1544 pour la SFECM.
Les données comparatives peuvent être résumées de la façon suivante :

	REGISTRE SFECM	BNPV
Nombre de patients	1544	44
Abus d'antalgiques non opiacés	38,2%	32,1%
Abus de triptan	29,3%	18,3%
Abus d'antalgiques opiacés	22,3%	24,8%
Abus d'ergotamine	3,2%	9,1%
Autres	7%	15,7%

Information contenue dans les Résumés de Caractéristiques du Produit (RCP)
Après avoir revu l'ensemble des RCP concernés, il apparaît que le risque de CAM est de façon générale peu mentionné dans les RCP. En effet, seules les spécialités contenant de l'aspirine, du zolmitriptan ou de la dihydroergotamine comportent un libellé relatif au risque de CAM.

Annexe 3-45

Le CRPV de Saint-Etienne a l'issue de sa présentation a tiré les conclusions suivantes :

- La faible notification des cas de CAM, peut s'expliquer par la méconnaissance du problème des professionnels de santé et des patients eux-mêmes
- Le CRPV a rappelé la récente publication, par l'Agence Nationale d'Accréditation en Santé (ANAES)[1], de recommandations de prise en charge des céphalées chroniques quotidiennes.
- A la lumière de ces différentes données, le CRPV a souligné la nécessité de modification des RCP et des notices des produits concernés .

Par ailleurs, le CRPV de Saint-Etienne a fait part, lors de l'adoption du procès-verbal, de nouvelles informations : une étude concernant la surconsommation des triptans a été coordonnée par l'URCAM de la région Rhône-Alpes et certains neurologues. Le CRPV de Saint-Etienne est en attente des résultats.

CONCLUSION GENERALE

A la lumière de ces différentes données, le Comité technique a souligné la nécessité de modification des RCP et des notices des produits concernés.

Concernant les RCP, il a été rapporté qu'une NUI (Non Urgent Information) avait été demandée par le Danemark auprès de l'Europe en septembre 2004, concernant les CAM. 9 Etats Membres ont répondu (Irlande, Suède, Royaume-Uni, Lettonie, Portugal, Malte, Italie, Islande et France). Au total, les résultas français correspondent à la tendance européenne qui se dégage des réponses reçues.

Par ailleurs, une identification plus précise de la consommation des triptans dans la population française et le nombre d'abuseurs est nécessaire.

En accord avec le CRPV de Dijon, il a été conclu de centrer en premier lieu les actions sur les triptans. De plus, le CRPV de Dijon s'est engagé à finaliser le protocole d'une étude de suivi de consommations des triptans dans le région Bourgogne, en partenariat avec la Caisse d'Assurance Maladie.

Annexe 3-45

VIII - QUESTIONS DIVERSES

Rappel des conditions de prescription d'ELSEP® (mitoxantrone) et de suivi des patients :

La spécialité ELSEP® (mitoxantrone) 2mg/ml a obtenu une autorisation de mise sur le marché en Octobre 2003 dans le traitement des formes agressives de sclérose en plaques de type récurrente/rémittente ou de type secondairement progressive. ELSEP®est agréé aux collectivités depuis le 4 Mai 2004. Ce médicament est en réserve hospitalière et sa prescription est limitée exclusivement aux neurologues des services spécialisés en neurologie.

En raison, notamment, des risques hématologiques (8 cas de leucémie rapportés) et cardiaques, liés à l'utilisation du produit, l'autorisation de mise sur le marché octroyée pour ELSEP prévoit :

- le recueil d'un accord de soins du patient avant l'initiation du traitement,
- une surveillance particulière et obligatoire de la pharmacovigilance, chez tous les patients traités, tout au long du traitement et pendant 5 ans après la fin de celui-ci.

Le 15 décembre 2004, une lettre d'information a été adressée par l'Afssaps aux neurologues hospitaliers exerçant en service de neurologie et aux pharmaciens hospitaliers concernés, afin de rappeler les conditions de prescription d'ELSEP® et de suivi des patients traités. Un communiqué de presse a également été diffusé sur le site internet de l'Afssaps. Il est rappelé dans ces documents que les patients traités par mitoxantrone dans le cadre d'une sclérose en plaques doivent impérativement recevoir la spécialité ELSEP et non NOVANTRONE, et ce afin de bénéficier du suivi de pharmacovigilance prévu. Les prix de ces deux spécialités sont aujourd'hui identiques.

Les Centres Régionaux de Pharmacovigilance ont demandé à disposer d'un exemplaire du classeur de suivi des patients traités par ELSEP, transmis aux prescripteurs pour toute initiation de traitement. Une demande en ce sens sera faite aux laboratoires Wyeth.

Exposition in utero à des hormones sexuelles, naturelles ou synthétiques et troubles psychiatriques ; cas recueillis par l'Association HHORAGES / CRPV de Bordeaux

Dans le cadre de l'étude des effets de l'exposition in utero au DiéthylStilbestrol et aux autres hormones stéroïdes naturelles ou de synthèse, un recueil de témoignages spontanés portés à la connaissance des associations de patients est effectué. L'association HHORAGES (Halte aux Hormones Artificielles pendant la Grossesse) s'intéresse tout particulièrement aux troubles psychiatriques induits. Cette association a collecté environ 525 témoignages, soit faits directement par les sujets exposés soit le plus souvent par l'intermédiaire des familles. Le Dr. F. Haramburu du CRPV de Bordeaux, membre du groupe de travail de l'Afssaps sur les conséquences de l'exposition au diéthylstilbestrol, a pris connaissance des cas transmis. Dans la majorité des cas, l'exposition est imprécise (nature, date d'exposition par rapport à la grossesse, durée de l'exposition, posologie) et la pathologie psychiatrique est vague, non médicalement confirmée. Soixante témoignages correspondant à 60 familles avec 74 enfants présentant des troubles psychiatriques (sur 89 exposés, pour un total de 144 enfants dans ces familles) ont été retenus. Si la nature de l'exposition est connue dans la plupart de ces cas, les autres caractéristiques de l'exposition sont le plus souvent imprécises ; il n'y a pas dans la majorité des cas de confirmation médicale des diagnostics psychiatriques retenus. Les tableaux cliniques présentés semblent très variés ; en revanche un certain nombre de cas correspondent indubitablement à des cas graves (hospitalisations, suicides, invalidité). Aussi, si ces témoignages représentent une source d'information intéressante et sans aucun doute un signal fort, ils ne peuvent pas constituer une base d'analyse pour l'évaluation d'une relation causale.

Suite à une étude pharmaco-épidémio-génétique « REGISCAR » des syndromes de Steven's Johnson et de Lyell, une copie des dossiers remplis par les investigateurs sera adressée par le centre de Paris–Henri-Mondor aux différents CRPV selon leur territoire d'intervention.

Objet

Madame le Docteur CASTOT
Département de Pharmacovigilance
Agence du Médicament
143-147 Bd Anatole France
93285 SAINT DENIS CEDEX

Madame et Cher Confrère,

Je me permets de vous écrire de la part du Pr BECHTEL du CHU de BESANCON dans le cadre d'une étude que réalise le Service Médical de l'Assurance Maladie de Saint Etienne sur les prescriptions hors AMM concernant le benfluorex Mediator ®.

La pré-étude montre sur 309 prescriptions concernant le même prescripteur, 89 prescriptions de Mediator ® à la posologie de 300 à 450 mg/j (2 à 3 cp) pour une durée de 3 à 6 mois.

Il apparaît clairement que le benfluorex est utilisé dans la majorité des cas comme « coupe faim ou amaigrissant » chez des patients n'ayant ni hypercholestérolémie ni DNID.

Avez-vous connaissance de cas d'utilisation dans cette « indication » non officielle ?

A titre d'exemple, je vous fais part d'une observation concernant une jeune femme de 27 ans (née le 23/6/69) que je viens d'examiner ce matin :
Surcharge pondérale du post-partum (+ 26 kg pendant la grossesse) avec poids maximal de 83 kg pour 1m 70 (BMI=28,72) le 5.10.93 (1er accouchement).
Prise en charge par le médecin « étudié » en novembre 1995. Poids=75 kg pour 1m70 (BMI=25,95). Bilan initial négatif à l'exception d'une thyroïde asymétrique en euthyroïdie mais traité par 50 µg de Levothyrox. HGPO dans les limites de la normale mais prétexte à la prescription du Médiator à la posologie de 450 mg/j. Actuellement, la patiente a accouché d'une 2e enfant le 20.12.96. Elle avait semble t'il interrompu la prise de benzofluorex et de levo-thyroxine pendant sa grossesse. Elle reprend contact avec le prescripteur qui, le 27.1.97, reconduit in extenso sa prescription de Mediator et de Levothyrox. Actuellement, la patiente pèse 64 kg pour 1m 70 (BMI=22,14) à 2 mois de son 2e accouchement. Les glycémies pratiquées pendant la grossesse sont restées normales.
Que pensez-vous de ce cas clinique ?

3, avenue du Président-Emile-Loubet
42027 Saint-Etienne cedex

Fax : 04.77.42.21.07

Annexe 3-46

Avez-vous connaissance d'effets indésirables imputables au benfluorex qui ne soient pas mentionnés dans la monographie du VIDAL ? Le risque d'HTAP est-il connu ou possible (cf. Isoméride®) ?

Le Mediator ® benfluorex parait apparenté aux amphétaminiques anorexigènes : clobenzorex, méfénorex et fenfoprorex. Cette parenté est-elle établie au plan biochimique et pharmacologique ?

Je vous remercie de nous apporter votre éminent concours dans cette étude qui relève de la Santé Publique dans la mesure où, au moins, 89 personnes sont concernées.

Je vous prie de croire, Madame et Cher Confrère, en l'assurance de ma haute et confraternelle considération.

Docteur Marc WASSERSTROM
Médecin Conseil

PJ : documents anonymisés concernant le cas clinique décrit

Vue en Nov 91 1692

Annexe 3-46

Cher Ami,

J'ai eu l'occasion de voir à mon cabinet ta patiente Madame , née le 23 juin 1969.

Cette jeune femme est venue me consulter pour plusieurs problèmes :

1) celui d'un *diabète* ?
2) celui d'un *problème de thyroïde*,
3) elle présentait une *surcharge pondérale* de 75 kg pour 1 m 70.

Le bilan que j'ai réalisé montre quelques anomalies, c'est la raison pour laquelle je te passe ce courrier :

1) en ce qui concerne sa thyroïde, elle fonctionne normalement puisque :

* la TSH est normale,
* la recherche des anticorps antipéroxydases est négative,
* l'échographie montre une thyroïdie asymétrique mais non nodulaire,
* enfin la scintigraphie confirme la normalité de cette thyroïde avec simplement un lobe droit plus gros que le lobe gauche.

Je lui ai donc conseillé de prendre sous ta surveillance jusqu'à fin avril 1 comprimé par jour de [redacted] afin d'essayer d'empêcher ce goitre de grossir.

2) en ce qui concerne le diabète et donc le poids, j'ai fait réaliser une hyperglycémie sur 2 heures qui est anormale puisque sa glycémie atteint 1 g 87 à la 30ème minute, est encore à 1 g 70 à la 60ème minute, et encore à 1 g 23 à la 120ème minute. A cet état d'intolérance aux glycides, il existe également associé un hyperinsulinisme à environ 3 fois le taux habituellement rencontré.

.../...

Annexe 3-46

J'ai expliqué tout cela à [redacted] et je lui ai donc donné un régime diabétique standard associé à au [redacted] si cela est nécessaire. ajout du 31/12.

J'aimerais qu'elle atteigne à peu près 60 kg car l'insulinorésistance diminuerait alors et cela éloignera le moment où elle deviendra diabétique.

En attendant, je l'ai renvoyée à tes bons soins.

Bien amicalement.

Annexe 3-46

Saint-Denis le, 12 MARS 1997

Monsieur le Docteur WASSERSTROM
ASSURANCE MALADIE
Service Médical de Saint-Etienne
3, avenue du Président Emile-Loubet
42027 SAINT-ETIENNE cedex

Monsieur,

En réponse à votre courrier du 24 février 1997 relatif au Mediator® (benfluorex), je vous prie de bien vouloir trouver ci-joints ces quelques éléments d'information :

Le benfluorex est indiqué comme adjuvant du régime adapté dans les hypertriglycéridémies ou dans les diabètes asymptomatiques avec surcharge pondérale. Cette spécialité n'est donc pas indiquée dans la prise en charge de l'obésité et ses conditions de prescription et de délivrance ne sont pas actuellement soumises aux restrictions des médicaments coupe-faims.

En raison de sa parenté structurale, ce médicament fait l'objet d'un suivi de pharmacovigilance et son utilisation dans des préparations magistrales a été interdite (l'arrêté publié au JO du 31/10.95). Néanmoins les dérives d'utilisation sont difficiles à appréhender et nous sommes vivement intéressés par les résultats de votre enquête de prescriptions. En effet le suivi régulier des chiffres de ventes n'est pas suffisant pour identifier les reports de prescription. Aussi, nous examinons avec attention, les quelques signalements individuels que nous transmettent nos collègues pharmaciens .

Je vous conseille de joindre le Pr Ollagnier au Centre Régional de Pharmacovigilance de Saint-Etienne, pour répondre à vos questions relatives à la pharmacologie du produit et à sa parenté avec les amphétamines.

Restant à votre disposition pour tout complément d'information, je vous prie de recevoir Monsieur , mes meilleures salutations.

Le Chef de l'unité de Pharmacovigilance

Dr Anne CASTOT

AGENCE
MEDICAMENT

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis, le 20 JUIL. 1998

NOTE A MONSIEUR FLEURETTE
Direction des Etudes et de l'Information Pharmaco-économiques

Objet : MEDIATOR® (benfluorex) et détournement d'usage

A la suite des mesures prises concernant la classe des médicaments anorexigènes, une enquête officieuse de pharmacovigilance sur le MEDIATOR® a été mise en place en 1995.
En effet, la métabolisation du benfluorex dans l'organisme entraîne la formation de norfenfluramine, métabolite apparenté à la fenfluramine, elle-même impliquée dans la survenue d'hypertensions artérielles pulmonaires. Par ailleurs, le risque de déviation d'utilisation du benfluorex comme anorexigène est à craindre.
Les premiers résultats de l'enquête ont été présentés au Comité Technique du 11 juillet 1995. Aucun cas d'hypertension artérielle pulmonaire d'allure primitive résultant d'une monothérapie n'a été rapporté et aucune déviation d'utilisation n'a été signalée. Il a alors été considéré que ce premier bilan était trop prématuré et qu'il fallait continuer à surveiller le profil de sécurité d'emploi.
Un second bilan des effets indésirables a été présenté au Comité Technique du 30 avril 1998. Le nombre d'effets indésirables observés n'a pas semblé plus important que celui rapporté en juillet 1995. Cependant, la possibilité d'une déviation de l'utilisation comme anorexigène ne peut être estimée au vue des seules données des centres régionaux de pharmacovigilance alors qu'il semble que des cas aient été identifiés, notamment par la Caisse Régionale d'Assurance Maladie de Bourgogne.
Compte-tenu de ce constat, le Comité Technique a demandé la mise en place d'une enquête officielle sous la responsabilité du Centre de Pharmacovigilance de Besançon afin d'obtenir les chiffres de vente et les observations du laboratoire.

Le Comité Technique a, par ailleurs, souhaité que l'Observatoire de la Prescription soit interrogé sur les conditions d'utilisation actuelles de cette spécialité et de leur évolution depuis ces dernières années. En conséquence, nous vous remercions vivement de nous communiquer les données d'utilisation disponibles concernant ce médicament.

NOTE

- A l'attention de Monsieur Jean-Michel ALEXANDRE -

- Direction de l'Evaluation -

Objet : Evolution de la consommation et des prescriptions de MEDIATOR®

Les données dont dispose la DEIPE sur l'évolution des consommations et des prescriptions de MEDIATOR® au cours de ces dernières années ne permettent pas de mettre en évidence un détournement d'usage de ce médicament. Si MEDIATOR® a été - et est encore - prescrit comme anorexigène et, de façon plus large, comme médicament anti-obésité, la part des prescriptions dans ces indications hors AMM est modeste et - surtout - a décru au cours de la période étudiée. Ainsi, les prescriptions de ce médicament dans le traitement de l'obésité[1] étaient, selon le DOREMA, de 9 % en 1994 mais seulement de 5,1 % au cours de l'hiver 1997-1998.

Comme le montre le tableau joint en annexe, une tendance similaire peut être dégagée en ce qui concerne la prescription de MEDIATOR® comme amaigrissant ou comme anorexigène. En tout état de cause, si l'on admet que la rubrique "effets attendus" du DOREMA est correctement renseignée, les mesures prises en 1995 pour restreindre la prescription d'anorexigènes n'ont pas entraîné de reports en faveur de MEDIATOR®. Ce médicament demeure très largement prescrit comme hypocholestérolémiant et comme antidiabétique (80,2 % des prescriptions en 1997).

Quant à l'évolution globale du nombre de prescriptions de MEDIATOR®, si elle a été positive, elle est restée néanmoins modeste : + 5,6 % entre 1994 et 1997.

---

[1] Effet attendu : traitement de l'obésité

.../...

Il sera seulement indiqué le nombre de ventes en hausse augmentant de [illegible] progression plus importante que celle de l'ensemble des spécialités [illegible] Toutefois, cette progression aurait dû être encore beaucoup plus forte si les prescriptions d'anorexigènes s'étaient reportées de façon tangible sur MEDIATOR®. En effet, les ventes (en unités) d'anorexigènes s'élevaient en 1994 à 4,4 millions et, en 1995, à 2,8 millions.

Aussi, en conclusion, apparaît-il que le détournement d'usage de MEDIATOR®, s'il existe, ne pourrait être évalué qu'à l'aide de données beaucoup plus fines, et qui font actuellement défaut, sur la prescription de ce médicament.

Le Directeur des Etudes et de
L'Information Pharmaco-Economiques

Frédéric FLEURETTE

Santé-médicaments
Le Médiator, un médicament détourné de ses indications thérapeutiques

DIJON, 1er juil (AFP) - Le médicament appelé Médiator, classé parmi les amphétamines, est fréquemment détourné de ses indications thérapeutiques pour servir d'amaigrissant, révèle une étude menée par l'Union régionale des caisses d'assurance maladie (URCAM) de Bourgogne.

Le Médiator, classé par l'Organisation mondiale de la santé (OMS) parmi le groupe des amphétamines, mais non soumis en France à la législation qui s'y rapporte, est normalement prescrit comme adjuvant des traitements du diabète avec surcharge pondérale. Mais l'étude, menée sur 568 prescriptions du médicament présentées au remboursement en Bourgogne pendant 5 jours en avril 1997, montre qu'il est utilisé comme amaigrissant dans un tiers des cas.

L'URCAM de Bourgogne, jugeant les risques pour la santé importants, préconise le reclassement de ce médicament dans le groupe des amphétamines, ce qui implique une prescription restreinte. L'URCAM s'interroge également sur la légitimité à rembourser un médicament dont les indications thérapeutiques ne sont pas respectées. Le Médiator représente effectivement une dépense annuelle potentielle d'environ 4 millions de francs pour la seule Bourgogne.

Ce détournement du médicament lui semble d'autant plus grave que 66% des patients ne présentent pas d'obésité avérée. Deux patientes présentaient même un état de maigreur, indique le rapport de l'étude. De même, 20 % des médecins ne peuvent pas fournir d'information sur la taille et le poids du patient auquel ils ont prescrit ce médicament.

L'étude de cette structure régionale, créée début 97 pour être la pièce essentielle de la réforme de la Sécurité sociale, fait partie d'autres menées par les URCAM de France pour apprécier quels sont les médicaments utilisés de manière frauduleuse.

V - POINT BENFLUOREX (MEDIATOR®)

Le Centre Régional de Pharmacovigilance de Besançon a effectué une mise au point concernant les effets indésirables observés avec le benfluorex.

Le MEDIATOR® (chlorydrate de benfluorex) est commercialisé en France (depuis 1976) dans les indications suivantes :
- adjuvant du régime adapté dans les hypertriglycéridémies.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex est inscrit depuis le 10 mai 1995, comme les anorexigènes, sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales.

Sur les 291 notifications rapportées avec le benfluorex, 152 ont été retenues au 30 avril 1998 (lors de la précédente mise au point de juillet 1995, 101 notifications avaient été rapportées).

● Les atteintes hépatiques : 16 cas
Les cas les plus souvent rapportés sont des hépatites et des perturbations de la biologie hépatique : élévation des transaminases. Ces effets ne sont pas mentionnés dans le RCP.

● Les atteintes digestives : 16 cas
Les cas les plus souvent notifiés sont les diarrhées. Cet effet indésirable est mentionné dans le RCP.

● Les atteintes hématologiques : 8 cas
Les effets les plus fréquents sont les thrombopénies. Il n'y a pas eu de nouveaux cas rapportés depuis juillet 1995.

● Les atteintes respiratoires : 8 cas
Les cas rapportés sont principalement des toux et des hypertensions pulmonaires (dans les 2 cas rapportés, il existe un traitement anorexigène associé).

● Les atteintes cardiovasculaires : 11 cas
Des cas d'hypertension artérielle, de tachycardie, d'extrasystoles ventriculaires et de syndrome de Raynaud sont le plus souvent notifiés.

● Les atteintes rénales : 9 cas
Parmi lesquelles on observe le plus souvent des dysuries, des pollakiuries.

● Les atteintes métaboliques : 3 cas
Une hyperlipémie, une hypothyroïdie et une crise de goutte ont été rapportées.

● Les atteintes cutanées : 38 cas
Des urticaires, des chocs anaphylactiques, des eczémas, des vascularires, des érythèmes ainsi que des purpuras sont les effets les plus fréquents. Ces effets indésirables ne sont mentionnés pas dans le RCP.

MEDIATOR (benfluorex)
Effets indésirables

Mise au point

Comité Technique du 30 Avril 1998

Confidentiel

M.DAVII
P.BECHTE

Le MEDIATOR (chlorhydrate de benfluorex) est commercialisé en France depuis 1974 sous forme de comprimés, dosés à 150 mgL La posologie recommandée est : 3 comprimés par jour.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène.
(Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Une enquête officieuse a été ouverte, suite à la première mise au point des effets indésirables du benfluorex, présentée lors du Comité Technique du 11 juillet 1995.

Pharmacocinétique humaine du chlorhydrate de benfluorex :

L'absorption gastro-intestinale du chlorhydrate de benfluorex est complète et rapide, avec une concentration plasmatique maximale entre 1h et 2 h après l'administration.
Le volume de distribution est faible : 0,37 ± 0,03 l/Kg chez l'homme (1,4 l/Kg chez le rat, 1,6 l/Kg chez le chien,0.36l/Kg chez le singe et 0,31 l/Kg chez le babouin.
Le chlorhydrate de benfluorex est métabolisé rapidement dans le foie. Au niveau tissulaire, il n'y a aucune accumulation ou rétention de métabolites.

Les métabolites principaux retrouvés dans l'urine sont :
- le 1-(3-trifluorométhylphényl)-2-N-(carboxyméthyl)amino propane : 65% de la dose
- le 1-(3-trifluorométhylphényl)-2-N-(2-hydroxyéthyl)amino propane : 22% de la dose

- la 3-trifluorométhylphényl)-1 -hydroxy-propanone-2 sous forme conjuguée (5% de la dose)
- la Nor-fenfluramine : 2% de la dose.

Les métabolites principaux retrouvés dans le plasma sont :
- le 1-(3-trifluorométhylphényl)-2-N-(carboxyméthyl)amino propane
- le 1-(3-trifluorométhylphényl)-2-N-(2-hydroxyéthyl)amino propane

On ne retrouve pas de benfluorex inchangé dans le plasma.,

A. BILAN GLOBAL :

Parmi 291 notifications dans lesquelles le MEDIATOR est présent, et qui sont rapportées aux Centres Régionaux de Pharmacovigilance, 152 notifications ont été retenues.

Elles concernent 54 hommes et 97 femmes (1 sexe non précisé), dont l'age moyen est de :
- 57 ans pour les hommes (N = 54)
- 55,6 ans pour les femmes (N = 92)

Pour les notifications reçues jusqu'à 1995 , l'age moyen est de :
- 55,4 ans pour les hommes (N = 45)
- 56,7 ans pour les femmes (N = 66)

Pour les notifications reçues après 1995 , l'age moyen est de :
- 64,7ans pour les hommes (N = 9)
- 52,8 ans pour les femmes (N = 26)

Annexe 3-48

Les éruptions cutanées sont variées

- 3 cas d'érythème polymorphe, avec une évolution favorable à l'arrêt du MEDIATOR, chez 2 hommes agés de 60 et 68 ans.

- 3 notifications de vascularite aigue leucocytoclasique:
  - dans 1 cas, l'évolution est favorable à l'arrêt du MEDIATOR (RE9420042)
  - dans 1 cas, l'évolution est favorable sans arrêt du MEDIATOR , mais avec un traitement corticoïde (lorsque la corticothérapie est arrêtée, 4 moisplus tard, survient un érythème polymorphe :MA9700957)
  - dans le troisième cas (MP9700134), l'évolution n'est pas complète malgré l'arrêt du MEDIATOR et une corticothérapie.

- 3 cas de purpura:
  - purpura des membres inférieurs avec un oedème apparu une semaine après le début du traitement par MEDIATOR (PP8990384)
  - purpura des membres inférieurs, s'étendant aux membres supérieurs, disparaissant 1 semaine après l'arrêt du traitement (CF9200106)
  - purpura rhumatoïde survenant après 2 semaines de traitement, l' évolution est inconnue (PO9700410)

IX. ATTEINTES NEURO-PSYCHIATRIQUES :

Elles concernent 18 hommes (Age moyen : 54,5 ans) , 25 femmes (Age moyen : 58,7 ans)

1. Asthénie, Somnolence, Impuissance :

16 cas ont été notifiés: il s 'agit de patients agés,en général, avec une pathologie lourde : diabète, insuffisance cardiaque...

Cet effet indésirable est mentionné dans les RCP.

Annexe 3-48

VIDAL 1992

☆ MEDIATOR®

benfluorex

FORMES et PRÉSENTATIONS

Comprimé enrobé (blanc) : Boîte de 30.

Modèle hospitalier : Boîte de 100, sous plaquette thermoformée unidose.

COMPOSITION

	p cp	*p boîte*
Benfluorex chlorhydrate	150 mg	4,5 g

Excipients : amidon de maïs, carmellose sodique, cire d'abeille blanche, éthylcellulose, stéarate de magnésium, oléate de glycérol, polysorbate 80, povidone, silice colloïdale, saccharose, bicarbonate de sodium, talc, dioxyde de titane.

DC INDICATIONS

- Adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

DC POSOLOGIE et MODE D'ADMINISTRATION

3 comprimés par jour.

Cette posologie peut être prescrite d'emblée ou atteinte progressivement :

- 1 comprimé la première semaine au dîner,
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner,
- 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

Par la suite, la posologie peut être ramenée à 2, parfois 1 comprimé par jour, en fonction des résultats biologiques.

Coût du traitement journalier : 1,43 à 4,29 F.

En association avec le régime, Mediator constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

DC CONTRE-INDICATIONS

Pancréatites chroniques avérées.

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI

Mises en garde :

Les troubles métaboliques relevant d'un traitement par Mediator sont essentiellement observés chez l'adulte. La prescription de Mediator n'est donc pas justifiée chez l'enfant.

Précautions d'emploi :

Si, après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

DC GROSSESSE et ALLAITEMENT

Grossesse : Les résultats des études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence de données dans l'espèce humaine, ces résultats expérimentaux ne permettent pas de préjuger un effet malformatif. Cependant, par mesure de prudence, ne pas prescrire pendant la grossesse.

Allaitement : En l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

DC EFFETS INDÉSIRABLES

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.

DC SURDOSAGE

Conduite à tenir en cas d'absorption massive : le traitement sera purement symptomatique : lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

PP PHARMACODYNAMIE

Hypolipémiant :

Il agit sur plusieurs facteurs liés au risque athérogène.

- Actions de Mediator sur le métabolisme lipidique :
  - Mediator diminue l'absorption intestinale des triglycérides (rat). Cet effet, confirmé chez l'homme en pharmacologie clinique, repose sur la diminution d'activité de la lipase pancréatique.
  - Il réduit la synthèse hépatique des triglycérides et du cholestérol in vitro et in vivo (rat).
  - Il diminue la stéatose hépatique induite par des régimes riches en lipides, en glucides chez le rat obèse et au cours du diabète expérimental (rat).
  - Il limite l'incorporation du cholestérol dans la paroi artérielle (lapin).

  Ce mode d'action est susceptible d'expliquer la diminution du cholestérol et des triglycérides chez l'homme.
- Actions de Mediator sur le métabolisme glucidique :
  - Il facilite la pénétration et l'utilisation cellulaires du glucose (rat).
  - Il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'HPO chez le lapin.
  - Dans le diabète asymptomatique chez les patients obèses, il entraîne une baisse de la glycémie postprandiale et une amélioration de la courbe d'HPO supérieure à celle qu'on obtient avec un régime identique associé à un placebo.

  Mediator, n'ayant pas d'action sur l'insulinosécrétion, ne peut pas provoquer d'hypoglycémie.
- Effet complémentaire de Mediator :

  Chez des patients obèses hyperuricémiques traités par Mediator et régime, une baisse de l'uricémie d'environ 14 % a été observée.

Aucune interférence indésirable de Mediator avec les traitements associés au cours des études n'a été constatée.

Mediator :

- ne potentialise pas les anticoagulants,
- ne provoque pas d'hypoglycémie,
- n'interfère pas avec la fonction thyroïdienne.

PP PHARMACOCINÉTIQUE

- Absorption gastro-intestinale rapide et totale avec un pic maximal survenant entre 1 et 2 heures après l'administration.
- Élimination rapide et totale par voie urinaire : en 8 heures, une excrétion moyenne d'environ 74 % de la dose administrée est constatée.

  L'élimination se fait en 2 phases :
  - une première phase rapide (60 % en 3 ou 4 heures),
  - une deuxième phase lente, se terminant en 36 heures environ.

LISTE I

AMM 317 557.9 (1974, validée 1987) 30 comprimés.

Objet : Prescription de MEDIATOR.

Monsieur le Directeur Général,

L'Union Régionale des Caisses d'Assurance Maladie (URCAM) de Bourgogne a réalisé une étude[1] portant sur les modalités d'utilisation de la spécialité MEDIATOR® (Benfluorex).

Il est constaté qu'un nombre important de cas (environ 1/3) correspond à des prescriptions médicales se situant hors du champ des indications thérapeutiques prévues par l'Autorisation de Mise sur le Marché (adjuvant du régime dans les hypertriglycéridémies ou traitement du diabète asymptomatique avec surcharge pondérale), notamment dans le cadre de traitements à visée amaigrissante.

En conséquence, il nous est apparu nécessaire de vous transmettre les résultats de cette étude même si, en l'absence de données issues du codage pharmacie, ceux-ci ne peuvent être exhaustifs.

Face aux constats établis par les praticiens conseils, il nous apparaîtrait particulièrement opportun de procéder à une réévaluation de l'utilité du MEDIATOR dans la stratégie thérapeutique de la maladie diabétique et dans celle des hyperlipidémies.

D'autre part, il nous semble également utile d'alerter l'Agence du médicament sur l'utilisation non contrôlée d'un produit de structure amphétaminique, dans un but anorexigène. Il est en effet, assez paradoxal de constater que la prescription de MEDIATOR est tout à fait libre tandis que celle des médicaments du groupe des amphétamines est strictement encadrée depuis mai 1995.

[1] 2 documents joints en annexe.

Enfin, il convient de rappeler que la présente démarche relève d'une volonté de promouvoir la qualité des soins qui s'inscrit dans le cadre des missions de santé publique dévolues aux organismes d'assurance maladie.

Nous vous prions de croire, Monsieur le Directeur Général, à l'assurance de nos sentiments distingués.

Le Médiator, un médicament détourné de ses indications thérapeutiques

DIJON, 1er juil (AFP) - Le médicament appelé Médiator, classé parmi les amphétamines, est fréquemment détourné de ses indications thérapeutiques pour servir d'amaigrissant, révèle une étude menée par l'Union régionale des caisses d'assurance maladie (URCAM) de Bourgogne.

Le Médiator, classé par l'Organisation mondiale de la santé (OMS) parmi le groupe des amphétamines, mais non soumis en France à la législation qui s'y rapporte, est normalement prescrit comme adjuvant des traitements du diabète avec surcharge pondérale. Mais l'étude, menée sur 568 prescriptions du médicament présentées au remboursement en Bourgogne pendant 5 jours en avril 1997, montre qu'il est utilisé comme amaigrissant dans un tiers des cas.

L'URCAM de Bourgogne, jugeant les risques pour la santé importants, préconise le reclassement de ce médicament dans le groupe des amphétamines, ce qui implique une prescription restreinte. L'URCAM s'interroge également sur la légitimité à rembourser un médicament dont les indications thérapeutiques ne sont pas respectées. Le Médiator représente effectivement une dépense annuelle potentielle d'environ 4 millions de francs pour la seule Bourgogne.

Ce détournement du médicament lui semble d'autant plus grave que 66% des patients ne présentent pas d'obésité avérée. Deux patientes présentaient même un état de maigreur, indique le rapport de l'étude. De même, 20 % des médecins ne peuvent pas fournir d'information sur la taille et le poids du patient auquel ils ont prescrit ce médicament.

L'étude de cette structure régionale, créée début 97 pour être la pièce essentielle de la réforme de la Sécurité sociale, fait partie d'autres menées par les URCAM de France pour apprécier quels sont les médicaments utilisés de manière frauduleuse.

MARS 1998

Analyser la réalité de la prescription d'une spécialité pharmaceutique

L'Union régionale des caisses d'Assurance Maladie de Bourgogne a choisi en 1997 d'étudier la prescription du Médiator dans les quatre départements de la région.
Le Médiator est un adjuvant des traitements du diabète asymptomatique avec surcharge pondérale et des hypertryglycéridémies.
Or, les praticiens conseils des organismes d'assurance maladie ont détecté cette spécialité dans des traitements à visée amaigrissante.
Par ailleurs, le Médiator dont le principe actif est le Benfluorex fait en réalité partie du groupe des amphétamines, mais de part ses indications thérapeutiques, n'est pas soumis à la législation qui s'y rapporte.

Au delà des aspects de « santé publique » liés à des prescriptions inutiles voire dangereuses pour la santé, le constat d'une utilisation du Médiator en dehors du champ des indications reconnues et validées, pose également une question d'ordre économique. L'Assurance maladie doit-elle prendre en charge des prescriptions qui ne répondent pas à une utilité médicale ?

Aussi, l'URCAM de Bourgogne a décidé d'analyser plus précisément le réel respect des indications du Médiator et de rechercher les détournement éventuels de ce médicaments pour des traitements à visée amaigrissante.

Toutes les ordonnances accompagnant les feuilles de soins présentées au remboursement ont ainsi été analysées pendant une semaine avril 1997/

Parallèlement à la démarche de l'URCAM de Bourgogne, des interrogations se sont fait jour sur l'utilité médicale réelle du Médiator. Ainsi, deux articles sont parus en mai et en décembre 1997 dans La Revue ***Prescrire***.
Ainsi, il est estimé que « *l'on ne sait toujours pas à quoi sert ce médicament administré au diabétique* [1] » et « *qu'il n'y a actuellement aucune raison de traiter les patients ayant une hypertriglycéridémie avec le Benfluorex* » [2].
La Revue ***Prescrire*** va jusqu'à conclure que « *le maintien sur le marché et la prise en charge par l'assurance maladie de ce médicament doivent être reconsidérés* » [1][2]

Les deux réflexions motivaient donc une étude précise de l'utilisation réelle du Médiator.

[1] tome 17 N°173 page 328
[2] tome 17 °179 page 809

MARS 1998

Quelle est l'utilité réelle du Médiator ?

Le Médiator a comme indications thérapeutiques actuellement inscrites à l'autorisation de mise sur le marché :

« Adjuvant du régime adapté dans les hypertriglycéridémies, la poursuite du régime étant toujours indispensable.
Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale »

Il est également remarqué dans ces indications que « *l'efficacité du Médiator pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.* »

Différentes analyses médicales ont été menées récemment sur le Médiator, notamment par la revue ***Prescrire*** (N° de mai et de décembre 1997).
Leurs conclusions amènent à s'interroger sur l'utilité du Médiator tant pour le traitement des diabétiques asymptomatiques que chez les patients atteints d'hypertriglycéridémie.

En effet, le dossier d'évaluation clinique du Médiator apparaît de mauvaise qualité méthodologique :

- les essais versus placebo n'ont pas apporté la preuve convaincante d'un éventuel effet.
- les essais versus autre molécules pharmacologiques sont ininterprétables.

Par ailleurs, actuellement on ne connaît pas de donnée claire et indépendante sur les effets indésirables du Médiator.

MARS 1998

Pourquoi le Médiator n'est-il pas classé comme anorexigène. ?

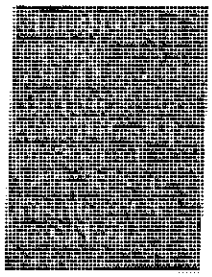
« Le principe actif du Médiator est le benfluorex, proche de substances anorexigènes. D'ailleurs, son suffixe en « orex » est attribué aux dénominations communes internationales des substances anorexigènes par l'Organisation Mondiale de la Santé. Dans le Vidal 1997, le Benfluorex figure dans le groupe des « amphétamines et autres excitants » (*Revue Prescrire*)

Ainsi, bien que faisant partie d'une liste de substances anorexigènes (arrêté du 25 octobre 1995 Journal Officiel) qui ne doivent être incorporées dans des préparations magistrales, le Médiator ne fait pas l'objet d'une prescription restreinte.

On ne peut que s'étonner de cet état de fait qui prend une dimension particulière lorsque l'on pose parallèlement la question de l'utilité réelle du Médiator sur un plan médical.

MARS 1998

Le Médiator est utilisé dans le cadre de régimes à visée amaigrissante



Parallèlement aux analyses médicales sur l'utilité du Médiator, l'URCAM de Bourgogne a entrepris une étude sur le respect de ses indications thérapeutiques .

Dans les quatre départements de la région, un échantillon de 568 prescriptions de Médiator présentées au remboursement pendant 5 jours en avril 1997 a été analysé.

Dans 35 % des cas, les indications thérapeutiques ne sont pas respectés. Ce taux monte à 43 % chez les patients de sexe féminin. Or 69 % des prescriptions concernent des femmes.

En fait, près de la moitié des cas de non respect de l'indication thérapeutique du Médiator concernent des personnes polymédicamentées à visée amaigrissante. Ce taux atteint 86 % des prescriptions délivrées à la population de sexe féminin.

De surcroît, l'étude de l'indice de Masse Corporelle montre que dans le cadre de traitements à visée amaigrissante, 20 % des médecins ne peuvent pas fournir d'information sur le poids et la taille de leur patient.
45 % ne retrouvent pas, ne possèdent pas ou n'ont pas fait réaliser de bilan biologique et enfin 66 % des patients ne présentent pas d'obésité avérée (IMC < 30) ou tout au moins ne justifient pas de tels traitements. Par ailleurs, deux patientes présentent un état de maigreur (IMC <20).
On peut alors s'interroger sur les raisons qui ont poussé le médecin à prescrire en dehors de l'indication thérapeutique...

MARS 1998

Le Médiator : un enjeu économique

Au delà des aspects médicaux, l'analyse économique des ordonnances étudiées dans le cadre de l'étude de l'URCAM de Bourgogne permet d'estimer que le coût annuel des prescription de Médiator pour l'Assurance maladie est d'environ 4 millions de francs par an sur la seule région, soit envoi 2 % des dépenses remboursées annuellement en Côte d'Or.

Ainsi bien qu'adjuvant d'un traitement, le Médiator n'en a pas moins de réelles implications économiques. Porté sur l'ensemble des régions, l'enjeu financier n'est pas négligeable.

MARS 1998

[redacted]aut-il reconsidérer les conditions de mise sur le marché du Médiator ?

L'étude réalisée sur le respect des indications du Médiator conjuguée aux différentes analyses médicales sur l'utilité de cette spécialité amène à s'interroger sur la pertinence de son classement thérapeutique, mais aussi de son remboursement à 65 % par l'Assurance maladie.

Ainsi, un reclassement dans le groupe des amphétamines avec la législation qui s'y rapporte (prescription restreinte) apparaît être la mesure de premier niveau nécessaire .
Au -delà, on peut s'interroger sur la légitimité à rembourser un médicament dont les indications thérapeutiques ne sont pas respectées et ne répondent donc pas à un souci de qualité, de sécurité et d'efficacité.

MARS 1998

Etude du respect des Indications thérapeutiques du Médiator en Bourgogne

Fiche signalétique de l'étude

Le médecin est tenu de signaler sur l'ordonnance le cas où il prescrit un médicament en dehors de l'indication thérapeutique pour laquelle le produit a été admis au remboursement.

Une étude du Médiator a été réalisée pendant 5 jours en avril 1997 dans les quatre département de Bourgogne. Toutes les prescriptions de Médiator présentées au remboursement par les malades pour l'ensemble des praticiens de Bourgogne ont été concernées par l'enquête. Les praticiens conseils de l'Assurance maladie ont pu ainsi estimer la pratique médicale des prescriptions en évaluant les écarts retrouvés entre les motifs des prescriptions et les indications thérapeutiques du Médiator.
Outre les données d'ordre administratif tels que le sexe du patient, la date de prescription, les données médicales comme le poids, la taille, les résultats des examens biologiques réalisés, les traitements amaigrissants associés ont également été analysés.

Pourquoi une étude sur le Médiator ?
Deux raisons :

- la connaissance du terrain par les praticiens conseils de l'Assurance maladie a permis de détecter le Médiator dans certaines prescriptions à visée amaigrissante, en dehors de ses indications thérapeutiques;
- le Médiator est un traitement adjuvant, donc non majeur, dont les indications sont claires et facilement vérifiables.
  Par ailleurs, c'est la seule molécule qui bien que faisant partie du groupe des amphétamines » n'est pas soumise à la législation de ces spécialités pharmaceutiques.

Qualité de l'échantillon.
568 ordonnances ont été saisies manuellement lors du traitement des dossiers présentés au remboursement sur une période de 5 jours. Si une déperdition a eu lieu, elle est par définition involontaire, liée au hasard et n'influence pas les structures de l'étude.
On note toutefois que quelque soit le régime d'assurance maladie (régime général, mutualité sociale agricole ou assurance maladie des professions indépendantes), la structure de l'échantillon est la même.

L'Indice de masse corporelle (IMC) n'a pu être calculée pour 264 patients. Leurs poids et leur taille n'ont pas pu être fournis par le médecin traitant. Il n'a pas été choisi de convoquer les malades dans le cadre d'une étude. Les avis par rapport à l'IMC ont donc concernés 304 dossiers.

Les avis sur le respect ou non des indications thérapeutiques ont été cependant donnés sur l'échantillon complet.

Choix de l'IMC pour définir l'obésité;
Ce choix a été fait après analyse de la littérature et semble le plus objectif pour apprécier la pertinence de traitement à visée amaigrissante.

MARS 1998

URCAM de Bourgogne : Agir ensemble pour la santé

Pièce essentielle de la Réforme de la sécurité sociale inscrite dans les Ordonnances de 1996 et concrétisée par le décret d'octobre 1997, la mise en place des Unions régionales des caisses d'assurance maladie marque une étape décisive dans la déclinaison d'une véritable politique de santé, conjuguant l'amélioration constante de la qualité et de l'efficience du système de soins et la régulation des dépenses de soins de ville.

En Bourgogne, comme dans les autres régions, l'Union régionale est un lieu de concertation et d'analyse des données médicales et de santé pour permettre une meilleure efficacité des actions des caisses, tous régimes confondus, et de leurs services de médecin-conseil.

L'activité de l'Union régionale se centrera sur deux pôles essentiels :

- la santé publique : l'URCAM sera le lieu où s'élaborera la politique de prévention et d'éducation pour la santé qui permettra à l'Assurance Maladie de répondre aux priorités arrêtées par les conférences nationale et régionale de santé.

- l'analyse et l'expertise en matière de comportements et de pratiques médicales : l'URCAM proposera à ses partenaires, que sont notamment l'Agence Régionale de l'hospitalisation et l'Union régionale des médecins libéraux , de mener ensemble des actions pour une meilleure prise en charge des malades.

Petite structure de 8 personnes et forte d'un conseil d'administration représentant les assurés sociaux et les employeurs bourguignons, l'URCAM ne se substitue pas aux caisses locales qui restent les interlocuteurs de proximité des professionnels de santé et des assurés. Elle vient fédérer leurs actions.

RESUME

OPPORTUNITE DE L'ETUDE

- les ordonnances du 24/04/1996 créant les URCAM.
- mise en place en Bourgogne d'un comité opérationnel régional de gestion du risque dans l'attente de celle officielle de l'URCAM.
- le domaine d'intervention sur le poste pharmacie a été dégagé comme prioritaire par le comité opérationnel régional.
- les indications thérapeutiques sur le MEDIATOR sont précises et claires avec des indicateurs objectifs.
- des anomalies ont été constatées lors de contrôles antérieurs (régimes amaigrissants).

OBJECTIFS

- vérifier le respect des indications thérapeutiques du MEDIATOR pour lesquelles cette molécule a été admise au remboursement .
- rechercher les détournements de ce médicament à usage de régime à visée amaigrissante et cibler les médecins coutumiers de ce fait.
- Vérifier le respect des règles de délivrance.
- Cette étude doit se dérouler selon deux modalités :
  - une première phase pédagogique, sous la forme d'une enquête collective dont les résultats sont présentés ci-dessous
  - et une seconde phase normative sous la forme de contrôles individuels ciblés à l'issue de l'enquête initiale.

La première phase s'est faite à partir des prescriptions de MEDIATOR reçues sur une semaine de liquidation au printemps 1997 par l'ensemble des caisses d'Assurance Maladie de la BOURGOGNE. Une communication des résultats à l'ensemble des prescripteurs sera faite à l'issue de cette première analyse.

METHODOLOGIE

Dans la phase collective, l'avis du médecin conseil sur le respect de l'indication thérapeutique du MEDIATOR et sur l'existence d'un traitement associé à visée amaigrissante est donné sur un questionnaire papier après demande de renseignements auprès du prescripteur concerné.

Outre des données d'ordre administratif (identification prescripteur, sexe du patient, date de la prescription), il est relevé sur ce questionnaire des données médicales telles que les poids et taille du patient avec calcul de l'Indice de Masse Corporelle, les résultats des examens biologiques passés, les traitements amaigrissants associés.

Les questionnaires sont regroupés afin d'être saisis puis analysés.

Les informations recueillies sont retournées aux services concernés pour informer les prescripteurs des résultats de cette première phase d'étude et se préparer à la phase de contrôle des plus déviants aboutissant si nécessaire à des actions contentieuses.

RESULTATS

L'échantillon recueilli est composé de 568 prescriptions

- l'utilisation du MEDIATOR apparaît être très variable selon les départements :
  - 48 % des prescriptions proviennent de Côte d'Or
  - 28 % ..... de Saône et Loire
  - 20 %..... de l'Yonne
  - et 5 % ..... de la Nièvre

Comparativement à la structure démographique, la Côte d'Or est sur-représentée et la Nièvre sous-représentée.

- La population du régime général représente 87 % des prescriptions
- le régime agricole 12 %
et - le régime des travailleurs non salariés à peine 1 %

- les prescriptions concernant les patients de sexe féminin représentent 69 % des ordonnances

- dans 93 % des cas, le prescripteur est un généraliste
et dans 6 % des cas, le prescripteur est un endocrinologue

- il est constaté 35 % de prescriptions pour lesquelles l'indication thérapeutique du MEDIATOR n'est pas respectée soit 197 cas.

Ce taux de non respect est de.... - 43 % chez les patients de sexe féminin
et... - 17 % chez les patients de sexe masculin.

- ventilé selon la spécialité médicale, le taux de non respect de l'indication thérapeutique est de 55 % chez les spécialistes
contre 33 % chez les généralistes

- 7 médecins ont précisé "NR" (non remboursable) sur leurs prescriptions appliquant ainsi les nouvelles dispositions, mais il est à noter que dans 3 cas le traitement rentrait effectivement dans les indications thérapeutiques et que dans tous les cas, le pharmacien a présenté la dépense au remboursement.

- sur les 197 prescriptions ne respectant pas l'indication thérapeutique du MEDIATOR, on retrouve 98 prescriptions associées à des traitements à visée amaigrissante. Ces prescriptions sont essentiellement destinées à des patients de sexe féminin : 86 %.

- au surplus, l'étude de l'indice de masse corporelle de cette population (lorsqu'il est connu : 3 cas sur 4), montre que 2 patients sur 3 reçoivent du MEDIATOR alors que l'IMC n'est pas véritablement perturbé (<30), 2 patientes présentant même un état de maigreur (IMC<20).

Il s'agit là d'un détournement manifeste des indications thérapeutiques du MEDIATOR, avec des risques majeurs en terme de santé publique.

DISCUSSION - CONCLUSION

Cette étude est intéressante à divers titres :

- elle montre, si besoin était, que le travail en inter régime et à l'échelle de la région est possible dans une bonne coordination avec des résultats que seule la région permet d'espérer en terme de puissance d'étude. Les actions de communication à l'égard des professionnels de santé n'en ont que plus de poids.

- elle est importante en terme de Santé Publique, puisqu'au regard des résultats, on observe des traitements à visée amaigrissante chez des personnes qui n'en ont pas l'indication. Elle a permis de retrouver des polymédicamentations dont certaines présentent un caractère de dangerosité.

- elle a également permis d'identifier des médecins prescripteurs ne respectant pas l'indication thérapeutique du MEDIATOR de façon coutumière. Ces médecins feront l'objet de la deuxième phase de l'étude.

Ce travail dont l'objectif premier était d'apporter un éclairage sur l'utilisation réelle d'une spécialité en l'occurrence MEDIATOR, permet en fait de s'interroger sur le problème général du bon usage des spécialités pharmaceutiques dans le cadre de leurs indications thérapeutiques reconnues et validées.

Annexe 3-49

SYNTHESE

1. INTRODUCTION

L'ordonnance N° 96-344 du 24 avril 1996 relative à la maîtrise médicalisée des dépenses de santé a créé, dans son titre V, les Unions Régionales des Caisses d'Assurance Maladie (URCAM)

Dans l'attente de leur mise en place officielle et sous l'impulsion commune des services médicaux et administratifs de l'ensemble des régimes d'assurance maladie de la région BOURGOGNE, un comité régional de gestion du risque a été organisé.

L'analyse médico-administrative des postes de dépense a permis de dégager comme domaine d'intervention prioritaire LE POSTE PHARMACEUTIQUE.

A la demande du Comité Régional, une analyse sur le respect des indications thérapeutiques de cinq molécules, dont le MEDIATOR dans un premier temps, est diligentée.

Cette analyse doit se dérouler selon deux modalités.

- une première phase pédagogique, sous la forme d'une enquête collective.

et - une seconde phase normative sous la forme de contrôles individuels.

A l'issue de la première phase, devra être réalisé un ensemble d'actions systémiques validées par le Comité Régional opérationnel de coordination.

Les vecteurs choisis sont :

- Les instances conventionnelles
- Les journaux professionnels
- les supports d'information des caisses

Parallèlement à ces actions à visée systémique, seront effectués des ciblages des professionnels les plus déviants, et tout particulièrement lès responsables des prescriptions du MEDIATOR dans le cadre des régimes amaigrissants.

Ces praticiens feront l'objet de contrôles individuels spécifiques et seront à ce titre concernés par la seconde phase de ce travail sur le respect des indications thérapeutiques.

Pour le service médical du contrôle médical du régime général, chef de projet, les objectifs de ce travail sont les suivants.

- mesurer globalement à l'échelle des 4 départements bourguignons et des 3 régimes d'assurance maladie, le respect de la réglementation : Articles L 162-4 et L 315-3 du code de sécurité sociale.

- appréhender en terme de santé publique, l'incidence de ce non respect, et tout particulièrement dans le cadre des prescriptions à visée amaigrissante.

- cibler les professionnels les plus déviants.

Les résultats présentés ci-après concernent la première phase.

2. MATERIEL ET METHODES

2.1. Champ de l'enquête

L'étude porte sur l'ensemble des prescriptions de MEDIATOR tous praticiens confondus : omnipraticiens et spécialistes, et liquidées par les caisses d'Assurance Maladie de Bourgogne : Régime Général dont les sections locales mutualistes, Mutualité Sociale Agricole, régime des travailleurs non salariés.

2.2. Echantillon

L'individu statistique ciblé par l'enquête est la prescription de MEDIATOR.

L'échantillon est constitué par la totalité des ordonnances présentées au remboursement au cours d'une période de 5 journées consécutives située entre le 01 avril 1997 et le 30 avril 1997.

La période de 5 jours était, pour des raisons d'organisation interne et de charge de travail, laissée à l'appréciation de chacune des caisses d'assurance maladie concernées par l'enquête.

Chaque service administratif avait pour responsabilité la saisie des prescriptions de MEDIATOR, par tri manuel au fil de l'eau et de les transmettre aux services médicaux.

L'échantillon ainsi composé comporte 568 prescriptions de MEDIATOR.

Cependant, compte tenu de l'impossibilité que nous avons de valider cet échantillon de par l'absence du codage pharmacie, nous ne pouvons pas considérer cet échantillon comme représentatif.

2.3. Les modalités de recueil de l'information

Le recueil de l'information par les médecins conseils (30 praticiens) s'est fait sur un questionnaire spécifique à l'enquête (Annexe 1).

Tous les individus statistiques ont fait l'objet d'un questionnaire.

L'origine des informations recueillies sur les questionnaires papier est le dossier médical du service médical, les renseignements fournis par les médecins prescripteurs et si nécessaire l'examen du malade.

S'agissant du versant pédagogique de l'analyse du respect des indications thérapeutiques, il était prévu un grand nombre d'échanges avec les praticiens libéraux. Un fort effet psychologique était attendu de cette démarche.

L'opportunité de l'examen clinique des patients était laissée à l'appréciation des médecins conseils en fonction de la situation, mais dans le strict respect du décret n° 96-786 du 10 septembre 1996.

Le recueil de l'information concernait :

- des éléments d'identification : département, régime...
- des données médicales : poids, taille, résultat des examens biologiques...
- l'avis des praticiens conseils.

Le questionnaire a été retranscrit sur une grille de saisie informatique rigoureusement anonyme établie sous EPI-INFO version 5.

2.4. L'exploitation des données

Compte tenu des réserves pouvant être exprimées sur la représentativité statistique de l'échantillon :

- saisie manuelle sans source de contrôle (absence de codage)
- 5 jours en flux continu sans possibilité de validation

Nous ne parlerons pas d'analyse statistique mais d'exploitation des données.

Cependant compte tenu de la qualité de l'échantillon, il est fort probable mais non certain que la réalité corresponde aux résultats qui vont être ci-dessous développés.

Il est par ailleurs important de préciser qu'il n'existe aucune possibilité de lien entre les questionnaires papier et la base de données informatiques sous EPI-INFO.

Les logiciels utilisés pour l'exploitation sont
- EPI-INFO version 5
et - SPSS version 6-1-2

Enfin, les questionnaires papier seront détruits après la diffusion des conclusions de cette étude.

3. RESULTATS

L'échantillon est composé de 568 prescriptions de MEDIATOR.

Les résultats seront présentés en huit parties :

- résultats globaux : répartition par département
- les prescripteurs
- les patients
- analyse des indices de masse corporelle
- les bilans biologiques
- le respect des indications thérapeutiques
- les traitements à visée amaigrissante

3.1. Résultats globaux répartition par département et par régime

Tableau I Par département

Département	Observations	Pourcentages	Structure démographique
Côte d'or	268	47,2	32,2
Nièvre	25	4,4	13,6
Saône et Loire	160	28,2	33,9
Yonne	115	20,2	20,3
BOURGOGNE	568	100	100

Comparativement à leur poids structurel, la Côte d'Or est sur-représentée, et la Nièvre sous-représentée. La différence qui existe dans la répartition de l'âge des populations ne peut pas à elle seule expliquer ce constat.

Tableau II Par regime

Régime	Echantillon = répartition %	Bénéficiaires = Répartition BOURGOGNE %
Regime général	87,6	82,7
MSA	12	11,2
TNS	0,4	6,1

La part des TNS "semble" sous représentée, mais il est à noter que pour ce régime, aucun dossier n'a été recueilli dans trois départements.

3.2. Les prescripteurs

3.2.1. *Répartition*

Tableau III

Spécialité	Observation	Pourcentage
Omnipraticiens	527	92,8
Endocrinologue	36	6,4
Autres	5	0,8

La part des omnipraticiens prédomine très largement.

La part des prescriptions des endocrinologues est de 10 %. Elle est nulle ou négligeable pour certains départements : Saône et Loire et Yonne.

3.2.2. *Signalement de l'indication non remboursable*

L'article 162-4 du code de sécurité sociale précise que les médecins qui prescrivent une spécialité pharmaceutique en dehors des indications thérapeutiques ouvrant droit au remboursement ou à la prise en charge par l'assurance maladie, sont tenus de le signaler sur l'ordonnance.

Parmi les 568 prescriptions recueillies, 7 fois (1,2 %) la mention NR (Non Remboursable) a été indiquée. Tous les cas concernent des généralistes et seuls 2 départements sont intéressés.

Il est par ailleurs intéressant de signaler que les 7 cas ont fait l'objet d'un remboursement, le MEDIATOR ayant été facturé comme remboursable par le pharmacien.

Dernier constat : dans 3 des 7 cas, l'indication thérapeutique était en fait respectée.

Il y a manifestement une méconnaissance totale des textes.

3.3. Les patients - Répartition

Tableau IV

Sexe	Nombre	Pourcentage
Hommes	178	31,3
Femmes	390	68,7

La répartition par département oscille autour de ces valeurs.

Au plan régional nous connaissons la répartition des diabètes non insulino-dépendant (enquête ALD 30 de 1995) exonérés du ticket modérateur. Les populations sont très certainement très différentes mais la logique voudrait que globalement les répartitions ne soient pas très éloignées.

Or la répartition des DNID est : femme 53 %, hommes 47 % - valeurs à rapprocher de la répartition de notre échantillon : 69 % - 31 %

Le MEDIATOR, traitement adjuvant au traitement des diabètes asymptomatiques avec surcharge pondérale et des hypertriglycéridémies trouve très probablement, du moins chez la femme, des indications autres.

3.4. Les indices de masse corporelle - les bilans biologiques

Compte tenu des indications du MEDIATOR "avec surcharge pondérale", et des indications détournées connues du service médical, c'est-à-dire les traitements à visée amaigrissante, les indices de masse corporelle de la population ont été étudiés.

Pour cela la formule suivante a été appliquée :

$$IMC = \frac{Poids}{(Taille)^2} \quad (en\ kg/m^2)$$

Tableau V N = 304 observations

Observations	Nombre	Pourcentage
IMC < 20	2	0.6
20 IMC 24,9	55	18,1
25 IMC 29,9	109	35,8
30 IMC 39,9	118	38,9
IMC 40	20	6,6

Ce tableau objective les résultats globaux y compris les cas "avoués" de régimes amaigrissants.

La bibliographie parle d'obésité moyenne pour un IMC supérieur à 27,8 pour un homme et 27,9 pour une femme, et d'obésité massive à partir de 31,1 et 32,3.

Tableau VI Type d'obésité : N = 304

	Hommes	Femmes	Total
pas de surcharge pondérale	6	51	57
surcharge modérée	27	38	65
Obésité moyenne	18	67	85
Obésité massive	34	63	97
Total	85	219	304

La méthodologie prévoyait l'interrogation du médecin prescripteur sur l'existence d'un bilan biologique, la date du dernier bilan et les résultats. Il nous est donc possible d'étudier, pour chaque classe d'IMC, le contenu des bilans biologiques et le comportement des prescripteurs.

3.4.1. *Population "pas de surcharge pondérale"(IMC <25), bilans biologiques et prescripteurs* : N = 57

3.4.1.1. *Le bilan biologique : répartition par sexe*

Tableau VI Existence retrouvée d'un bilan et le sexe

Bilan	Hommes	Femmes	Total
Non	0	23	23
Oui	6	28	34
Total	6	51	57

Dans 23 cas, il n'a pas été retrouvé d'examen biologique notamment la glycémie et la triglycéridémie

3.4.1.2. *Le bilan biologique : les résultats*

Tableau VII **Dosage des triglycérides si réalisation d'un bilan biologique**
Hommes Nle = 0,26 à 1,6 g/l - femmes Nle = 0,22 à 1,27 g/l

TRIGLYCERIDES	Hommes	Femmes	Total
Non dosés	0	4	4
Normaux	1	10	11
Elevés	5	14	19
Total	6	28	34

L'absence de surcharge pondérale, compte tenu des indications thérapeutiques, rend la prescription de MEDIATOR justifiée par l'élévation des triglycérides soit 19 cas sur 57 (33 %)..., les autres dossiers étant injustifiés de par :

- l'absence d'une surcharge pondérale
- l'absence d'un bilan biologique
- l'absence d'une élévation des triglycérides

Tableau VIII **Dosage de la glycémie, réalisation d'un bilan biologique**

Glycémie	Observations
Non dosée	5
Inférieure ou égale à 1 g	18
Comprise en 1 g et 1,4 g	7
Elevée	4
Total	34

4 patients ont présenté un véritable diabète = glycémie > 1,4 g
et 7 patients ont présenté une glycémie comprise en 1 g et 1,4 g

Il n'existait pas chez ces patients de surcharge pondérale. Ceux-ci ne justifiaient donc pas, au regard des indications thérapeutiques, une prescription de MEDIATOR.

L'ancienneté moyenne des examens de biologie, lorsqu'ils ont été réalisés (34/57), est d'une année pour la triglycéridémie et d'une dizaine de mois pour la glycémie.

Cette ancienneté est de 10 mois lorsqu'il existe une élévation de la triglycéridémie et sans changement pour l'élévation de la glycémie.

3.4.1.3. *Le bilan biologique : les prescripteurs*

Au sein de cette population qui ne présente pas de surchage pondérale, examinons le comportement des professionnels.

Tableau IX Prescripteurs et réalisation d'un bilan biologique

Spécialités	Pas de bilan	Bilan	Total
Omnipraticien	21	31	52
Endocrinologue	2	3	5
Total	23	34	57

Tableau X Respect des indications thérapeutiques

Spécialités	Non Précisé	Non	Oui	Total
Omnipraticien	1	31	20	52
Endocrinologue	0	4	1	5
Total	1	35	21	57

Tableau XI Traitements à visée amaigrissante associés au MEDIATOR

Spécialités	Non Précisé	Non	Oui	Total
Omnipraticien	1	27	24	52
Endocrinologue	0	3	2	5
Total	1	30	26	57

La part de prescription des endocrinologues est faible, ce qui, compte tenu des indications du MEDIATOR, peut s'expliquer.

On constate néanmoins que pour les patients avec un IMC normal leur pratique vis à vis de cette molécule est identique à celle des omnipraticiens pour ce qui concerne :

- la part de traitement sans examens retrouvés

- la part de traitement en dehors des indications thérapeutiques
- la part de traitement à visée amaigrissante associé

3.4.2. *Population "surcharge pondérale modérée", bilan biologique et prescripteurs*

Critères retenus IMC compris entre 25 et 27,8 pour l'homme
et IMC compris entre 25 et 27,9 pour la femme

3.4.2.1. *le bilan biologique : répartition par sexe*

Tableau XI **Existence d'un bilan biologique et le sexe**

Bilan	Hommes	Femmes	Total
Non	3	6	9
Oui	24	32	56
Total	27	38	65

Dans 9 cas sur 65 il n'a pas été signalé de bilan biologique ce qui, proportionnellement, est inférieur aux résultats retrouvés lors d'IMC normal (23/57).

On pourrait penser que le bilan biologique ne dépend pas de la prescription de MEDIATOR mais de l'état du patient.

3.4.2.2. *le bilan biologique : résultats*

Tableau XII **Dosage des triglycérides si réalisation d'un bilan biologique**
Hommes N = 0,26 à 1,6 g/l - femmes N = 0,22 à 1,27 g/l

Triglycérides	Hommes	Femmes	Total
non dosée	4	2	6
Normaux	11	16	27
Elevés	9	14	236
Total	24	32	56

Tableau XIII Dosage de la glycemie si réalisation d'un bilan biologique

Glycémie	Hommes	Femmes	Total
non dosee	0	4	4
Inférieure ou égale à 1 g	5	17	22
Compnse entre 1 g et 1,4 g	11	8	19
Elevée	8	3	11
Total	24	32	56

Dans 9 cas, il n'y a pas eu d'examen, et ce, malgré la légère surcharge pondérale : rien ne justifie donc le traitement.
De même comment expliquer le traitement de deux patients pour lesquels la glycémie n'a pu être retrouvée et qui présentent par ailleurs une triglycéridémie normale.

L'ancienneté moyenne des examens biologiques est d'une année pour la triglycéridémie et d'une dizaine de mois pour la glycémie. Ces données sont identiques à la classe des patients avec IMC normal.

3.4.2.3. le bilan biologique : le respect des indications thérapeutiques

Tableau XIV Respect des indications et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
Respect	33	0	33
Non respect	23	9	32
Total	56	9	65

Tableau XV Traitement à visée amaigrissante associé au MEDIATOR et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
Visée amaigrissante	6	7	13
Pas de visée amaigrissante	50	2	52
Total	56	9	65

Sur les 9 dossiers sans bilan biologique fourni qui ne respectent pas les indications thérapeutiques, 7 correspondent à des prescriptions de MEDIATOR avec des traitements à visée amaigrissante associés : 3/3 chez l'homme et 4/6 chez la femme.

Tableau XVI Respect des indications thérapeutiques, traitement à visée amaigrissante associé au MEDIATOR, si existence d'un bilan biologique

	Respect	Non respect	Total
Visée amaigrissante	0	6	6
Pas de visée amaigrissante	33	17	50
Total	33	23	56

Les 6 patients recevant un traitement à visée amaigrissante associé présentent :

- un IMC très peu augmenté à 26-27,
- une glycémie normale ou proche de la normale,
- des triglycérides non dosés, normaux ou peu augmentés.

3.4.2.4. le bilan biologique : les prescripteurs

Au sein de cette population qui présente une surchage pondérale modérée, examinons le comportement des professionnels

Tableau XVII Prescripteurs et réalisation d'un bilan biologique

Spécialités	Pas de bilan	Bilan	Total
Endocrinologues	1	8	9
Omnipraticiens	8	48	56
Total	9	56	65

Tableau XVIII Respect des indications thérapeutiques

Spécialités	Non	Oui	Total
Endocrinologues	6	3	9
Omnipraticiens	26	30	56
Total	32	33	65

Tableau XIX Traitement à visée amaigrissante associé au MEDIATOR

Spécialités	Non	Oui	Total
Endocrinologues	8	1	9
Omnipraticiens	44	12	56
Total	52	13	65

La part des prescriptions faites par les endocrinologues diabétologues est faible se situant autour de 10 %, tout comme pour le groupe des patients avec un indice de masse corporelle normal.

Concernant les anomalies, il semblerait que quelles que soient les spécialités, les tendances soient les mêmes.

3.4.3. *Population "obésité moyenne", bilans biologiques et prescripteurs*

Critères retenus :
IMC compris entre 27,8 et 31,1 pour l'homme
et 27,9 et 32,3 pour la femme

3.4.3.1. *le bilan biologique : répartition par sexe*

Tableau XX Existence d'un bilan et le sexe

Bilan	Hommes	Femmes	Total
non	5	18	23
oui	13	49	62
Total	18	67	85

Dans 23 cas sur 85, alors que ces patients présentent une obésité moyenne et qu'un traitement est prescrit, il n'a pas été possible au médecin traitant contacté par le médecin conseil, de présenter les résultats d'examens de biologie notamment : triglycéridémie et/ou glycémie.

3.4.3.2. *le bilan biologique :les résultats*

Tableau XXI Dosage des triglycérides si réalisation d'un bilan biologique
Hommes - N : 0.26 à 1.60 g/l
Femmes - N : 0.22 à 1.27 g/l

Triglycérides	Hommes	Femmes	Total
non dosés	3	6	9
normaux	7	21	28
élevés	3	22	25
Total	13	49	62

Tableau XXII Dosage de la glycémie, si réalisation d'un bilan biologique

Glycémie	Hommes	Femmes	Total
non dosée	0	3	3
< ou = a 1 g/l	2	11	13
> 1 g/l < 1.40 g/l	3	24	27
élevée	8	11	19
Total	13	49	62

On remarque que les 3 patientes chez lesquelles on ne retrouve pas de dosage de la glycémie, présentent, pour 2 d'entre elles, un dosage de la triglycéridémie rigoureusement normal. Il s'agit de prescriptions de MEDIATOR avec un traitement à visée amaigrissante associé.

De même, parmi les 9 patientes sans bilan des triglycérides, 2 d'entre elles présentent un bilan glycémique normal. Il s'agit, dans les deux cas, de prescriptions de MEDIATOR avec un traitement à visée amaigrissante associé.

L'ancienneté moyenne des examens est de 7 à 8 mois autant pour la triglycéridémie que pour la glycémie. Il semble que la fréquence des examens ait tendance à augmenter avec l'importance de l'IMC.

3.4.3.3. le bilan biologique : le respect des indications thérapeutiques

Tableau XXIII Respect des indications et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
Respect	41	1	42
Non respect	21	22	43
Total	62	23	85

Tableau XXIV Traitement à visée amaigrissante associé au MEDIATOR et existence des indications et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
non précisé	1	0	1
à visée amaigrissante	10	12	22
pas de visée amaigrissante	51	11	62
Total	62	23	85

Sur les 23 dossiers sans bilan biologique fourni, 12 correspondent à des prescriptions associées à des traitements à visée amaigrissante : 1 fois chez l'homme et 11 fois chez la femme.

Tableau XXV Non respect et traitement à visée amaigrissante, si existence d'un bilan biologique

	Respect	Non respect	Total
Non précisé	1	0	1
Visée amaigrissante	0	10	10
pas de visée amaigrissante	40	11	51
Total	41	21	62

Les 10 patientes recevant un traitement à visée amaigrissante associé présentent un bilan biologique normal. Dans 2 cas, le dosage des triglycérides n'a pas été retrouvé.

3.4.3.4. le bilan biologique : les prescripteurs

Au sein de cette population qui présente une obésité moyenne, examinons le comportement des professionnels

Tableau XXVI Prescripteurs et réalisation d'un bilan biologique

Spécialités	Pas de bilan	Bilan	Total
Endocrinologue	3	5	8
Homéopathe	0	1	1
omnipraticien	20	55	75
Total	23	62	85

Tableau XXVII Respect des indications therapeutiques

Spécialités	Non	Oui	Total
Endocrinologue	5	3	8
Homéopathe	1	0	1
omnipraticien	36	39	75
Psychiatre	1	0	1
Total	43	42	85

Tableau XXVIII Traitement à visée amaigrissante associé au MEDIATOR

Spécialités	Non précisé	Non	Oui	Total
Endocrinologue	0	5	3	8
Homéopathe	0	0	1	1
omnipraticien	1	57	17	75
Psychiatre	0	0	1	
Total	1	62	22	85

Au total : 50 % de non respect dont 25 % de prescriptions associées à des traitements à visée amaigrissante.
Les femmes sont très largement concernées, 21/22 dans les cas de traitement à visée amaigrissante associé.

Quel que soit le prescripteur, la proportion d'anomalies est sensiblement constante.

3.4.4. *population "obésité massive", bilans biologiques et prescripteurs*

Critères retenus :
IMC supérieur à 31.1 pour les hommes
et 32.3 pour les femmes.

3.4.4.1. *Le bilan biologique : répartition par sexe*

Tableau XXIX Existence d'un bilan et le sexe

Bilan	Hommes	Femmes	Total
Non	3	8	11
Oui	31	55	86
Total	34	63	97

Au sein de cette population le nombre de traitements sans bilan biologique réalisé ou retrouvé par le médecin traitant est, "semble-t-il", beaucoup plus faible que dans les autres classes d'IMC - (11/97).
Compte-tenu des réserves émises sur la représentativité de notre échantillon, ceci ne peut être qu'un constat.

3.4.4.2. le bilan biologique : les résultats

Tableau XXX Dosage des triglycérides si réalisation d'un bilan biologique
Hommes - N : 0,26 à 1,60 g/l
Femmes - N : 0,22 à 1,27 g/l

Triglycérides	Hommes	Femmes	Total
non dosés	4	12	16
normaux	14	11	25
élevés	13	32	45
Total	31	55	86

Tableau XXXI Dosage de la glycémie si réalisation d'un bilan biologique

Glycémie	Hommes	Femmes	Total
Non dosée	1	2	3
Inférieure ou égale à 1 g	8	11	19
Comprise entre 1 g et 1,4 g	13	28	41
Elevée	9	14	23
Total	31	55	86

Parmi les 16 patients qui n'ont pas eu de dosage des triglycérides, 4 d'entre eux présentent une glycémie normale ne justifiant pas à priori le traitement par MEDIATOR.

Par contre, parmi les 3 patients n'ayant pas eu de dosage de la glycémie, tous présentent des valeurs élevées de la triglycéridémie.

L'ancienneté moyenne des examens biologiques est de l'ordre de 8 mois environ. Il n'y a pas de différence avec la classe précédente.
Néanmoins, la tendance retrouvée précédemment sur un raccourcissement des délais entre les deux examens semble confortée.

3.4.4.3. le bilan biologique : le respect des indications thérapeutiques

Tableau XXXII Respect des indications thérapeutiques et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
Respect	63	1	64
Non respect	23	10	33
Total	86	11	97

Tableau XXXIII Traitement à visée amaigrissante associé au MEDIATOR et existence d'un bilan biologique

	Bilan biologique	Pas de bilan	Total
Non précisé	1	0	1
Visée amaigrssante	10	4	14
Pas de visée amaigrissante	75	7	82
Total	86	11	97

Sur les 11 dossiers sans bilan biologique retrouvé, 4 correspondent à des prescriptions associées à des traitements à visée amaigrissante :

- 1 fois chez l'homme

et - 3 fois chez la femme.

La proportion est la même que dans la classe d'IMC précédente.

Tableau XXXIV Non respect des indications thérapeutiques, traitement à visée amaigrissante associé au MEDIATOR, si existence d'un bilan biologique

	Respect	Non respect	Total
Non précisé	0	1	1
Visée amaigrissante	1	9	10
Pas de visée amaigrissante	62	13	75
Total	63	23	86

Parmi les 9 patients recevant le MEDIATOR en vue d'un régime amaigrissant, tous présentent un bilan normal ou peu modifié. Par contre, le patient dont le traitement est associé à un traitement à visée amaigrissante, présente une élévation importante des triglycérides.

En admettant "l'indication thérapeutique du MEDIATOR dans les régimes amaigrissants" retenue, il est fort étonnant que le médecin traitant ne s'enquière pas d'un minimum d'indicateurs biologiques avant de mettre en place ce type de traitement puisque dans 52 % (39/75) des cas, il n'est pas retrouvé de bilan biologique.

3.7. Le respect des indications et les prescripteurs

La part des prescriptions des spécialistes est de 7,2 % (41/568) qui sont endocrinologues - diabètologues dans 36 cas (36/41).

Il n'existe pas de différence dans la réalisation ou la connaissance des résultats d'un bilan biologique entre les spécialistes et les omnipraticiens.

Par contre la connaissance du poids et de la taille, donc de l'IMC est de meilleure qualité chez les spécialistes.

Tableau XXXXI Respect des indications thérapeutiques

Spécialités	Non précisé	Non	Oui	Total
Omnipraticiens	18	175	334	527
Endocrinologues	0	20	16	36
Autres spécialités	1	2	2	5
Total	19	197	352	568

Avec beaucoup de prudence sur le résultat du test, il semble qu'il y ait une différence significative entre le respect chez les omnipraticiens et chez les endocrinologues.

Ces derniers respectent moins souvent les indications thérapeutiques (55 % contre 33 %) ; par contre la part due aux prescriptions de MEDIATOR associées au traitement à visée amaigrissante est identique : 19 % contre 17 %.

Lorsque nous étudions l'ensemble des dossiers, tous prescripteurs confondus, nous retrouvons :

- non respect des indications thérapeutiques .....33 %
- Traitement à visée amaigrissante associé .....15 %

Ces deux valeurs sont probablement les plus proches de la réalité.

3.8. Analyse spécifique des prescriptions associées à des traitements à visée amaigrissante

98 traitements sont associés à des traitements à visée amaigrissante parmi lesquels les médecins conseils ont justifié 7 prescriptions au regard des résultats des bilans biologiques.

Tableau XXXXII Répartitions des IMC si traitement amaigrissant associé (si IMC connu)
N =75 (23 dossiers sans information sur l'IMC)

	Homme	Femmes	Total	Pourcentages
IMC < 20	0	2	2	2.7
20 IMC 24,9	1	23	24	32
25 IMC 29,9	4	20	24	32
30 IMC 39,9	5	18	23	30.6
IMC 40	0	2	2	2.7
Total	10	65	75	100

Plusieurs questions:

- *Comment expliquer la nette prédominance de la population féminine* : 65 dossiers sur 75 ?
- *Comment expliquer les prescriptions de MEDIATOR associées à des traitements dits à visée amaigrissante sans connaissance précise du poids et de la taille soit 23 dossiers sur 98 ?*
- *Comment expliquer les prescriptions associées à des traitements dits à visée amaigrissanté sans bilan biologique préalable* : 45 dossiers sur 98 (36 dossiers sur 75 lorsque l'IMC est connu) ?
- *Comment expliquer un traitement à visée amaigrissante associé au MEDIATOR chez des patients*
  - en état de maigreur ..... 2 = IMC < 20
  - de poids normal ..... 24 = IMC > 20 et < 25
  - avec un surpoids léger ..... 24 = IMC > 25 et < 30
    soit plus de 66 % des patients ?
- *Comment expliquer un traitement dit "amaigrissant"associé au MEDIATOR chez des patients présentant une obésité, voire une obésité massive ?*
  - sans bilan biologique connu, on retrouve 10 dossiers.
  - avec un bilan biologique non perturbé, 15 dossiers. Où sont la place du régime et celle du suivi diététique ?

Autant de questions qui en terme de santé publique mériteraient une réponse.

Annexe 3-49

4. AU TOTAL

Le MEDIATOR a comme indications thérapeutiques actuellement inscrites à l'autorisation de mise sur le marché :

- "Adjuvant du régime adapté dans les hypertriglycéridémies, la poursuite du régime étant toujours indispensable.
- Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale".
- le laboratoire déclare que ce produit n'a jamais fait la preuve de son efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose.
  Ce produit est actuellement remboursé à 65 %.

Compte tenu du fait que dans un tiers des cas les indications thérapeutiques ne sont pas respectées,

Compte tenu du fait que dans 15 à 20 % des cas le but avoué est une prescription associée à un traitement à visée amaigrissante alors que cette molécule n'a pas cette indication thérapeutique,

Compte tenu du fait que dans les traitements déclarés à visée amaigrissante associés

- plus de 20 % des médecins ne peuvent pas fournir d'information sur le poids et la taille de leur patient
- 45 % ne retrouvent pas, ne possèdent pas ou n'ont pas fait réaliser de bilan biologique
- 66 % des patients ne présentent pas d'obésité avérée IMC < 30 (si IMC connu).

(On peut s'interroger sur les raisons qui ont poussé le médecin à prescrire en dehors de l'indication thérapeutique, est-ce par manque d'information ?)

Compte tenu du fait que l'étude de la bibliographie et tout particulièrement celle la revue PRESCRIRE de mai 1997 (tome 17 N° 173) **et décembre 1997** (tome 17 n° 179) **où sont retrouvées les conclusions suivantes :**

" Après 20 ans de commercialisation du BENFLUOREX (Médiator), on ne sait toujours pas à quoi sert ce médicament aux diabétiques... Le seul essai comparant le BENFLUOREX à la METFORMINE est ininterprétable... Le maintien sur le marché et la prise en charge par l'assurance maladie de ce médicament doivent être reconsidérés".

Il semble évident que les conditions de prise en charge de ce médicament doivent être reconsidérées.

Annexe 3-49

BIBLIOGRAPHIE

- Indications thérapeutiques
  - Adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable.
  - Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
    Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis le,

Madame le professeur BLUM-BOISGARD
Monsieur le Professeur ALLEMAND
Monsieur le Professeur CHOUTET

Objet : prescription de Médiator®

Madame, Messieurs

Je vous remercie de m'avoir communiqué les résultats de l'étude portant sur les modalité s d'utilisation de la spécialité Médiator® qui ont été examinés avec attention.

En réponse aux différents points que vous avez soulevés dans votre courrier, je souhaite vou s appportez ces quelques informations suivantes :

- Les conditions de prescription de cette spécialité n'ont pas été restreintes puisque c e médicament n'est pas indiqué dans la prise en charge de l'obésité. Toutefois, en raison de sa parenté structurale avec les amphétaminiques, l'Agence du Médicament conscient e du risque de report de prescription, a décidé dès les mesures prises à l'encontre de s anorexigènes,en Octobre 1995,la mise en place d'une enquête de pharmacovigilance et d'un suivi des chiffres de vente de cette spécialité.

-sur le plan de la Pharmacovigilance, cette spécialité commercialisée depuis 1974 n'a pas fait l'objet d'une alerte particulière.

Les conditions d'utilisation de cette spécialité apparaissent également comme une préoccupatio n européenne, aussi une enquête a t-elle été mise en place sous la repsonsabilité de l'Italie. L'Agence du Médicament maintient donc la surveillance attentive de cette spécialité dan s l'attente des données Européennes.

Nous vous tiendrons informés de la suite de ce dossier.

Restant à votre disposition pour tout complément d'information, je vous prie de croi re Madame, Messieurs à l'assurance de nos sentiments distingués

Mon cher confrère,

J'ai bien reçu votre réponse à mes inquiétudes concernant le benfluorex.

Je note bien que l'Agence du médicament ne classe pas le benfluorex parmi les amorexigènes ce qui contredit l'Organisation mondiale de la Santé qui classe le benfluorex dans la liste "anorexigenic agents".(1)

La question me semble suffisamment grave pour que vous interrogiez les experts de l'OMS sur les effets indésirables potentiels de ce médicament. A défaut, pouvez-vous me donner leurs coordonnées afin que je les interroge moi-même ?

Je confirme l'utilisation massive, dans AOM, comme amorexigène en ville. Cette utilisation m'inquiète, pourquoi ne vous inquiète-t-elle pas ?

Inquiète-t-elle ou pas l'Agence du Médicament ?

28, rue des Jacinthes
11100 NARBONNE
Tél. : 04 68 65 23 91

Le sujet me paraît grave c'est pourquoi je demande toute votre vigilance et (utilisation comme anorexigène en pratique, Antidiabétique, anti hyperthyroïdie en théorie) et de tirer tout cela au clair avec les experts de l'OMS.

Je vous remercie et vous prie de croire à mes sentiments les meilleurs.

Gutierrez

du mois de 1990.

Chère amie,

Je te prie de trouver ci-joint , pour information,le rapport que nous avons rédigé pour le GT du 2 octobre concernant MEDIATOR, et que je t'ai déjà faxé.

Je te prie de recevoir mes amicales salutations.

Martine DAVID-LAROCHE

P.S. : je te joins d'autre part, les données du DOREMA concernant MEDIATOR, qui seront présentées au Comité Technique de décembre 1998.

CENTRE REGIONAL DE PHARMACOVIGILANCE DE FRANCHE COMTE
CHU Jean Minjoz 25030 BESANCON Cedex

Analyse des données de Pharmacovigilance relevées lors des études cliniques de benfluorex (MEDIATOR), réalisées en vue de la validation du produit dans l'indication : diabète de type 2

Experts:
P.R. BECHTEL
M. DAVID - LAROCHE

Annexe 3-52

Le présent rapport est établi à partir de l'analyse des dossiers fournis par l'Agence du Médicament, Direction de l'Evaluation intitulée :

- Etude d'efficacité du Benfluorex versus placebo (analyse principale) volume 1/13 et 2/3

- Efficacité du Benfluorex par voie orale chez 500 patients diabétiques de type 2, mal contrôlés par le régime seul, volume 1/29 et 2/29.

Dans les faits, l'ensemble des données se trouvant dans les volumes 1/29 et 2/29 et afin éviter toute erreur liée à une redondance entre les deux dossiers, le présent rapport est essentiellement basé sur les volumes 1/29 et 2/29.

Introduction.

Cette étude de pharmacovigilance concerne un essai clinique randomisé en aveugle portant sur 722 malades traités, soit par Benfluorex (294 malades), Metformine (284 malades) ou placebo (144 malades).

L'âge moyen était de 56 ans+/- 9 ans avec comme extrême : 33 ans -72 ans.

La majorité des malades présentait des pathologies associées au diabète de type 2 avec les thérapeutiques correspondantes.

Nous distinguerons dans notre analyse :

-des événements indésirables liés soit au diabète, à la pathologie associée ou au traitement.

- des événements indésirables émergents : événements indésirables qui sont apparus après la mise en route du traitement, objet de l'étude. Ces événements indésirables n'étaient pas rapportés à S0 (début de la période de traitement) ou présents à S0, ils se sont aggravés au cours de l'étude.

- DES EFFETS INDÉSIRABLES, tous émergents, en relation avec le traitement, objet de l'étude. Après vérification nous avons accepté les imputations telles qu'elles étaient faites dans les dossiers.

Annexe 3-52

1°) Evènements et/ou effets indésirables apparus au cours de l'étude. (tableau I)

Sur le total des 722 malades traités, 178 (24,7%) ont présenté au moins un évènement indésirable.
Le nombre de malades ayant présenté au moins un évènement indésirable sont répartis de la façon suivante :

- placebo : 30 (20,8%)

- benfluorex : 73 (24,8%)

- metformine : 75 (26,4%)

Le nombre de malades ayant présenté au moins un évènement indésirable émergent est de 153 (21,2%).
La répartition entre les traitements étant de :

- placebo : 24 (16,7%)

- benfluorex : 64 (21,8%)

- metformine : 65 (22,9%)

Quel que soit le type d'évènement indésirable il n'y a pas de différence entre benfluorex et metformine

Le nombre total d'évènements indésirables émergents est de 592 réparti comme suit:

- placebo : 96

- benfluorex : 224

- metformine : 272

Le nombre total **d'effets indésirables émergents** est de 223 réparti entre les trois groupes de la façon suivante :

- placebo : 32

- benfluorex : 80

- metformine : 111

Parmi les évènements indésirables émergents, 64 ont été classés comme étant sévères :

- placebo : 15 (16%)
- benfluorex : 19 (8%)
- metformine : 30 (11%)

Parmi ceux-ci, 34 sont des **effets indésirables émergents** en rapport avec le traitement :

- placebo : 8
- benfluorex : 5
- metformine : 21

Les 5 **effets indésirables émergents** sévères attribués à benfluorex sont :

- un trouble de l'équilibre
- un vertige
- deux diarrhées
- un ballonnement abdominal

Les investigateurs ont de plus caractérisé comme étant des effets indésirables **émergents graves,** sans hospitalisation, mais en rapport avec le traitement par benfluorex :

- un vertige à la 13e semaine
- une urticaire à la 5e semaine.

De plus des évènements indésirables graves ou assimilés graves (tableau II) ont été rapportés dans le groupe traité par benfluorex.

Ces événements sont réputés sans relation avec le traitement.

2°) Evènements indésirables émergents les plus fréquents. (tableau III)

Il s'agit d'évènements indésirables, dont certains peuvent être qualifiés **d'effets indésirables car en rapport avec le traitement** qui pour la plupart sont des manifestations de type gastro-intestinal :

- diarrhées
- nausées
- douleurs abdominales

avec une prédominance des diarrhées (Benfluorex: 15 malades (5,1%), Metformine: 39 malades (13,7%)..

Les autres évènements indésirables dont certains peuvent être qualifiés d'effets indésirables avec le traitement concernent des désordres de l'état général (asthénie, vertige) et le système ostéo-articulaire (myalgie, douleurs lombaires).

L'ensemble de ces effets indésirables sont cités dans les RCP et correspondent aux effets indésirables du benfluorex, qui fait l'objet actuellement d'une enquête de Pharmacovigilance.

On notera par ailleurs qu'aucun effet de type atteinte hépatique, atteinte des lignées sanguines, atteinte rénale n'a été observé au cours de cet essai clinique.

CONCLUSION.

1°) Tous les effets indésirables rapportés au traitement sont des effets connus.

2°) Les effets indésirables les plus fréquents concernent la sphère digestive avec notamment des diarrhées, ce qui est également parfaitement conforme avec ce que la Pharmacovigilance connnait de ces médicaments.

3°) La comparaison entre benfluorex et metformine n'est pas facile. Il semblerait que dans cette série de malades traités les effets indésirables, identiques pour les deux produits, aient été un peu moins fréquents dans le groupe benfluorex que dans le groupe metformine.

4°) On notera un nombre non négligeable "d'effets indésirables" dans le groupe placebo, notamment ceux concernant le système gastro-intestinal (15 effets indésirables, soit 10,4%).

Tableau des événements et effets indésirables au cours de l'étude

	Placebo	Benfluorex	Metformine	TOTAL
Nb patients inclus	144	294	284	722

Lab. Biopharma (Servier)

antidiabétique ?

Le *benfluorex*, Mediator° des laboratoires Servier, est commercialisé en France depuis 1976, sous forme de comprimés dosés à 150 mg (**a**). Chimiquement, le *benfluorex* est proche d'autres substances anorexigènes dont la *fenfluramine* (Pondéral°, Isoméride° pour la forme dextrogyre, du même groupe Servier) (**b**)(1). Une de ses indications officielles, « *adjuvant au régime dans le diabète asymptomatique avec surcharge pondérale* » fait l'objet depuis de nombreuses années d'une campagne promotionnelle récurrente (**c**)(2). Pour répondre à la demande de lecteurs qui nous interrogent régulièrement sur l'intérêt éventuel du *benfluorex* chez les diabétiques, et sur les affirmations de certains visiteurs médicaux tendant à faire croire que le *benfluorex* serait aussi efficace que la *metformine* (Glucinan°, Glucophage°, Stagid°), nous avons recherché les données disponibles dans le dossier d'évaluation clinique (**d**).

Le traitement des diabétiques devrait avant tout prévenir les complications cliniques, et réduire la mortalité. Sur ces critères, l'intérêt des divers antidiabétiques oraux actuellement commercialisés est mal établi (3,4). Le *benfluorex* occupe-t-il une place privilégiée dans ce lot ?

Indication officielle dans le diabète :
« adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale ».

Quelques effets, modestes et à court terme (3 mois), sur des paramètres biologiques

L'essentiel des essais cliniques comparatifs recensés dans une brochure d'information des laboratoires Servier (5) est publié.

Essais versus placebo. Nous avons identifié 6 essais cliniques *benfluorex* versus placebo réalisés en double aveugle chez des patients atteints de diabète non insulino-dépendant (5à10). Ces essais ont été menés selon des méthodologies très proches : après une phase de pré-inclusion (de 1 mois en général) sous placebo, destinée à vérifier la stabilité du diabète, les patients ont reçu durant 3 mois en double aveugle, soit un placebo, soit du *benfluorex*

a- En Europe, le benfluorex est également commercialisé en Espagne, en Grèce, en Italie, au Luxembourg, au Portugal et en Suisse (réf. 5). Le benfluorex n'est commercialisé dans aucun pays anglosaxon ou du nord de l'Europe.

b- En France, le benfluorex est bizarrement classé. Il n'est pas officiellement classé parmi les anorexigènes pour ce qui concerne les spécialités : de ce fait, Mediator° ne fait pas l'objet d'une prescription restreinte. Cependant, une circulaire de la Direction générale de la santé en date du 25 octobre 1995 (Journal Officiel du 31 octobre 1995, page 15937) inclut le benfluorex dans la liste des anorexigènes, et précise qu'il ne doit pas être incorporé dans des préparations magistrales. Par ailleurs, la dénomination "benfluorex" est incluse dans la liste des anorexigènes par l'Organisation mondiale de la santé (OMS).

c- L'autre indication officielle est « adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable ». Nous étudierons cette indication dans un autre article. Les deux indications officielles du benfluorex datent de 1974. En application de la directive européenne 75/319/CEE visant les spécialités pharmaceutiques enregistrées avant le 1er décembre 1976, les indications officielles du benfluorex ont fait l'objet d'une procédure de validation en 1987.

d- Notre recherche documentaire a reposé sur le suivi prospectif continu des sommaires des principales revues internationales et des Current Contents, ainsi que sur la consultation systématique d'ouvrages de référence en pharmacologie clinique (Martindale The Extra Pharmacopoeia, etc.). Nous avons également consulté sur CD-Rom les bases de données Medline (1996-mars 1997), Embase Drugs and Pharmacology (1991-décembre 1996) et Cochrane (1996 issue 3), et interrogé par Minitel, pour la dernière fois le 26 mars 1997, les bases de données Pascal et EMC. Par ailleurs, les laboratoires Servier nous ont communiqué divers documents publiés et non publiés. Deux membres de l'ISDB (International Society of Drug Bulletins), le Boletin Terapeutico Andaluz et Informazion sui Farmaci nous ont aussi communiqué les documents en leur possession.

(450 mg/jour par voie orale). L'efficacité a été jugée uniquement sur des critères biologiques (lire tableau page 330). Un essai a été réalisé chez des patients soumis seulement à un régime hypocalorique, sans autre médicament antidiabétique (6) ; 3 essais ont été réalisés chez des patients obèses recevant par ailleurs de l'insuline (5,7,8,9) ; 2 essais ont été réalisés chez des patients recevant par ailleurs un sulfamide hypoglycémiant (5,10).

Selon l'American Diabetes Association, le but du traitement antidiabétique est de ramener la glycémie à jeun à 6,7 mmol/litre (environ 1,2 g/litre) et l'hémoglobine glyquée à 7 % (11). Dans deux essais sur six seulement, le *benfluorex* a eu un effet supérieur à celui du placebo sur la glycémie à jeun, et la glycémie moyenne n'a été ramenée à 6,7 mmol/litre que dans un seul essai (7). Si dans les cinq essais où la comparaison est possible, l'effet du *benfluorex* sur l'hémoglobine glyquée est statistiquement supérieur à celui du placebo, c'est seulement dans un essai que le taux moyen d'hémoglobine glyquée a été ramené au-dessous de 7 % (7). À l'exception d'un essai (7), le *benfluorex* n'a pas modifié l'insulinémie à jeun par rapport au placebo. Sur les trois essais réalisés chez des patients traités par insuline, le *benfluorex* n'a permis une réduction statistiquement significative des besoins quotidiens en insuline que dans un essai (9). Aucun de ces essais cliniques versus placebo ne mentionne un effet du *benfluorex* sur des critères de morbimortalité ; ils n'ont d'ailleurs pas été conçus pour cela (e).

Essai versus metformine. Un essai comparatif *benfluorex* versus *metformine*, réalisé chez 121 patients a été publié (12). Cet essai est ininterprétable en raison de sources de biais importantes. Les patients du groupe *metformine* avaient, lors de l'inclusion, une glycémie post-prandiale et une aire sous la courbe d'hyperglycémie provoquée statistiquement inférieures à celles du groupe *benfluorex*. Or, le critère d'évaluation principal était l'évolution de la glycémie au cours d'une épreuve d'hyperglycémie provoquée par voie orale. Par ailleurs, l'essai n'a pas été réalisé en aveugle.

En somme. Les essais disponibles montrent que le *benfluorex* a des effets, au moins à court terme (3 mois), sur certains critères permettant d'évaluer l'équilibre glycémique, hémoglobine glyquée notamment. Cependant, ces effets sont modestes, et faute de comparaisons, on ne sait pas s'ils sont voisins ou non de ceux des antidiabétiques oraux actuellement commercialisés. Aucune donnée relative à l'éventuel effet du *benfluorex* sur la morbimortalité du diabète n'est disponible.

Quid des effets indésirables ?

Compte tenu de l'absence de données indépendantes, il est impossible de connaître avec précision le profil des effets indésirables du *benfluorex*. Selon les laboratoires Servier, « *les effets indésirables le plus souvent observés avec benfluorex sont des effets digestifs (nausées, vomissements, gastralgies, diarrhées) mais aussi asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles* » (5). Ces affirmations ne reflètent pas les données de quatre essais cliniques au cours desquels le *benfluorex* a été utilisé à la dose de 3 comprimés par jour (450 mg) et au cours desquels ces mêmes effets indésirables ont été observés (10,13,14,15). D'après ces essais de petite taille, réalisés avec la dose thérapeutique de 450 mg/jour, une somnolence ▶▶

metformine	GLUCOPHAGE°	GLUCOPHAGE°

Quelques essais comparatifs à court terme (3 mois) montrent que le *benfluorex* n'a, au mieux, que des effets limités sur la glycémie à jeun et l'hémoglobine glyquée des patients diabétiques non insulinodépendants, sans effet démontré sur la morbimortalité. Les effets indésirables du *benfluorex* sont fort mal connus. Au terme de 20 ans de commercialisation, il n'y a toujours aucune raison de prescrire le *benfluorex* chez les diabétiques.

e- Par ailleurs, certains de ces essais ne sont pas exempts de sources de biais qui peuvent rendre aléatoire leur interprétation. Par exemple, dans un essai, la dose quotidienne d'insuline et le taux d'hémoglobine glyquée étaient statistiquement supérieurs dans le groupe benfluorex lors de l'inclusion (réf. 9).

MEDIATOR°

► peut être notée chez 7 à 10 % des patients sous *benfluorex* (1), et une diarrhée a été observée chez 25 % des patients dans un essai non comparatif (13). Dans un autre essai, 5 patients sur 34 ont arrêté le *benfluorex* pour effets indésirables (contre 2 patients sur 34 sous placebo) (10).

Conclusion

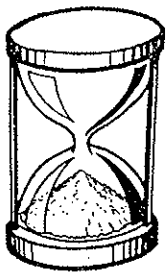
Après 20 ans de commercialisation du *benfluorex* (Mediator°), on ne sait toujours pas à quoi sert ce médicament administré aux diabétiques. Aucun essai au long cours, prenant en compte la morbimortalité du diabète n'est disponible.

Quelques essais comparatifs versus placebo réalisés à court terme (3 mois) chez des diabétiques non insulinodépendants montrent que le *benfluorex* en monothérapie ou en association avec l'insuline ou avec un sulfamide hypoglycémiant réduit l'hémoglobine glyquée. Une réduction de la glycémie à jeun n'a été observée que dans deux essais sur six. Ces effets sont cependant modestes, permettant rarement de ramener la valeur de ces paramètres dans les limites considérées comme la normale. Le seul essai comparant le *benfluorex* à la *metformine* (Glucinan°, Glucophage°, Stagid°) est ininterprétable.

Le *benfluorex* a des effets indésirables, à la dose officiellement recommandée de 450 mg/jour : somnolence et diarrhée, entre autres. Mais ni le profil d'effets indésirables du *benfluorex*, ni leur fréquence ne sont connus avec précision.

Il n'y a actuellement aucune raison de traiter les diabétiques non insulinodépendants avec le *benfluorex*. Le maintien sur le marché et la prise en charge par l'assurance maladie de ce médicament doivent être reconsidérés.

Annexe 3-53



Avec plus de recul

benfluorex pour quoi faire ?

Le *benfluorex*, Mediator° des laboratoires Biopharma (du groupe Servier), est commercialisé en France depuis 1976, sous forme de comprimés dosés à 150 mg (a). Chimiquement, le *benfluorex* est proche d'autres substances anorexigènes (b)(1). En France, le *benfluorex* possède deux indications officielles. Nous avons revu récemment, "avec plus de recul", son dossier d'évaluation dans l'indication "traitement adjuvant du diabète avec surcharge pondérale", pour conclure que ses effets limités (sur des critères intermédiaires) ne justifiaient pas sa prescription chez les diabétiques (2).

La deuxième indication officielle du *benfluorex* concerne les hypertriglycéridémies (lire en encadré ci-contre). Elle suscite régulièrement des demandes de la part de lecteurs de la revue, parfois soumis par certains visiteurs médicaux à une promotion intensive. En réalité, la question primordiale qui se pose est la suivante : chez les patients atteints d'hypertriglycéridémie, est-il démontré que le *benfluorex* possède des effets bénéfiques sur les seuls critères cliniquement pertinents, la morbidité cardiovasculaire et la mortalité, chez les patients sans antécédents (prévention primaire) et/ou avec antécédents cardiovasculaires (prévention secondaire) ?

Une conférence de consensus aux États-Unis d'Amérique a été consacrée à l'hypertriglycéridémie (3). Selon cette conférence, seules les hypertriglycéridémies importantes justifient une prise en charge thérapeutique ayant pour but non seulement de réduire l'hypertriglycéridémie, mais surtout de diminuer les taux de LDL-cholestérol et d'augmenter ceux de HDL-cholestérol ; les liens de causalité entre fractions du cholestérol et morbidité cardiovasculaire étant mieux établis que pour la triglycéridémie. Le traitement de première intention d'une hypertriglycéridémie est fondé sur l'hygiène de vie (suppression du tabac et de l'alcool, lutte contre la sédentarité) et le régime alimentaire (apport plus important en poissons gras). Selon cette conférence de consensus américaine, les médicaments ne sont utiles qu'en seconde intention (3).

Les hypolipémiants permettant une réduction marquée des hypertriglycéridémies sont les fibrates, les dérivés de l'acide nicotinique et l'huile de chair de poisson (Maxepa°) (c)(3,4). Le *gemfibrozil* (Lipur°), un fibrate, est le seul de ces médicaments pour lequel un effet préventif, sur des critères cliniques, ait été démontré lors d'un essai ▶▶

a- En Europe, le benfluorex est également commercialisé en Espagne, en Grèce, en Italie, au Luxembourg, au Portugal et en Suisse (réf.1). Le benfluorex n'est commercialisé dans aucun pays anglosaxon et du Nord de l'Europe.

***b-** En France, le benfluorex est bizarrement classé. Il n'est pas officiellement classé parmi les anorexigènes pour ce qui concerne les spécialités : de ce fait, Mediator° ne fait pas l'objet d'une prescription restreinte. Cependant, un arrêté du 25 octobre 1995 (Journal Officiel du 31 octobre 1995 : 15 937) inclut le benfluorex dans une liste de substances qui ne doivent pas être incorporées dans des préparations magistrales et cette liste ne comporte que des anorexigènes. Par ailleurs, le suffixe "orex" est attribué aux dénominations communes internationales des substances anorexigènes par l'Organisation mondiale de la santé (OMS) (réf. 1), et le benfluorex figure dans la liste des substances dopantes, dans le groupe des "amphétamines et autres excitants" (Dictionnaire Vidal édition 1997, page 6).*

***c-** Les inhibiteurs de l'HMG-CoA réductase (alias statines) ont un effet modeste sur la triglycéridémie.*

évaluant les effets du *benfluorex* sur des critères cliniques.

Nous avons souligné dans un article récent, l'absence de données claires et indépendantes sur les effets indésirables du *benfluorex* (1). Nous n'avons pas recueilli d'éléments nouveaux susceptibles de modifier ce constat.

Conclusion : aucune estimation sérieuse du rapport bénéfices/risques

Le *benfluorex* (Mediator°) est chimiquement apparenté à certains anorexigènes. Son dossier d'évaluation clinique dans les hypertriglycéridémies est pauvre. Aucun essai clinique n'a été réalisé avec des critères d'évaluation cliniques de morbi-mortalité. Les essais versus placebo sont de petite taille, généralement de mauvaise qualité méthodologique, et leurs résultats sur la triglycéridémie sont contradictoires. Aucun des trois essais *benfluorex* versus fibrate n'est interprétable en raison de problèmes méthodologiques.

Ni le profil des effets indésirables du *benfluorex*, ni leur fréquence ne sont connus avec précision.

Il n'y a actuellement aucune raison de traiter les patients ayant une hypertriglycéridémie avec le *benfluorex*. Le maintien sur le marché et la prise en charge de Mediator° par l'assurance maladie doivent être reconsidérés.

Note à l'attention de M. Le Pr ALEXANDRE

Objet : premier cas d'insuffisance aortique sous MEDIATOR (benfluorex)

Une observation d'insuffisance aortique survenue chez un homme de 43 ans, traité depuis 6 ans par MEDIATOR (benfluorex), a été rapportée le 10 février 1999 au CRPV de Marseille.

Il s'agit d'un patient ayant pour antécédents un tabagisme et une hypercholestérolémie. En janvier 1992, ce patient a présenté un infarctus du myocarde inférieur non compliqué. La coronarographie mettait en évidence une lésion interventriculaire antérieure et une insuffisance mitrale minime. Les examens pratiqués (échocardiographie, coronarographie et cathétérisme) ne montraient pas d'insuffisance aortique. Il n'y avait pas de souffle aux examens cliniques pratiqués en mars et juin 1993 et l'épreuve d'effort réalisée en juin 1993 ne montrait aucune anomalie.

Ce patient a été traité de juillet 1992 à octobre 1998 par MEDIATOR (benfluorex) à raison de 300 mg / jour pour surpoids, hypercholestérolémie et sensation hypoglycémique réactionnelle.
Il prenait par ailleurs du VASTEN (pravastatine) : 20 mg / jour depuis janvier 1993, de l'ASPEGIC (acétylsalicylate de DL lysine) : 250 mg / jour depuis 1992 et du TENORMINE (aténolol) : 100 mg / jour depuis janvier 1992.

En octobre 1998, lors d'un examen systématique, un souffle diastolique, facile à percevoir et évocateur d'une insuffisance aortique, est découvert à l'auscultation. Il existe également un souffle systolique d'accompagnement (l'insuffisance mitrale pouvant être rattachée à la cicatrice ischémique de l'infarctus du myocarde de 92).
Il n'existe aucun signe fonctionnel. L'échocardiographie met en évidence une insuffisance aortique nette ainsi qu'une insuffisance mitrale minime.
Il n'y a pas d'argument en faveur d'une endocardite chronique. Par ailleurs, le patient n'a jamais pris d'anorexigènes ou d'amphétamines.

En janvier 1999, l'insuffisance aortique demeure bien tolérée au plan clinique.

Nous avons averti les laboratoires SERVIER afin qu'ils prennent contact directement avec le CRPV de Marseille.
Par ailleurs, nous adressons ce jour à l'Agence Italienne, suite à leur demande, un line-listing accompagné des fiches CIOMS des effets indésirables cardio-vasculaires, pulmonaires et neurologiques graves rapportés en France avec le benfluorex. Nous joindrons à cet envoi l'observation d'insuffisance aortique.

COMMENTAIRES

MA 9900176

H, né le 28/10/55, 72 kg, présentant une insuffisance aortique découverte en octobre 1998 après traitement prolongé par MEDIATOR (2 cp/j) depuis 6 ans.

ANTECEDENTS : tabagisme, hypercholestérolémie. le 18/1/92 : infarctus du myocarde inférieur non compliqué. Coronarographie : lésion interventriculaire antérieure 50 %. Insuffisance mitrale minime. Pas d'insuffisance aortique décelée.

TRAITEMENT :
- MEDIATOR , po, 2 cp par jour pour surpoids, hypercholestérolémie et sensation hypoglycémique réactionnelle, depuis 92 jusqu'en octobre 98,

- VASTEN, TENORMINE, ASPEGIC depuis 92.

HISTOIRE DE LA MALADIE :
- Mi octobre 98 : découverte lors d'un examen systématique d'un souffle diastolique à l'auscultation, facile à percevoir, évocateur d'une insuffisance aortique.
- Souffle systolique d'accompagnement (l'insuffisance mitrale pouvant être rattachée à la cicatrice ischémique de l'infarctus du myocarde de 92 ?).
- Aucun signe fonctionnel.
- L'insuffisance aortique n'existait pas lors des examens pratiqués en 92 : cathétérisme et coronarographie, échocardiographie réalisées en milieu hospitalier puis en cabinet. Pas de souffle aux examens cliniques pratiqués en mars et juin 93. Epreuve d'effort : RAS en juin 93.

EXAMENS PARACLINIQUES :
- Pour l'effet indésirable :
  * échocardiographie le 17/10/98 : insuffisance aortique nette avec jet large, insuffisance mitrale minime.
- Pour le diagnostic différentiel :
  * pas d'argument en faveur d'une endocardite chronique,
  * jamais aucune prise d'anorexigène ou d'amphétamine.

DLUTION :
insuffisance aortique bien tolérée au plan clinique en janvier 99.

IMPUTABILITE :
Médicament suspect MEDIATOR (benfluorex).

II - TOUR DE TABLE DES CAS MARQUANTS

Seuls sont signalés les cas d'effets indésirables donnant suite à des mesures (mise en enquête, notes, ...) ou faisant l'objet d'une mise au point. La liste complète des cas est jointe en annexe 1.

- **CERVOXAN® (vinburnine), ZYLORIC® (allopurinol), ARICEPT® (donépezil) / CRPV de Nantes** : crise de porphyrie aiguë intermittente chez un homme de 86 ans.
Il n'existe aucune contre-indication pour les porphyries dans les RCP de ces spécialités.
Cette observation soulève le problème de l'absence d'une liste officielle et validée par l'Agence du Médicament, énumérant les médicaments contre-indiqués dans les porphyries.
Le problème est le même pour les médicaments contre-indiqués dans les déficits en G6PD.
→ Une note sera adressée à l'unité des Affaires Réglementaires de la Direction de l'Evaluation.

- **FRAXODI® (nadroparine calcique) / CRPV de Saint-Etienne** : hémorragie massive rétropéritonéale chez un homme de 73 ans après utilisation de FRAXODI® (0,8 ml x 2/j) au lieu de FRAXIPARINE® (0,8 ml x 2/j) initialement prescrite. Il n'existe pas d'équivalence d'activité anti-Xa entre les doses de ces deux spécialités de nadroparine calcique ce qui peut entraîner des confusions.
→ Un note sera adressée à l'attention de l'évaluateur de la classe des HBPM.

- **KETODERM crème 2% (kétoconazole) / CRPV de Caen** : eczéma aigü localisé chez une femme de 23 ans. Le libellé actuel de la rubrique "effets indésirables" du RCP est "1 cas d'eczéma de contact a été rapporté". Plusieurs cas sont rapportés dans la banque nationale ou décrits dans la littérature.
→ L'unité de pharmacovigilance adressera un courrier au laboratoire afin qu'il dépose une demande de modification de l'information.

- **LOPRIL® (captopril) / CRPV de Marseille** : augmentation de la lipase à 3,5 N (amylase normale) chez une femme de 71 ans. Cet effet est mentionné dans le RCP du captopril mais pas dans celui de l'énalapril alors que des cas sont décrits dans la littérature.
→ L'unité de pharmacovigilance adressera un courrier au laboratoire afin qu'il dépose une demande de modification de l'information.

- **MEDIATOR® (benfluorex), VASTEN® (pravastatine), ASPEGIC® (acétylsalicylate de DL lysine), TENORMINE® (aténolol) / CRPV de Marseille** : insuffisance aortique découverte chez un homme de 43 ans traité par benfluorex depuis 6 ans. Aucune prise d'anorexigènes ou d'amphétamines.
→ Le benfluorex qui se métabolise en norfenfluramine, fait l'objet d'une discussion au groupe de travail de pharmacovigilance européen. L'Italie qui envisage de saisir le CSP en vertu de l'article 12, rédige un rapport sur le métabolisme et les données de sécurité de ce produit en collaboration avec la France.

- **OESCLIM® (estradiol) / CRPV de Marseille** : eczéma chez une femme de 45 ans.
→ Cette spécialité est enregistrée selon une procédure de reconnaissance mutuelle (France Etat membre de référence). Dans le dernier RCP datant du mois d'octobre 1998, il est mentionné : "dermatite de contact allergique et démangeaisons". Cependant ce libellé n'apparaît pas au dictionnaire Vidal® 1999.

Cher Ami,

Tu trouveras ci-joint le compte-rendu de cathétérisme cardiaque effectué à Monsieur [redacted] hospitalisé dans notre Service pour nécrose inférieure thrombolysé à la deuxième heure. Il existe une sténose d'environ 50 à 60% sur l'I.V.A proximale à la limite de la significativité sur le plan angiographique La coronaire droite est strictement normale. Le réseau circonflexe est peu développé normal, La ventriculographie révèle une séquelle importante de nécrose inférieure. Je te le confie pour surveillance cardiovasculaire. Je reste à ta disposition pour toutes informations complémentaires.

Bien Amicalement.

Cher ami,

Merci pour les documents que tu m'as envoyés et merci pour l'excellente présentation que tu as faite de l'observation.

Tu trouveras, ci-joint, ce qui a été saisi dans la Banque de Pharmacovigilance à la suite de ta déclaration.

J'ai fait des photocopies et je te renvoie tous tes originaux. Je conserve, comme tu me l'as suggéré, les originaux que je n'ai pas pu photocopier.

Je t'envoie quelques feuilles vierges de déclaration d'effet indésirable... à moins que tu ne préfères écrire sur papier libre.

Bien amicalement,
A bientôt.

état clinique

06/93

Souffles = 0

Je soussigné Docteur Georges CHICHE,

Certifie donner mes soins à MR Nom patient ...

qui a présenté un infarctus du myocarde de siège inférieur en JANVIER 92

Cet infarctus a pu être thrombolisé avec succès en moins de 3h après le début du symptome.

L'évolution hospitalière a été favorable. La coronarographie de controle réalisée a montré une liberté totale de l'artère coronaire droite responsable de l'infarctus.

On ne retrouvera que quelques irrégularités sur le réseau gauche.

Il existait comme facteur de risque, une hyperlipidémie mixte, et un tabagisme modéré.

Ces deux facteurs ont été totalement supprimés tant pour le tabagisme que pour l'hyperlipidémie mixte grace à un traitement par VASTEN.

Actuellement Nom patient ... est totalement asymptomatique, il a repris ses activités professionnelles sans restriction.

Ses épreuves d'effort strandart, couplées à une scintigraphie du myocarde au thallium, et couplées à une échographie d'effort sont tout à fait satisfaisantes.

En effet, il n'y a ni angor ni modification du segment ST, ni trouble du rythme ventriculaire.

L'imagerie ne retrouvera qu'un défaut limité au niveau de la cicatrice inférieure, ou une simple hypocinésie au niveau de la paroi inférieure à l'échographie d'effort.

On ne retrouve pas de dyskinésie.

Son traitement comporte une association de béta bloquant (TENORMINE), d'I E C (LOPRIL) d'ASPEGIC et d'hypolipémiant (VASTEN)

Monsieur mène une vie normale, assume parfaitement ses activités professionnelles.

On peut considérer que le pronostique global de cette coronaropathie aigue est excellent.

Remis en mains propres pour servir et valoir ce que de droit.

MARSEILLE, le 23/06/93

COMMENTAIRES

MA 9900176

H, né le 28/10/55, 72 kg, présentant une insuffisance aortique découverte en octobre 1998 après traitement prolongé par MEDIATOR (2 cp/j) depuis 6 ans.

ANTECEDENTS : tabagisme, hypercholestérolémie. le 18/1/92 : infarctus du myocarde inférieur non compliqué. Coronarographie : lésion interventriculaire antérieure 50 %. Insuffisance mitrale minime. Pas d'insuffisance aortique décelée.

TRAITEMENT :
- MEDIATOR , po, 2 cp par jour pour surpoids, hypercholestérolémie et sensation hypoglycémique réactionnelle, depuis 92 jusqu'en octobre 98,
- VASTEN, TENORMINE, ASPEGIC depuis 92.

Annexe 3-56

Fiche N° : **MA9900176** Centre de : **MARSEILLE** Dossier Complet

HISTOIRE DE LA MALADIE :
- Mi octobre 98 : découverte lors d'un examen systématique d'un souffle diastolique à l'auscultation, facile à percevoir, évocateur d'une insuffisance aortique.
- Souffle systolique d'accompagnement (l'insuffisance mitrale pouvant être rattachée à la cicatrice ischémique de l'infarctus du myocarde de 92 ?).
- Aucun signe fonctionnel.
- L'insuffisance aortique n'existait pas lors des examens pratiqués en 92 : cathétérisme et coronarographie, échocardiographie réalisées en milieu hospitalier puis en cabinet. Pas de souffle aux examens cliniques pratiqués en mars et juin 93. Epreuve d'effort : RAS en juin 93.

EXAMENS PARACLINIQUES :

- Pour l'effet indésirable :
  * échocardiographie le 17/10/98 : insuffisance aortique nette avec jet large, insuffisance mitrale minime.
- Pour le diagnostic différentiel :
  * pas d'argument en faveur d'une endocardite chronique,
  * jamais aucune prise d'anorexigène ou d'amphétamine.

EVOLUTION :
insuffisance aortique bien tolérée au plan clinique en janvier 99.

IMPUTABILITE :
Médicament suspect MEDIATOR (benfluorex).

Saint-Denis, le 17 JUIN 1999

Note à l'attention de M. Le Pr ALEXANDRE

Objet : Hypertension artérielle pulmonaire (HTAP) sous MEDIATOR® (benfluorex)

L'unité de pharmacovigilance vient d'être contactée par le Pr SIMONEAU de l'Hôpital Antoine Béclère qui s'étonne de ne pas avoir été informé que le benfluorex se métabolisait en norfenfluramine (métabolite de la fenfluramine) et qu'il pouvait induire des HTAP.
Son appel fait suite à l'hospitalisation récente dans son service d'une patiente traitée par MEDIATOR® et présentant une HTAP.

Cette observation a été rapportée la semaine dernière au CRPV de Paris St-Antoine par le médecin qui suivait la patiente avant qu'elle soit ré-adressée pour exploration à l'hôpital A. Béclère.
A ce jour, nous disposons de peu d'information sur ce cas. Il s'agit d'une patiente de 50 ans traitée par benfluorex depuis 4 ans. Une dyspnée est apparue en décembre 1998. En mars 1999, il y a une exacerbation de la symptomatologie. Les examens réalisés mettent en évidence une HTAP d'allure primitive (PAPS à 91 mmHg) avec absence de shunt droit-gauche, EFR normales. La scintigraphie pulmonaire a permis d'éliminer une maladie thrombo-embolique chronique.
Le CRPV de Paris Saint-Antoine et le Pr Simoneau documentent l'observation.

En France, depuis 1995, le benfluorex a fait l'objet d'une enquête officieuse qui est devenue officielle en mai 1998. L'un des motifs de cette enquête était la métabolisation du benfluorex en 9 métabolites dont le principal est la norfenfluramine qui est également le métabolite de la fenfluramine.
11 observations d'HTAP ont été rapportées dans cette enquête. Dans 10 cas, le benfluorex était associé à de la dexfenfluramine et dans 1 cas à de l'amfépramone et du clobenzorex. Par ailleurs, 9 de ces 11 cas ont été expertisés dans le cadre de l'enquête officielle sur les anorexigènes.

Le nouveau cas rapporté au CRPV de Paris St-Antoine est le premier cas d'HTAP rapporté avec le benfluorex utilisé en monothérapie.

Il est à noter qu'à la demande de l'Agence italienne, le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (l'Italie et la France sont rapporteurs du dossier). Les données de notification spontanée et de pharmacocinétique disponibles ne permettent pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex. Le groupe de travail des 10 et 11 juin dernier a proposé que les deux pays rapporteurs adressent une liste de questions au laboratoire en demandant notamment la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites.

Au vu de ce nouveau cas d'HTAP qui vient s'ajouter au cas d'insuffisance aortique rapporté en février 1999 (cf. note ci-jointe), et compte-tenu de l'inquiétude des cliniciens, devons-nous accélérer la ré-évaluation de ce dossier ?

Annexe 3-58

Direction de l'Evaluation
Unité de pharmacovigilance

MEDIATOR® (benfluorex)

Résumé pour la Commission d'AMM du 8 juillet 1999

En France, le benfluorex a fait l'objet d'une enquête officieuse dès 1995 en raison de sa parentée structurale avec les anorexigènes amphétaminiques. Cette enquête est devenue officielle en mai 1998.

Depuis septembre 1998, à la demande de l'Agence italienne, le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (l'Italie et la France sont rapporteurs du dossier). L'un des motifs de cette enquête est la métabolisation du benfluorex en 9 métabolites dont l'un des 3 principaux est la norfenfluramine qui est également le métabolite des fenfluramines.

Les données de métabolisme, de pharmacocinétique et de notification spontanée disponibles ont été présentées au groupe de travail européen de pharmacovigilance de juin 1999.

Pharmacocinétique et métabolisme du benfluorex :

L'absorption gastro-intestinale du benfluorex est complète et rapide. Le Tmax est compris entre 1h et 2h.

Le benfluorex est rapidement métabolisé au niveau du foie en 9 métabolites au moins dont les trois principaux sont le S1475, le S422 et la (dl)-norfenfluramine (S585).
La concentration plasmatique de (dl)-norfenfluramine chez l'homme après administration de 3 x 150 mg / j de benfluorex pendant 14 jours est d'environ 40 ng / ml. Cette concentration est très proche de celle retrouvée chez l'homme après administration de 3 x 20 mg / j de fenfluramine qui est d'environ 50 ng / ml.
Il faut toutefois noter qu'après administration de fenfluramine, la quantité circulante de norfenfluramine vient s'additionner à celle de la fenfluramine ce qui n'est pas le cas après benfluorex.

Données de pharmacovigilance :

L'enquête de pharmacovigilance a été réalisée d'après les observations rapportées aux CRPV et au laboratoire jusqu'au 15 décembre 1998, soit 265 notifications.

Depuis la mise sur le marché du MEDIATOR®, les ventes correspondent à plus de 25 millions de mois de traitement.

Effets indésirables	enquête jusqu'au 15/12/98
cutanés et allergiques	64
neuro-psychiatriques	48
hépatiques	25
digestifs	21
métaboliques	21
respiratoires	20
vertiges	20
cardio-vasculaires	18
hématologiques	14
urologiques	13
divers	1
TOTAL	265

- **Atteintes respiratoires** : il s'agit principalement d'hypertension artérielle pulmonaire (HTAP) et de toux. Jusqu'au 15 décembre 1998, 11 observation d'HTAP ont été rapportées. Dans tous les cas, le benfluorex était associé à de l'ISOMERIDE® (dexfenfluramine) (10 cas) ou à de l'amfépramone et du clobenzorex (1 cas). 6 cas sur 11 ont été classés en HTAP d'allure primitive.

- **Atteintes cardio-vasculaires** : il s'agit principalement de cas d'HTA (3 cas), de tachycardie (2 cas), de syndromes de Raynaud (3 cas) et d'une fibrillation auriculaire pour laquelle le benfluorex était associé à de l'amfépramone.
En février 1999, une observation d'insuffisance aortique a été rapportée sans association avec un anorexigène. L'imputabilité reste douteuse.

- **Atteintes neuropsychiatriques** : il s'agit principalement d'asthénie, de somnolence, agressivité, agitation, nervosité, délire et paresthésies.

- **Atteintes cutanées et allergiques** : il s'agit principalement de chocs anaphylactiques (6 cas), d'oedèmes de Quincke (4 cas), d'urticaires, d'eczéma, de prurit et d'éruptions cutanées. Le RCP devra être modifié en conséquence.

- **Troubles de l'équilibre et vertiges** : cet effet est mentionné dans le RCP.

- **Atteintes hépatiques** : La plupart du temps, le benfluorex est associé à d'autres médicaments qui ont la même imputabilité. L'imputabilité a été jugée plausible dans 7 cas et vraisemblable dans 1 cas.

Annexe 3-58

- **Atteintes digestives** : il s'agit le plus souvent de diarrhées, effet mentionné dans le RCP.

- **Atteintes hématologiques** : l'imputabilité est douteuse dans tous les cas. Il existe très souvent un traitement associé pouvant être responsable de l'effet.

- **Atteintes rénales** : il s'agit le plus souvent de dysurie et pallakiurie.

- **Atteintes métaboliques** : il s'agit principalement d'hypoglycémies, d'hyperlipémies, d'hypertriglycéridémies, de goutte.

Ces données ne permettant pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex, le groupe de travail a souhaité que les pays rapporteurs (France et Italie) proposent des modifications de RCP et adressent une liste de questions au laboratoire en demandant une mise à jour des données de tolérance et la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites chez un petit nombre de volontaires sains après dose unique et dose répétée de benfluorex avec étude de la cinétique à l'état d'équilibre et en fin de course.

C'est alors que mi- juin 1999, un nouveau cas d'HTAP d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans (antécédents d'HTA et hypercholestérolémie). Pas d'autre étiologie retrouvée. Traitement par prostacycline envisagé. Il s'agit du premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène.

Compte-tenu de ce cas, l'Agence a adressé un courrier aux laboratoires SERVIER leur demandant de verser une mise à jour des données de tolérance ainsi que les données de pharmacologie et pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines. Un infofax a par ailleurs été envoyé à tous les Etats-Membres.

Ces données ont été versées le 28 juin 1999. Globalement, il existe peu d'éléments nouveaux.

Pharmacocinétique et métabolisme du benfluorex :

Il est à noter que la l-norfenfluramine (représentant la moitié de la (dl)-norfenfluramine) n'aurait pas d'activité métabolique.
Dans le cas de la dexfenfluramine, l'exposition relative (AUC) à la d-norfenfluramine représente environ 50% de l'exposition à la dexfenfluramine. Cette valeur est de 37% pour la fenfluramine et de 4% pour les métabolites S1475 et S422 du benfluorex.

Pharmacologie comparée du benfluorex et des fenfluramines :

Les propriétés hypolipémiantes et antidiabétiques du benfluorex reposent sur l'activité de la molécule mère et de ses métabolites actifs. D'après des travaux menés in vitro dans différents systèmes cellulaires, le S422 et le S1475 sont les métabolites porteurs du plus grand nombre d'activités sur le métabolisme glucidique.

L'activité de la d-norfenfluramine sur le système sérotoninergique serait inférieure à celle de

la d-fenfluramine. L'affinité de la d-norfenfluramine pour le transporteur de la sérotonine serait 9 fois plus faible que celle de la d-fenfluramine. Sur des préparations de synaptosomes, l'inhibition de la capture de sérotonine par la d-norfenfluramine est 3 fois plus faible que celle exercée par la d-fenfluramine.

Données de pharmacovigilance :

Du 15 décembre 1998 au 1er juillet 1999, 22 observations ont été rapportées dans la banque nationale de pharmacovigilance.

Effets indésirables	du 15/12/98 au 01/07/99
cutanés et allergiques	6
neuro-psychiatriques	0
hépatiques	2
digestifs	1
métaboliques	1
respiratoires	1
vertiges	6
cardio-vasculaires	1
hématologiques	1
urologiques	0
divers	3
TOTAL	22

Conclusion

Au total, au vu de toutes ces données, il est difficile d'affirmer que le benfluorex a la même toxicité que les fenfluramines. Cependant, certains doutes persistent notamment en ce qui concerne le devenir de la norfenfluramine. La réalisation d'une étude cinétique des métabolites du benfluorex pourrait permettre de lever ces doutes.
De plus, le RCP devra être modifié afin d'y mentionner notamment les risques de réactions allergiques et cutanées.

Par ailleurs, le service de Pneumologie de l'hôpital A. Béclère entreprend une interrogation de tous les patients ayant une HTAP à la recherche d'une prise antérieure de MEDIATOR®.
Ce dossier devrait être discuté au prochain groupe de travail européen de pharmacovigilance (12-13 juillet 1999).

MEDIATOR® (benfluorex)

Point au 04/10/99

En France, le benfluorex a fait l'objet d'une enquête officieuse dès 1995 en raison de sa parentée structurale avec les anorexigènes amphétaminiques. Cette enquête est devenue officielle en mai 1998.

Depuis septembre 1998, à la demande de l'Agence italienne, le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (l'Italie et la France sont rapporteurs du dossier). L'un des motifs de cette enquête est la métabolisation du benfluorex en 9 métabolites dont l'un des 3 principaux est la norfenfluramine qui est également le métabolite des fenfluramines.

Les données de métabolisme, de pharmacocinétique[1] et de notification spontanée disponibles ont été présentées au groupe de travail européen de pharmacovigilance des 10 et 11 juin 1999.

Ces données ne permettant pas de conclure sur une possible neurotoxicité ou cardiotoxicité du benfluorex, le groupe de travail a souhaité que les pays rapporteurs (France et Italie) proposent des modifications de RCP et adressent une liste de questions au laboratoire en demandant une mise à jour des données de tolérance et la réalisation d'une étude de pharmacocinétique du benfluorex et de ses métabolites.

---

1 **Résumé des données de pharmacocinétique et de métabolisme du benfluorex :**

L'absorption gastro-intestinale du benfluorex est complète et rapide. Le Tmax est compris entre 1h et 2h.

Le benfluorex est rapidement métabolisé au niveau du foie en 9 métabolites au moins dont les trois principaux sont le S1475, le S422 et la (dl)-norfenfluramine (S585).
La concentration plasmatique de (dl)-norfenfluramine chez l'homme après administration de 3 x 150 mg / j de benfluorex pendant 14 jours est d'environ 40 ng / ml. Cette concentration est très proche de celle retrouvée chez l'homme après administration de 3 x 20 mg / j de fenfluramine qui est d'environ 50 ng / ml.
Il faut toutefois noter qu'après administration de fenfluramine, la quantité circulante de norfenfluramine vient s'additionner à celle de la fenfluramine ce qui n'est pas le cas après benfluorex.

Annexe 3-60

En juin 1999, un cas d'HTAP d'allure primitive a été rapporté chez une femme de 51 ans traitée par benfluorex depuis 4 à 5 ans (antécédents d'HTA et hypercholestérolémie) : pas d'autre étiologie retrouvée ; traitement par prostacycline envisagé.
Il s'agit du premier cas d'HTAP rapporté avec le benfluorex utilisé sans association de médicament anorexigène. 11 cas avaient auparavant été rapportés lors d'un traitement associant le benfluorex à de la dexfenfluramine dans 10 cas et à de l'amfépramone et du clobenzorex dans 1 cas.
Le service de Pneumologie de l'hôpital A. Béclère entreprend une interrogation de tous les patients ayant une HTAP à la recherche d'une prise antérieure de MEDIATOR®.

Compte-tenu de ce nouveau cas, l'Agence a adressé le 18 juin 1999, un courrier aux laboratoires SERVIER leur demandant de verser une mise à jour des données de tolérance ainsi que les données de pharmacologie et pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines. Un infofax a par ailleurs été envoyé à tous les Etats-Membres de l'Union Européenne.

Ces données ont été versées le 28 juin 1999 et n'apportent pas d'élément nouveau.

Conclusion

Au total, au vu de toutes ces données, il est difficile d'affirmer que le benfluorex a la même toxicité que les fenfluramines. Cependant, certains doutes persistent notamment en ce qui concerne le devenir de la norfenfluramine. La réalisation d'une étude cinétique des métabolites du benfluorex pourrait permettre de lever ces doutes.
Par ailleurs, le RCP devra être modifié afin d'y mentionner notamment les risques de réactions allergiques et cutanées.

L'Italie prépare un projet de courrier à l'attention des laboratoires SERVIER leur demandant :

- la réalisation d'une étude à long terme avec contrôle périodique de la glycémie et des lipides, échocardiographie et mesure des paramètres pharmacocinétiques,
- des modifications du RCP :
  - indications,
  - contre-indications,
  - mises en garde,
  - effets indésirables.

Ce courrier sera co-signé par l'Italie et la France. L'Italie devrait nous adresser son projet de lettre dans la semaine du 4 au 8 octobre 1999.

VII - QUESTIONS DIVERSES 14

I - ADOPTION DU PROCES-VERBAL DE LA SEANCE DU MARDI 4 NOVEMBRE 2003

Le procès-verbal de la séance du 4 novembre 2003 a été adopté avec les corrections suivantes :

Page 4 : II – Tour de table des cas marquants et de la littérature

- Ligne 14 : remplacer « FURADANTINE (nitrofurantoïne) et mésusage » par « Nitrofurantoïne (FURADANTINE, FURADOINE, MICRODOINE) et mésusage »
- Ligne 16 : remplacer « FURADANTINE (nitrofurantoïne) » par « Nitrofurantoïne (FURADANTINE, FURADOINE, MICRODOINE) »

Page 5 : II – Tour de table des cas marquants et de la littérature

- Ligne 31 : remplacer « Le CRPV de Marseille a signalé 3 ou 4 appels de patientes qui ont reçu MIFEGYNE » par « Le CRPV de Marseille a signalé 3 ou 4 appels récents pour des patientes qui ont reçu MIFEGYNE »

Page 9 : IV – Enquête officielle : sclérosants veineux et réactions anaphylactiques, sclérosants veineux et céphalées »

- Ligne 26 : ajouter « Les RCP d'AETOXISCLEROL® et de SCLEREMO® doivent être harmonisés ».

Page 10 : V – Enquête officielle sur les pneumopathies interstitielles diffuses et Lipiocis® / Lipiodol®

- Ligne 40 : remplacer « Le service de radiologie du Centre Hospitalier E. Marquis de Rennes (CRLCC) considéré comme centre français de référence dans l'utilisation de Lipiocis® dans le CHC, a décidé de faire une étude rétrospective visant à répertorier tous les cas de pneumopathies » par « Le Centre Régional de Lutte Contre le Cancer (CRLCC) de Rennes, étant considéré comme centre français de référence dans l'utilisation de Lipiocis® dans le CHC, une étude rétrospective y a été menée dans le cadre d'un travail de thèse de doctorat en médecine. L'objectif était de répertorier tous les cas de pneumopathies ».

Page 12 : V – Enquête officielle sur les pneumopathies interstitielles diffuses et Lipiocis® / Lipiodol®

- Ligne 4 : remplacer « Enfin ces pneumopathies peuvent être dues à des embols » par « Enfin ces pneumopathies pourraient être dues à des embols ».

Page 17 : VIII – Questions diverses

- Ligne 27 : ajouter

« Dictionnaire Vidal® et pharmacovigilance

Afin d'améliorer la lisibilité en matière d'information sur la sécurité d'emploi des médicaments dans le dictionnaire Vidal®, l'Afssaps a souhaité recueillir les propositions et les remarques des différents CRPV.

Ainsi, les CRPV ont suggéré de :

1- permettre une identification claire et rapide des modifications récentes apportées aux RCP des médicaments ;
2- indiquer systématiquement la quantité exacte de principe actif par unité de conditionnement ;
3- Indiquer la quantité de principe actif sous forme de sel mais également la quantité de principe actif base par unité de prise ;
4- indiquer l'ASMR (amélioration du service médical rendu) ou le SMR (service médical rendu) en fonction de l'indication pour chaque médicament ;

5- clarifier les données de pharmacocinétique ;
6- indiquer si la rubrique « grossesse » a fait l'objet d'une réévaluation récente (avec la date de réévaluation) ;
7- créer une rubrique « femme en âge de procréer et contraception » ;
8- lister tous les génériques dans le Vidal® ;
9- indiquer les excipients à effet notoire pour chaque médicament ;
10- ajouter dans les premières pages du Vidal® un espace d'information concernant la pharmacovigilance et l'antibiothérapie en général ainsi que la liste des médicaments dont la commercialisation a été arrêtée (avec les dates d'arrêt) et les raisons de ces arrêts de commercialisation ;
11- indiquer pour chaque médicament la date d'AMM et la nature de la procédure d'enregistrement d'AMM ;
12- harmoniser les informations entre les versions papier et informatique (Vidal Pro®) du dictionnaire Vidal® ;
13- faire figurer dans le Vidal® tous les médicaments commercialisés (et pas uniquement les médicaments dont les laboratoires veulent faire la promotion).

Il est à noter que le livret « Interactions médicamenteuses » ne devrait plus être intégré au Vidal® 2004. Une nouvelle version sera élaborée par l'Afssaps et mis à disposition sur le site internet de l'Afssaps.

Conclusion : l'Afssaps doit rencontrer le PDG ainsi que le directeur scientifique du Vidal® fin novembre 2003 afin d'intégrer certaines des propositions des CRPV dans l'édition 2004 du Vidal®. »

II - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Sont signalés les cas d'effets indésirables, de mésusages, d'erreurs et de manque de cohérence de l'information ainsi que les risques potentiels d'effets indésirables pouvant donner lieu à des mesures (mises en enquête, notes…) ou pouvant faire l'objet d'une mise au point dans le cadre de la prévention du risque médicamenteux. La liste complète des cas est jointe en annexe 1.

Effets indésirables avérés :

AGREAL (véralipride) et syndrome parkinsonien / CRPV d'Amiens

Le CRPV d'Amiens a signalé un syndrome parkinsonien avec galactorrhée chez une patiente de 69 ans traitée sans interruption depuis 25 ans par AGREAL (véralipride) à la suite d'une hystérectomie. La fenêtre thérapeutique recommandée dans le RCP n'a pas été respectée. Onze autres cas de syndrome parkinsonien sont rapportés dans la base nationale de pharmacovigilance avec ce médicament.

→ L'unité de pharmacovigilance demandera à l'unité pharmaco-toxico-clinique 2 si l'indication de ce médicament dans le « traitement des bouffées vasomotrices invalidantes associées aux manifestations psycho-fonctionnelles de la ménopause confirmée », est justifiée.

REMINYL (galantamine) et crise d'épilepsie / CRPV d'Amiens

Le CRPV d'Amiens a signalé un cas de crise d'épilepsie chez une patiente de 72 ans sans antécédent épileptique avec bilan négatif. Trois autres cas de crise d'épilepsie sont signalés dans la base nationale de pharmacovigilance.

→ L'unité de pharmacovigilance demandera à la firme de déposer une demande de modification d'information afin d'introduire cette mention dans la rubrique « Effets indésirables » du Résumé des Caractéristiques du Produit.

DIAMICRON 80mg (gliclazide) et interaction avec les anticoagulants / CRPV de Clermont-Ferrand

Le CRPV de Clermont-Ferrand a signalé que l'interaction des sulfamides hypoglycémiants avec les anticoagulants n'est pas mentionnée dans les RCP de DIAMICRON 80mg (gliclazide) et des anticoagulants, alors qu'elle est mentionnée pour DIAMICRON LP30mg®. Cette intéraction n'est pas mentionnée dans le livret interaction.

→ L'unité de pharmacovigilance transmettra cette information aux unités pharmaco-toxico-clinique concernées pour suite à donner avec copie à l'unité coordination des actions transversales et interaction médicamenteuse.

PROPOFOL FRESENIUS (propofol) et inefficacité / CRPV de Dijon

Le CRPV de Dijon a signalé 3 cas nécessitant une augmentation très importante des doses de PROPOFOL FRESENIUS (propofol), forme ampoule de 20 ml, pour obtenir une efficacité lors d'anesthésies courtes et rapides. PROPOFOL FRESENIUS (propofol) est le générique de DIPRIVAN®. Il a été supposé que la baisse d'efficacité du médicament pourrait être lié à un problème de conservation des ampoules dans le service pendant la canicule des mois de juillet et août 2003.

→ Le CRPV de Dijon transmet à la Direction des Laboratoires et des Contrôles les échantillons d'ampoules qui ont été utilisées ainsi que les ampoules du même lot restant dans le service pour analyse physico-chimique (dosage du principe actif).

CALMOSINE (extrait d'aneth) et état de mal épileptique / CRPV de Lyon

Le CRPV de Lyon a signalé un cas de convulsion chez un nouveau-né de 3 mois traité pour des troubles digestifs par CALMOSINE (extrait d'aneth).

→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification d'information sur ce produit afin de mettre à jour les rubriques concernant la sécurité d'emploi.

GEMZAR (gemcitabine) et atteintes hépatiques / CRPV de Grenoble et CRPV de Lyon

Le CRPV de Grenoble a signalé un cas d'hépatite veino-occlusive et le CRPV de Lyon un cas d'hépatite fulminante sous GEMZAR (gemcitabine). D'autres cas d'hépatites fulminantes ont été rapportés dans la base nationale de pharmacovigilance et deux cas d'hépatites cholestatiques fatales ont été récemment publiés.

→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification de l'information médicale, laquelle sera évaluée par le CRPV de Poitiers.

5 Fluoro-uracile et leucoencéphalopathie / CRPV de Paris - Saint-Vincent de Paul

Le CRPV de Paris-Saint-Vincent de Paul a signalé le cas d'une patiente de 48 ans, ayant un déficit en enzyme dihydropyrimidine déhydrogénase (DPD), traitée par FLUORO-URACILE (5 fluorouracile) et CISPLATYL (cisplatine) pour un cancer utérin qui a manifesté des convulsions suivi d'un coma puis du décès de la patiente. Il a été observé une leucoencéphalopathie à l'IRM sans manifestation d'aplasie médullaire ni de troubles digestifs. 35 autres cas d'encéphalopathie ou de coma sous 5 fluoro-uracile, associé ou non au cisplatine, ont été signalés dans la base nationale de pharmacovigilance.

A la suite du point présenté par le CRPV d'Angers, la conclusion qui était d'effectuer un test permettant de dépister les patients ayant un déficit en DPD, n'a pas été retenue par le Groupe de travail onco-hématologie (GTOH) faute de méthode de dosage validée.

→ Le CRPV d'Angers proposera néanmoins au GTOH un nouveau libellé pour les rubriques 4.4 et 5.2.

Méconnaissance des effets indésirables centraux du MEDIATOR (benfluorex) par les professionnels de santé / CRPV de Reims

Le CRPV de Reims a signalé les cas de deux patientes de 79 et 66 ans traitées par MEDIATOR (benfluorex) et qui ont présenté des effets indésirables centraux (asthénie, somnolence, malaise, désorientation, stupeur) qui ont disparu en quelques jours à l'arrêt du traitement. Il semblerait qu'il y ait une méconnaissance des effets indésirables centraux par les prescripteurs de MEDIATOR®.

→ L'unité de pharmacovigilance demandera à la firme l'évolution des chiffres de vente de ce médicament.

PROPRANOLOL RATIOPHARM (propanolol) et inefficacité / CRPV de Saint-Etienne

Le CRPV de Saint-Etienne a signalé les cas de deux patients traités efficacement depuis 3 ans par AVLOCARDYL (propranolol) pour des troubles du rythme. Lors de la substitution du princeps par le générique, PROPANOLOL RATIOPHARM®, les patients se plaignent de palpitations et de malaise. La reprise du traitement par AVLOCARDYL® a permis le retour à un traitement efficace des troubles du rythme.

→ L'unité de pharmacovigilance demandera à la Direction des laboratoires et des contrôles d'analyser si possible le(s) lot(s)concerné(s) de PROPRANOLOL RATIOPHARM® (dosage du principe actif).

MEGACE (mégestrol) et insuffisance surrénalienne / CRPV d'Amiens

Le CRPV d'Amiens a signalé un cas d'insuffisance surrénalienne chez une patiente de 39 ans traitée par MEGACE pour un cancer du sein. Aucun autre cas n'est retrouvé dans la base nationale de pharmacovigilance. Toutefois, ce type d'observation est bien documenté au niveau de la littérature.

→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification de l'information médicale afin de compléter les rubriques « effets indésirables » et « pharmacodynamie ».

Documents distribués :

- Rapport annuel 2002 de l'Afssaps,
- Les déclarations d'intérêts des membres des conseils, des commissions et groupes de travail 2002.

III - POINT SUR LES EFFETS INDESIRABLES VISUELS RAPPORTES SOUS OMEPRAZOLE (MOPRAL®) PROCEDURE NATIONALE

A la suite de la notification de plusieurs cas de vision trouble rapportés avec l'oméprazole, l'Afssaps a demandé aux laboratoires AstraZeneca et aux laboratoires Aventis, commercialisant respectivement les spécialités Mopral® (oméprazole) et Zoltum® (oméprazole), de fournir une revue des effets indésirables visuels, et en particulier des cas de cécité et de vision trouble, rapportés avec leur spécialité. Tous les cas de troubles visuels enregistrés dans la base de données d'AstraZeneca au 30 novembre 2002 et dans la base de données d'Aventis au 22 octobre 2002 ont été transmis.
L'analyse de cette revue a été confiée au CRPV de Marseille qui a présenté son rapport au Comité technique de Pharmacovigilance le 9 décembre 2003.

En 1994, les autorités sanitaires allemandes ont soulevé le problème de la survenue d'atteintes visuelles irréversibles lors de l'utilisation d'oméprazole en bolus à de fortes doses. Ce point a fait l'objet d'une analyse la même année par le Comité des Spécialités Pharmaceutiques. Il a été conclu, au vu des données disponibles, qu'un lien de causalité entre l'oméprazole et les atteintes observées n'était pas établi. Les résultats de deux études de cohortes (Garcia Rodriguez L.A. et al[1], 1996 et Mannino S. et al, 1998[2]), portant sur 140 128 patients traités par anti-ulcéreux concluent à la bonne tolérance oculaire de l'oméprazole.

Concernant la notification spontanée, 944 cas d'effets indésirables visuels correspondant à 1085 effets, dont 141 graves, ont été rapportés aux laboratoires AstraZeneca.
Parmi ces cas, 251 sont des observations de « vision trouble », dont 18 présentent un rechallenge positif et 104 un déchallenge positif. Dans 17 cas, dont certains avec rechallenge positif, on retrouve un médicament concomitant susceptible de modifier la vision. La moyenne d'âge des patients ayant présenté cet effet est de 55 ans et dans la plupart de cas, ces patients présentent une pathologie associée (pathologie oculaire dans 22 cas, cardiaque dans 21 cas, allergique dans 17 cas,…). D'autre part, 216 observations de troubles visuels susceptibles d'entraîner une vision trouble mais non rapportés comme tel ont été analysées. Parmi ces cas, 9 présentent un rechallenge positif et 61 un déchallenge positif. Comme pour les observations précédentes, ces cas concernent des patients d'âge moyen de 55 ans, présentant souvent des pathologies associées.
Les données transmises par les laboratoires Aventis se limitent à 3 observations, toutes d'imputabilité douteuse.
Enfin, 30 cas relatifs à une atteinte de l'appareil visuel ont été enregistrés dans la Base Nationale de Pharmacovigilance. L'imputabilité est douteuse dans 25 cas, plausible dans 4 cas et vraisemblable dans 1 cas.
Au total, compte-tenu de la large utilisation de l'oméprazole, la fréquence de survenue de « vision trouble » lors de traitement par Mopral® ou Zoltum® est faible. Dans la majorité des cas, l'imputabilité est douteuse. Toutefois, le rôle du médicament ne peut être exclu dans certains cas.

Le terme « vision trouble » est mentionné dans le document interne à la firme (Company Core Data Sheet) pour la spécialité Mopral®. Les troubles de la vision sont un effet mentionné dans le Résumé des Caractéristiques de tous les autres inhibiteurs de la pompe à protons. Il est à noter que dans le Résumé des Caractéristiques d'Inexium® (ésoméprazole), la possibilité de survenue de vision trouble est mentionnée à la rubrique 4.8 comme un effet ayant été observé avec le racémique oméprazole et qui pourrait survenir avec l'ésoméprazole.

Au vu de ces données et afin d'harmoniser les Résumés des Caractéristiques du Produit des différents inhibiteurs de la pompe à protons, le Comité technique de Pharmacovigilance s'est montré favorable à l'ajout de la mention « vision trouble » à la rubrique 4.8 « Effets indésirables » des spécialités Mopral® et Zoltum®. Le dépôt d'une demande de modification de l'information sera demandé aux laboratoires AstraZeneca et Aventis.

IV - ENQUETE OFFICIELLE SUR LE SYNDROME DE SEVRAGE LIE A ZOLPIDEM (STILNOX®) ET ZOPICLONE (IMOVANE®)
PROCEDURE NATIONALE

Le CRPV de Nantes a présenté les résultats de l'enquête officielle concernant les syndromes de sevrage au zolpidem et à la zopiclone rapportés entre le 1er janvier 1996 et le 31 décembre 2002.
Cette enquête regroupe les cas de syndrome de sevrage et les cas d'effets thérapeutiques inattendus ou ETI (effets psychiques positifs, effets antalgiques, améliorations cognitives) responsables de mésusage, pouvant également être à l'origine de syndromes de sevrage.

1/ Zolpidem et syndrome de sevrage

Le zolpidem (STILNOX®) est un hypnotique d'action rapide commercialisé par les laboratoires SANOFI SYNTHELABO depuis février 1988 ; il est indiqué dans le traitement des insomnies occasionnelle, transitoire, et chronique.

a/ Données des CRPV et des laboratoires
112 observations correspondant à 132 effets indésirables ont été retenues (39 cas provenant des CRPV et 73 cas du laboratoire). Ces observations concernent une population jeune, 49% des patients étant âgés de moins de 40 ans.

- 61 dossiers (54%) font état de syndromes de sevrage, dont les principaux symptômes sont anxiété (33%), convulsions (30%), tremblements (10%) et plus rarement, insomnie, cauchemars, céphalées, douleurs musculaires, crampes, irritabilité. Ces syndromes ont entraîné une hospitalisation dans 32 cas (52%). 44 % des patients présentant un syndrome de sevrage n'avaient pas de facteur de risque connu. 25% des symptômes de sevrage sont survenus après arrêt du zolpidem pris à doses thérapeutiques.
20 dossiers associent un syndrome de sevrage à un ETI et font état d'un dépassement de posologie, la posologie minimale observée étant de 30 mg/j. Dans 65% des cas le zolpidem était associé à d'autres psychotropes et dans 60% des cas, les patients avaient des troubles psychiatriques. Le taux de réussite de sevrage dans ce groupe a été de 54%.
Dans 41 dossiers, le syndrome de sevrage n'est pas associé à un ETI, et dans 41% de ces dossiers, le syndrome de sevrage est survenu après arrêt du zolpidem pris à doses thérapeutiques. 19% des patients avaient des troubles psychiatriques associés et 46% recevaient d'autres psychotropes que le zolpidem. Le taux de réussite de sevrage dans ce groupe était de 56%.
- 51 dossiers font état d'ETI. Il s'agit notamment d'effets anxiolytiques (15 cas), euphoriques (12 cas) et antalgiques (5 cas). Dans 2 cas, l'ETI est survenu à dose recommandée (10 mg/j). 10 patients (20%) ne présentaient pas de facteurs de risque et 26 patients (50%) ont été hospitalisés. 12 patients (24%) ne présentaient pas de somnolence malgré des posologies s'échelonnant de 30 à 400 mg.

b/ Données de la littérature
Les données de la littérature suggèrent, d'après des études expérimentales menées chez le primate non humain et des résultats d'essais cliniques, que :

- la tolérance, le rebond d'insomnie et les symptômes de sevrage sont moins fréquents et moins significatifs cliniquement avec le zolpidem qu'avec les benzodiazépines ;
- l'incidence du syndrome de sevrage est faible après un traitement à dose et à durée recommandées (10 mg/j pendant 4 semaines).

36 cas de syndrome de sevrage ont été publiés dans la littérature (dont 13 avec ETI). Ces cas possèdent les mêmes caractéristiques que les observations des CRPV et du laboratoire.

2/ Zopiclone et syndrome de sevrage

Le zopiclone (IMOVANE®) est un hypnotique commercialisée par le laboratoire AVENTIS, qui bénéficie d'une AMM depuis le 10 décembre 1984. Une douzaine de génériques sont également commercialisés mais cette enquête ne repose que sur les cas rapportés avec le médicament princeps, les laboratoires génériqueurs ayant peu ou pas répondu aux requêtes du rapporteur.

a/ Données des CRPV et des laboratoires
22 observations, correspondant à 23 effets indésirables, ont été retenues (17 cas provenant des CRPV et 5 cas

du laboratoire). Ces observations concernent une population jeune, 55% des patients sont en effet âgés de moins de 40 ans.

• 21 dossiers rapportent un syndrome de sevrage, principalement caractérisé par des convulsions (7 cas soit 33%) et plus rarement par des effets indésirables tels qu'insomnie, cauchemars, céphalées, douleurs musculaires, crampes, irritabilité. Ces effets ont nécessité une hospitalisation dans 48% des cas. Dans 7 cas (37%), la zopiclone avait été administrée à doses thérapeutiques. Dans 9 cas (41%), les patients ne présentaient pas de facteur de risque et 74 % des patients utilisaient une dose inférieure ou égale à 15 mg soit 2 comprimés. A noter que 29 % des notifications correspondent à des sevrages néonataux (d'évolution favorable) de mères toxicomanes ou alcooliques.
Dans un dossier, le syndrome de sevrage a été associé à un ETI.
• 1 dossier rapporte un ETI.

b/ Données de la littérature
L'analyse de la littérature suggère les mêmes constatations que pour le zolpidem, à savoir que l'incidence du syndrome de sevrage est faible lors d'un traitement à dose et à durée recommandées (7,5 mg/j pendant 4 semaines)
15 cas de syndrome de sevrage au zopiclone ont été publiés et sont similaires aux cas rapportés aux CRPV et au laboratoire.

3/ Conclusions du rapporteur
Etant donné la gravité potentielle de ces effets indésirables, même si leur incidence est faible (avec un effet pour 61 millions de jours de traitement pour le zopiclone et un effet pour près de 15 millions de jours de traitement pour le zolpidem), le rapporteur a insisté sur :
- le fait qu'en aucun cas, la zopiclone ne devrait être utilisée dans un but d'anxiolyse,
- la nécessité d'être vigilant chez les patients à risque, toxicomanes, alcooliques ou dépendants aux benzodiazépines, et chez les patients sans risque apparent qui augmentent rapidement leur dose initiale,
- la nécessité de prévenir les patients du risque de symptômes de sevrage et de rebond d'insomnie à l'arrêt brutal de la zopiclone ou du zolpidem, à dose thérapeutique ou supra thérapeutique.

Le rapporteur a suggéré d'intégrer dans la rubrique 4.4 du RCP de zopiclone et de zolpidem les informations suivantes :
- A l'arrêt du traitement, les symptômes d'un syndrome de sevrage peuvent apparaître pour des doses thérapeutiques et/ou chez des patients ne présentant pas de facteur de co-morbidité psychiatrique.
- À dose thérapeutique, les syndromes de sevrage ou les rebonds d'insomnie sont exceptionnels.

Le Comité technique n'émet pas de remarque particulière.
Le dossier sera présenté lors de la Commission nationale de mars 2004.

V - POINT CONCERNANT L'ENQUETE D'OPINION AUPRES DES MEDECINS LIBERAUX DU MAINE ET LOIRE SUR LES MEDICAMENTS GENERIQUES

Le Centre Régional de Pharmacovigilance d'Angers a présenté les résultats de l'enquête d'opinion sur les spécialités génériques menée au mois de mars 2002 auprès des médecins libéraux du Maine et Loire.
Cette enquête, présentée sous forme de questionnaire, avait pour objectif de connaître l'opinion des médecins libéraux sur les médicaments génériques mais également de recueillir les propositions des cliniciens pour une prescription plus sécuritaire des spécialités génériques.

Taux de participation des médecins libéraux

Le CRPV d'Angers a envoyé le questionnaire à 1235 médecins libéraux du Maine et Loire et a obtenu un taux de réponse de 35%, émanant majoritairement des généralistes (67%).

Opinion des médecins sur les spécialités génériques

Pour les médecins libéraux ayant répondu au questionnaire, les spécialités génériques :

- présentent un intérêt économique (64% des répondants)
- sont de même qualité, efficacité et sécurité que les médicaments de référence (56% des répondants)
- sont trop nombreux (62% des répondants)
- sont préjudiciables à la recherche (53% des répondants)
- sont inutiles (20% des répondants)

Facteurs influençant la fréquence de prescription des spécialités génériques

L'enquête montre que 59% des médecins libéraux prescrivent peu ou pas de génériques. Les différents facteurs susceptibles d'influencer la prescription de génériques sont :

- Liés au médecin :

- les médecins généralistes et les médecins référents prescrivent plus de génériques que les spécialistes

Les médecins référents sont des médecins particulièrement sensibilisés aux médicaments génériques. Les médecins adhérant à l'option « médecin référents » s'engagent, entre autre, à prescrire des médicaments moins chers à hauteur de 15% de leurs prescriptions dont 5% de médicaments génériques.

- la taille de la ville d'exercice du prescripteur influence également la fréquence de prescription : les médecins prescrivant peu ou pas de génériques exercent leur activité dans les villes de plus de 10 000 habitants.

- Liés au patient :
  - 80% des médecins déclarent ne tenir compte ni de l'âge, ni du caractère aigu ou chronique de la pathologie, lors de la prescription de génériques.
  - les facteurs susceptibles d'influencer cette prescription :
  *les commentaires, la personnalité du patient
  *l'absence de mutuelle complémentaire
  *l'inscription à la CMU (Couverture Maladie Universelle)
  - 30% des médecins prescrivent les génériques à l'instauration du traitement.
- Liés aux médicaments :
  - la présence d'excipients à effet notoire n'est pas prise en compte par 60% des médecins
  - 41% des médecins ne connaissent pas le prix des médicaments
  - la forme galénique, la facilité d'utilisation et la connaissance de l'existence du générique influencent sa prescription.

De nombreuses informations (prix, forme galénique, présence d'excipients à effet notoire, emballage extérieur et conditionnement…) relatives aux médicaments génériques ne sont pas toujours facilement accessibles aux médecins dans leur pratique quotidienne.

Risques liés à l'utilisation des génériques :

- Liés à la différence de biodisponibilité :

Au plan réglementaire, le médicament générique est bioéquivalent à la spécialité de référence. En revanche, la bioéquivalence des médicaments génériques entre eux n'est pas exigée. De ce fait, un risque de survenue d'effet indésirable ou de moindre efficacité d'un générique est possible, notamment pour les principes actifs à marge thérapeutique étroite.

- Liés à la différence de présentation :
  Le médicament générique étant différent du princeps par sa présentation, des risques de mauvaise observance, de confusion voire de surdosage (par prise simultanée du princeps et du générique) sont susceptibles de survenir. De nombreux médecins ont observé ce type d'effets et 69% d'entre eux ont été confrontés à des plaintes de leurs patients rapportant un effet indésirable ou une moindre efficacité d'un médicament générique.

Droit de substitution :

- Attitude des médecins face au droit de substitution :
  Environ 45% des médecins exercent un contrôle de la substitution, 52% laissent faire le pharmacien et 3% la refusent. Ces chiffres varient en fonction de l'âge du médecin et de sa qualité de généraliste ou de spécialiste. Les médecins ne semblent pas opposés à l'utilisation des génériques, mais soulignent qu'il est important, pour les patients de toujours recevoir le même générique.
- Craintes des médecins :
  - problème médico-légal
  - risque pour le patient (mauvaise observance)
  - dérive commerciale
  - atteinte à la liberté de prescription (méconnaissance de la substitution)

Diverses actions permettant une meilleure utilisation du générique

- Prescription en DCI :
  Plus de la moitié des praticiens ayant répondu estiment qu'ils prescriraient plus en DCI si un cadre légal était instauré, ce qui est le cas aujourd'hui. Les médecins soulignent néanmoins la difficulté de cette pratique (formation inadaptée, complexité des dénominations, similitude des noms des produits d'une même classe avec risque de confusion).
- Concertation entre médecins et pharmaciens sur le choix des génériques : 57% des médecins y sont favorables
- Incitation ou pénalités financières :
  20% des médecins pourraient être influencés par ces mesures.
- Amélioration de la formation et de l'information : diverses voies sont à explorer.
  - Intégration au cursus universitaire
  - Formation médicale continue spécifique à la prescription des génériques (non souhaitée par 64% des médecins)
  - Visite médicale spécifique (70% y sont opposés)
  - Elaboration de documents de travail aisément consultables
  - Sensibilisation aux risques des excipients à effet notoire
  - Information des patients par les professionnels de santé et les médias.
- Proposition des prescripteurs :
  - Diminution du nombre de génériques
  - Instauration d'un prix unique ou prix de référence
  - Eviter les noms de fantaisie
  - Repenser le conditionnement extérieur

Utiliser la carte Vitale comme support d'information sur la spécialité générique délivrée.

VI - PHARMACOVIGILANCE EUROPEENNE

Vaccins hexavalents : Hexavac® et InfanrixHexa®

Les vaccins hexavalents InfanrixHexa® (GSK) et Hexavac® (Aventis Pasteur MSD) sont des vaccins combinés, utilisés pour protéger contre six maladies infectieuses graves (diphtérie, tétanos, poliomyélite, coqueluche, hépatite B, infections invasives à Haemophilus influenzae).
La sécurité d'emploi de ces vaccins, autorisés depuis 2000 selon une procédure européenne centralisée et commercialisés dans la majorité des pays européens, a été réévaluée par le Comité des Spécialités Pharmaceutiques (CSP) de l'Agence européenne pour l'évaluation des médicaments (EMEA) en avril 2003. Cette réévaluation a été conduite suite à 5 cas de décès inexpliqués, en Allemagne et en Autriche, survenant chez des enfants dans les 24 heures suivant l'administration de ces vaccins. Le CSP a conclu que le rapport bénéfice/risque de ces vaccins demeurait inchangé, mais a continué l'évaluation.
Une analyse exhaustive de l'ensemble des cas rapportés de mort subite a plus particulièrement identifié la survenue de 4 cas de décès dans les 48 heures suivant la vaccination (Hexavac®) chez des enfants âgés de plus de 1 an. Ce signal a été confirmé par une étude cas attendus-cas observés, réalisée en Allemagne, qui a montré que le nombre de décès inexpliqués au décours de la 2ème année de vie et dans les 24 heures suivant l'administration du vaccin hexavalent (Hexavac®) était supérieur au nombre de cas attendus. Cependant, en raison du très faible nombre de cas recensés et de certaines limites méthodologiques, cette analyse ne permettait pas d'établir une quelconque relation de cause à effet.
En novembre 2003, le CSP et l'ensemble des Etats membres ont estimé cependant nécessaire de mettre en place d'autres études pour examiner l'existence ou non d'un risque de mort subite liée à la vaccination hexavalente. Ils ont conclu qu'en l'état actuel des connaissances, aucune modification des conditions actuelles d'utilisation de ces vaccins n'était justifiée et que la balance bénéfice/risque de ces vaccins demeurait favorable.
Il est à noter qu'en France, aucun cas de décès n'a été recensé depuis la mise à disposition de ce vaccin (depuis leur mise sur le marché jusqu'à fin septembre 2003, environ 150 000 doses ont été délivrées en France). Les vaccins hexavalents ne sont actuellement distribués que dans certaines collectivités et ne sont pas remboursés par la sécurité sociale.

COXIBS : conclusion de la procédure d'arbitrage (Art.31) déclenchée par la France

Le 8 juillet 2002, la France a saisi l'EMEA en vue d'une réévaluation du rapport bénéfice/risque des inhibiteurs de la cyclooxygénase-2 (coxibs ou COX-2), notamment en raison des risque digestif et cardiovasculaire.
La procédure d'arbitrage a débuté le 25 juillet 2002 et les firmes concernées (Pfizer et MSD) ont été entendues par le CSP de septembre 2003. Le 20 novembre, le CSP a conclu à un rapport bénéfice/risque positif pour l'ensemble des coxibs (célécoxib, étoricoxib, parécoxib, rofécoxib et valdécoxib).
Le 21 novembre, l'EMEA a publié les conclusions de cet arbitrage en expliquant que les mises en gardes concernant les risques cardiaque, digestif et cutané avaient été ajoutées ou renforcées. Par ailleurs, l'EMEA a rappelé qu'aucune communication nationale ne devrait être réalisée avant la publication de la décision de la Commission européenne, comme l'impose la procédure.

Le Comité technique de pharmacovigilance s'est interrogé sur les conclusions de cet arbitrage au vu des modifications apportées au RCP qui lui ont été présentées. Il a été souligné que ces conclusions sont le reflet d'une position européenne et non nationale.
De plus, le Comité technique a regretté l'absence de lien du site de l'Afssaps à celui de l'EMEA, ce qui aurait permis, en France, aux praticiens d'avoir un accès direct à l'information européenne.

Erythroblastopénies rapportées avec les érythropoïétines

Un point sur le nombre de cas d'érythroblastopénies avec présence d'anticorps anti-érythropoïétine rapportés avec les érythropoïétines a été présenté.
En novembre 2001, la notification de 40 cas mondiaux d'érythoblastopénie chez des insuffisants rénaux chroniques traités avec Eprex® (époétine alfa) a conduit l'Afssaps à déclencher une mesure de restriction urgente

(USR) qui a permis de modifier l'information du Résumé des Caractéristiques du Produit (mention de l'effet indésirable et conduite à tenir en cas de suspicion). Devant l'augmentation du nombre de cas, une deuxième mesure de restriction urgente a été déclenchée par la France en juillet 2002 recommandant l'utilisation préférentielle de la voie intraveineuse dès lors de celle-ci était possible. En décembre 2002, une troisième USR visant à contre-indiquer l'administration d'Eprex® par voie sous-cutanée chez les patients insuffisants rénaux chroniques a été déclenchée par la France.

L'analyse des dernières données (jusqu'au 31 août 2003) révèle qu'une très nette diminution du nombre de cas a été rapportée depuis le début de l'année 2003.

Il est à noter que les causes de ce problème sont vraisemblablement multifactorielles et qu'aucune étiologie précise n'est à ce jour identifiée. Néanmoins, le Comité technique se réjouit que les différentes mesures prises précitées ont permis de juguler le problème.

VII - QUESTIONS DIVERSES

Dossier suivi par E. POINSARD

Dictionnaire Vidal®2004

Afin d'améliorer la lisibilité en matière d'information sur la sécurité d'emploi des médicaments dans le dictionnaire Vidal®, l'Afssaps a rencontré fin novembre 2003 le PDG ainsi que le directeur scientifique du Vidal®. Un espace d'information sur la pharmacovigilance dans les pages figurant au début du dictionnaire devrait être ajouté dans l'édition 2004, une demi-page environ serait réservée aux informations importantes de pharmacovigilance et trois quart de page aux nouveautés en antibiothérapie. La rubrique intitulée « informations importantes de pharmacovigilance » expliquerait l'intérêt des lettres d'informations destinées aux professionnels de santé et répertorie leurs thèmes de l'année 2002 jusqu'en juin 2003.
Un point relatif à la réalisation du dictionnaire Vidal® devrait être présenté lors d'un prochain Comité technique de pharmacovigilance.

Protection de l'identité du notificateur

Le CRPV de Limoges a signalé que l'identité du pharmacien a été révélée par le département alerte de la Direction de l'inspection et des établissements (DIE). En effet, la notification du pharmacien révélant un cas de brûlure sous SEREVENT® a été faxée, intempestivement, par le département alerte à la firme commercialisant ce médicament.

Analyse d'échantillons par la Direction des laboratoires et des contrôles / CRPV de Paris-Saint-Vincent de Paul

Le CRPV de Paris-Saint-Vincent de Paul a signalé que l'échantillon d'ELOXATINE (oxaliplatine) transmise à la Direction des laboratoires et des contrôles pour analyse a fait l'objet d'une recherche d'endotoxine, alors que le CRPV aurait préféré que soit réalisé l'essai de stérilité.
L'unité pharmacovigilance précisera désormais à la direction des laboratoires et des contrôles le type d'analyse sollicité en particulier lors de la transmission des échantillons.

Transmission des convocations et dossiers de la Commission d'AMM

Le Président de la Commission Nationale de Pharmacovigilance a signalé qu'il ne recevait pas les convocations et les dossiers de la Commission d'AMM. Ceci a été signalé aux personnes en charge de transmettre les convocations et les dossiers.

Versement du solde de la subvention 2003 de fonctionnement des CRPV

Le solde de la subvention 2003 de fonctionnement des centres a été versé par mandat administratif sur le compte de vos établissement de santé le 12 décembre 2003.

Convention triennale de fonctionnement des centres

Il a été rappelé que les centres doivent adresser à l'unité pharmacovigilance au plus tard le 16 décembre les conventions signées ainsi que les demandes de subvention 2004. Les problèmes relatifs à l'établissement des bilans financiers et aux conventions sont à adresser par écrit à l'unité pharmacovigilance pour qu'ils soient transmis au contrôleur financier.

TABLE DES MATIERES

I - Adoption du Procès-verbal du 12/10/2004 3

II - Tour de table des cas marquants et de la littérature 5

III - Enquête officielle relative aux effets indésirables graves observés avec la desmopressine. 9

IV - Enquête officielle : mirtazapine et arthralgies et myalgies, miansérine et myalgies 13

V - Point sur les effets coronaires des triptans 15

VI - Point sur l'abus des triptans et migraines aggravées 17

VII - Point sur les céphalées par abus d'antalgiques 19

VIII - Questions diverses 21

Annexe 3-65

I - ADOPTION DU PROCES-VERBAL DU 12/10/2004

Le procès-verbal de la séance du 12 octobre 2004 a été adopté avec les corrections suivantes :

Page 4 : II – Tour de table des cas marquants et de la littérature

- Ajouter après « 450 mg deux fois par jour de NEORAL » soit « 4 à 9 fois la dose usuelle ».

Page 7 : III – Bilan des données de pharmacovigilance des vaccins contre l'hépatite B au 31/12/2003

- Ligne 29 : supprimer « Enfin, le CRPV de Strasbourg suggère que l'incidence nationale des formes graves d'hépatopathies virales aiguës ou chroniques liées au virus de l'hépatite B fasse l'objet d'un suivi rigoureux durant les 10 années à venir. »

Page 9 : IV – Effets neuro-excitateurs de la morphine par voie générale

- Ligne 60 : remplacer « 3 par voie sous-cutanée, dont 2 représentaient une IR sévère» par « 3 par voie sous-cutanée (dans deux cas avec une dose de 10 mg/jour, dans un autre cas avec une dose non calculable) ».

Page 10 : IV – Effets neuro-excitateurs de la morphine par voie générale

- Ligne 1 : remplacer « 3 par voie intra-veineuse » par « 3 par voie intra-veineuse (dans un cas avec une dose de 500 mg/ jour, dans un cas avec une dose de 16 mg en 30 heures, et dans un dernier cas avec une dose inconnue mais probablement élevée chez un toxicomane) ».
- Ligne 6 : remplacer « Le remplacement, ou la diminution de la posologie de la morphine doivent être envisagés » par « La diminution de la posologie de la morphine ou sa substitution par un autre opiacé doivent être envisagés ».

Page 14 : V –Point sur les hyperkaliémies induites par l'association inhibiteurs de l'enzyme de conversion et spironolactone

- Ligne 13 : ajouter après « les notifications ne sont pas toutes spontanées » la phrase « comme en témoigne la répartition des observations en fonction du CRPV. En effet deux CRPV, Amiens et Angers, totalisent 46% des observations de la période post-RALES. Début 2003, le CRPV d'Angers a recueilli dans le cadre d'une enquête prospective une quarantaine de cas d'hyperkaliémie médicamenteuse. »
- Ligne 23 : remplacer « le taux de prescription de la SPIRO est passée de 34/1000 patients à 149/1000 » par « le taux de prescription de la SPIRO chez des patients hospitalisés sous IEC pour insuffisance cardiaque est passé de 34/1000 patients à 149/1000 ».
- Ligne 24 : remplacer « le taux d'hospitalisation pour hyperkaliémie est passé de 2,4/1000 patients à 11/1000 patients » par « le taux d'hospitalisation pour hyperkaliémie est passé de 2,4/1000 à 11/1000 chez ces mêmes patients ».

Page 15 : V –Point sur les hyperkaliémies induites par l'association inhibiteurs de l'enzyme de conversion et spironolactone

- Ligne 4 : rajouter « et la dose de spironolactone » après « essai ».

Annexe 3-65

Page 21 : VII – Questions diverses

- Ligne 19 : supprimer « significative ».

Page 22 : VII – Questions diverses

- Ligne 18 : remplacer « aucune valvulopathie chez les témoins » par « l'absence de signe de valvulopathie chez les témoins ».

Annexe 3-65

II - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Sont signalés les cas d'effets indésirables, de mésusages, d'erreurs et de manque de cohérence de l'information ainsi que les risques potentiels d'effets indésirables, pouvant donner lieu à des mesures (mises en enquête, notes...) ou pouvant faire l'objet d'une mise au point, dans le cadre de la prévention du risque médicamenteux.
La liste complète des cas est jointe en annexe 1.

Effets indésirables avérés :

Agénésie de la coupole diaphragmatique et hypoplasie pulmonaire bilatérale chez un nouveau-né de mère traitée par KEPPRA (lévétiracétam) pendant la grossesse/ CRPV de Clermont-Ferrand

Le CRPV de Clermont-Ferrand a signalé un cas d'hypoplasie pulmonaire bilatérale fatale chez un nourrisson né à 35 semaines d'aménorrhée d'une mère traitée par KEPPRA (lévétiracétam) et EPITOMAX (topiramate) pendant la grossesse.
→ Une note sera transmise à la cellule grossesse afin de signaler ce nouveau cas.

Oedèmes des membres inférieurs bilatéraux en présence de différents vaccins / CRPV de Clermont-Ferrand

Le CRPV de Clermont-Ferrand a signalé, à la suite de l'administration de différents vaccins, plusieurs observations d'oedèmes des membres inférieurs bilatéraux, nécessitant pour deux d'entre elles une hospitalisation (9 cas sous PENTACOQ®, 2 cas sous PENTAVAC®, 2 cas sous PREVENAR® associé à PENTAVAC® ou HBVaxPRO®). Le CRPV de Paris-HEGP a également signalé 4 cas sous PENTAVAC®.
→ Une enquête prospective des cas d'oedèmes survenant en présence de vaccins sera effectuée par les CRPV de Clermont-Ferrand, Dijon, Tours avec la collaboration des Centres de Protection Maternelle et Infantile.

TROXERUTINE MAZAL et choc anaphylactique / CRPV de Dijon

Le CRPV de Dijon a signalé un cas de choc anaphylactique sous TROXERUTINE MAZAL® sachet, qui est un générique de VEINAMITOL®.
→ Une note sera transmise au département pharmaceutique afin de connaître les excipients contenus dans la spécialité TROXERUTINE MAZAL® susceptibles d'être à l'origine d'un choc anaphylactique.

DEROXAT (paroxétine) et colite lymphocytaire / CRPV de Lyon

Le CRPV de Lyon a signalé un 10ème cas de colite lymphocytaire sous inhibiteurs sélectifs de la recapture de la sérotonine (DEROXAT®) avec normalisation après arrêt du traitement. Des cas de colites lymphocytaire sous paroxétine ont été rapportés dans une étude clinique rétrospective de 199 patients atteints de colites lymphocytaires publiés récemment dans Gut 2004 ; 53:536-541.
→ Une revue des données sur les colites lymphocytaires et les diarrhées chroniques sera demandée aux firmes commercialisant les inhibiteurs sélectifs de la recapture de la sérotonine (citalopram, escitalopram, fluoxétine, fluvoxamine, paroxétine, sertraline).

MIRENA (lévonorgestrel) et alopécie / CRPV Marseille

Le CRPV de Marseille a signalé un cas d'alopécie majeure 5 semaines après la pose de MIRENA (lévonorgestrel) chez une femme de 35 ans. 6 cas de chutes de cheveux ou d' alopécie sont signalés dans la base nationale de pharmacovigilance. Cet effet n'est pas mentionné dans le RCP de ce médicament. Dans la littérature, ce médicament semble entraîner plus d'alopécie que d'autres produits contraceptifs.
→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification d'information pour cette spécialité afin d'ajouter cet effet indésirable.

Annexe 3-65

Intoxication au méthotrexate / CRPV de Marseille

Le CRPV de Marseille a signalé un cas d'intoxication au méthotrexate (20 fois le taux attendu) avec insuffisance rénale aiguë d'apparition retardée à la suite de l'administration de doses recommandées de DANTRIUM (dantrolène) et de méthotrexate à forte posologie. Le CRPV de Montpellier a fait état des nombreux surdosages en méthotrexate associé au développement d'une insuffisance rénale. Le seul antidote efficace est le carboxypeptidase G2, a priori seulement disponible en Allemagne

→ Un point sera effectué par le CRPV de Montpellier sur le sujet et en particulier les modalités du suivi thérapeutique des traitements par méthotrexate.

CHLORAMINOPHENE (chlorambucil) et neuropathie périphérique / CRPV de Marseille

Le CRPV de Marseille a signalé un cas de neuropathie sensitivo-motrice sous CHLORAMINOPHENE (chlorambucil) chez un homme de 48 ans. Cinq autres cas sont signalés dans la base nationale de pharmacovigilance et cet effet n'est pas mentionné dans le RCP de cette spécialité.

→ L'unité de pharmacovigilance demandera à la firme le dépôt d'une demande de modification d'information pour cette spécialité afin d'ajouter ce type d'effet indésirable.

BRONCHODERMINE et troubles du comportement / CRPV de Marseille

Le CRPV de Marseille a signalé le cas d'un enfant de 20 mois traité par ADVIL, OCTOFENE, BRONCHODERMINE suppositoires, BRONCHOKOD, CELESTENE, hospitalisé pour troubles du comportement pendant 12 heures avec somnolence, aréactivité et regard fixe. La spécialité BRONCHODERMINE (cinéole ou eucalyptol, gaïacol, huile essentielle de pin) contient un dérivé terpénique pouvant être à l'origine de ces effets indésirables. La forme suppositoire n'est pas contre-indiquée chez l'enfant de moins de 30 mois. Seules les formes en application cutanée ou nasale sont contre-indiquées chez l'enfant de moins de 30 mois suite à une décision de la Commission d'AMM en 1996. Le 3 décembre 2004, le baume Vicks BABYBALM, contenant deux dérivés terpéniques avait été retiré du marché et il était envisagé une révision des spécialités contenant des dérivés terpéniques.

→ Ce cas sera signalé au groupe de travail concerné pour suite à donner.

UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) et volume de délivrance inadapté aux nouveaux-nés / CRPV de Montpellier

Le CRPV de Montpellier a signalé trois cas de cyanose dont un avec hospitalisation, chez des nouveaux-nés à la suite de fausses routes lors de la prise d'UVESTEROL (vitamines A, D2, E, C). L'injection trop rapide du volume nécessaire de la pipette (1 ml) aurait entraîné ces fausses routes.

→ Un point sur l'utilisation de l'UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) chez les nouveaux-nés sera effectué par les CRPV de Nantes et de Paris – Saint-Vincent de Paul.

FUZEON (enfuvirtide) et pneumopathies bactériennes / CRPV de Paris – Henri-Mondor

Le CRPV de Paris – Henri-Mondor a signalé deux cas de pneumopathies bactériennes survenues deux à quatre semaines après le début d'un traitement par FUZEON (enfuvirtide) chez une femme de 38 ans et un homme de 41 ans, sans qu'il y ait de mise en garde dans le RCP sur ce risque.

→ L'unité pharmacovigilance vérifiera les données d'essais cliniques sur le risque de survenue d'infections bactériennes précoces.

Mode d'administration des collyres et information dans les notices / CRPV de Paris – Saint-Vincent de Paul

Le CRPV de Paris – Saint-Vincent de Paul a fait état d'un cas étranger de surdosage massif lié à l'utilisation du collyre SKIAKOL (cyclopentolate), avec état de mal et décès survenu chez un enfant de 4 ans. Les notices des collyres précisent mal leurs modalités pratiques d'administration de ces produits.

→ Un point sur l'informativité des notices quant aux modes d'administration des collyres sera réalisée par le CRPV de Paris - Saint-Vincent de Paul.

Annexe 3-65

MEDIATOR (benfluorex) et bouffées délirantes / CRPV Toulouse
Le CRPV de Toulouse a signalé un cas de vision floue et malaise et un cas de bouffée délirante sous MEDIATOR (benfluorex), produit amphétaminique. Cette spécialité fait l'objet d'un large mésusage comme anorexigène.
→ Une mise à jour de l'enquête MEDIATOR sera effectuée par le CRPV de Besançon. Une relance sera effectué auprès de l'Italie sur ce sujet.

Effets indésirables potentiels

PROTOPIC (tacrolimus) et intolérance à l'alcool / CRPV Tours
Le CRPV de Tours a signalé deux cas d'érythèmes de la face sous PROTOPIC (tacrolimus) pommade, après la prise d'une boisson alcoolisée. Cet effet est mentionné en rubriques 4.4 et 4.8 du RCP de PROTOPIC pommade, alors qu'il n'est pas mentionné dans le RCP de PROGRAF gélule (tacrolimus).
→ L'unité de pharmacovigilance demandera l'avis du groupe de travail concerné.

Association MEXITIL® et CORDARONE® / CRPV Tours
A la suite d'une question posée au CRPV de Tours sur le RCP de MEXITIL (méxilétine), il a été observé une anomalie dans la rubrique « interaction médicamenteuse » puisque l'association avec l'amiodarone (CORDARONE®) est citée à deux niveaux : « contre-indiquée » et « nécessitant des précautions d'emploi » ce qui peut induire un risque de confusion.
→ Une note sera adressée à l'unité interaction médicamenteuse afin de signaler ce risque de confusion.

ZOMETA (acide zolédronique) et ostéonécrose de la mâchoire / CRPV Lille
Le CRPV de Lille a signalé un cas d'osctéonécrose de la mâchoire chez un patient atteint de myélome et traité par ZOMETA. Ce problème, soulevé au niveau européen, a conduit à la modification de la rubrique « effets indésirables » du RCP de ZOMETA et à l'ajout de cet effet indésirable. Par ailleurs, une DMI d'AREDIA (acide pamidronique) devant intégrer cet effet indésirable est en cours de finalisation par le CRPV de Reims.
→ Une information relative aux ostéonécroses des mâchoires pouvant survenir lors de traitement par acide zolédronique ou acide pamidronique sera effectuée auprès des prescripteurs.

Trimétazidine et syndrome extrapyramidal / CRPV Toulouse
Le CRPV de Toulouse a évoqué la publication de 8 cas de syndromes parkinsoniens observés avec la trimétazidine. Une vingtaine d'observations de ce type sont par ailleurs retrouvées dans la base nationale de pharmacovigilance.
→ Un point sur les syndromes parkinsoniens observés sous trimétazidine sera effectué par la CRPV de Toulouse.

MICROPAKINE (acide valproïque) et hyponatrémie / CRPV Reims
Le CRPV de Reims a signalé un cas d'hyponatrémie ayant entraîné une hospitalisation chez une patiente de 77 ans traitée avec MICROPAKINE. Plusieurs observations de ce type avec ce médicament sont retrouvées dans la base nationale de pharmacovigilance et dans la littérature.
→ Une analyse de l'ensemble des cas d'hyponatrémie rapportés avec l'acide valproïque sera demandée à la firme par l'unité de pharmacovigilance.

Documents distribués :

- Lettres aux pharmaciens hospitaliers et neurologues relatives au rappel des conditions de prescriptions d'ELSEP® et de suivi des patients atteints de sclérose en plaque selon l'autorisation de mise sur le marché.

Nouvelles enquêtes officieuses et officielles de pharmacovigilance :
- Une enquête prospective des cas d'oedèmes survenant en présence de vaccins sera effectuée par les CRPV de Clermont-Ferrand, Dijon, Tours avec la collaboration des Centres de Protection Maternelle et Infantile.

Annexe 3-65

- Un point sera effectué par le CRPV de Montpellier sur le sujet et en particulier les modalités du suivi thérapeutique des traitements par méthotrexate.
- Un point sur l'utilisation de l'UVESTEROL vitaminé A, D, E, C (vitamines A, D2, E, C) chez les nouveaux-nés sera effectué par les CRPV de Rennes et de Paris – Saint-Vincent de Paul.
- Une mise à jour de l'enquête MEDIATOR sera effectuée par le CRPV de Besançon.
- Un point sur l'informativité des notices quant aux modes d'administration des collyres sera réalisée par le CRPV de Paris - Saint-Vincent de Paul.

Annexe 3-65

III - ENQUETE OFFICIELLE RELATIVE AUX EFFETS INDESIRABLES GRAVES OBSERVES AVEC LA DESMOPRESSINE

Le Centre Régional de Pharmacovigilance (CRPV) de Caen a présenté l'enquête officielle relative aux effets indésirables graves observés avec la desmopressine.

Introduction

La desmopressine est un principe actif analogue de la vasopressine naturelle, aussi appelée hormone anti-diurétique (ADH). Cette dernière possède deux actions principales : une action anti-diurétique et un effet vasopresseur puissant. La structure chimique de la desmopressine diffère de celle de l'ADH, ce qui lui confère une demi-vie beaucoup plus longue et une forte diminution de l'effet vasopresseur au profit de l'effet anti-diurétique.

Statut

La desmopressine a obtenu une autorisation de mise sur le marché (AMM) en France le 22 janvier 1980. La spécialité Minirin®, commercialisée depuis 1982, existe sous 3 formes : Minirin® solution injectable 4µg/ml Intraveineuse (IV), Intramusculaire (IM) ou sous-cutanée (SC), Minirin® comprimé 0,1mg et 0,2mg (la forme sublinguale n'est pas encore disponible), Minirin® intranasal soit sous forme de Minirin® 0,1 mg/ml avec tube gradué (Rhinyle®) pour les posologies inférieures à 10 µg, soit Minirin® spray 10 µg/dose pour les posologies supérieures à 10 µg/dose.

Trois voies d'administration sont donc possibles, avec des indications distinctes :

Voie INTRA-NASALE :

- diabète insipide central pitresso-sensible ;
- traitement symptomatique de courte durée (3 mois) de l'énurésie nocturne de l'enfant de plus de 5 ans après élimination d'une pathologie organique sous-jacente ;
- étude du pouvoir de concentration du rein.

Voie ORALE :

- diabète insipide central pitresso-sensible ;
- traitement symptomatique de l'énurésie nocturne de l'enfant de plus de 6 ans après élimination d'une pathologie organique sous-jacente, la durée d'utilisation étant limitée à 6 mois ;
- depuis août 2003, extension des indications au traitement symptomatique de la nycturie chez l'adulte âgé de moins de 65 ans, lorsqu'elle est associée à une polyurie nocturne.

Voie INJECTABLE :

- traitement correcteur et préventif des accidents hémorragiques observés dans l'hémophilie A modérée et atténuée, maladie de Willebrand en dehors des formes sévères ou de type IIB, allongement inexpliqué du temps de saignement en particulier au cours de l'insuffisance rénale chronique ;
- traitement du diabète insipide central pitresso-sensible en particulier quand l'administration intra-nasale est malaisée ou impossible ;
- étude de pouvoir de concentration du rein.

Il existe une autre spécialité Octim® commercialisée en France depuis 1998, présente sous une seule forme à 150 µg/dose pour une administration intra-nasale, indiquée pour la prévention et la correction des accidents hémorragiques (tels que déjà définis ci-dessus).

Objectifs de l'enquête

- caractériser les effets indésirables (Ei) les plus fréquents de la desmopressine et déterminer l'imputabilité du médicament ;
- comparer l'incidence des Ei graves avec l'indication, l'âge des patients et la posologie ;
- évaluer les mesures préventives susceptibles de minimiser le risque.

Données de vente, données d'exposition

Le laboratoire Ferring titulaire de l'AMM de Minirin® et d'Octim® a transmis les données de vente pour la France et au niveau mondial.

Entre 1995 et 2003, **11,6 millions de patients** ont été traités par desmopressine dans le monde (11 millions par Minirin® et 600 000 par Octim®), ce qui représente 1,29 millions de patients traités par an.

En France, la voie intra-nasale est toujours la plus utilisée, même s'il apparaît que la voie orale prenne de plus en plus d'importance. Ainsi, en 1997, 10,4 fois plus de patients étaient traités par voie nasale que par voie orale, alors qu'en 2002 ce rapport n'est plus que de 1,9.
Au niveau mondial, depuis 2001 (et contrairement aux années 1996-2000), la desmopressine est plus souvent utilisée par voie orale que par voie intra-nasale, avec un rapport de 2,25 pour l'année 2003.

Analyse des cas notifiés en France
Les cas rapportés sont issus de la base nationale de pharmacovigilance et des cas enregistrés par le laboratoire Ferring.

La base nationale de pharmacovigilance contient 118 fiches d'effets indésirables (87 graves) en rapport avec la desmopressine dont 61 en relation avec une intoxication par l'eau. Il existe par ailleurs 29 autres observations en rapport avec une intoxication par l'eau dans la base du laboratoire. Au total 90 observations d'intoxication par l'eau ont été notifiées en France depuis la commercialisation.

- *Observations non liées à une intoxication par l'eau.*

Sur les 118 observations d'effets indésirables, 57 n'avaient pas de rapport avec une intoxication par l'eau. Sur les 57 observations, 29 concernent des effets indésirables graves. Dans 7 cas, l'imputabilité est vraisemblable. Il faut souligner la notification d'un décès par hépatite fulminante sur cirrhose (la desmopressine a une imputabilité douteuse).

- *Observations en rapport avec une intoxication par l'eau.*

Sur les 118 observations, 61 (dont 59 concernent des effets indésirables graves) concernent une intoxication par l'eau. Ces observations sont marquées par la survenue d'une hyponatrémie aiguë, associée ou non, en fonction de la gravité, aux signes cliniques suivants : asthénie, céphalées, nausées, vomissements, rétention hydrique, hypertension artérielle, œdème cérébral, troubles de l'humeur, confusion, coma, convulsions, détresse respiratoire.
L'imputabilité est vraisemblable dans 83,6% des cas.

Par ailleurs, le laboratoire Ferring a enregistré 29 observations françaises d'effets indésirables graves en rapport avec une intoxication par l'eau avec une imputabilité vraisemblable de la desmopressine.

La voie d'administration (connue dans 86/90 cas) se répartit en: **intra-nasale dans 77,9%** (67 cas), intra-veineuse dans 15,1% (13 cas) et orale dans 7% des cas (6 cas).

Les indications se répartissent en : **énurésie 53,3% (48 cas),** diabète insipide 13 cas, anomalies de la coagulation 12 cas, troubles mictionnels 11 cas, hypotension orthostatique 3 cas, test au Minirin® 1 cas, indication inconnue 1 cas.

L'âge des patients se répartit en : 58 cas concernent des enfants entre **0 et 15 ans, soit 64,4%.** Une majorité d'enfants est concernée par la voie d'administration intra-nasale qui représente les trois quarts des notifications, avec 86% de prescriptions dans l'indication énurésie. Pour la voie orale, la majorité des cas d'intoxication par l'eau concerne des adultes de plus de 65 ans (dans 2/3 des cas). En ce qui concerne la voie intra-veineuse, dans 12 cas sur 13, l'indication est en rapport avec un trouble hémorragique et les patients concernés sont des adultes de moins de 65 ans dans 62% des cas et des enfants de 0 à 16 ans dans 38% des cas.

La posologie par kilogramme de poids et par jour a été estimée dans 63 cas. Par voie intra-nasale la posologie moyenne est de **1,33 µg/kg/jour**, par voie intra-veineuse de **0,63 µg/kg/jour** et par voie orale, de **5,33 µg/kg/jour**. Une très grande disparité entre les valeurs extrêmes des posologies pour les formes intra-nasale et intra-veineuse, avec un rapport de 1 à 40 est mise en évidence. Pour la forme orale, il existe un rapport de 7,7 seulement entre les posologies les plus extrêmes.

Analyse des cas cliniques internationaux
Le laboratoire Ferring a reçu 1830 observations d'effets indésirables survenus sous desmopressine, dont 36,8% sont des cas graves (674). Sur ces 674 cas graves, 632 sont associés au Minirin® (dont 371 par voie intra-nasale) et 42 à Octim/Octostim®. Parmi les 1156 effets non graves, 1106 sont associés au Minirin® dont 766 lors d'une administration intra-nasale.

L'analyse des cas a porté sur les observations d'effets indésirables graves en rapport avec une intoxication par l'eau, ce qui représente **315 observations** issues de 25 pays. On observe que :

Annexe 3-65

- dans plus de 2/3 des cas, il s'agit de formes intra-nasales (67,9%) ;
- l'indication la plus souvent retrouvée est l'énurésie (43,2%) ;
- l'âge est inférieur ou égal à 16 ans dans 52,7% des cas (dont 1 sur 3 inférieur à 5 ans), entre 17 et 64 ans dans 23,5%, supérieur à 65 ans dans 15,6%.

Indications	Voies d'administration				
	Intranasale	Intraveineuse	Orale	Inconnue	TOTAL
Enurésie	**127**	0	10	1	**138**
Diabète insipide	49	6	9	2	66
Troubles mictionnels	8	0	20	1	29
Troubles de la coagulation	13	38	0	2	53
Test au Minirin®	11	5	0	1	17
Inconnue	6	0	3	3	12
TOTAL	**214**	41	42	10	**315**

Répartition des observations internationales d'effets indésirables graves relatives à une intoxication par l'eau sous desmopressine, en fonction de l'indication et de la voie d'administration.

Indications	Age					
	< 5 ans	5 – 16 ans	17 – 64 ans	> 65 ans	Inconnu	TOTAL
Enurésie	6	**103**	17	4	8	**138**
Diabète insipide	18	6	25	5	12	66
Troubles mictionnels	0	0	2	27	0	29
Troubles de la coagulation	16	2	21	9	5	53
Test au Minirin®	13	0	3	1	0	17
Inconnue						12
TOTAL	53	**111**	68	46	25	**315**

Répartition des observations internationales d'effets indésirables graves relatives à une intoxication par l'eau sous desmopressine, en fonction de l'indication et de l'âge.

Il est à souligner que l'indication de la desmopressine dans l'**énurésie** est réservée aux enfants de plus de 5 ans, or 4,3% des observations rapportées dans cette indication concernent des enfants de **moins de 5 ans**. Par ailleurs, la restriction d'âge à moins de 65 ans dans l'indication de **nycturie** n'est pas présente dans tous les pays, ce qui peut expliquer que 27/29 cas d'intoxication par l'eau dans cette indication soient décrits chez des patients de **plus de 65 ans.**

Dans l'indication de **diabète insipide**, la répartition en fonction de l'âge des cas d'intoxication par l'eau est de 24 enfants (dont 18 concernent des enfants de moins de 5 ans) et 25 adultes de moins de 65 ans. Cette répartition entre enfants et adultes est beaucoup plus homogène que celle observée dans l'indication énurésie où 109 observations d'effets indésirables graves sur 138 concernent des enfants.

Les cas concernant les **troubles de coagulation** sont assez équilibrés quant à la répartition par âge avec une forte représentation des très jeunes enfants de moins de 5 ans (30% de l'ensemble des cas).

Synthèse et discussion

L'incidence globale des effets indésirables notifiés sous desmopressine est estimée à **1,63 pour 10000 patients traités**. La proportion de notifications d'effets indésirables en rapport avec une **intoxication par l'eau** est importante puisqu'elle représente **51,7% des cas de la base nationale** de pharmacovigilance (**67,8% des effets graves**) et **51% des effets graves rapportés à la firme**.

La forme intra-nasale est le plus souvent en cause et représente 77,9% des cas français et 67,9% des cas internationaux d'intoxication par l'eau. Entre 1997 et 2002 en France, 4 fois plus de patients ont été traités par voie intra-nasale que par voie orale.

L'indication la plus souvent retrouvée dans les cas d'intoxication par l'eau sous desmopressine est **l'énurésie** (53,3% des cas français et 43,2% des cas internationaux).

Les observations d'intoxication par l'eau concernent en majorité des **enfants** de 0 à 16 ans (64,4% des cas français et 52% des cas internationaux).
L'analyse des **posologies** par indication, âge et voie d'administration montre une grande disparité avec des fourchettes de dose extrêmement importantes, ce qui illustre que la posologie n'est pas le seul facteur en cause dans ces observations.

Propositions :

- définir, si cela s'avère possible, des posologies initiales particulières (en µg/kg) :
  - chez le nourrisson pour le traitement du diabète insipide,
  - chez l'enfant de moins de 25 kg pour le traitement de l'énurésie
- insister sur la nécessité en cas d'énurésie de ne pas instaurer de traitements en dessous de 5 ans ;
- insister sur l'information donnée aux patients et à leur famille telle que la restriction hydrique, avec un ordre de grandeur du volume de boissons autorisé, identifier les situations à risque de déséquilibre, savoir reconnaître les éventuels symptômes d'une intoxication à l'eau, et insister sur les associations médicamenteuses à risque ;
- favoriser l'usage de la voie orale par rapport à la voie intra-nasale. Une forme sublinguale (Minirin® melt) permettrait de remplacer la voie intra-nasale.
- insister sur les risques lors d'une utilisation hors AMM ;
- harmoniser les différents RCP. L'ajout d'un tableau d'équivalences posologiques entre les différentes présentations et en particulier entre les formes orales et les formes intra-nasales pourrait être utile.

Le Comité technique estime par ailleurs que la ré-évaluation du rapport bénéfice/risque pourrait se justifier dans l'indication « énurésie ». Une présentation de cette enquête par domaines d'indication est prévue en Commission nationale de pharmacovigilance.

Annexe 3-65

IV - ENQUETE OFFICIELLE : MIRTAZAPINE ET ARTHRALGIES ET MYALGIES, MIANSERINE ET MYALGIES

Le CRPV de Nantes a présenté les résultats de l'enquête officielle concernant d'une part la mirtazapine et les myalgies – arthralgies et d'autre part la miansérine et les myalgies. Cette enquête recense les observations notifiées du 1er septembre 1999 au 31 décembre 2003.

1/ mirtazapine (NORSET®) et myalgies – arthralgies

NORSET® est autorisé en France depuis 1997 et commercialisé depuis le 1er septembre 1999 par les laboratoires Organon. Il est indiqué dans les épisodes dépressifs majeurs.

Données des Centres Régionaux de Pharmacovigilance (CRPV)

221 observations ont été recensées avec la mirtazapine dont 7 cas d'arthralgie, 9 cas de myalgie et 3 cas possédant les deux items, soit 13 notifications correspondant à 16 effets indésirables. Ces observations, le plus souvent non graves, concernent une population à légère prédominance féminine, âgée de 30 à 60 ans. Le délai de survenue est variable (de une heure à un an) et dans 4 cas, la mirtazapine était administrée en monothérapie. Ces effets indésirables sont tous survenus à la posologie recommandée. Aucune utilisation hors autorisation de mise sur le marché (AMM) n'a été relevée.

Il s'agit dans ces observations de polyarthralgies concernant essentiellement les petites articulations (mains, poignets, coudes) et pouvant être associées à des oedèmes (face, membres inférieurs, mains), une prise de poids, une asthénie. Ces effets indésirables ne semblent pas dose-dépendants. L'évolution a été favorable dans la grande majorité des cas à l'arrêt de la mirtazapine. Un cas de réadministration positive a été observé.

A noter que les arthralgies sont déjà signalées dans le Résumé des Caractéristiques du Produit (RCP) de la miansérine qui appartient, comme la mirtazapine, à la classe des pipérazinoazépines.

Données des laboratoires Organon

330 dossiers d'arthralgie - myalgie ont été colligés par le laboratoire sur un total de 6492 cas au niveau mondial. 16 cas, correspondant à 18 effets indésirables ont été rapportés en France. Ces observations sont superposables à celles notifiées aux CRPV.

Données des essais cliniques

Sur une population de 2521 patients, 46 cas d'arthralgie (soit 1,8%) et 51 cas de myalgie (soit 2%) ont été rapportés. Ces cas présentent les mêmes caractéristiques que ceux décrits après la mise sur le marché.

Au total, 29 cas d'arthralgie – myalgie ont été notifiés en France (330 dans le monde) avec la mirtazapine, d'où une fréquence de cas notifiés de l'ordre de $0{,}23.10^{-6}$ (le nombre de traitements vendus en France du 1er septembre 1999 au 31 décembre 2003 étant de 743306). Il est probable que ces effets indésirables fassent l'objet d'une sous-notification, en raison de l'absence de gravité de ces cas, de la chronologie variable et de la sémiologie banale. Cependant, l'information mérite d'apparaître dans le RCP afin d'éviter un traitement symptomatique par AINS.

Le rapporteur a suggéré d'intégrer dans la rubrique 4.8 du RCP de la mirtazapine :
« Dans de rares cas, les effets indésirables suivants ont également été rapportés : arthralgies, myalgies ».

2/ Miansérine (ATHYMIL® et molécules génériques) et myalgies

ATHYMIL® est un antidépresseur commercialisé depuis 1979 par les laboratoires Organon et indiqué dans les épisodes dépressifs majeurs. 14 médicaments génériques ont à ce jour une Autorisation de Mise sur le Marché (AMM) et 11 sont commercialisés.

Données des CRPV

1879 observations ont été recensées avec la miansérine dont 13 cas de myalgie. Ces observations, le plus souvent non graves, concernent une population à prédominance féminine, âgée de 34 à 80 ans. Le délai de survenue est variable (de 3 jours à 2 ans) et dans 2 cas, la miansérine était administrée en monothérapie.

Annexe 3-65

Il s'agit dans ces observations de myalgies associées à d'autres effets indésirables tels que asthénie, anorexie, élévations des transaminases, diarrhées, nausées, vertiges, ou augmentation des CPK. L'évolution a été favorable dans la grande majorité des cas à l'arrêt de la miansérine. Un cas de réadministration positive a été observé.

Données des laboratoires

13 observations de myalgie rapportés avec ATHYMIL®, présentant les mêmes caractéristiques que celles décrites plus haut, ont été transmis par le laboratoire Organon (sur 649 notifications françaises). 60 cas de myalgie ont été signalés dans le monde.

Un cas supplémentaire australien a été transmis par le laboratoire Merck générique et concerne la spécialité MIANSERINE MERCK®.

Données de la littérature

L'analyse de la littérature a permis de retrouver un article issu du bulletin de pharmacovigilance des autorités de santé australiennes, l'ADRAC (Australian Adverse Drug Reactions Bulletin) de février 1984, recensant 14 cas de douleurs musculaires et articulaires sous miansérine.

Le rapporteur a suggéré d'intégrer dans la rubrique « Effets indésirables » 4.8 du RCP de la miansérine :
« Ont été signalés : de rares cas de myalgies ».

Le Comité technique a suivi l'avis du rapporteur, mais a proposé le terme « arthromyalgies » en remplacement de « arthralgie, myalgie ».
Le dossier sera présenté lors de la Commission nationale de janvier 2005.

Annexe 3-65

V - POINT SUR LES EFFETS CORONAIRES DES TRIPTANS

Le Centre Régional de Pharmacovigilance de Toulouse a présenté un point sur les effets indésirables coronaires des triptans. Ce point a été demandé par le Comité technique suite à la notification de 2 cas d'infarctus du myocarde chez des sujets jeunes (35 et 36 ans).
Les triptans sont des agonistes des récepteurs sérotoninergiques 5HT1B et 5HT1D, présents sur les artères intracrâniennes mais également sur les artères périphériques, comme les artères coronaires. Ces récepteurs déterminent, quand ils sont activés par un agoniste, un effet vasoconstricteur. Par ailleurs, les triptans inhibent l'extravasation des protéines plasmatiques.

A ce jour, 5 triptans sont commercialisés en France :

- *sumatriptan* (IMIGRANE® : comprimés pelliculés, solution injectable, solution pour pulvérisation nasale et IMIJECT® : solution injectable)
- *zolmitriptan* ZOMIG® (comprimés pelliculés) et sous forme de comprimés orodispersibles sous le nom de ZOMIGORO®
- *naratriptan* NARAMIG® (comprimés pelliculés)
- *almotriptan* ALMOGRAN® (comprimés pelliculés)
- *élétriptan* RELPAX® (comprimés pelliculés)

Ils sont indiqués dans deux indications :

- *« Traitement de la phase céphalalgique de la crise avec ou sans aura »*. La forme injectable est réservée *« au traitement de la crise de migraine sévère lorsque les autres traitements de la crise de migraine n'ont pas été efficaces au cours des crises précédentes »*.
- *« Traitement de la crise d'algie vasculaire de la face »* pour IMIGRANE® solution injectable et IMIJECT® solution injectable.

Analyse de la Base nationale de Pharmacovigilance :

Une interrogation de la Base Nationale de Pharmacovigilance en juin 2004, avec les mots clés « triptans » et « collapsus cardiovasculaire, troubles cardiaques, angine de poitrine, angine de poitrine compliquée, coronaropathie » a révélé 11 observations. Ces observations concernent 7 hommes et 4 femmes (le ratio homme/femme dans la migraine est de 1/3).

Dans 3 cas sur 11, le tableau a été qualifié de « non grave ». il s'agit de :

- 2 cas de précordialgie,
- un trouble visuel conduisant à la découverte de troubles de la repolarisation avec susdécalage du segment ST,

Dans les 8 autres cas, le tableau été qualifié de grave. Il s'agit de :

- un arrêt circulatoire avec fibrillation ventriculaire,
- quatre infarctus
- un angor spastique,
- deux spasmes coronariens.

Des facteurs de risque cardiovasculaire ont été noté dans 8 cas sur les 11 rapportés.
L'évolution a été favorable dans tous les cas sauf un. Il s'agit d'un cas concernant un homme de 36 ans ayant présenté un arrêt circulatoire avec fibrillation ventriculaire. L'évolution s'est faite vers un coma et une encéphalopathie post-anoxique avec décès ultérieur.

Concernant les triptans imputés, il s'agissait :

- dans 5 cas, du *zolmitriptan* comprimés,
- dans 3 cas, du *naratriptan*,
- dans 2 cas, du *sumatriptan* injectable (IMIJECT®)
- dans 1 cas de la prise successive à 1 heure d'intervalle de zolmitriptan puis de spray de *sumatriptan*.

L'imputabilité a été jugée :

- douteuse (I1) dans 7 cas,
- plausible (I2) dans 1 cas,
- vraisemblable (I3) dans 2 cas,
- très vraisemblable (I4) dans 1 cas.

Annexe 3-65

Dans un cas, a été notée l'association a de l'oxymétazoline (ATURGYL®) aux propriétés alpha stimulantes pouvant potentialiser les effets coronaroconstricteurs des triptans.
Dans 5 cas (45,5 %), une notion de mésusage a été retrouvée. Il s'agit dans 2 cas, d'interaction médicamenteuse et dans 3 cas, de non respect des posologies recommandées.

Analyse de la littérature :
Les symptômes thoraciques représentés par une impression d'oppression thoracique avec parfois une symptomatologie algique et observés très classiquement sous triptans, ont été exclus de ce travail.
La revue de la littérature réalisée au 3 septembre 2004 a permis de retrouvé 41 articles.
Concernant les cas rapportés dans ces articles, on note :

- Une dizaine d'accidents ischémiques myocardiques, coliques et cérébraux
- Des cas d'infarctus du myocarde, essentiellement rapportés avec le sumatriptan injectable
- De façon très anecdotique, la survenue d'infarctus du myocarde chez des patients sans pathologie cardiovasculaire préexistante
- Deux observations d'effets indésirables coronaires après utilisation de sumatriptan par voie orale.

Le « Groupe d'Experts de Sécurité Cardiovasculaire des Triptans » a publié ses résultats en 2004 (Doddick et al, Headache 2004, 44, 414-425). Ce groupe, travaillant au nom de l'American Headache Society, a conduit une revue générale de l'ensemble des données scientifiques et cliniques sur le risque cardiovasculaire associé aux triptans. Le groupe d'experts conclut que : « le risque d'effets indésirables cardiovasculaires sous triptans apparaît très faible chez les patients respectant les critères d'inclusion ou d'exclusion des essais cliniques ou recevant les triptans selon les recommandations officielles ». Ainsi, « les triptans peuvent être prescrits en confiance sans bilan cardiovasculaire préalable ».

Conclusion :
Les accidents coronaires graves sous triptans surviennent dans presque 50 % des cas en dehors de tout mésusage et peuvent apparaître en l'absence de tout antécédent cardiovasculaire connu. Ces accidents graves concernent non seulement le sumatriptan (injectable ou administré par voie orale) mais également les autres triptans disponibles par voie orale. Ces données conduisent à rappeler qu'il faut, avant la prescription de tout triptan, évaluer le terrain coronaire par un interrogatoire sur les facteurs de risque cardiovasculaires et l'existence ou non d'un comportement addictif (ou d'une tendance addictive). L'évaluation du risque cardiovasculaire doit être dynamique dans le temps : il convient donc de la renouveler régulièrement car l'âge est un facteur de risque en soi et le risque augmente donc au cours du temps.
L'information présente dans les résumés des caractéristiques des produits (RCP) des différents triptans mériterait d'être mieux présentée et surtout d'être mieux connue des prescripteurs. Des propositions pourront être faites dans ce sens au niveau européen, pour les produits enregistrées selon des procédures européennes. Les RCP des produits enregistrés en procédure nationale (ZOMIG® et IMIGRAN® solution pour pulvérisation nasale, solution injectable et comprimés) pourront être modifiés.
Par ailleurs, l'ajout, dans les RCP, de l'interaction avec les alpha-stimulants qui ne sont pas des dérivés de l'ergot de seigle (comme l'oxymétazoline) devra être discutée.

Annexe 3-65

VI – POINT SUR LES CEPHALEES PAR ABUS MEDICAMENTEUX

1 - POINT SUR L'ABUS DES TRIPTANS ET MIGRAINES AGGRAVEES

Le Centre régional de Pharmacovigilance (CRPV) de Dijon a présenté un point sur les migraines aggravées induites par abus de triptans. Ce point a été réalisé conjointement par le CRPV de Dijon et le Centre d'Evaluation et d'Information sur les Pharmacodépendances (CEIP) de Toulouse.
Ce point ne concerne que la classe des triptans même si l'abus dans la migraine est le plus souvent plurimédicamenteux. Les triptans sont des agonistes sélectifs des récepteurs $5HT_{1B}$ et $5HT_{1D}$ vasculaires. Il sont indiqués dans le traitement de la crise de migraine, avec ou sans aura et ne doivent pas être utilisés en traitement prophylactique.
Cinq spécialités sont commercialisées en France, sous des formes orales, injectables ou inhalées.

Définitions :

En 2004, l'Agence Nationale d'Accréditation et d'Evaluation en Santé (ANAES) a publié des recommandations concernant le diagnostic, et a précisé le rôle de l'abus médicamenteux dans ces circonstances et la prise en charge **des céphalées chroniques quotidiennes (CCQ)**. Les CCQ y sont définies comme : « un ensemble hétérogène défini par la présence de céphalées plus de 15 jours par mois et plus de 4 heures par jour en l'absence de traitement, depuis plus de 3 mois, sans *substratum* lésionnel ou symptomatique. Il s'agit le plus souvent d'une céphalée initialement épisodique (migraine ou céphalée de tension) qui évolue vers une céphalée chronique, sous l'influence notamment d'un abus médicamenteux et de facteurs psychopathologiques.»
Selon l'International Headache Society (IHS), **l'abus médicamenteux** se définit comme un usage excessif intentionnel, persistant ou sporadique, de médicaments, accompagné de réactions physiques ou psychologiques nocives et caractérisé par une prise médicamenteuse régulière et qui dure depuis plus de 3 mois et qui est présente plus de 15 jours par mois pour les antalgiques non opioïdes (AINS, aspirine, paracétamol) et plus de 10 jours par mois pour les autres traitements de la crise (opioïdes ergotés, triptans, spécialités antalgiques associant plusieurs principes actifs). L'abus médicamenteux serait à l'origine d'un tiers des CCQ dans la population générale.

Les céphalées par abus médicamenteux (CAM) sont définies par les 3 critères suivants :
- la céphalée est présente plus de 15 jours par mois
- la céphalée se développe ou s'aggrave lors de la surconsommation médicamenteuse
- la céphalée disparaît ou revient à son état initial dans les deux mois après l'arrêt de la surconsommation médicamenteuse.

La CAM répond à des caractéristiques cliniques dépendant du type de substance consommée. En cas de CAM liée à une prise excessive de triptans, la céphalée secondaire doit être à prédominance unilatérale, et /ou de nature pulsatile, et/ou d'intensité modérée à sévère, et/ou aggravée par les activités physiques usuelles, et/ou associées soit à des nausées, des vomissements, soit à une phono- et photophobie. L'aggravation clinique se traduit souvent par une augmentation de la fréquence des crises.
Les **céphalées de sevrage** surviennent après l'utilisation d'une dose importante de substance pendant plus de 3 mois, apparaissent dans les heures suivant son arrêt, sont soulagées par une réadministration et disparaissent dans les 14 jours après l'arrêt total.

Analyse de la Base Nationale de Pharmacovigilance :
La recherche des observations enregistrées dans la Base Nationale de Pharmacovigilance a été réalisée, pour chaque molécule de triptan en recherchant les effets indésirables suivants : céphalée, migraine, céphalée par abus médicamenteux, céphalalgie, aggravation des céphalées, abus médicamenteux. Chaque observation a ensuite été revue et ont été sélectionnées comme abus toutes celles pour lesquelles les critères de l'IHS étaient retrouvés :
- céphalée par abus médicamenteux : céphalées durant plus de 15 jours par mois, s'aggravant avec la consommation de triptans, cédant à l'arrêt de la surconsommation,
- surconsommation : prise de triptans pendant plus de 15 jours par mois et pendant au moins 3 mois,
- nécessité d'un ou plusieurs sevrages,
- indication d'abus (terme préférentiel), ou présence d'éléments tels que la falsification d'ordonnance.

La recherche, menée en juillet 2004, a permis d'identifier 49 observations, enregistrées depuis 1992, année de mise sur le marché du premier triptan. Ces observations concernent 43 femmes et 6 hommes, d'âge moyen 48 ans.

Pour ces 49 observations, le diagnostic de céphalées par abus médicamenteux a été objectivé par :
- une amélioration des céphalées après sevrage en triptans : 35 observations,
- une fréquence de prise trop importante d'après les critères de l'IHS : 8 observations,
- une falsification d'ordonnance dans 1 observation,
- une prise chronique dans 2 observations,
- un abus probable mais difficile à objectiver par manque de renseignements dans 2 observations.

Dans 20 % des observations, un syndrome dépressif associé est indiqué.
Les triptans imputés sont :
- Zolmitriptan dans 30 cas (58%),
- Naratriptan dans 15 cas (30,6%),
- Sumatriptan dans 10 cas (20,4%) voie orale 6 fois, voie SC 2 fois, voie inhalée 2 fois,
- Almotriptan dans 1 cas (2%).

Dans 7 observations, une association de plusieurs triptans a été constatée. Une association aux autres traitements de la crise a été notée dans 61,2% des cas et aux antalgiques simples dans 12% des cas.
Dans les cas avec abus objectivé selon les critères de l'IHS, les consommations vont de 10 jours par mois (limite inférieure pour parler d'abus) à 6 comprimés par jour tous les jours au maximum.
Un sevrage médical a été nécessaire dans 37 cas, dont 24 en milieu hospitalier.

Données des CEIP :
Ces données ont été obtenues en utilisant les outils des CEIP à savoir OSIAP (Ordonnances Suspectes, Indicateur d'Abus et de Pharmacodépendance), NOTS (Notifications Spontanées) et OPPIDUM (Observation des Produits Psychotropes Illicites ou Détournés de leur Utilisation Médicamenteuse). Vingt-sept cas d'abus ont été recensés grâce à ces outils.
Dans 22 cas sur 27, le triptan était associé à d'autres médicaments. Il s'agissait notamment d'antalgiques, dans 15 cas, de caféine dans 9 cas. Dans 1 cas, il y avait également consommation de substances illicites (héroïne, ectasy).
Treize des 27 cas ont été identifiés comme étant des doublons des observations de la base nationale de Pharmacovigilance.

Analyse de la littérature
Les céphalées chroniques induites par abus médicamenteux ne semblent survenir que chez des patients qui sont déjà céphalalgiques, le plus souvent migraineux.
Une étude portant sur la consommation de sumatriptan par la population danoise en 1994 et 1995 a montré une prévalence d'utilisation en 1994 à 7,8/1000, avec un sexe ratio F/H à 3,8.
L'analyse des délivrances de médicaments par les pharmacies au Danemark en 1995, représentant 46 500 patients, a montré le caractère inapproprié de la consommation de sumatriptan dans la population : 5% des patients consomment 40% des triptans. Trois grands groupes de consommateurs ont été définis : importants (plus de 60 unités par mois), intermédiaires (entre 30 et 59), et modérés (moins de 30 unités /mois). Dans chaque groupe la proportion de céphalées induites a été estimée respectivement à 86 %, 47% et 14%.
Une étude israélienne visant à documenter la relation entre consommation de sumatriptan et changement de la nature des migraines, a montré chez tous les patients une recrudescence des crises 3-4 semaines après introduction, des modifications des caractéristiques des céphalées et une augmentation de leur durée.
Concernant la prise en charge, le sevrage médicamenteux est indispensable, mais les protocoles thérapeutiques sont actuellement très hétérogènes et mal évalués. Les moyens non médicamenteux sont parfois déterminants. L'éducation du patient céphalalgique et le suivi régulier sont primordiaux pour éviter les rechutes. Des facteurs pronostiques ont été mis en évidence mais ne seraient pas déterminants à long terme. Le taux de réussite, actuellement évalué à 60% à 5 ans, et les bénéfices d'une prise en charge adaptée encouragent à détecter précocement ces céphalées induites encore largement sous-diagnostiquées

Annexe 3-65

Information contenue dans les Résumés de Caractéristiques du Produit (RCP)

Il a été signalé qu'une information concernant le risque de céphalées chroniques induites par abus est mentionnée en section Mises en garde et précautions d'emploi pour tous les triptans commercialisés excepté pour Naramig, pour lequel une procédure de variation européenne est en cours à ce sujet, et Zomig, enregistré selon une procédure nationale. Une information est présente dans la section concernant les effets indésirables que pour Zomig.

2 - POINT SUR LES CEPHALEES PAR ABUS D'ANTALGIQUES

A la suite d'une alerte rapportée par deux médecins du centre de la douleur et de traitement des céphalées du CHU de Saint-Etienne en juin 2004, le CRPV de Saint-Etienne a souhaité présenter un point sur les céphalées par abus médicamenteux (CAM). Ce point a été réalisé en collaboration avec la Société Française d'Etudes des Migraines (SFEMC).

Après avoir rappelé les définitions de la CAM et de la surconsommation médicamenteuse, les données de la SFEMC ainsi que les cas de la base nationale de pharmacovigilance ont été présentés.

Données de la SFECM

Depuis le 1er juin 2002, cette société a créé un registre multicentrique de patients céphalgiques reçus dans 13 centres hospitalo-universitaires spécialisés dans la prise en charge des douleurs chroniques et/ou des céphalées.

Au 31 mars 2004, 20 628 patients étaient dénombrés, les conclusions suivantes pouvaient être dégagées :

- 1544 (7,5%) patients ont été identifiés comme souffrant de CAM
- les médicaments responsables se répartissent comme suit :
  - antalgiques non opiacés : 38,2%
  - triptans : 29,3%
  - antalgiques opiacés : 22,3%
  - ergotamine : 3,2%
  - associations : 4,3%
  - autres (sans précision) : 2,7%.

Par ailleurs, à la suite de ces premiers résultats, la SFEMC a instauré une étude épidémiologique observationnelle, transversale, multicentrique, réalisée auprès des centres hospitalo-universitaires spécialisés dans la prise en charge de patients céphalalgiques. L'objectif de cette étude est de décrire les caractéristiques sémiologiques des patients souffrant de CAM. Elle a débuté en juillet 2004 et doit inclure 500 patients au total.

Données de la base nationale de pharmacovigilance

Le recueil des données de la base nationale a été effectué sur une période identique (du 1er juin 2002 au 31 mars 2004) à celle de la SFEMC, afin de permettre une comparaison des résultats.

La recherche croisée de céphalalgie / migraine / abus de médicament / pharmacodépendance avec tous les principes actifs antalgiques ou antimigraineux appartenant aux listes « antalgiques » et « neurologie, antimigraineux, traitement de la crise » extraits du classement des médicaments par famille pharmacothérapeutique (section jaune du Dictionnaire Vidal 2004), a permis de colliger 44 observations, contre 1544 pour la SFECM.

Les données comparatives peuvent être résumées de la façon suivante :

	REGISTRE SFECM	BNPV
Nombre de patients	1544	44
Abus d'antalgiques non opiacés	38,2%	32,1%
Abus de triptan	29,3%	18,3%
Abus d'antalgiques opiacés	22,3%	24,8%
Abus d'ergotamine	3,2%	9,1%
Autres	7%	15,7%

Information contenue dans les Résumés de Caractéristiques du Produit (RCP)

Après avoir revu l'ensemble des RCP concernés, il apparaît que le risque de CAM est de façon générale peu mentionné dans les RCP. En effet, seules les spécialités contenant de l'aspirine, du zolmitriptan ou de la dihydroergotamine comportent un libellé relatif au risque de CAM.

Annexe 3-65

Le CRPV de Saint-Etienne a l'issue de sa présentation a tiré les conclusions suivantes :

- La faible notification des cas de CAM, peut s'expliquer par la méconnaissance du problème des professionnels de santé et des patients eux-mêmes
- Le CRPV a rappelé la récente publication, par l'Agence Nationale d'Accréditation en Santé (ANAES)[1], de recommandations de prise en charge des céphalées chroniques quotidiennes.
- A la lumière de ces différentes données, le CRPV a souligné la nécessité de modification des RCP et des notices des produits concernés .

Par ailleurs, le CRPV de Saint-Etienne a fait part, lors de l'adoption du procès-verbal, de nouvelles informations : une étude concernant la surconsommation des triptans a été coordonnée par l'URCAM de la région Rhône-Alpes et certains neurologues. Le CRPV de Saint-Etienne est en attente des résultats.

CONCLUSION GENERALE

A la lumière de ces différentes données, le Comité technique a souligné la nécessité de modification des RCP et des notices des produits concernés.

Concernant les RCP, il a été rapporté qu'une NUI (Non Urgent Information) avait été demandée par le Danemark auprès de l'Europe en septembre 2004, concernant les CAM. 9 Etats Membres ont répondu (Irlande, Suède, Royaume-Uni, Lettonie, Portugal, Malte, Italie, Islande et France). Au total, les résultas français correspondent à la tendance européenne qui se dégage des réponses reçues.

Par ailleurs, une identification plus précise de la consommation des triptans dans la population française et le nombre d'abuseurs est nécessaire.

En accord avec le CRPV de Dijon, il a été conclu de centrer en premier lieu les actions sur les triptans. De plus, le CRPV de Dijon s'est engagé à finaliser le protocole d'une étude de suivi de consommations des triptans dans le région Bourgogne, en partenariat avec la Caisse d'Assurance Maladie.

VIII - QUESTIONS DIVERSES

Rappel des conditions de prescription d'ELSEP® (mitoxantrone) et de suivi des patients :

La spécialité ELSEP® (mitoxantrone) 2mg/ml a obtenu une autorisation de mise sur le marché en Octobre 2003 dans le traitement des formes agressives de sclérose en plaques de type récurrente/rémittente ou de type secondairement progressive. ELSEP®est agréé aux collectivités depuis le 4 Mai 2004. Ce médicament est en réserve hospitalière et sa prescription est limitée exclusivement aux neurologues des services spécialisés en neurologie.

En raison, notamment, des risques hématologiques (8 cas de leucémie rapportés) et cardiaques, liés à l'utilisation du produit, l'autorisation de mise sur le marché octroyée pour ELSEP prévoit :

- le recueil d'un accord de soins du patient avant l'initiation du traitement,
- une surveillance particulière et obligatoire de la pharmacovigilance, chez tous les patients traités, tout au long du traitement et pendant 5 ans après la fin de celui-ci.

Le 15 décembre 2004, une lettre d'information a été adressée par l'Afssaps aux neurologues hospitaliers exerçant en service de neurologie et aux pharmaciens hospitaliers concernés, afin de rappeler les conditions de prescription d'ELSEP® et de suivi des patients traités. Un communiqué de presse a également été diffusé sur le site internet de l'Afssaps. Il est rappelé dans ces documents que les patients traités par mitoxantrone dans le cadre d'une sclérose en plaques doivent impérativement recevoir la spécialité ELSEP et non NOVANTRONE, et ce afin de bénéficier du suivi de pharmacovigilance prévu. Les prix de ces deux spécialités sont aujourd'hui identiques.

Les Centres Régionaux de Pharmacovigilance ont demandé à disposer d'un exemplaire du classeur de suivi des patients traités par ELSEP, transmis aux prescripteurs pour toute initiation de traitement. Une demande en ce sens sera faite aux laboratoires Wyeth.

Exposition in utero à des hormones sexuelles, naturelles ou synthétiques et troubles psychiatriques ; cas recueillis par l'Association HHORAGES / CRPV de Bordeaux

Dans le cadre de l'étude des effets de l'exposition in utero au DiéthylStilbestrol et aux autres hormones stéroïdes naturelles ou de synthèse, un recueil de témoignages spontanés portés à la connaissance des associations de patients est effectué. L'association HHORAGES (Halte aux Hormones Artificielles pendant la Grossesse) s'intéresse tout particulièrement aux troubles psychiatriques induits. Cette association a collecté environ 525 témoignages, soit faits directement par les sujets exposés soit le plus souvent par l'intermédiaire des familles. Le Dr. F. Haramburu du CRPV de Bordeaux, membre du groupe de travail de l'Afssaps sur les conséquences de l'exposition au diéthylstilbestrol, a pris connaissance des cas transmis. Dans la majorité des cas, l'exposition est imprécise (nature, date d'exposition par rapport à la grossesse, durée de l'exposition, posologie) et la pathologie psychiatrique est vague, non médicalement confirmée. Soixante témoignages correspondant à 60 familles avec 74 enfants présentant des troubles psychiatriques (sur 89 exposés, pour un total de 144 enfants dans ces familles) ont été retenus. Si la nature de l'exposition est connue dans la plupart de ces cas, les autres caractéristiques de l'exposition sont le plus souvent imprécises ; il n'y a pas dans la majorité des cas de confirmation médicale des diagnostics psychiatriques retenus. Les tableaux cliniques présentés semblent très variés ; en revanche un certain nombre de cas correspondent indubitablement à des cas graves (hospitalisations, suicides, invalidité). Aussi, si ces témoignages représentent une source d'information intéressante et sans aucun doute un signal fort, ils ne peuvent pas constituer une base d'analyse pour l'évaluation d'une relation causale.

Suite à une étude pharmaco-épidémio-génétique « REGISCAR » des syndromes de Steven's Johnson et de Lyell, une copie des dossiers remplis par les investigateurs sera adressée par le centre de Paris–Henri-Mondor aux différents CRPV selon leur territoire d'intervention.

I – ADOPTION DU PV DU 8 FEVRIER 2005

Le procès-verbal de la séance du 8 février 2005 a été adopté avec les corrections suivantes :

Page 4 : II – Tour de table des cas marquants et de la littérature

- Ligne 44 : supprimer la cas marquant intitulé « TISANE MEDIFLOR à visée amaigrissante... »
- Ligne 57 : remplacer le terme « sublinguale » par « orale »

Page 21 : IX – Questions diverses

- Ligne 28 : ajouter « le CRPV de Nantes a indiqué qu'il avait réussi à limiter ce type de problème. Toutefois, certaines prescriptions sont réalisées en dehors du cadre strict prévu par l'AMM (posologie ou durée d'exposition supérieure etc...). Dans ce contexte, une lettre très informative destinée aux patients, leur expliquant que ce médicament leur est prescrit en dehors du cadre prévu par l'AMM, a été élaborée. De plus, dans ces situations, le patient devra signer un consentement éclairé. Ces documents seront présentés au Comité d'éthique du CHU mi-mars, pour avis. »

Annexe 3-67

II - POINT SUR LE BENEFICE/RISQUE DES CORTICOÏDES EN PERIODE PERINATALE

Compte tenu de plusieurs publications faisant état d'effets délétères possibles des glucocorticoïdes à long terme chez des nouveau-nés exposés, un point sur le rapport bénéfice-risque des corticoïdes en période périnatale a été présenté par le Pr Autret-Leca du CRPV de Tours. Cette analyse a été complétée par l'avis d'un expert, le Dr Baud, néonatologiste.

1- L'effet bénéfique des glucocorticoïdes anténataux en cas de menace d'accouchement prématuré avant 32-34 semaines (réduction de la mortalité et de la survenue de détresses respiratoires et d'hémorragies intra-ventriculaires) a été clairement établi dans une récente méta-analyse portant sur 18 essais. Toutefois, l'intérêt de répéter les cures de corticoïdes jusqu'à l'accouchement reste controversé.
Une étude de cohorte a montré que l'administration anté-natale de béthaméthasone (BMT) est associée à une réduction du risque de leucomalacie périventriculaire (LPV) par rapport à l'absence de traitement par corticoïdes et par rapport à la dexaméthasone (DMT). Le rôle neurotoxique des sulfites contenus dans le Soludécadron® a été proposé comme hypothèse pouvant expliquer les mauvais résultats observés avec la DMT *(Baud et al. N Engl J Med 1999)*.
Le suivi d'une seconde cohorte a montré que l'exposition répétée à la DMT est associée à une augmentation du risque de LPV et de troubles du neurodéveloppement par rapport à une exposition répétée à la BMT *(Spinillo et al. Am J Obstet Gynecol 2004)*.
Un essai randomisé évaluant l'administration de BMT soit en cure unique soit en cures répétées a montré qu'il n'existait pas de différence entre ces deux procédures sur le critère principal composite (détresse respiratoire, dysplasie bronchopulmonaire, hémorragie intra-ventriculaire, entérocolite, sepsis ou décès) bien que les cures répétées permettent de réduire l'incidence des détresses respiratoires sévères *(Guinn et al. JAMA 2001)*. Le suivi à long terme de ces enfants, annoncé par les auteurs, est d'une importance majeure (essai randomisé) puisque des études non randomisées ont suggéré un retard du développement neurocomportemental associé à la DMT.

Ainsi, le bénéfice des corticoïdes administrés <u>en pré-natal</u> dans la MAP est acquis si la naissance a lieu entre 32 et 34 semaines de gestation. Toutefois, l'intérêt de les renouveler si l'accouchement n'a pas eu lieu dans la semaine suivante n'est pas résolu. Les Sociétés américaines et canadiennes de gynécologie et obstétrique ont émis des recommandations en faveur d'un traitement par cure unique (DMT ou BMT) en cas de menace d'accouchement prématuré dans les 7 jours entre 24 et 34 semaines. En France, il n'existe pas de recommandations mais il semblerait que la pratique d'utilisation des corticoïdes en période anténatale se soit homogénéisée avec une utilisation majoritaire de la BMT, et un recul du recours à des cures répétées. Une étude européenne conduite en 1999 *(Truffert et al. Acta Paediatr 2003)* a montré qu'en pré-natal, le corticoïde le plus utilisé est la BMT (2/3 des cas) alors que la DMT est prescrite dans 1/3 des cas. Le recours à des cures répétées est par contre, quasi constante (99% en France). Enfin, la corticothérapie est prescrite dans 37% des cas en France chez des enfants nés dans un contexte de chorio-amniotite, alors que cette situation est une contre-indication à la corticothérapie.

2- En néonatologie, les propriétés anti-inflammatoires des glucocorticoïdes ont amené les médecins à tester ces produits dans la prévention et le traitement de la bronchodysplasie pulmonaire (BDP), pathologie chronique fréquemment rencontrée chez les prématurés. Les essais sont nombreux et ont d'abord étudié la réponse à des doses élevées pendant des durées prolongées (jusqu'à 42 jours) alors que les études plus récentes ont évalué des doses et des durées de traitement plus faibles.
Une large méta-analyse *(Halliday et al. Cochrane Database Syst Rev. 2003)*, portant sur 39 essais, permet de faire le point des données sur la corticothérapie en post-natale. Trois périodes de traitement sont à distinguer :
- <u>la corticothérapie précoce, avant les 96 premières heures de vie (J4)</u> et qui a pour but de prévenir la maladie, a fait l'objet de 20 essais randomisés portant sur 3072 prématurés. Le traitement précoce par DMT permet de diminuer l'incidence des BDP et facilite l'extubation. Toutefois, les effets indésirables précoces (effets digestifs, hyperglycémie, hypertension) et les effets à long terme (retard de croissance, anomalies neurologiques dont retard psychomoteur) suggèrent que le rapport bénéfice-risque est insuffisant. En effet, les données les plus inquiétantes sont celles correspondant au suivi sur le long terme des enfants. Il est ainsi rapporté à deux et six ans des retards psychomoteurs sévères (diminution du quotient intellectuel et des performances motrices) et des retards de

croissance chez les enfants ayant reçu de la DMT (résultats portant cependant sur seulement 56% des inclusions dans les études).
- la corticothérapie entre J4 et J14, dans un but préventif ou curatif, a fait l'objet de 7 essais portant sur 670 prématurés. Une diminution de la mortalité et de l'incidence des BDP a été observée. Les effets indésirables à court terme sont les mêmes que ceux observés en cas d'administration précoce et il n'y a pas de données sur les effets à long terme.
- la corticothérapie au-delà des 3 premières semaines de vie à visée curative a été évalué dans 9 essais portant sur 562 enfants. Les corticoïdes confirment leur effet positif sur la mortalité précoce et la ventilation mais aussi une tendance à un moins bon développement neurologique à plus long terme.

Ainsi, les données de l'utilisation post-natale des corticoïdes, en prévention ou traitement de la BDP, indiquent clairement un effet délétère majeur à 18 mois et à 8 ans.
Ces données ont amené les Académies de pédiatrie canadienne et américaine à publier des recommandations en 2002 qui rappellent que la DMT n'est pas recommandée en routine pour prévenir ou traiter la maladie pulmonaire chronique des enfants de petits poids de naissance. Toutefois, deux études nord américaines récentes montrent qu'en dépit de ces recommandations, 19 à 23% des prématurés recevaient en 2002 des corticoïdes en post natal. Une étude européenne conduite en 1999 *(Truffert et al. Acta Paediatr 2003)* a montré que 80% des centres de néonatologie utilisaient des corticoïdes en post natal. La DMT est prescrite dans 84% des cas y compris chez 31% des enfants non ventilés avec une FiO2 <50%.
Le Pr Autret-Leca afait également remarquer qu'une série de cardiomyopathie hypertrophique est enregistrée dans la base nationale de pharmacovigilance avec le Soludécadron®.

En conclusion, selon le Pr Autret-Leca et le Dr Baud il existe en France une utilisation non standardisée des corticoïdes en période périnatale avec un recours à une large utilisation de produits non évalués ou insuffisamment évalués. Il apparaît donc urgent de faire un état des lieux actualisé de la pratique en néonatologie afin de pouvoir émettre rapidement des recommandations appropriées sur l'utilisation des corticoïdes en période périnatale. Comme suggéré par certains auteurs, si des essais sont encore envisagés avec des corticoïdes, ils ne devraient cibler que les enfants chez lesquels un bénéfice est attendu (persistance de la ventilation assistée à 3 semaines de vie, atteinte pulmonaire progressive), en utilisant les doses les plus faibles possibles, pendant une durée la plus courte possible et avec un suivi systématique du développement neurologique et staturo-pondéral. Dans ce cadre, la place de la BMT devrait, plus particulièrement, être précisée car elle est utilisée par de nombreux centres depuis que les effets délétères de la DMT sur le long terme ont été mis en avant. Toutefois, si la BMT a fait preuve d'effets bénéfiques à court terme, elle n'a pas fait l'objet d'études d'utilisation et on ne connaît pas ses effets éventuels sur le long terme. L'hydrocortisone, potentiel corticoïde de substitution de la DMT, devrait également faire l'objet d'essais thérapeutiques. La place de la corticothérapie inhalée, un peu moins efficace mais offrant l'avantage d'un moindre passage systémique, pourrait aussi faire l'objet d'essais thérapeutiques. Enfin, il semble primordial que les parents soient informés des effets possibles de la corticothérapie à court terme et à long terme et que leur consentement soit recueilli avant l'administration d'une corticothérapie périnatale.

Le Comité technique de pharmacovigilance est favorable à la mise en place d'une enquête permettant de faire un état des lieux de la pratique actuelle sur l'utilisation de la corticothérapie en néonatologie et souhaite qu'un groupe de travail se mette en place rapidement afin d'émettre des recommandations sur cette problématique.

Annexe 3-67

III - DOSSIER MEDICAL INFORMATISE RELATIF AUX ANTIRETROVIRAUX (PROJET NADIS)

Le Docteur P. Puglièse du Service du Pr Dellamonica (Maladies Infectieuses, Hôpital Larchet, Nice) a présenté le Dossier Médical Informatisé NADIS et son application à un suivi de pharmacovigilance de l'atazanavir.

Introduction

Le dossier médical informatisé NADIS a été déployé en 2000 dans 6 sites pilotes[1]. Son but est l'exploitation de données scientifiques, l'évaluation des pratiques médicales et la mise en place d'études de phase IV. Plus récemment, a été développé un module de pharmacovigilance.

Les Enjeux

L'intérêt de ce dossier réside en une amélioration de la prise en charge individuelle du patient, grâce à la saisie en temps réel des données et au partage de l'information entre les différents intervenants.

L'exploitation scientifique collective des données peut être réalisée soit en mono-site soit en multi-site sur plusieurs établissements. Enfin, ce dossier permet d'évaluer non seulement les pratiques médicales de la prise en charge des patients VIH positifs, mais également de screener des patients susceptibles d'être inclus dans des essais cliniques de phase IV.

Le dossier

NADIS comporte divers types d'informations à renseigner successivement :

- Données administratives et sociales,
- Informations clés relatives à l'infection par le VIH ou/et par les VHB et VHC,
- Histoire clinique et thérapeutique du patient
- Examen clinique,
- Eléments biologiques spécifiques et généraux,
- Prescriptions médicamenteuses et examens paracliniques,
- Diagnostics et conclusions avec possibilité de texte libre.

Toutes ces données sont partagées entre services de soins, pharmacie et laboratoires (virologie, pharmacologie), avec échanges via une messagerie interne.

Chaque élément biologique saisi dans NADIS peut être édité et imprimé sous forme graphique, permettant une visualisation synthétique de son évolution. La saisie codée des résultats du génotype du VIH est facilitée par une interface intuitive. Le module de prescription médicamenteuse permet de pré-enregistrer les prescriptions habituelles. Le profil pathologique du patient (VIH,VHC,VHB ou co-infection) est choisi lors de la création du dossier. Il peut être modifié au cours du temps, permettant la saisie d'éléments spécifiques. Le choix du profil du patient permet en outre de paramétrer les différentes tables de codage (diagnostics, actes, médicaments), facilitant ainsi la saisie des données. NADIS permet aussi l'impression de nombreux documents facilitant la gestion de la consultation (ordonnances de prescriptions médicamenteuses et examens paracliniques, lettre de sortie, résumé de consultation, synthèse immuno-virologique, et certificats divers). Des alertes (pré-inclusion dans des protocoles thérapeutiques, cohérence diagnostic/stade CDC de l'infection à VIH, posologie hors AMM des antirétroviraux prescrits...) permettent une aide à la décision fondée sur des recommandations consensuelles. Des fenêtres d'alertes, non bloquantes, s'affichent en cas d'absence de prescriptions d'examens paracliniques recommandés dans certaines situations de prise en charge (par exemple consultation gynécologique semestrielle pour les femmes infectées).

L'amélioration des prescriptions médicamenteuses se fait grâce à différents outils :

- Outils de prescription
- Contrôles posologiques
- Historique des thérapeutiques antirétrovirales
- Motifs d'arrêts des schémas thérapeutiques
- Au cours du 1er semestre 2005 : utilisation de la Banque Claude Bernard
- Fiches produits en ligne
- Moteur d'interactions médicamenteuses
- Module de pharmacovigilance (en cours de développement)

Les bénéfices secondaires directs en consultation sont nombreux pour les médecins et les patients : ordonnances claires et compréhensibles (contrôles de posologies avec demande de validation en cas d'écart avec la posologie recommandée selon l'âge et le poids), éditions de documents standards (récapitulatif des différentes lignes thérapeutiques avec raison de l'arrêt, suivi des différents marqueurs de la maladie).

---

[1] Infectiologie Pitié Salpétrière, Infectiologie CHU Toulouse, CISIH CHU Nantes, Hématologie & Cisih APHM, CH de Tourcoing

Les enjeux scientifiques sont également majeurs dans l'utilisation de cette base. En effet la constitution en temps réel d'une base de données patients :

- Facilite le screening pour essais thérapeutiques
- Permet le suivi rétrospectif et prospectif d'une cohorte
- Autorise l'exploitation multicentrique

La qualité des données saisies est attestée par un contrôle qualité de routine et de façon aléatoire sur échantillonnage.

Un module de Pharmacovigilance est actuellement en développement. Son objectif est de faciliter et d'augmenter l'exhaustivité des déclarations de pharmacovigilance, d'optimiser la qualité des données des études de phase IV issues de NADIS et de faciliter le remplissage des clinical report form (CRF) (dans le cadre d'essais thérapeutiques ou de demandes d'ATU).
Le but de ce module est de permettre le déclenchement d'alertes et de générer des propositions de déclaration de pharmacovigilance en fonction de la saisie ou de la présence d'éléments dans le dossier patient (saisie de signes cliniques, résultats biologiques, et modification d'une ligne thérapeutique). Il doit intégrer les tables des grades OMS des effets indésirables (pour alertes si grade OMS > 2).
Les données déjà saisies auxquelles s'ajouteront les données nécessaires pour compléter la déclaration des effets indésirables graves, permettront d'éditer le formulaire de déclaration.
Ce même formulaire sera accessible en visualisation et/ou saisie par le centre de pharmacovigilance.

Utilisation de NADIS dans le cadre d'une étude de phase IV concernant l'atazanavir :
Cette étude de phase IV du Reyataz (atazanavir) a été réalisée parmi les patients suivis dans les sites pilotes Nadis. Pour être inclus, les patients devaient avoir débuté leur traitement par atazanavir après le 01/03/2004 (date de mise à disposition de l'atazanavir auprès des prescripteurs). Les données pharmacologiques, les paramètres immuno-virologiques, lipidiques et hépatiques étaient colligées, ainsi que l'analyse des arrêts de traitement et de génotypes VIH. Parmi les 6703 (88,6%) patients traités répertoriés dans la base, 570 (88%) ont reçu l'atazanavir après sa mise sur le marché. 72% des patients étaient de sexe masculin, d'âge moyen 42 ans et infectés depuis en moyenne 12 ans. 31,2 % étaient co-infectés par les virus de l'hépatite B ou C. Le nombre moyen de lignes de traitement précédant l'initiation de l'atazanavir était de 6,67 pour une durée totale de traitement de 6,7 ans. 44% des patients avaient été précédemment traités par 2 inhibiteurs nucléosidiques de la transcriptase inverse et 1 inhibiteur de la protéase (IP). 41% des patients avaient arrêté leur précédent traitement pour effets secondaires (effets secondaires digestifs, lipodystrophies, dyslipidémie). Dans 77% des cas l'atazanavir était associé à 2 inhibiteurs nucléosidiques de la transcriptase inverse et 1 IP (166 patient sous Epivir®, Norvir®, Reyataz® et Viread®). 288 patients ont bénéficié d'une analyse du génotype VIH dans leur histoire thérapeutique avant l'introduction de l'atazanavir (soit 47% des patients traités par atazanavir). La posologie de l'atazanavir était principalement de 300 mg, boostée par 100mg de ritonavir (79%), mais d'autres posologies atazanavir/ritonavir étaient également observées (400/100 9,5%; 300/200 2,2%; 400/200 1,8%). 7,5% des patients traités ne recevaient pas d'atazanavir boosté (400mg : 5,1%; 300mg : 2,4%).
6% des patients ont présenté une hyperbilirubinémie de grade supérieur à 2. Chez les patients ayant arrêté leur traitement précédent pour dyslipidémie, à 12 semaines le cholestérol total a diminués (médiane cholestérol –1.38 mmol/L) ainsi que les triglycérides (médiane – 0,89mmol/l).
8% des patients (n=45) ont arrêté leur traitement après un délai médian de 38,5 jours. Dans 4,7% dans cas l'arrêt du traitement était du en raison d'un effet secondaire (principalement cutané).
Au total, ce premier travail a permis d'évaluer la faisabilité d'études de phase IV avec Nadis (rapidité des extractions et analyses, homogénéité des bases, reproductibilité), d'évaluer l'utilisation de l'atazanavir "en grandeur nature", enfin d'évaluer les pratiques thérapeutiques et les comparer aux dernières recommandations "Delfraissy 2004" (Indications hors AMM (résistances aux IP), posologies hors AMM).
L'intérêt de NADIS réside également en une réactivité supérieure à celle du dossier médico-économique de l'immunodéficience humaine (DMI_2) (mise à jour en temps réel vs semestrielle) et par le développement prochain d'un module dédié au couple mère/enfant.

Annexe 3-67

IV – TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Sont signalés les cas d'effets indésirables, de mésusages, d'erreurs et de manque de cohérence de l'information ainsi que les risques potentiels d'effets indésirables, pouvant donner lieu à des mesures (mises en enquête, notes...) ou pouvant faire l'objet d'une mise au point, dans le cadre de la prévention du risque médicamenteux.
La liste complète des cas est jointe en annexe 1.

Effets indésirables avérés :

ORBENINE (cloxacilline) et effet indésirables neurologiques centraux / CRPV d'Amiens
Le CRPV d'Amiens a signalé deux cas d'effets indésirables neurologiques centraux sous ORBENINE (cloxacilline) chez des patients ayant une insuffisance rénale sévère. Dans les deux cas, des taux importants de cloxacilline (et de ses métabolites) ont pu être documentés. Cet antibiotique a une élimination rénale significative. Or, il est indiqué dans le RCP qu'il est inutile de réduire la posologie en cas d'insuffisance rénale.
→ La firme s'est engagée à déposer une demande de modification de l'information médicale pour ORBENINE®.

CORDARONE (amiodarone) et contre-indication à l'Iode / CRPV de Dijon
Le CRPV de Dijon a signalé que dans le RCP de certains médicaments, il est mentionné une contre-indication chez la personne allergique à l'Iode. Cette mention pose le problème de la notion abusive d'allergie à l'iode qui correspond en fait le plus souvent à une allergie à un produit de contraste iodée. Par ailleurs, il n'a jamais été rapporté d'allergie croisée entre amiodarone et produit de contraste iodé ou povidone iodée.
→ La liste des médicaments présentant cette mention d'une contre-indication à l'Iode sera listée par l'Afssaps pour d'éventuelles suites à donner.

DEROXAT (paroxétine) et risque hémorragique chez les nouveaux-nés exposés en fin de grossesse au inhibiteurs de recapture de la sérotonine (IRS) / CRPV de Grenoble
Le CRPV de Grenoble a signalé un cas d'hématome sous-dural et intraparenchymateux chez un nouveau-né de mère traitée par DEROXAT tout au long de la grossesse. Un autre cas d'hématome sous-dural et d'hémorragie intra-parenchymateuse avait été rapporté en 2004 à ce même CRPV chez un nouveau-né de mère traitée par SEROPRAM (citalopram). Deux cas similaires sont décrits dans la littérature. La question du risque hémorragique chez le nouveau-né de mère traitée par IRS a été discuté en Groupe de Travail Grossesse en 2000. Les données animales et cliniques disponibles ont été considérées comme insuffisantes pour permettre de conclure à un risque. Le Groupe de travail est en train de revoir la rubrique grossesse des médicaments utilisés en psychiatrie.
→ Une note sera transmise à la cellule grossesse et allaitement à propos de ces deux observations.

Interaction médicamenteuse sous ZOCOR (simvastatine) et FUCIDINE (acide fusidique) / CRPV de Limoges
Le CRPV de Limoges a signalé une rhabdomyolyse sévère à la suite de l'administration de FUCIDINE® pour une infection urinaire à staphylocoques chez un patient traité depuis 9 ans par ZOCOR®. L'évolution a été favorable après l'arrêt du traitement par ZOCOR®. L'interaction médicamenteuse entre ZOCOR® et FUCIDINE® n'apparaît pas dans les RCP de ces deux spécialités.
→ Une note sera transmise à l'unité interactions médicamenteuses afin de signaler ce cas.

SEROPRAM (citalopram) et glaucome aigu à angle fermé / CRPV de Paris –HEGP
Le CRPV de Paris-HEGP a signalé un cas de glaucome aigu à angle fermé sous SEROPRAM (citalopram). Cet effet n'est pas mentionné dans le RCP de SEROPRAM. A la suite de l'arbitrage européen sur paroxétine, un rectificatif est en cours afin d'ajouter cet effet et une mise en garde sur cet effet pour DEROXAT.
→ Le rapport périodique de pharmacovigilance de SEROPRAM sera transmis au CRPV de Paris – HEGP pour évaluer le risque de glaucome.

MEDIATOR (benfluorex) et hypertension artérielle pulmonaire / CRPV de Montpellier

Le CRPV de Montpellier a signalé un cas d'hypertension artérielle pulmonaire d'évolution fatale chez une patiente de 55 ans traitée par MEDIATOR® comme anorexigène. Quatre autres cas d'hypertension pulmonaire sont signalés dans la base nationale de pharmacovigilance.

→ La mise à jour de l'enquête officielle sur les effets neuropsychiatriques sous MEDIATOR® décidée lors du comité technique de décembre 2004 sera étendue aux cas d'hypertension pulmonaire.

PHYTALGIC (huile de poisson omega 3, vitamine E, zinc) et purpura vasculaire / CRPV de Rouen

Le CRPV de Rouen a signalé un cas de purpura vasculaire sous PHYTALGIC, qui est un produit sans AMM, lequel aurait été utilisé par le patient dans le traitement des douleurs articulaires.

→ Une note sera adressée à la direction de l'inspection pour suite à donner.

ACUPAN® (nefopam) et modalités d'administration / CRPV de Strasbourg

Le CRPV de Strasbourg a signalé la mauvaise tolérance d'ACUPAN® administrée en IV lente de 5 minutes conformément au RCP alors que la pratique habituelle semble être en IV lente d'une heure voire plus.

→ Ce cas sera signalé à l'évaluateur pharmaco-toxico-clinique concerné afin de revoir les modalités d'administration.

CRESOPHENE (dexaméthasone, thymol, parachlorophénol, camphre) solution pour usage dentaire et arthrite dentaire / CRPV de Strasbourg

Le CRPV de Strasbourg a signalé deux cas d'arthrite dentaire sous CRESOPHENE (dexaméthasone, thymol, parachlorophénol, camphre) avec évolution favorable à l'arrêt du traitement. La teneur en camphre (64,9g) et parachlorophénol (30g) dans ce produit est élevée.

→ Ces cas seront signalés à l'évaluateur pharmaco-toxico-clinique concerné afin d'envisager une réflexion plus globale sur ce type de produit en ondotologie.

TEGRETOL (carbamazépine) et infertilité liée à une anomalie du sperme / CRPV de Strasbourg

Le CRPV de Strasbourg a signalé un cas d'anomalie du sperme chez un homme de 32 ans traité par TEGRETOL (carbamazépine), réversible à l'arrêt de ce médicament.

Deux autres cas suspects d'anomalie du sperme sous TEGRETOL® sont signalés dans la Base Nationale de Pharmacovigilance. Cet effet indésirable est mentionné dans le PDR et des petites séries de cas ont fait l'objet de publication par les Scandinaves.

→ Une note sera adressée à la cellule grossesse et allaitement afin de signaler ce cas.

Interaction médicamenteuse entre tramadol et les antivitamines K tels que fluindione, acécoumarol, warfarine / CRPV de Tours

Le CRPV de Tours a signalé une interaction médicamenteuse se manifestant par une hémarthrose du genou avec un INR à 10 après introduction de tramadol chez une femme de 62 ans traitée par PREVISCAN (fluindione). Cette interaction entre tramadol et fluindione n'est pas mentionnée dans le RCP des spécialités à base de fluindione et le risque d'interaction avec les coumariniques ne figure que pour quelques spécialités contenant du tramadol. 8 cas d 'interaction tramadol avec fluindione, 4 cas avec acécoumarol et 2 avec warfarine sont signalés dans la base nationale de pharmacovigilance et il existe plusieurs publications. Le risque d'interaction AVK-tramadol ne figure pas dans le thésaurus récemment mis sur le site de l'Afssaps.

→ Une note sera transmise à l'unité interaction médicamenteuse afin de signaler ce nouveau cas et d'envisager que l'interaction médicamenteuse antivitamine K et tramadol soit mentionnée dans les RCP de toutes les spécialités contenant du tramadol.

Annexe 3-67

Effets indésirables potentiels

Risque de confusion du fait du nouveau conditionnement des ampoules de SUFENTANIL MERCK 50 microgrammes du nouveau conditionnement des ampoules d'ADRENALINE AGUETTANT 5mg/5ml / CRPV de Dijon

→ La notion d'un risque de confusion de SUFENTANIL MERCK 50 microgrammes avec des ampoules de serum physiologique pour solutions injectables réservé à d'autres médicaments, et d'un risque de confusion des ampoules d'ADRENALINE AGUETTANT 5mg/5ml avec les ampoules de NORADRENALINE lié à un changement de conditionnement de ces produits injectables de petit volume, est transmise aux affaires réglementaires.

Documents distribués :

Nouvelles enquêtes officieuses et officielles de pharmacovigilance :

→ La mise à jour de l'enquête officielle MEDIATOR® décidée lors du comité technique de décembre 2004 sera étendue aux effets indésirables d'hypertension pulmonaire.

Annexe 3-67

V - MISE AU POINT SUR LE BON USAGE DES MÉDICAMENTS POUR PRÉVENIR LA IATROGÉNÈSE MÉDICAMENTEUSE CHEZ LE SUJET ÂGÉ

Cette mise au point a été élaborée à partir des évaluations d'un groupe pluridisciplinaire d'experts qui s'est réuni en janvier 2005. Anne CASTOT a indiqué que le document comprenait 10 pages et qu'il serait nécessaire de l'accompagner d'un résumé. Alice ROULEAU (Département CORGRIS) a précisé que cette mise au point n'était pas exhaustive et qu'elle se limitait aux classes pharmacologiques le plus souvent responsables d'effets indésirables sur la base des études publiées, des données de pharmacovigilance et de l'avis des experts. De plus, Anne Castot a indiqué le projet de rédaction d'un cahier « médicaments et sujets âgés » comme cela vient d'être fait pour les interactions médicamenteuses. Pour cela, l'aide des CRPV serait la bienvenue.

Jacques CARON a proposé aux membres du Comité technique de faire les remarques et commentaires sur le document avant le 15 mars 2005, du fait du passage en commission d'AMM prévu le 24 mars 2005.

Catherine SGRO a suggéré de faire apparaître des renvois pour les thèmes ayant déjà été traités dans d'autres documents (médicaments et canicule ; médicaments et grand froid).
Catherine NOBLET a suggéré d'indiquer la formule de Cockcroft & Gault pour l'estimation de la clairance de la créatinine.

Annexe 3-67

VI - PRÉSENTATION DES RÉSULTATS DU REGISTRE FRANÇAIS DES NEUTROPÉNIES CHRONIQUES SÉVÈRES : ÉVALUATION DES EFFETS SECONDAIRES DU G-CSF CHEZ DES PATIENTS PORTEURS DE NEUTROPÉNIES CHRONIQUES

Le Dr DONADIEU, médecin au service d'hémato-oncologie pédiatrique à l'Hôpital Trousseau à Paris, a présenté les résultats de l'évaluation des effets secondaires du G-CSF chez des patients appartenant au registre français des neutropénies.

C'est en 1994 qu'est né le registre français des neutropénies afin de répondre à une question de pharmacovigilance : le risque de survenue de leucémies est-il majoré par l'utilisation du G-CSF ? Il s'agit d'un registre portant sur une maladie et non sur ce médicament.

L'analyse a porté sur 306 patients dont 231 atteints de neutropénie congénitale et 65 atteints de neutropénie sévère chronique de l'adulte (recueil des données : 31 mars 2003).

Treize cas de transformation maligne (leucémies ou syndromes myélodysplasiques, MDS) ont été rapportés parmi les 231 patients atteints de neutropénie congénitale.

Les patients porteurs d'un syndrome de Shwachman Diamond et les patients porteurs de neutropénie congénitale sévère sont les seuls à avoir développé des leucémies secondaires. Chez ces patients, le taux de leucémie est de 10,8% et 18,8% respectivement à l'âge de 10 ans et 20 ans. Cette incidence augmente jusqu'à 36% à 30 ans parmi les patients atteints du syndrome de Shwachman Diamond.

Sur l'ensemble des patients porteurs de neutropénie constitutionnelle, il existe une corrélation entre l'exposition au G-CSF, représentée par la dose moyenne par injection et par la dose cumulée de G-CSF, et le risque de leucémie. Les groupes de patients les plus souvent traités par G-CSF sont les patients atteints de neutropénie congénitale sévère.

Suite à la mise à jour de septembre 2004, l'analyse a dénombré 2 cas supplémentaires de MDS pour un total de 253 patients suivis.

Le registre international répertorie jusqu'en 1999 731 patients. Le taux de leucémies dans ce groupe se rapproche de celui déterminé pour le groupe français à 20 ans d'âge. Contrairement à la France, l'influence de la dose n'a pas été étudiée. Seule, la dose moyenne (TAD : Time Averaged Dose) a été prise en compte : le risque de leucémie est 2,7 fois plus élevé chez les patients ayant reçu une dose supérieure à la TAD.

L'utilisation du G-CSF a transformé le pronostic infectieux des patients porteurs de neutropénie chronique. Chez les patients qui nécessitent les doses les plus importantes de G-CSF et à un rythme le plus intense, le G-CSF est associé à une augmentation du risque de transformation maligne (effet G-CSF) alors que ce risque est déjà important en l'absence de G-CSF (effet maladie). Ainsi, il ne semble pas fondé de contre-indiquer le traitement par G-CSF chez les patients porteurs de neutropénie chronique, en raison de l'effet protecteur du G-CSF vis à vis des infections vitales. La dose minimale doit toujours être recherchée lors d'un usage prolongé. Un suivi médullaire, cytogénétique attentif de ces patients est indispensable, d'autant plus que les besoins en G-CSF sont importants. Il est utile pour les patients chez qui de fortes doses de G-CSF sont nécessaires d'évaluer l'intérêt potentiel d'une greffe de moelle. C'est en effet le seul traitement alternatif disponible aujourd'hui mais qui présente lui aussi des risques.

Annexe 3-67

VII - MISE A JOUR DES DONNEES DE L'ENQUETE OFFICIELLE SUR LE RISQUE DE LEUCEMIE SECONDAIRE OU DE MYELODYSPLASIE APRES UTILISATION DES G-CSF

Le Pr COQUEREL (CRPV de Caen) a présenté les résultats de l'enquête française ne concernant que le lénograstim. Les conclusions sont similaires à celle faites précédemment par le Dr DONADIEU. Il a cependant été précisé que la relation linéaire effet/dose était soumise à d'importantes variabilités interindividuelles. Une présentation des cas issus de la base nationale de pharmacovigilance a également été effectuée sur la période de 2000 à 2005. Il n'y a pas de cas signalé de MDS ni de leucémie (myéloblastique) ni de cancer avec le GRANOCYTE®. En revanche 3 cas sont signalés avec le NEUPOGEN® (filgrastim).
Les laboratoires pharmaceutiques ont déclaré 2 cas japonais : une leucémie myéloïde (fatale) et une tumeur cérébrale ; et 3 cas français : 2 MDS sous GRANOCYTE® et 1 MDS sous NEUPOGEN® (fatal).
En conclusion, le CRPV de Caen rappelle que toutes les études randomisées publiées qui ont évalué le risque de néoplasie secondaire liée à l'utilisation du G-CSF sont négatives. Il n'y a aucun doute sur les bénéfices à court terme du G-CSF chez les patients atteints de neutropénie congénitale sévère. Il faut cependant recommander l'utilisation de la dose minimale active et la durée la plus courte possible ainsi qu'une surveillance prudente chez les patients qui reçoivent du G-CSF. En outre, il faut renforcer la surveillance lors des chimiothérapies adjuvantes des cancers du sein et des donneurs de cellules souches (Peripheral Blood Precursor Cells : PBPC). Le suivi longitudinal des différents registres des leucopénies sévères est également une nécessité et doit servir de modèles pour le suivi des prescriptions prolongées ou réitérées de G-CSF.

Discussion
Catherine SGRO a fait remarquer que les leucémies induites par la MITOXANTRONE (anthracycline utilisée dans le traitement du cancer du sein) ne sont pas du même type que celles observées sous facteurs de croissance. Ces dernières se rapprochent plus de celles induites par les alkylants.
Laurence MOACHON et Antoine COQUEREL ont soulevé le problème des patients sains qui développent une leucémie à la suite d'un don de cellules souches stimulé par facteurs de croissance.

Françoise BAVOUX pose le problème de l'absence de suivi des enfants nés de mères traitées par G-CSF pour cancer du sein au cours des 2ème et/ou 3ème trimestre de grossesse.
En conclusion, il n'est pas utile de modifier les données du RCP actuel. Une surveillance clinique et hématologique rapprochées des patients recevant de fortes doses de G-CSF semble plus que nécessaire.

Annexe 3-67

VIII - PEDEA® : IBUPROFEN THAM DANS LE TRAITEMENT DE LA PERSISTANCE DU CANAL ARTERIEL

Le CRPV de Saint-Vincent de Paul a présenté un point sur un nouveau traitement de la persistance du canal artériel : Pedea® ibuprofen THAM IV (laboratoires Orphan).

-Rappel concernant la circulation fœtale et naissance

Circulation fœtale :

D'après les études réalisées chez l'animal (fœtus du mouton), 70% du débit cardiaque total retourne à l'oreillette droite par la veine cave inférieure, 20% par la veine cave supérieure et 4% par le sinus coronaire. Seuls 5% du débit cardiaque empruntent la circulation pulmonaire. Le reste du débit ventriculaire droit (55% du débit cardiaque total) est dévié du poumon en passant dans l'aorte descendante à travers le canal artériel. 35% du débit cardiaque est délivré à l'oreillette gauche par l'intermédiaire du foramen ovale, qui reste ouvert pendant la vie fœtale du fait de la différence des pressions entre les deux oreillettes.

Naissance :

La pression artérielle pulmonaire et les résistances pulmonaires diminuent rapidement après la naissance avec fermeture fonctionnelle du canal artériel (dans les 10 à 96 premières heures chez le nouveau né à terme) puis anatomique (en 2 à 3 semaines).

PERSISTANCE DU CANAL ARTERIEL (PCA)

La fréquence de la PCA est inversement proportionnelle à l'âge gestationnel et au poids de naissance.

L'incidence de la PCA chez le prématuré de poids < 1750g est de 40 à 45%, et de 80% pour un poids<1000g.

Chez le nouveau-né à terme, l'incidence de la PCA est de 1/2000.

- *Facteurs de risque de la PCA* : maladies des membranes hyalines, apports liquidiens, souffrance fœtale, hypoxie à la naissance, certaines pathologies congénitales, malformations cardiaques. Les AINS (les inhibiteurs des prostaglandines) reçus pendant la grossesse peuvent modifier le tissu du canal artériel qui peut se rouvrir après la naissance.
- *Facteurs pouvant diminuer la PCA* : corticoïdes anténataux pour la maturation du surfactant et prévention de la maladie des membranes hyalines et la rupture prolongée des membranes
- Les signes cliniques de la PCA sont : pouls pulsatiles, hypotension, cardiomégalie, détresse respiratoire, hépatomégalie.
- *Le diagnostic* est souvent difficile surtout s'il existe une maladie des membranes hyalines associée. Il repose essentiellement sur l'échographie doppler cardiaque qui apprécie le retentissement hémodynamique et permet la recherche d'une anomalie congénitale associée.
- *La prise en charge thérapeutique de la PCA :* est largement dominée par le traitement médicamenteux, la chirurgie n'étant proposée qu'en deuxième intention en cas d'échec de fermeture pharmacologique du canal artériel.
- *Le traitement médicamenteux* repose sur les inhibiteurs de la synthèse des prostaglandines (AINS). L'indométacine a été le premier AINS utilisé dans cette indication et ce, depuis plus de 20 ans. Bien qu'efficace (70 à 80% de fermeture chez le grand prématuré), est encore mal évaluée et ses effets indésirables restent préoccupants (constriction de la circulation cérébrale et mésentérique, oligurie et rétention hydrosodée).

PEDEA® : IBUPROFEN THAM

Plusieurs données bibliographiques existent sur le traitement de la PCA avec la forme ibuprofène lysine. L'efficacité est similaire à l'indométacine, avec une meilleure tolérance. Les 2/3 des essais cliniques ont été réalisés avec ibuprofen lysine (commercialisé dans plusieurs pays pour l'adulte).

Les données relatives à Ibuprofen tham sont insuffisantes chez le grand prématuré de moins de 28 SA avec des données à 18 mois insuffisantes par rapport aux données dont on dispose pour l'indométacine.

En 2001, l'ibuprofène a été désigné par la Commission des Communautés Européennes comme médicament orphelin pour deux indications: traitement du canal artériel persistant et prévention du canal artériel persistant chez le nouveau-né prématuré de moins de 34 semaine d'age gestationnel.

Une demande d'autorisation de mise sur le marché (AMM) en Europe et d'ATU de cohorte en France a été présentée par le laboratoire Orphan pour une nouvelle formulation de l'ibuprofène avec modification de l'excipient (Tham).
L'usage en prophylaxie de l'ibuprofène Tham a été contre-indiqué en raison d'un arrêt d'essai clinique du fait de la survenue au cours de celui-ci de 3 cas d'hypoxie.
Pedea® a obtenue une AMM européenne selon la procédure centralisée en juillet 2004 (Irlande, rapporteur ; Grande Bretagne, co-rapporteur). Il a été demandé à la firme de réaliser deux études en post-AMM :

- une étude de dose, cinétique, efficacité et tolérance chez le prématuré de moins de 28 semaines d'aménorrhée (SA) avec la forme ibuprofen tham
- une étude de suivi des complications neurologiques et pulmonaires à 18 mois.

Les protocoles de ces deux études seront discutés par le groupe d'experts pédiatres à Londres au Comité des Spécialités Pharmaceutiques du mois avril 2005.

Pedea® a été mis à disposition dans les hôpitaux français en octobre 2004 ce qui a pour conséquence la suspension de l'ATU de l'indométacine et l'ibuprofène.

L'indication retenue est la suivante : traitement curatif de la PCA à la posologie de 10-5-5mg/kg en cure de trois jours.

BILAN DES CRPV

Dix-huit observations ont été retrouvées dans la base nationale de pharmacovigilance à la date du 31 décembre 2004. L'âge gestationnel était de 24 à 29 semaines d'aménorrhée (SA) (dont 11< 27SA).
Quatorze patientes ont eu un traitement curatif par ibuprofène seul, les 4 autres ont eu recours à un traitement par indométacine aprés échec du traitement par ibuprofène. Dans la moitié des cas, le traitement a été interrompu à la suite de l'apparition d'effets indésirables.
Parmi les facteurs de risque, on note : souffrance fœtale aiguë (n=9), maladies des membranes hyalines (n=11), éclampsie ou pré-éclampsie (n=4), infection mère et enfant (n=2).

Les effets indésirables rapportés étaient représentés par :

- les **atteintes digestives** dont 2 perforations digestives à l'emporte pièce, 2 entérocolites nécrosantes, 2 distensions abdominales avec souffrance mésentérique, 2 hémorragies hautes.
- les **atteintes rénales** dont 2 insuffisances rénales aiguës, une rétention hydrosodée et une hyperkaliémie.
- les **atteintes cardio-pulmonaires** représentées par une hypertension artérielle pulmonaire aiguë survenue une heure aprés l' administration de l'ibuprofène et corrigée par le NO.
- les **atteintes cérébrales** représentées essentiellement par des hémorragies intra-ventriculaires dont 2 de grade II, 2 de grade III et une de grade IV.

L'évolution était fatale chez six prématurés (<27SA) sur les 18. Le décès était lié à la grande prématurité et aux pathologies sous jacentes.

COMPARAISON DE DEUX ESSAIS CLINIQUES EN PROPHYLAXIE

L' un des essais a été réalisé avec ibuprofen lysine ne rapportant pas d' HTAP ni d'effets indésirables digestifs dans le groupe ibuprofen lysine.
L' autre essai a été réalisé avec l'ibuprofen tham PEDEA et a été arrêté en raison HTAP. De plus dans cette étude ibuprofen PEDEA, étaient rapportées des perforations digestives : 5/65 contre 1/66 dans le groupe placebo.

PROPOSITIONS DU COMITE TECHNIQUE

Le Comité technique a proposé :

- une mise en suivi du produit qui sera assuré par le CRPV de Saint-Vincent de Paul,
- de demander au laboratoire de réaliser une étude chez le rat pour mieux étudier la toxicité digestive de l'ibuprofène et comparer les deux formes d'excipients lysine et tham (perforation à l'emporte-pièce non observée avec l'ibuprofène lysine).
- de demander au laboratoire de clarifier pour quelle raison a t-il développé une nouvelle formulation de l'ibuprofène avec un nouvel excipient pour le dossier d'AMM, alors que plusieurs essais cliniques ont été conduit avec la forme ibuprofène lysine.

IV - INHIBITEURS DE LA POMPE A PROTONS ET RISQUE D'HYPERTENSION ARTERIELLE

Le Centre Régional de Pharmacovigilance du Languedoc-Roussillon a présenté un point sur les hypertensions artérielles secondaires à la prise d'inhibiteurs de la pompe à protons (IPP). Ce point fait suite à la notification d'un cas d'hypertension artérielle accompagnée de flush et de sueurs chez une femme de 80 ans, sans antécédents notables et traitée par IPP depuis environ 8 ans. Un examen complet à la recherche d'une tumeur endocrinienne a montré que cette patiente présentait une gastrinémie élevée (142ng/l, N<110) et des taux de chromogranine A à 5N. Les autres examens biologiques étaient normaux (sérotonine plasmatique, catécholamines urinaires, acide 5-hydroxy-indole acétique: 5HIAA, neuron specific enolase: NSE, thyrocalcitonine), ainsi que l'ostéoscan (scanner osseux). Le traitement par IPP a été arrêté, ce qui a permis une amélioration de la symptomatologie avec normalisation du taux de chromogranine A 5 jours plus tard. Un cas similaire a été rapporté aux XXIV° Journées de l'hypertension artérielle du 16-17 décembre 2004. Un phéocromocytome, initialement suspecté dans ce cas, avait conduit à la réalisation d'examens complémentaires montrant un taux de chromogranine A à 9N. Une résolution à l'arrêt de l'IPP a été observée (*Lopez-Sublet et coll*).

Dans la base nationale de pharmacovigilance, 12 cas d'augmentation de la tension artérielle ont été rapportés. Ils concernent des patients d'âge moyen 72,4 ans. Dans 1/3 des cas, l'effet indésirable est accompagné de flush et de sueurs. Dans 5 cas, l'effet survient dans les 2 premiers jours de traitement. L'arrêt du médicament a permis la régression de la symptomatologie et il n'y a pas eu d'exploration complémentaire. De plus, 12 autres observations de sueurs et flush ont été retenus. Elles concernent des patients d'âge moyen 60,1 ans. De même, la survenue de l'effet est rapide avec 2/3 des cas survenant dans les premiers jours de traitements. Une régression de la symptomatologie est observée à l'arrêt du traitement.

Dans la littérature, Guisti et al. *(Eur J Endocrinol. 2004 Mar ;150(3) :299-303)* rapportent une série de 9 cas d'augmentation de chromogranine A avec des taux supérieur à 90ng/l chez des patients traités par oméprazole. Dans 6 de ces cas, on note une symptomatologie ou des antécédents d'hypertension. Il est à noter, cependant, qu'aucune corrélation entre le taux de chromogranine A et les chiffres tensionnels n'a pu être établie dans cette étude. Par ailleurs, 4 cas d'hypertension artérielle ont été rapportés dans les essais cliniques avec le lansoprazole. *(Harford W et al. Helicobacter. 1996 Dec;1(4):243-50 et Swarbrick et al. Eur J Gastroenterol Hepatol. 1996 May;8(5):431-8).*

Un mécanisme d'action a été proposé : on observe en effet une augmentation de la gastrinémie en réponse à la réduction de la sécrétion d'acide chlorhydrique lors de traitement par IPP. L'hypergastrinémie peut provoquer au long cours une hyperplasie des cellules entérochromaffines (ECL) avec augmentation de la concentration de chromogranine A, glycoprotéine contenue dans les granules de sécrétion de ces cellules. L'hypergastrinémie pourrait également provoquer une libération de l'histamine, également contenue dans ces vésicules, pouvant expliquer les phénomènes de vasodilatation à type de flush. Takiyyundin et al. (*Hypertension. 1993 ;21(5) :674-9*) ont montré que le taux de chromogranine A était plus élevé chez les patients ayant une hypertension artérielle essentielle que chez les patients normotendus. A l'inverse, une augmentation isolée de chromogranine A n'entraîne pas forcément une hypertension artérielle. Dans leur étude, Giusti et al. concluent qu'il existe, rapidement après l'instauration d'un traitement par oméprazole, une élévation des taux de chromogranine A. Toutefois, les auteurs notent que celle-ci est plus élevée chez les patients ayant un taux de chromogranine A basal élevé. Ce taux est lui-même corrélé à l'âge, aux antécédents d'hypertension artérielle et à la créatininémie. Il a également été rapporté que les patients porteurs d'*Helicobacter pylori* ont des taux de chromogranine A plus élevés que les patients non porteurs d'*Helicobacter pylori*. Un rôle du polymorphisme du cytochrome CYP2C19, impliqué dans la dégradation de l'oméprazole, a été évoqué par Sagar et al. *(Aliment Pharmacol Ther. 2000 ;14(11) :1495-502)*. Les patients mutés sur l'allèle codant le CYP2C19 ont un taux de gastrinémie et de chromogranine A plus élevés. On peut enfin rappeler que la suppression de l'acidité

gastrique a été associée à la constatation de carcinoïdes gastriques à cellules entérochromaffines chez le rat, mais que ces tumeurs n'ont toutefois pas été observées chez l'homme lors d'études évaluant la prise d'IPP au long cours.

Au niveau du résumé des caractéristiques du produit (RCP) des différents IPP, l'augmentation de la gastrinémie est mentionnée en Section 5.1 (Propriétés pharmacodynamiques) pour le pantoprazole, le rabéprazole et l'ésoméprazole. Une augmentation du nombre de cellules ECL en relation possible avec l'hypergastrinémie, lors de traitement au long cours par IPP, est mentionné dans cette section pour le pantoprazole et l'ésoméprazole. Le RCP du rabéprazole mentionne que « des prélèvements, obtenus par biopsie d'estomac humain provenant de l'antre et du fundus chez plus de 500 patients traités par rabéprazole sodique ou comparateur sur une durée allant jusqu'à 8 semaines, n'ont pas permis de déceler de modifications de l'histologie des cellules ECL ».

- **Propositions du Rapporteur :**

- Les IPP entraînent une augmentation de la gastrinémie et de la chromogranine A. Cette notion devrait être précisée au niveau de tous les RCP et éviterait certains examens coûteux.
- Exceptionnellement, les IPP peuvent révéler ou aggraver une hypertension artérielle. Cette hypertension peut s'accompagner de flush et sueurs excessives. Faut-il ajouter cette mention dans le RCP des IPP malgré les arguments limités disponibles à ce jour ?

- **Conclusion :**

On peut rappeler que le dosage plasmatique de chromogranine A occupe une place de choix dans le bilan biologique des tumeurs -. Au niveau des cas rapportés d'hypertension, on constate que, même pour les IPP pour lesquels le risque d' hypergastrinémie et d'hyperplasie des cellules ECL est déjà mentionné dans le RCP, la survenue d'une hypertension avec élévation des taux de chromogranine A a conduit à la réalisation d'un bilan complet à la recherche d'une tumeur neuroendocrinienne.
D'autre part, le nombre de cas rapportés d'hypertension est faible alors que l'utilisation de ces produits est répandue. Très peu de cas sont documentés avec des dosages de chromogranine A. De plus, il n'existe pas de mécanisme suffisamment étayé sur la relation entre élévation initiale des taux de chromogranine A et une hypertension artérielle secondaire induite. Enfin, il n'est pas sûr que les mesures proposées modifieraient la prise en charge d'une hypertension pour laquelle on soupçonne une origine tumorale.
Au vu de ces éléments, le Comité technique de pharmacovigilance considère **qu'il n'est pas justifié de proposer d'éventuelles mesures à ce jour.**

X – PHARMACOVIGILANCE EUROPEENNE

EZETROL® (ézetimibe) est un agent hypolipémiant bénéficiant d'une AMM selon une procédure de reconnaissance mutuelle depuis mars 2003 (Allemagne, Etat membre de référence). Il est commercialisé en France depuis le 10 janvier 2005. L'ézetimibe agit en inhibant l'absorption intestinale du cholestérol et des phytostérols mais son mécanisme d'action est incomplètement élucidé.
Un suivi national a été mis en place en février 2005 sous la responsabilité du CRPV de Paris-HEGP. Un communiqué de presse sera diffusé aujourd'hui sur le site Internet de l'Afssaps afin d'avertir les professionnels de santé et le public sur le risque de survenue de rhabdomyolyse chez les patients traités par Ezétrol®. Des cas de rhabdomyolyse ont en effet été rapportés chez des patients traités par Ezétrol en association avec une statine, mais également lorsque Ezétrol était utilisé seul. Ce communiqué sera accompagné des recommandations concernant la prise en charge thérapeutique du patient dyslipidémique.

PROTOPIC® (tacrolimus) est un immunosuppresseur qui se présente sous la forme d'une crème destinée au traitement de la dermatite atopique modérée à sévère chez l'enfant et l'adulte après échec ou intolérance aux traitements conventionnels. Une étude au long cours (étude APPLES) a été demandée lors de l'octroi de l'AMM afin d'évaluer le risque de cancers cutanés, systémiques et de lymphomes chez les enfants traités par ce médicament pendant au moins 6 semaines. Le protocole est maintenant finalisé et doit être adopté prochainement par la FDA et les autorités compétentes européennes. Cette étude devrait débuter en mai 2005 et inclure 8000 enfants qui seront suivis pendant 10 ans.

EPREX® (époétine alfa) : demande par les laboratoires Janssen-Cilag d'une réintroduction de la voie sous-cutanée
En novembre 2001, la notification de 40 cas mondiaux d'érythoblastopénie chez des insuffisants rénaux chroniques traités avec Eprex® (époétine alfa) avait conduit l'Afssaps à déclencher une mesure de restriction urgente (USR) afin de modifier l'information du Résumé des Caractéristiques du Produit. Devant l'augmentation du nombre de cas, une deuxième USR puis une troisième USR ont été déclenchées avec pour résultat final une contre-indication de l'administration d'Eprex® par voie sous-cutanée chez les patients insuffisants rénaux chroniques (la voie intra-veineuse étant considérée moins immunogène que la voie sous-cutanée).

Les causes de ce problème avaient toujours été considérées comme multifactorielles et aucune étiologie précise n'avait été identifiée.

Les laboratoires Janssen-Cilag ont déposé en juin 2004 une demande de modification du RCP destinée à lever la contre-indication relative à l'utilisation de la voie sous cutanée en développant l'hypothèse suivante pour expliquer la survenue des cas d'érythroblastopénie : en 1998, l'albumine est remplacée par du polysorbate 80 dans la composition du produit. Ce polysorbate 80 agirait comme un détergent au niveau du caoutchouc des pistons des seringues pré-remplies, ce qui provoquerait la libération de substances appelées « leachates » dans le produit fini. Ce serait donc ces « leachates » d'après Janssen-Cilag qui seraient à l'origine des érythroblastopénies observées avec Eprex®. Au vue des données fournies par le laboratoire, le rapport préliminaire de l'Afssaps de février 2005 est resté en faveur du maintien de la contre-indication de la voie sous-cutanée chez l'insuffisant rénal chronique. Cet avis a été suivi en majorité par les Etats membres ayant répondu.

Inhibiteurs de la cyclo-oxygénase II ou « coxibs » : lors de la semaine du 14 février 2005, les membres du CHMP ont discuté de la procédure d'arbitrage commencée en novembre 2004 pour l'ensemble des coxibs. Le CHMP a décidé de déclencher une mesure de restriction urgente (*urgent safety restriction, USR*) permettant de modifier en urgence les RCP (notamment ajout de contre-indications et de mises en garde) au regard du risque cardiovasculaire et d'informer les professionnels de santé par l'envoi d'une lettre (*Dear Doctor letter*). Cette USR a été déclenchée le 16 février et finalisée le 17 février 2005. Un communiqué de presse a été diffusé sur le site Internet de l'Afssaps et l'envoi de la lettre d'information au professionnels de santé a été effectuée le 4 mars 2005 par le laboratoire Pfizer. L'opinion finale du CHMP concernant la procédure d'arbitrage est attendue pour avril 2005.

XI – QUESTIONS DIVERSES

Groupe qualité

Le groupe qualité mis en place par l'association des CRPV, et représenté par Anne Chiffoleau et Pascale Lainé, souhaite centraliser l'ensemble des fiches d'aide au recueil spécifique d'effets indésirables. Afin de d'effectuer ce travail, le groupe qualité demande aux CRPV de bien vouloir collaborer en leur faisant parvenir les fiches d'aide au recueil.

TABLES DES MATIERES

I - Adoption du procès verbal de la séance du mardi 10 Mai 2005 3

II - Tour de table des cas marquants et de la littérature 4

III – Enquête officielle relative aux hypertensions artérielles pulmonaires et aux troubles neuro-psychiatriques observés avec MEDIATOR® (benfluorex) 6

IV - Point relatif aux anti-TNF α et cancer : bibliographie et données de la base nationale de pharmacovigilance 9

V - Point relatif à RISPERDAL CONSTA® (rispéridone) et résurgences des délires 12

VI - Enquête officielle de pharmacovigilance relative aux effets indésirables hépatiques avec le proguanil et la chloroquine 14

VII – Présentation du projet « observatoires interrégionaux des médicaments et des innovations thérapeutiques (OMIT) en cancérologie » 20

VIII - Questions diverses 21

Annexe 3-68

I - ADOPTION DU PROCES VERBAL DE LA SEANCE DU MARDI 10 MAI 2005

Le procès-verbal de la séance du 10 mai 2005 a été adopté avec les corrections suivantes :

Page 5 : III – Enquête officielle de pharmacovigilance relative aux effets indésirables observés en cas de surdosage accidentel ou volontaire avec le buflomédil (FONZYLANE®)

- Ligne 22 : remplacer « passage du buflomédil de la liste I à la liste II des substances vénéneuses » par « passage du buflomédil de la liste II à la liste I des substances vénéneuses ».

Page 8 : IV – Point relatif aux effets indésirables de l'enfuvirtide (FUZEON®)

- Ligne 19 : ajouter « inhibiteur » après « un analogue non nucléosidique » et après « un analogue nucléosidique ».

Page 10 : V – Tour de table des cas marquants et de la littérature

- Ligne 15 : supprimer « deux ».

Annexe 3-68

II - TOUR DE TABLE DES CAS MARQUANTS ET DE LA LITTERATURE

Sont signalés les cas d'effets indésirables, de mésusages, d'erreurs et de manque de cohérence de l'information ainsi que les risques potentiels d'effets indésirables, pouvant donner lieu à des mesures (mises en enquête, notes...) ou pouvant faire l'objet d'une mise au point, dans le cadre de la prévention du risque médicamenteux.
La liste complète des cas est jointe en annexe 1.

Effets indésirables avérés :

ACTIFED RHUME et ACTIFED JOUR ET NUIT et accident vasculaire cérébral / CRPV de Caen
Le CRPV de Caen a signalé un cas d'accident vasculaire cérébral chez une adolescente de 14 ans et demi après une automédication par ACTIFED RHUME® et ACTIFED JOUR ET NUIT®. La contre-indication chez l'adolescente n'a pas été respectée.
→ L'unité pharmacovigilance demandera à la firme l'évolution des chiffres de ventes pour ces spécialités et demandera au département publicité de porter son attention sur le contenu de l'information relative à la contre-indication chez l'enfant de moins de 15 ans au niveau des publicités grand public.

VASTEN (pravastatine) et effets malformatifs / CRPV de Clermont-Ferrand
le CRPV de Clermont-Ferrand a rapporté un cas d'interruption médicale de grossesse à 22 semaines d'aménorrhée pour multiples malformations dont holoprosencéphalie chez une femme traitée par VASTEN (pravastatine) en début de grossesse. Deux cas d'effets malformatifs similaires, l'un avec cérivastatine, l'autre avec lovastatine ont été publiés dans la littérature. Les statines sont contre-indiqués pendant la grossesse pour un risque potentiel ; ici, se pose la question de malformations spécifiques des inhibiteurs des HMG-CoA réductase.
→ Une note sera transmise à la cellule grossesse et allaitement afin de signaler ces trois cas avérés de malformations sous statines.

Confusion entre l'acide borique et glucose / CRPV de Marseille
Le CRPV de Marseille rapporte un cas d'erreur de délivrance entre deux poudres blanches, acide borique au lieu de glucose, non étiquetées dans une pharmacie de ville. L'acide borique est utilisé sous forme de topique dans l'hypersudation.
→ Une note sera transmise à l'unité affaires réglementaires afin de signaler cette erreur de délivrance. L'inspection régionale a été informée directement.

CRESTOR (rosuvastatine) et rupture tendineuse / CRPV de Lyon
Le CRPV de Lyon a signalé une cas de rupture tendineuse chez un patient de 50 ans sous CRESTOR®. Deux autres cas sont rapportés dans la base nationale de pharmacovigilance. L'enquête officielle sur les tendinites en présence de statines a été effectuée avant la mise sur le marché de CRESTOR®, spécialité en procédure de reconnaissance mutuelle Pays-Bas Etat membre de référence.
→ L'attention sera portée sur cet effet indésirable dans le prochain PSUR CRESTOR®.

VARILRIX (vaccin varicelleux vivant) et neuronite et ataxie vestibulaire / CRPV de Lyon
Le CRPV de Lyon a signalé un cas de neuronite et ataxie vestibulaire 15 jours après la vaccination par VARILRIX (vaccin varicelleux vivant) chez une femme de 28 ans, avec récidive et persistance de ces effets un mois après la date d'apparition. A cette occasion, il est apparu une divergence de libellé des rubriques sécurité d'emploi entre VARILRIX® et VARIVAX®. Ces deux vaccins varicelleux ont une composition différente et suivent des procédures d'enregistrement différentes.
→ Il sera envisagé une demande de modification de l'information pour VARILRIX®.

HYDROXYCUT complément alimentaire et deux cas d'hépatites aiguës / CRPV de Lyon
Le CRPV de Lyon a signalé un cas d'hépatite aiguë chez une patiente de 23 ans avec HYDROXYCUT complément alimentaire à visée amincissante. Deux cas d'hépatites aiguës ont été publiés récemment. Il contiendrait notamment des plantes (Garcinia cambogia, extraits de guarana, Citrus aurantium), du chrome, de la caféine, de la L-carnitine, de l'acide hydroxycitrique...

→ Une note sera transmise à la Direction de l'Inspection pour informer la Direction Générale de la Consommation, de la Concurrence et de la Répression des Fraudes, une fois l'observation du CRPV de Lyon complétée.

ZYVOXID et acidose lactique / CRPV de Montpellier

Le CRPV de Montpellier a signalé un cas d'acidose lactique chez une femme de 65 ans traitée par ZYVOXID (linézolide), spécialité en procédure de reconnaissance mutuelle, France état membre concerné. ZYVOXID fait l'objet d'un suivi national de pharmacovigilance. Trois autres cas d'acidose sont présents dans la base nationale de pharmacovigilance. Cet effet indésirable est par ailleurs signalé dans les PSURs.

→ La rubrique 4.8 « effets indésirables » du RCP de ZYVOXID® fera état de cet effet.

THALIDOMIDE LAPHAL® et pneumopathie interstitielle diffuse / CRPV de Paris – Fernand-Widal

Le CRPV de Paris – Fernand-Widal a rapporté un article du Journal of Clinical Oncology, vol 23, n°10, 2005 :2425-2426 sur thalidomide et pneumopathie interstitielle diffuse. Aucun cas de pneumopathie interstitielle diffuse n'est signalé dans la base nationale de pharmacovigilance.

→ Il sera envisagé de demander une revue des cas pour cette spécialité à la firme.

TENORDATE (aténolol, nifédipine) et gingivite hyperplasique / CRPV de Reims

Le CRPV de Reims a signalé un cas d'hyperplasie gingivale sous TENORDATE (aténolol, nifédipine), chez un homme de 64 ans. Dans le RCP de TENORDATE, il est juste mentionné « rares cas de gingivite », alors que dans le RCP des autres spécialités contenant de la nifédipine (ADALATE10mg®, CHRONADALATE®), il est mentionné « rarement, gingivite hyperplasique ».

→ Il sera demandé à la firme commercialisant TENORDATE® le dépôt d'une demande de modification de l'information afin de préciser la notion d'hyperplasie gingivale.

POMMADE MAURICE 2,5% (oxyde jaune de mercure) et eczéma / CRPV de Saint-Etienne

Le CRPV de Saint-Etienne a signalé un cas d'eczéma de contact à la deuxième application ophtalmique de la POMMADE MAURICE (oxyde jaune de mercure) chez un enfant de 7 ans et demi pour un orgelets. Les tests de contact, effectués ultérieurement, ont révélé une positivité à l'oxyde de mercure. 15 cas d'effets indésirables dont 5 cas d'eczéma, 5 cas d'œdème, un cas d'œdème de Quincke ont été rapportés dans la base nationale de pharmacovigilance pour les produits à base d'oxyde jaune de mercure, tels que POMMADE MAURICE 2,5%®, OPHTERGINE®, OXYDE MERCURIQUE JAUNE 1% CHAUVIN®. La possibilité d'irritation locale est le seul effet indésirable mentionné dans les RCP de POMMADE MAURICE® et OPHTERGINE®. Le RCP de la spécialité OXYDE MERCURIQUE JAUNE 1% CHAUVIN® mentionne également des réactions d'hypersensibilité cutanéo-conjonctivale en rubrique 4.8.

→ Il sera demandé aux firmes commercialisant ces médicaments le dépôt d'une demande de modification de l'information afin de mettre à jour le libellé de la rubrique 4.8. Il sera signalé à l'AMM que ce type de produit, indiqué dans le traitement local des blépharites infectieuses, notamment parasitaires, risque de sensibiliser les patients traités, aux dérivés mercuriels.

THALIDOMIDE LAPHAL® et aménorrhée / CRPV de Saint-Etienne

Le CRPV de Saint-Etienne a signalé un cas d'aménorrhée sous THALIDOMIDE LAPHAL® . Cet effet indésirable est connu : 6 autres cas dans la base nationale de pharmacovigilance. Cet effet est décrit dans la littérature mais n'est pas mentionné dans le RCP de cette spécialité.

→ Il sera envisagé de demander le dépôt d'une demande de modification de l'information pour cette spécialité en Autorisation Temporaire d'Utilisation afin d'ajouter cet effet indésirable.

Annexe 3-68

III – ENQUETE OFFICIELLE RELATIVE AUX HYPERTENSIONS ARTERIELLES PULMONAIRES ET AUX TROUBLES NEURO-PSYCHIATRIQUES OBSERVES AVEC MEDIATOR® (BENFLUOREX).

Lors du Comité Technique de Pharmacovigilance du 7 décembre 2004, plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique ayant été rapportées avec MEDIATOR® (chlorhydrate de benfluorex), une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité pharmaceutique a été décidée. Par la suite, du fait d'une notification d'un cas d'hypertension artérielle pulmonaire rapportée lors du Comité Technique du 8 mars 2005, l'enquête a été étendue aux hypertensions artérielles pulmonaires.

MEDIATOR® (chlorhydrate de benfluorex) appartient à la classe des amphétamines et est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg.

Ses indications sont :
- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Historique

Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables et avec les restrictions de délivrance de ces produits, le Comité Technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène. Ainsi, le benfluorex a été inscrit sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes le 10 mai 1995.

Le dossier relatif aux effets indésirables du benfluorex a été présenté lors de différentes réunions du Comité Technique de Pharmacovigilance en 1998 et au groupe de travail européen de Pharmacovigilance le 30 novembre 2000, entraînant les modifications de la rubrique « effets indésirables » du Résumé des Caractéristiques du Produit (en gras) :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, **confusion**, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles ;
- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke ;
- élévation des enzymes hépatiques, hépatite (très rare).

Résultats de l'enquête officielle de pharmacovigilance du CRPV de Besançon relative aux hypertensions artérielles pulmonaires et aux troubles neuro-psychiatriques observés avec MEDIATOR® (benfluorex)

1. Troubles neuro-psychiatriques

A. Troubles psychiatriques pendant le traitement :

35 cas ont été rapportés dont 10 déclarés depuis l'enquête présentée en juillet 1999.
Ils concernent 18 hommes (âge moyen : 58,5 ans) et 17 femmes (âge moyen : 60 ans).

Les troubles psychiatriques sont divers :

- agressivité (4), nervosité (3), irritabilité (1)
- cauchemars (2), angoisse (1), stupeur (1), dépression (1)
- désorientation (7), confusion (5), aggravation des troubles cognitifs (1)
- agitation (3), trouble du comportement (3)
- délire (2), bouffée délirante aiguë (1)

Annexe 3-68

Les cas graves ayant nécessité une hospitalisation sont :

- 4 cas de confusion (dont un provenant de la littérature) chez des patients ayant des traitements associés ;
- 3 cas de désorientation temporo-spatiale ;
- 2 cas de bouffées délirantes aiguës, avec d'autres troubles associés, d'évolution rapidement favorable après traitement symptomatique par neuroleptiques.

B. Troubles psychiatriques au sevrage :

10 notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés.

Ils concernent 2 hommes et 8 femmes, dont les âges varient respectivement de 27 à 34 ans (âge moyen : 30,5 ans) et de 30 à 65 ans (âge moyen : 45,25 ans)

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 à 15 mois).

La durée de traitement par MEDIATOR® est très variable : de 1 mois à 8 ans.

Trois cas ont nécessité une hospitalisation, chez des femmes ayant par ailleurs des antécédents de troubles psychiatriques. Une évolution favorable a été constatée dans un des cas après traitement symptomatique par neuroleptiques, les deux autres cas sont d'évolution inconnue.

C. Autres troubles neurologiques :

12 notifications ont été rapportées.
Elles concernent 8 hommes et 4 femmes :

- 2 cas de convulsions d'évolution favorable ;
- 2 cas de neuropathie, chez deux patients diabétiques présentant de multiples autres étiologies possibles ;
- 7 cas de paresthésies, d'apparition rapide et d'évolution favorable en quelques heures, dont deux mésusages ;
- 1 cas de tremblement des mains.

D. Abus

2 cas d'abus ont été rapportés :

- chez un homme augmentant les doses de MEDIATOR® à 10 comprimés par jour pendant 11 mois, sans effet indésirable associé ;
- chez un sportif, consommant (sur prescription médicale) des doses croissantes (1comprimé/semaine au début et jusqu'à 9 comprimés/jour) de MEDIATOR® comme « dopant » et présentant une excitation lors du sevrage.

2. Hypertension artérielle pulmonaire (HTAP) :

16 notifications dont 1 doublon ont été rapportées.

A. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«hypertension artérielle pulmonaire » avaient été rapportées.
9 d'entre elles ont été présentées lors de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » au Comité Technique du 28 avril 1995 :

- 6 ont été classées en HTAP d'allure primitive
- 2 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR® n'était jamais prescrit seul : il était associé à un ou plusieurs anorexigènes :

- ISOMERIDE® : 7 fois

Annexe 3-68

- ISOMERIDE® + PONDERAL® : 2 fois
- ISOMERIDE ®+ FENPROPOREX® : 1 fois
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois

La durée de traitement par MEDIATOR® était précisée dans 7 cas sur 11 et allait de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® était :
- concomitante dans 5 cas,
- antérieure dans 2 cas,
- postérieure dans 3 cas,
- imprécise dans 1 cas.

Sur les 3 cas où la prise de MEDIATOR® était postérieure à la prise d'anorexigènes, 2 cas présentaient une dyspnée et un cas une double atteinte valvulaire aortique et mitrale.

B. Notifications où MEDIATOR® n'est pas associé à un anorexigène :

5 notifications ont été rapportées chez des femmes (dont une présentait une HTAP post capillaire sur valvulopathie et une autre une HTAP sur embolies pulmonaires) n'ayant pas de traitement anorexigène associé. Il est à noter que l'un des cas rapportés est très succinct.

C. Fréquence

Depuis le début de la commercialisation de MEDIATOR®, le nombre de boites de 30 comprimés vendues est de : 110 693 331, correspondant à 45 515 349 mois de traitement*.

Après élimination des HTAP post-emboliques (2) et post-capillaires (3), il reste 11 cas d'HTAP idiopathique (ou primitive) soit :
- 1 cas pour 10 063 030 boites vendues
- ou 1 cas pour 4 137 759 mois de traitement.

(*mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (mois de 30,4 jours).

Discussion

La prévalence de l'hypertension artérielle pulmonaire primitive est de 100 cas par an.

Si on considère uniquement, parmi les cas rapportés, les diagnostics d'hypertension artérielle pulmonaire d'allure primitive et si l'on exclut les cas associés aux anorexigènes et les antécédents d'embolie pulmonaire et de valvulopathie, il reste 2 cas soit une incidence très faible de :
- 1 cas pour 55 346 666 boites vendues
- 1 cas pour 22 757 675 mois de traitement

Les résultats de cette enquête officielle seront présentés en Commission Nationale de Pharmacovigilance.

Annexe 3-68

IV - POINT RELATIF AUX ANTI-TNF α ET CANCER : BIBLIOGRAPHIE ET DONNEES DE LA BASE NATIONALE DE PHARMACOVIGILANCE

1/ Risque carcinogène des anti-TNF α : données bibliographiques

Le Centre Régional de Pharmacovigilance (CRPV) de Paris Saint-Vincent-de-Paul a présenté les données bibliographiques relatives au risque carcinogène des anti-TNF. A ce jour, trois anti-TNFα sont commercialisés en France :

- l'infliximab (REMICADE®),
- l'adalimumab (HUMIRA®),
- l'étanercept (ENBREL®),

Il ressort de cette analyse que :

- l'adalimumab et l'infliximab sont associés, dans la partie contrôlée des essais cliniques, à une augmentation du risque de cancers, par comparaison aux patients atteints de la même affection et recevant un placebo ;
- il existe des augmentations statistiquement significatives des cancers de la peau, hors mélanomes et basocellulaires, avec les trois anti-TNF α ;
- des cas de lymphomes ou autres cancers, d'évolution fulminante, survenus d'emblée ou après une rémission, ont été rapportés dans un délai pouvant être très court ;
- il semble enfin qu'il existe un risque carcinogène variable, en fonction de l'immunosuppresseur associé, toutefois seul le méthotrexate a été correctement étudié dans les essais cliniques.

Le CRPV de Saint-Vincent-de-Paul a souligné que :

- le rapport bénéfice/risque des anti-TNFα dans les formes sévères de polyarthrite rhumatoïde (PR) ou de maladie de Crohn n'est pas remis en question,
- des données des essais cliniques ont été occultées, dans leur partie contrôlée, sont insuffisamment discutées,
- à court et moyen terme, la chronologie suggère que les anti-TNFα viendraient révéler ou favoriser le développement de cancers pré-existants,
- le risque différentiel qualitatif et quantitatif en fonction de l'anti-TNFα est encore inconnu,
- l'association aux immunosuppressseurs, autres que le méthotrexate, en attendant d'autres données, devrait être considérée comme hasardeuse.

2/ Données de la base nationale de pharmacovigilance

a/ REMICADE® (infliximab)

Le CRPV de Nice a présenté les données de la base nationale de pharmacovigilance (BNPV) relatives au risque d'apparition de cancers solides lié à l'utilisation de REMICADE®.

Cet anti-TNF α a obtenu une autorisation de mise sur le marché selon la procédure centralisée le 13 août 1999.

22 cas de cancers solides ont été retrouvés dans la BNPV :

- 9 cas concernent l'appareil digestif (3 cancers de l'œsophage, 5 cancers coliques, 1 cancer du pancréas),
- 5 cas concernent la peau (2 epithélioma basocellulaires, 2 epithélioma spinocellulaire, 1 epithélioma de la verge),
- 4 cas concernent des cancers génito-urinaires (3 cancers du col utérin, 1 cancer de la prostate),
- 3 cancers bronchopulmonaires,
- 1 cancer de la thyroïde.

Ces cancers concernent 10 femmes et 12 hommes, dont les âges varient de 27 à 82 ans (âge moyen : 58 ans). Le délai moyen de survenue est de 10 mois.
Les traitements associés sont représentés par du méthotrexate et des corticoïdes dans 16 cas, et par de l'azathioprine dans 6 cas.
Parmi les 22 cas retrouvés dans la BNPV, 2 ont évolué vers un décès, les 20 autres sont en cours.

b/ ENBREL® (étanercept)

Le CRPV de Toulouse a présenté les données de la BNPV relatives au risque d'apparition de cancers solides lié à l'utilisation d' ENBREL®.

Cet anti-TNF a obtenu une autorisation de mise sur le marché selon la procédure centralisée en février 2000, mais a été commercialisé en France dès avril 1999, sous autorisation temporaire d'utilisation (ATU).

15 cas de cancers solides ont été retrouvés dans la BNPV et la base industrie :

- 3 cancers du poumon, avec dans 2 cas, des antécédents de tabagisme,
- 3 cancers du sein,
- 2 mélanomes,
- 1 cancer de l'ovaire,
- 1 cancer de l'endomètre,
- 1 myélome,
- 1 méningome,
- 1 cancer de la langue, 1 cancer colique et 1 cancer hépatique.

Ces cancers concernent 11 femmes et 3 hommes, dont l'âge moyen est de 54,5 ± 8,2 ans. Le délai de survenue est supérieur à 1 an dans 6 cas et inférieur à 1 an dans 8 cas.
L'imputabilité est douteuse dans tous les cas.

c/ HUMIRA® (adalimumab)

Le CRPV de Nancy a présenté les cas notifiés relatifs au risque d'apparition de cancers solides lié à l'utilisation d'HUMIRA®, dans la BNPV.

Cet anti-TNFα est un anticorps monoclonal humanisé qui a obtenu une autorisation de mise sur le marché selon la procédure centralisée en mai 2003.

7 cas de cancers solides ont été rapportés entre novembre 2003 et mai 2005 :

- 2 cas concernent l'appareil respiratoire (1 carcinome bronchique et 1 adénocarcinome pulmonaire chez des patients fortement tabagiques),
- 1 cancer du rectum,
- 3 cas concernent l'appareil génito-urinaire (2 cancers du sein dont 1 observé chez une patiente aux antécédents familiaux de cancer du sein , 1 tumeur de la vessie),
- 1 myélome multiple.

Ces cancers concernent 3 femmes et 4 hommes, dont les âges varient de 48 à 82 ans (âge moyen : 56,1 ans). Le délai entre le début du traitement par HUMIRA® et l'apparition des premiers symptômes varie de 1,5 et 14,5 mois (moyenne à 7 mois).

Le méthotrexate était associé dans 6 cas, des corticoïdes dans 6 cas, le léflunomide (ARAVA®) dans 2 cas et l'étanercept (ENBREL®) dans 1 cas.
Sur les 7 cas retrouvés, 1 cas a évolué vers un décès, 1 autre a évolué vers une guérison avec séquelles et 5 sujets sont encore non -rétablis.
Dans tous les cas, l'imputabilité a été déterminée douteuse l1.

3/ Conclusions

Au vu de ces différentes présentations, le Comité technique propose que ce dossier soit attentivement suivi.

Il a été rappelé par l'unité de pharmacovigilance que le Résumé des Caractéristiques du Produit (RCP) de l'infliximab (REMICADE®) et de l'adalumimab (HUMIRA®) ont fait l'objet de récentes mises à jour (variations) en ce qui concerne le risque de cancer. Les libellés adoptés sont les suivants :

- rubrique « mises en garde et précautions d'emploi » :

Tumeurs malignes et troubles lymphoprolifératifs

Dans la partie contrôlée des essais cliniques avec des anti-TNF, il a été observé plus de cas de lymphomes chez les patients traités par un anti-TNF que chez les patients du groupe contrôle. Cependant, l'incidence a été rare et la période de suivi des patients sous placebo était plus courte que celle des patients sous traitement anti-TNF. De plus, il existe un contexte de risque accru de lymphome chez les patients atteints d'une polyarthrite rhumatoïde ancienne, inflammatoire et hautement active, ce qui complique l'estimation du risque. Dans l'état actuel des connaissances, la possibilité d'un risque de développer des lymphomes ou autres maladies malignes chez les patients traités par anti-TNF ne peut être exclue.

Il n'existe pas d'études chez des patients avec antécédents de tumeurs malignes ou chez des patients qui continuent leur traitement alors qu'ils développent une tumeur maligne sous Humira. En conséquence, une prudence accrue devra être observée lorsqu'on envisage un traitement de ces patients par Humira (voir rubrique 4.8).

- rubrique « **effets indésirables** » : ajout de
Tumeurs malignes et troubles lymphoprolifératifs.

Par ailleurs, l'unité de pharmacovigilance a également rappelé qu'une réunion européenne constituée d'un groupe d'experts allait avoir lieu à Londres le 16 juin prochain. Le Comité technique sera tenu informé des conclusions de cette réunion.

Au total, les effets indésirables des anti-TNFα, et tout particulièrement le problème de survenue de cancers, font l'objet d'une surveillance étroite au niveau national, comme au niveau européen. Ceci se manifeste par les nombreuses variations en cours et à venir concernant ces produits. De ce fait, les RCP sont très régulièrement enrichis et complétés.

Annexe 3-68

V - POINT RELATIF A RISPERDAL CONSTA® (RISPERIDONE) ET RESURGENCES DES DELIRES

Le Centre Régional de Pharmacovigilance (CRPV) de Montpellier a présenté un point concernant les résurgences de délire, hallucinations et échecs thérapeutiques observés chez des patients traités par Risperdal Consta® (rispéridone).

Risperdal Consta® est le premier antipsychotique atypique à action retard, indiqué dans le *« traitement des psychoses, en particulier des psychoses schizophréniques, en relais d'un traitement antipsychotique par rispéridone par voie orale »* ; il a obtenu une AMM en octobre 2003 en France (procédure nationale). Il s'agit d'une suspension aqueuse de microsphères constituées d'une matrice de rispéridone et d'un copolymère biodégradable (contrairement aux antipsychotiques conventionnels à action prolongée dont la libération s'effectue par l'intermédiaire d'un véhicule huileux).
Risperdal Consta® est administré par injection intramusculaire, toutes les deux semaines, à des posologies variant de 25 à 50 mg. Une couverture par rispéridone par voie orale doit être assurée durant les trois premières semaines de traitement par Risperdal Consta®. Un tableau d'équivalence posologique entre la voie orale et la voie intramusculaire figure dans le Résumé des Caractéristiques du Produit (RCP) et recommande une dose de Risperdal Consta® de 25 mg, ou comprise entre 25 et 37,5 mg, ou de 50 mg lorsque la dose de rispéridone orale est respectivement de 2 mg, comprise entre 2 et 4 mg, ou bien de 4 mg et plus. La même posologie de 50 mg sera donc proposée, que le patient soit traité auparavant par une posologie de rispéridone orale de 4 mg, ou de 16 mg.

Eléments de pharmacocinétique du Risperdal Consta®
La rispéridone est métabolisée par le cytochrome P450 2D6 en 9-hydroxy-rispéridone qui constitue, avec la rispéridone, la fraction active du médicament. Le métabolisme dépendant du CYP 2D6 est soumis à un polymorphisme génétique.
Après injection intra-musculaire, la phase de libération principale débute à partir de la 3ème semaine, rendant nécessaire la prise orale de rispéridone pendant cette période. Cette phase se poursuit ensuite pendant 4 à 6 semaines et se termine à la 7ème semaine. L'état d'équilibre survient après la quatrième injection. Risperdal Consta® présente donc à la fois une action prolongée et une action retardée.

Eléments de pharmacodynamie
Les antipsychotiques atypiques se caractérisent par une action antagoniste sur les récepteurs D2 à la dopamine. Une occupation des récepteurs au moins égale à 60% est nécessaire pour assurer une efficacité antipsychotique. Une étude récente a étudié l'occupation des récepteurs D2 à la suite de l'injection de Risperdal Consta®[1]. Le taux d'occupation des récepteurs D2 a été de 25-48% chez les patients traités par 25 mg, de 59-83% pour une posologie de 50 mg, et de 62-72% pour une posologie de 75 mg. Cette étude a été réalisée après la 5ème injection chez 7 patients et après la 3ème chez un patient. Le taux d'occupation des récepteurs D2 à l'état d'équilibre après administration de Risperdal Consta® est équivalent à celui obtenu chez des patients traités efficacement par des doses de 2 à 6 mg par jour de rispéridone par voie orale.

Données de notifications spontanées
Entre mars et octobre 2004, 16 cas (dont 13 graves) de résurgence de délire ou d'échec thérapeutique ont été rapportés en France chez des patients, d'âge moyen 38 ans, traités par Risperdal Consta®.
Dans 11 cas, les patients avaient bénéficié de la couverture par rispéridone voie orale, comme recommandé dans le RCP. Dans 6 cas, les patients étaient bien équilibrés sous traitement oral par rispéridone à des posologies de 6 à 16 mg/j.
La rechute est survenue entre la première et la troisième injection dans 8 cas, et après la troisième injection dans 5 cas. Le délai de rechute par rapport à l'injection (et non par rapport au début du traitement) n'est connu que dans un cas (12-13 jours après la 4ème injection).

[1] Gefvert O, Eriksson B, Persson P, et al. Pharmacokinetics and D2 receptor occupancy of long-acting injectable risperidone (Risperdal Constatrade mark) in patients with schizophrenia. Int J Neuropsychopharmacol 2005; 8: 27-36.

Annexe 3-68

L'évolution a été favorable, ou une amélioration a été observée après réintroduction de la rispéridone par voie orale dans 4 cas. Dans deux cas, le traitement par Risperdal Consta® a été poursuivi en augmentant la dose sans que le patient ait été amélioré. Dans un autre cas, le traitement a été poursuivi et l'évolution est inconnue. Dans trois cas, la rechute a amené à interrompre l'arrêt du Risperdal Consta® et à administrer d'un autre traitement neuroleptique. Dans deux cas, Risperdal Consta® a été arrêté et un traitement par rispéridone par voie orale a été repris.

Données de l'étude DEPIST

En décembre 2004, les laboratoires Janssen ont débuté une étude de phase IV, l'étude DEPIST (Diagramme de l'Etat Psychotique utilisable par l'Infirmier dans la Schizophrénie Traitée au Long Cours), visant à permettre la poursuite du traitement par Risperdal Consta® chez des patients déjà traités, dans l'attente de la fixation du prix de la spécialité.
A la date du 15 avril 2005, 823 patients avaient été inclus, et 40 observations d'effets indésirables avaient été colligées ; 25 cas (tous graves) faisaient mention d'une résurgence de la symptomatologie. Les observations sont peu documentées ; l'existence de la couverture par rispéridone par voie orale ou la notion de médicaments antérieurs sont peu renseignées.

Données dans d'autres pays européens

Une information non urgente, envoyée à l'ensemble des Etats membres de l'Union européenne, a permis d'être informé de l'existence de 62 cas de rechute de psychose, d'échec thérapeutique, de résurgence de délire, rapportés aux Pays-Bas (25 cas), au Royaume-Uni (25 cas), en Irlande (6 cas), Espagne (4 cas), Finlande (2 cas).
La couverture par rispéridone voie orale n'est encore une fois pas bien documentée. A noter, dans deux observations anglaises, que la rechute a eu lieu juste avant l'injection suivante de Risperdal Consta®.

Au total, un nombre non négligeable de rechutes et d'échecs thérapeutiques ont été rapportés en France mais aussi dans d'autres pays européens avec Risperdal Consta®.
Dans la plupart des cas, ces rechutes ont nécessité l'hospitalisation des patients, dont certains étaient correctement équilibrés avant la mise sous Risperdal Consta®.
Plusieurs hypothèses peuvent être émises pour expliquer ce phénomène :

- une variabilité inter-individuelle,
- un polymorphisme génétique au niveau de la métabolisation,
- une modification des récepteurs,
- une durée trop courte (3 semaines) de la couverture par rispéridone orale.

Par ailleurs, le rapporteur et le Comité technique ont souligné la difficulté des modalités de préparation et d'administration de Risperdal Consta® (préparation longue et compliquée, administration devant être faite en intra-musculaire profonde dans le muscle fessier), pouvant être à l'origine d'une inefficacité du produit.

Le Comité technique souhaite que ce dossier soit revu par le Groupe de travail sur les médicaments de neurologie, psychiatrie, anesthésie, et antalgie, en apportant une attention particulière sur l'aspect pharmacocinétique.
Ce dossier sera ensuite présenté en Commission nationale de pharmacovigilance.

Annexe 3-68

VI - ENQUETE OFFICIELLE DE PHARMACOVIGILANCE RELATIVE AUX EFFETS INDESIRABLES HEPATIQUES AVEC LE PROGUANIL ET LA CHLOROQUINE

Les résultats de l'enquête officielle de pharmacovigilance relative aux effets indésirables hépatiques rapportés avec la chloroquine et le proguanil ont été présentés par le Centre Régional de Pharmacovigilance (CRPV) d'Angers. Cette enquête fait suite à la notification d'un cas d'atteinte hépatique mixte, survenu chez une patiente traitée par l'association chloroquine-proguanil pour une prophylaxie du paludisme.

La chloroquine est un dérivé amino-4-quinoléine qui exerce une action essentiellement schizonticide sur les formes érythrocytaires du plasmodium. Son métabolisme hépatique fait intervenir le CYP2C8, le CYP3A4 et dans une moindre mesure le CYP2D6. Le métabolite principal, la monodéséthylchloroquine, a une activité in vitro, un profil de distribution et une fixation tissulaire analogue à la chloroquine. La demi-vie de la chloroquine s'échelonne entre 30 et 60 jours.

Le proguanil ou chloroguanide n'a pas par lui-même d'activité mais son métabolite, le cycloguanil, produit via le CYP2C19, inhibe assez spécifiquement la dihydrofolate réductase du plasmodium et empêche sa division. Du fait d'un polymorphisme génétique du CYP2C19, certains patients sont métaboliseurs lents, à hauteur de 6 à 10 % de la population caucasienne mais pouvant atteindre 20 % dans le sud-est asiatique. La demi-vie d'élimination est d'environ 14 heures pour le proguanil et 19 heures pour le cycloguanil.

Cinq spécialités, contenant l'un et/ou l'autre des principes actifs sont concernées par cette enquête : NIVAQUINE® (chloroquine, laboratoire Sanofi-Aventis), PALUDRINE® (proguanil, laboratoires Astra Zeneca), SAVARINE® (chloroquine/proguanil, laboratoires Astra Zeneca), NOPALU® (chloroquine/proguanil, Pharmacie Centrale des Armées), MALARONE® (atovaquone/proguanil, laboratoires GSK).

Ces cinq spécialités sont indiquées dans la prophylaxie du paludisme. Par ailleurs, NIVAQUINE® et MALARONE® sont également indiqués dans le traitement curatif de l'accès palustre. Enfin, la forme dosée à 100 mg de NIVAQUINE® est aussi indiquée dans le traitement symptomatique de la polyarthrite rhumatoïde, du lupus discoïde, du lupus érythémateux subaigu et le traitement préventif des rechutes de lupus et des lucites.

METHODOLOGIE

Les observations, issues des CRPV et des laboratoires, appartenant à la classe-organe "foie" ont été sélectionnées puis ont fait l'objet d'une première analyse visant à exclure : les cas trop peu informatifs, les intoxications par la chloroquine qui peuvent s'accompagner d'une perturbation du bilan biologique hépatique par bas débit en cas de défaillance cardiaque, les atteintes musculaires, les cas pour lesquels une étiologie non médicamenteuse était démontrée.

Les observations retenues pour l'enquête ont été imputées selon la méthode française et classées en 4 groupes en fonction des résultats des tests biologiques : les atteintes hépatiques cytolytiques (ALAT/PAL $\geq$ 5), les atteintes hépatiques mixtes (2 < ALAT/PAL < 5), les atteintes cholestatiques (ALAT/PAL $\leq$ 2), les anomalies biologiques hépatiques isolées.

En raison du faible nombre d'observations, la période de recueil débute en 1985 pour la chloroquine, molécule la plus anciennement utilisée, et à la date de commercialisation pour les autres médicaments dont la commercialisation est postérieure à 1985. La fin de la période de recueil a été fixée au 30 juin 2004.

L'incidence des notifications a été estimée par mois (4 semaines) de traitement prophylactique en utilisant le nombre d'unités vendues et les posologies quotidiennes ou hebdomadaires conseillées pour un usage préventif. Cette estimation a été réalisée pour chaque produit. L'intervalle de confiance bilatéral à 95 % (IC95) a été calculé selon la loi de Poisson.

RESULTATS

Un total de 69 observations a été inclus dans l'enquête, se répartissent comme suit :

Annexe 3-68

Principes actifs	Nombre total de cas		Nombre de cas inclus dans l'enquête			
	CRPV	Industrie	CRPV	Industrie	Doublons	Total
Chloroquine	36	18	21	12	5	28
Proguanil	0	0	0	0	0	0
Chloroquine + Proguanil	31	24	20	14	4	30
Atovaquone + Proguanil	4	12	4	10	3	11

• Les atteintes hépatiques associées à la chloroquine utilisée seule sans proguanil sont au nombre de vingt-huit notifications se répartissant en :

- Atteinte cytolytique : 12 cas
- Atteinte mixte : 4 cas
- Atteinte cholestatique : 2 cas
- Anomalies biologiques isolées : 10 cas

Les atteintes cytolytiques touchent 9 femmes et 3 hommes, d'âge moyen 36 ± 13 ans [20-60]. Les indications du traitement par chloroquine sont les suivantes : prophylaxie du paludisme (6 cas), accès palustre (1 cas), porphyrie cutanée tardive (PCT) (1cas), tentative de suicide par absorption de chloroquine et de lorazépam sans atteinte cardiotoxique (1cas), injection par erreur de chloroquine au lieu d'héroïne chez un toxicomane (1cas) et indication inconnue (2 cas).
Lorsqu'elle est connue, la posologie est conforme à l'indication sauf dans deux cas où elle est jugée excessive par rapport aux recommandations de l'AMM.
Le délai de survenue de l'effet indésirable après le début du traitement par chloroquine est variable allant de quelques minutes (injection par erreur de chloroquine) à 120 jours. Dans 9 cas, l'atteinte hépatique survient dans le premier mois du traitement. Dans 2 cas, le délai est inconnu.

La cytolyse hépatique, marquée par une élévation des transaminases (les ALAT varient de 2 N à 100 N), s'associe à des troubles digestifs à type de douleurs abdominales et/ou nausées et/ou vomissements dans 4 cas, à un ictère dans 5 cas, à une asthénie dans 3 cas, à une fièvre dans 3 cas (en dehors de tout accès palustre) et à une éruption cutanée dans 2 cas. Aucune cytolyse n'a été documentée au plan anatomo-pathologique. L'évolution a été majoritairement favorable (12 cas), inconnue (2 cas). Au vu des éléments du dossier, il est difficile d'appréhender le mécanisme.

La chloroquine est le seul médicament suspect dans 7 cas. Dans les 5 autres cas, la chloroquine est associée à d'autres médicaments de même imputabilité et dont certains sont connus pour leur hépatotoxicité. Dans un seul cas d'imputabilité C2S2, la chloroquine est le seul médicament suspect (porphyrie sous-jacente méconnue suspectée).

Les atteintes mixtes touchent 1 femme et 3 hommes dont les âges varient de 48 à 77 ans. Les indications du traitement par chloroquine sont les suivantes : suspicion d'accès palustre (1 cas), lupus (1 cas), sclérodermie (1 cas), inconnue mais probablement prophylaxie du paludisme (1 cas). Lorsqu'elle est connue, la posologie est conforme aux recommandations de l'AMM.
Le délai de survenue de la symptomatologie après le début du traitement par chloroquine varie de 2 à 21 jours. Dans un cas, le délai de survenue est non précisé mais il s'agit d'une cirrhose hépatique évoluant chez un patient atteint de sclérodermie.

Outre le cas de cirrhose hépatique dont l'étiologie est inconnue, trois cas d'atteinte mixte sont enregistrés avec des ALAT comprises entre 2 et 10,6 N et des PAL entre 1,3 et 2,4 N. La symptomatologie clinique associe des douleurs abdominales (2 cas), des urines foncées (1 cas), une fièvre chez un patient (suspicion d'accès palustre non confirmée). Dans un cas, une atteinte pancréatique est associée à l'atteinte hépatique sans mise en évidence d'une lithiase biliaire à l'échographie. Enfin un cas, dont le bilan étiologique infectieux était négatif, s'est accompagné d'une thrombopénie, d'une neutropénie et d'une insuffisance rénale.

La chloroquine est le seul médicament suspect dans 2 cas. Dans le seul cas d'imputabilité C2S2, la chloroquine est le seul médicament suspect.

Les atteintes cholestatiques touchent deux hommes de 56 et 68 ans. Aucune de ces observations ne permet de retenir formellement le rôle de la chloroquine dans la cholestase du fait dans un cas de

l'association à un autre médicament de même imputabilité et dans l'autre d'un suivi évolutif et d'un bilan étiologique incomplets.

Les anomalies biologiques hépatiques isolées touchent 7 hommes et 3 femmes dont l'âge varie de 1 à 62 ans (3 patients d'âge inconnu). Ces cas sont très peu informatifs, d'évolution inconnue dans 6 cas, et ne permettent aucune conclusion.

• Les atteintes hépatiques observées lors d'une association chloroquine et proguanil

Trente notifications d'atteinte hépatique survenue à l'occasion d'un traitement associant chloroquine et proguanil ont été retenues pour l'enquête. Ils se répartissent en :

- Atteinte cytolytique : 17 cas
- Atteinte mixte : 7 cas
- Atteinte cholestatique : 4 cas
- Anomalies biologiques isolées : 2 cas

Huit cas sont survenus sous NIVAQUINE® associé à PALUDRINE®. Un cas est associé à un traitement en alternance NIVAQUINE® puis SAVARINE®. Les 21 autres cas sont survenus sous SAVARINE®. Aucun cas n'est associé à la prise de NOPALU®.

Dénombrement des cas en fonction du type d'atteinte hépatique et des spécialités

Spécialités	Atteinte cytolytique	Atteinte mixte	Atteinte cholestatique	Perturbations biologiques	Total
SAVARINE®	11	5	3	2	21
NIVAQUINE® + PALUDRINE	5	2	1	0	8
NIVAQUINE® + SAVARINE®	1	0	0	0	1
NOPALU®	0	0	0	0	0
Total	17	7	4	2	30

Les atteintes cytolytiques touchent 12 femmes et 5 hommes d'âge moyen 39 ± 16 ans [10-67]. L'association chloroquine et proguanil est dans tous les cas utilisée pour une prophylaxie du paludisme à une posologie classique de 100 mg de chloroquine et 200 mg de proguanil par jour (la posologie est inconnue dans 5 cas).
Le délai de survenue de la symptomatologie après le début de la chimioprophylaxie est variable de 8 à 63 jours. Dans 9 cas l'atteinte hépatique survient dans le premier mois du traitement. Ce délai est inconnu dans 4 cas.

La cytolyse hépatique, marquée par une élévation des transaminases (les ALAT varient de 1,5 N à 25 N), s'accompagne de troubles digestifs à type de douleurs abdominales (5 cas), de nausées et/ou vomissements (5 cas), de diarrhée (5 cas). Une fièvre est présente dans trois cas en dehors de tout accès palustre. Une éruption cutanée est présente dans un cas, associée à d'autres manifestations évocatrices d'un syndrome d'hypersensibilité. Enfin, un cas dont le bilan étiologique infectieux est négatif, s'est accompagné d'une thrombopénie et d'une neutropénie. Aucune cytolyse n'a été documentée au plan anatomo-pathologique en raison de la bénignité de l'atteinte et d'une évolution rapidement favorable à l'arrêt des médicaments suspects.

L'association chloroquine et proguanil est le seul traitement suspect dans 13 cas. Dans les 4 autres cas, d'autres médicaments de même imputabilité sont associés. Certains sont connus pour leur hépatotoxicité tel Augmentin®, paracétamol ou fénofibrate. Dans les deux cas d'imputabilité C2S2, SAVARINE® est le seul médicament suspect.

Les atteintes mixtes touchent 4 femmes et 3 hommes dont les âges varient de 43 à 50 ans (une patiente est d'âge inconnu). L'association chloroquine et proguanil est dans tous les cas utilisée pour prophylaxie du paludisme à posologie classique.
Le délai de survenue de la symptomatologie après le début de la chimioprophylaxie est variable de 5 à 40 jours. Un cas, d'imputabilité C1S1 a été découvert 25 jours après l'arrêt du traitement alors que le sujet était en plein accès palustre.

Les perturbations du bilan biologique hépatique sont modérées : ALAT entre 4 et 29,5 N, PAL entre 1,5 et 7 N quand les valeurs sont connues. Elles s'accompagnent de troubles digestifs (3 cas), d'un

ictère (2 cas). Quelques observations notent des manifestations évocatrices d'un mécanisme immuno-allergique. Aucune ponction biopsie hépatique n'a été réalisée. L'évolution est favorable dans 4 cas et inconnue dans 3.

L'association chloroquine et proguanil est le seul traitement suspect dans 5 cas. Dans les 3 cas d'imputabilité C2S2, SAVARINE® est le seul médicament suspect.

Les atteintes cholestatiques touchent 3 femmes et un homme âgés de 29 à 79 ans. L'association chloroquine et proguanil est dans tous les cas utilisée en prophylaxie.
Le délai de survenue de la symptomatologie après le début de la prophylaxie est inférieur à 1 mois dans 3 cas, et imprécis dans 1 cas mais d'environ 1 mois.

La cholestase est marquée par une élévation des PAL entre 5,5 et 9 N ou un ictère. Il s'y associe trois fois une cytolyse modérée (ALAT entre 2,7 et 12 N). Des manifestations évocatrices d'une réaction immuno-allergique sont présentes dans trois observations. L'évolution est dans tous les cas favorable. Elle est signalée comme lente avec persistance d'une cholestase à 10 mois avec PAL à 2 N dans un cas.

La chimioprophylaxie est le seul traitement suspect dans deux cas. Dans deux autres cas, il existe un autre médicament suspect de même imputabilité (simvastatine d'une part, contraceptif oestroprogestatif d'autre part).

Les anomalies biologiques isolées touchent 2 hommes de 48 et 55 ans. Il s'agit d'une simple élévation de la GGT (C2S1) dans un cas et d'une élévation modérée des transaminases et de la GGT d'évolution inconnue (C1S1) dans l'autre cas.

- Les atteintes hépatiques observées lors d'une association atovaquone et proguanil

Onze notifications d'atteinte hépatique survenue à l'occasion d'un traitement associant atovaquone et proguanil (MALARONE®) ont été retenues pour l'enquête. Ils se répartissent en :

- Atteinte cytolytique : 7 cas
- Atteinte mixte : 1 cas
- Atteinte cholestatique : 1 cas
- Anomalies biologiques isolées : 2 cas.

Les atteintes cytolytiques sont majoritaires avec cette spécialité et concernent 2 femmes et 5 hommes dont l'âge varie de 16 à 57 ans. Les indications du traitement par atovaquone et proguanil sont les suivantes : prophylaxie du paludisme (4 cas), accès palustre (2 cas) et suspicion d'accès palustre (1 cas).
Le délai de survenue est très variable de 2 à 28 jours. Un cas est de découverte tardive environ 3 mois après l'arrêt du traitement.

La cytolyse est marquée par une élévation des transaminases (les ALAT varient de 2,6 à 119 N). Elle s'associe dans un cas à d'autres effets évoquant une possible réaction immuno-allergique. L'évolution est favorable dans 5 cas et inconnue dans les 2 autres.

Dans 5 cas, MALARONE® est le seul médicament suspect. Dans le seul cas C2S2, la prophylaxie antipalustre est associée à un traitement par ibuprofène de même imputabilité.

Les atteintes mixtes sont survenues dans un seul cas chez une femme de 24 ans, hôtesse de l'air, traitée par MALARONE® pour un accès palustre à *Plasmodium falciparum* confirmé.

Les atteintes cholestatiques sont survenues dans un seul cas chez une femme de 50 ans traitée en prophylaxie antipalustre par MALARONE®.

Les anomalies biologiques hépatiques isolées sont représentés par deux cas peu informatifs et d'imputabilité C1S1.

Annexe 3-68

ESTIMATION DU TAUX DE NOTIFICATION

Le taux de notification des effets hépatiques sous chloroquine ou proguanil peut être qualifié de "très rare" ou "exceptionnel".

Taux de notification des atteintes hépatiques

Spécialités	Nb. d'unités de vente vendues (période) *Nb. de mois de prophylaxie*	Nb. de cas notifiés pendant la période	Incidence des notifications pour 10^6 mois de prophylaxie [IC95]
NIVAQUINE® (toutes unités des variétés PO)	236 453 395 (01/01/1994 au 31/12/2003) ***9 060 213***	21	2,3 [1,4-3,5]
SAVARINE® (boîte de 28 comprimés)	2 229 731 (01/02/2000 au 30/06/2004) ***2 229 731***	12	5,3 [2,8-9,4]
PALUDRINE® (boîte de 56 comprimés)	275 646 (01/02/2000 au 30/06/2004) ***275 646***	0	[0-13,4]
NOPALU® (flacons de 14 gélules)	26 682 (01/02/2004 au 30/06/2004) ***13 341***	0	[0-277]
MALARONE® (boîtes de 12 comprimés)	590 354 (01/01/2001 au 30/06/2004) ***253 008***	11	43,5 [21,7-77,8]

RESULTATS DE LA NOTIFICATION SPONTANEE HORS DE FRANCE

Les données internationales des différents laboratoires sont peu nombreuses et difficilement exploitables du fait d'un manque fréquent d'informativité en particulier sur le suivi évolutif. Ainsi, les seules données retenues pour l'enquête sont extraites de la base ASTRA ZENECA.

Il s'agit de neuf cas associés à : chloroquine seule (1 cas) ; proguanil seul (3 cas) ; association chloroquine et proguanil (5 cas).

Le cas survenu sous chloroquine seule concerne un ictère attribué à une hépatite subfulminante. Le cas est peu détaillé tant au plan clinique que paraclinique. L'évolution est favorable sans greffe hépatique.

Trois atteintes hépatiques survenues sous chloroquine et proguanil sont intéressantes à considérer car elles s'intègrent dans un tableau clinique plus large évoquant un problème d'hypersensibilité grave : un érythème polymorphe, un syndrome de Stevens Johnson et un syndrome d'hypersensibilité (DRESS syndrom).

Les deux autres atteintes hépatiques, d'évolution favorable, survenues sous chloroquine et proguanil sont : une atteinte mixte et une atteinte cholestatique associée à une stomatite.

Enfin trois atteintes hépatiques sont survenues sous proguanil utilisé seul en prophylaxie : une atteinte mixte, une atteinte cholestatique (récidive de moindre intensité un an après lors d'une nouvelle cure de proguanil) et une hépatite avérée au plan anatomo-pathologique (quelques éléments évoquent une participation immuno-allergique).

DISCUSSION

Chloroquine

L'analyse des cas notifiés associés à la chloroquine utilisée seule n'apporte pas beaucoup d'arguments pour valider l'existence d'effets indésirables hépatiques induits par ce médicament. Seules, deux observations où la chloroquine est le seul médicament suspect avec une imputabilité plausible sont disponibles. Aucun cas avec réintroduction positive n'a été recueilli.

En revanche, l'analyse bibliographique montre que la chloroquine présente une toxicité hépatique expérimentale lorsqu'elle est administrée à dose unique forte (970 mg/kg) chez le rat (peroxydation lipidique conséquence d'un stress oxydatif). In vitro, la chloroquine démontre une toxicité sur des hépatocytes de rat en culture à des concentrations 2 à 10 fois plus importantes que les concentrations plasmatiques retrouvées en thérapeutique humaine.

Un autre problème soulevé par l'analyse bibliographique est celui de la toxicité hépatique de la chloroquine lorsqu'elle administrée à des patients atteints de porphyrie cutanée tardive (PCT). La PCT est la plus fréquente des porphyries. Elle peut être familiale (type II ou III) ou sporadique (type I). Les réactions cutanées phototoxiques en sont la principale manifestation clinique. Un des traitements de la PCT réside dans l'administration de faibles doses de chloroquine (125 mg x 2/semaine). Ce traitement s'accompagne classiquement de fièvre, de douleurs abdominales, d'une élévation des transaminases de façon d'autant plus importante que la dose de chloroquine est forte. Le mécanisme de l'hépatotoxicité de la chloroquine dans ces conditions est mal connu mais pourrait être le fait d'une destruction sélective des mitochondries responsables de la surproduction de porphyrines. Une seule notification analysée dans l'enquête fait état d'une PCT chez un patient atteint de cytolyse. Ce problème est vraisemblablement mal connu et ne figure pas de façon explicite dans le RCP de la chloroquine ce qui justifie en conséquence un ajout dans le RCP.

Proguanil

Aucun des cas français inclus dans l'enquête ne concerne le proguanil utilisé seul. Cependant au vu des conclusions précédentes concernant la chloroquine et en raison de trois cas issus de la base ASTRA ZENECA impliquant le seul proguanil (un cas avec réintroduction positive, un cas publié), il est logique de conclure que le proguanil peut exceptionnellement être responsable d'atteinte hépatique. Ces atteintes sont le plus souvent cytolytiques ou mixtes. Elles sont d'évolution rapidement favorable à l'arrêt du traitement. La gravité de certains cas est souvent le fait d'autres manifestations associées qui évoquent parfois de véritables syndromes d'hypersensibilité (DRESS syndrom) comportant une atteinte hépatique. Une étude de la tolérance de l'association chloroquine-proguanil réalisée par une surveillance clinique et biologique rigoureuse de 131 militaires ayant séjourné 4 mois en République Centrafricaine montre une élévation franche des transaminases dans 3 cas (2,3 %) alors que les sérologies des hépatites virales sont négatives. L'interruption du proguanil a été suivie d'une normalisation de ces enzymes.

Les cas français rapportés avec l'association atovaquone-proguanil, inclus dans l'enquête, n'apportent pas d'argument supplémentaire pour valider l'existence d'atteinte hépatique induite par le proguanil, ce d'autant que des effets indésirables hépatiques sont également décrits avec l'atovaquone. Une communication récente au congrès annuel de l'American College of Gastroenterology décrit une hépatite fulminante, d'évolution favorable après greffe de foie (la biopsie hépatique montrait une nécrose hépatocytaire massive compatible avec une étiologie toxique ou médicamenteuse).

PROPOSITIONS

La rareté des effets hépatiques notifiés, et l'absence de cas particulièrement sévères justifient que les propositions se limitent à délivrer auprès des professionnels de santé une simple information.

A l'heure actuelle, aucune mention d'effet indésirable hépatique ne figure dans les RCP de NIVAQUINE®, SAVARINE®, PALUDRINE® et NOPALU®. Le RCP de MALARONE® signale la possibilité d'élévation des enzymes hépatiques liée plus spécifiquement à l'atovaquone.

La rubrique "Mises en garde" de NIVAQUINE® signale que la chloroquine est susceptible de déclencher une crise de porphyrie aiguë chez les patients atteints de porphyrie intermittente. L'indication porphyrie cutanée tardive ne figure pas dans l'AMM et aucune mention de l'hépatotoxicité de la chloroquine dans cette pathologie n'est signalée.

Au vu des données de l'enquête, il serait souhaitable de faire figurer à la rubrique "effets indésirables" les mentions suivantes :

- au RCP des spécialités contenant de la chloroquine : *"très rares cas d'élévation des enzymes hépatiques ou d'atteinte hépatique survenant notamment chez les patients porteurs d'une porphyrie cutanée tardive, et ce de façon dose-dépendante ".*
- au RCP des spécialités contenant du proguanil : *"très rares cas d'élévation des enzymes hépatiques ou d'hépatite survenant principalement dans un contexte d'hypersensibilité".*

Les résultats de cette enquête officielle seront présentés en Commission nationale de pharmacovigilance.

Annexe 3-68

VII – PRESENTATION DU PROJET « OBSERVATOIRES INTERREGIONAUX DES MEDICAMENTS ET DES INNOVATIONS THERAPEUTIQUES (OMIT) EN CANCEROLOGIE »

Madame Muriel Dahan, de l'Institut National du Cancer, a présenté en présence du Professeur Christian Riché, chargé de mission du projet, les grandes lignes d'un cahier des charges intervenant dans le cadre de la mise en place d'observatoires des médicaments et des innovations thérapeutiques (OMIT) en cancérologie, sur l'ensemble du territoire français. Ces observatoires viseront à assurer un suivi et à analyser des pratiques de prescription observées au niveau régional ou interrégional : l'analyse des données contribuera à améliorer le bon usage du médicament, la qualité et la sécurité des soins et à réduire les inégalités d'accès aux thérapeutiques appropriées. Ces OMIT en cancérologie seront sous la responsabilité des Agences Régionales d'Hospitalisation (ARH) des inter-régions, correspondant aux zones géographiques des cancéropoles. L'institut National du Cancer assurera leur coordination et la synthèse nationale des données.

Afin de définir le type de données à collecter auprès des prescripteurs, et les conditions dans lesquelles elles seront recueillies, exploitées et synthétisées, il convient d'élaborer un cahier des charges commun à l'ensemble des OMIT en cancérologie. Le but est de pouvoir le transposer aux médicaments hors cancer et aux dispositifs médicaux.

Afin d'apporter des solutions et de faire des propositions concernant la création de ce cahier des charges, le Comité technique a proposé la constitution d'un groupe de travail : 4 CRPV (Brest, Limoges, Marseille, Clermont-Ferrand et Reims) se sont proposés afin d'y participer. La première réunion de travail est prévue fin juin 2005.

Annexe 3-68

VIII - QUESTIONS DIVERSES

13ème cas de nouveau variant de la maladie de Creutzfeldt-Jakob en France

12 cas certains* ou probables* identifiés en France, dont 9 décédés.

Ces 9 décès présentent les caractéristiques suivantes :

- décédés en 1996 (1 cas), 2000 (1 cas), 2001 (1 cas), 2002 (3 cas), 2004 (2 cas) et 2005 (1 cas.
- 5 hommes et 4 femmes
- médiane des âges lors de leur décès est de 36 ans (entre 20 et 58 ans),
- 4 cas franciliens et 5 cas provinciaux,
- tous homozygotes Met-Met pour le codon 129 du gène de la protéine prion (PRP) et ne présentent aucun facteur de risque identifié pour les autres formes reconnues de MCJ.

Le 31 mai, un 13ème cas probable* de nvMCJ est notifié en France. Il est caractérisé par :

- Patient de 47 ans, vivant
- IRM évocatrice d'un nvMCJ
- EEG non caractéristique
- Ponction lombaire normale, recherche de la protéine 14-3-3 dans le LCR et examen génétique de la PRP en cours
- 17 dons connus pour ce patient effectués en Rhône Alpes entre 1991 et 2004 (17 CGR et 17 plasma).

Un rappel des lots en cours de validité a été effectué le 9 juin 2005. Un message destiné au professionnel de santé est en ligne sur le site de l'Afssaps avec la liste des lots retirés.

(*) Critères d'imputabilité :

- **vMCJ possible** : patient présentant un trouble neuropsychiatrique progressif pendant plus de 6 mois, sans examen de routine en faveur d'un autre diagnostic, sans argument pour une exposition à une source iatrogène potentielle ni pour une forme familiale de MCJ, avec au moins 4 des 5 signes suivants : symptômes psychiatriques précoces, symptômes sensitifs douloureux persistants, ataxie, myoclonies ou chorée ou dystonie, démence et absence d'un EEG typique de MCJ sporadique.
- **vMCJ probable** : vMCJ possible avec soit un "signe du pulvinar*" bilatéral sur l'IRM soit une biopsie d'amygdales positive (présence de PrPres en immunohistochomie et Western blot).
- **vMCJ certaine** : présence de lésions caractéristiques du vMCJ à l'examen neuropathologique cérébral et présence dans le tissu cérébral de protéine prion de type 4 (Western blot).

CENTRE REGIONAL DE PHARMACOVIGILANCE
BESANCON
CHU Saint-Jacques – 25030 BESANCON Cedex

MEDIATOR® (benfluorex)

ENQUETE OFFICIELLE

Troubles neuropsychiatriques

Hypertensions artérielles pulmonaires

Comité Technique du 7 juin 2005

Confidentiel

Lors du Comité Technique de Pharmacovigilance du 7 décembre 2004, plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique ayant été rapportés, il a été décidé d'actualiser les données relatives aux troubles neuro-psychiatriques avec MEDIATOR®.

Suite à une notification d'hypertension pulmonaire rapportée lors du Comité Technique du 8 mars 2005, l'enquête a été étendue aux hypertensions artérielles pulmonaires.

Le MEDIATOR® (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité Technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène. (Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Historique :
Une première mise au point des effets indésirables du benfluorex a été présentée lors du Comité Technique du 11 juillet 1995, suivie d'une enquête officieuse dont les rapports ont été présentés aux Comités Techniques:

- du 30 avril 1998 sur les effets indésirables du benfluorex, rapportés aux CRPV
- du 10 septembre 1998 sur le métabolisme et les chiffres de ventes du benfluorex

et de l'enquête officielle présentée aux Comités Techniques des 17 décembre 1998 et 20 juillet 1999.

Le Résumé des Caractéristiques du Produit a été modifié suite à une Demande de Modification de l'Information Médicale expertisée par le CRPV de Besançon en juin 2000 d'une part, et une réunion de Pharmacovigilance à l'EMEA le 30 novembre 2000 d'autre part (pour choc et effets hépatiques).
(Les modifications sont inscrites en gras dans le paragraphe ci-dessous)

Les effets indésirables sont :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, **confusion**, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles
- **très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke**
- **élévation des enzymes hépatiques, hépatite (très rare)**

Métabolisme :

- In vivo : Chez l'homme, le MEDIATOR® est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases en S422 (dérivé alcool), puis transformé en 8 métabolites majeurs identifiés dont, par oxydation (S1475, dérivé acide) ou désalkylation (S585, norfenfluramine).
  Le métabolite majoritaire est le dérivé carboxylique : S1475.
  Le métabolite primaire S422 et la norfenfluramine sont retrouvés à des taux très inférieurs.

Après administration de benfluorex radioactif, on retrouve 87 à 99% de la radioactivité après 72 heures dans les urines.
L'absence de quantité significative dans les fécès montre que le produit est bien absorbé.
Il n'existe donc pas de phénomène d'accumulation.

L'élimination se fait en 2 phases :
- une première phase rapide (60% en 3 ou 4 heures)

- une seconde phase lente de 96 heures environ

- *In vitro* : Les travaux faits *in vitro* après incubation d'hépatocytes frais humains montrent que les principaux cytochromes P450 jouent un rôle très minoritaire dans le métabolisme du benfluorex.

Annexe 3-68

I – TROUBLES NEUROPSYCHIATRIQUES

A. Asthénie, somnolence ou états vertigineux sont mentionnés dans les RCP.

B. Troubles psychiatriques lors du traitement

35 cas ont été rapportés dont 10 déclarés depuis l'enquête présentée en juillet 1999.
Elles concernent 18 hommes (âge moyen : 58,5 ans) et 17 femmes (âge moyen : 60 ans).

Les troubles psychiatriques sont divers :

- agressivité (4), nervosité (3), irritabilité
- cauchemars (2), angoisse, stupeur, dépression
- désorientation (7), confusion (5), aggravation des troubles cognitifs
- agitation (3), trouble du comportement (3)
- délire (2), bouffée délirante aiguë

La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue, dans la plupart des notifications.

1. Imputabilité :

Remarque : Les nouveaux cas (9) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras**.

4 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise de 1 comprimé de MEDIATOR®

- S10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 jours. Une réadministrationn ultérieure a été positive (traitement associé : KERLONE® et MOGADON®)

- **CN0000093** : désorientation temporo-spatiale et agitation chez un homme de 76 ans. Le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR® et la réadministration est positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P®. et FOZIRETIC®).

- **128E22** : chez un homme de 72 ans , traité pour démence, prenant pendant plusieurs années MEDIATOR® pour troubles métaboliques et MODOPAR® pour maladie de Parkinson, est observée une amélioration de ses troubles cognitifs lors d'un arrêt fortuit du MEDIATOR® et une aggravation lors de la reprise du MEDIATOR®.

5 cas sont imputés « plausible »

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR®, pendant 6 jours. Disparition des symptômes 12 heures après l'arrêt du MEDIATOR®.

- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.

- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2 heures après avoir ingéré 4 comprimés de MEDIATOR®.

- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.

- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR®, HALDOL®, SERESTA®, ZESTRIL®, CATAPRESSAN®, PRAXILENE®, SERMION®. L'évolution est favorable à l'arrêt de tous les médicaments.

26 cas ont été imputés « douteux » dont 13 (C2, S1).

Annexe 3-68

Les effets indésirables ont nécessité une hospitalisation dans 9 cas

SE9500017 : Un **état confusionnel** ayant duré 12 h est survenu, chez une femme de 41 ans après 83 jours de traitement par MEDIATOR® (1cp/j) et INCITAL® et 2 ans par LEXOMIL®. Elle avait été retrouvée errante sur la voie publique après une dispute avec son mari. (Imputabilité : C1,S1)

010326 : Un homme de 61 ans, traité par MEDIATOR® (dose et durée inconnues), FONZYLANE® et SINTROM® est hospitalisé pour déshydratation avec fièvre et **confusion**. L'évolution est favorable après rehydratation et arrêt du MEDIATOR®.

120M85 : Un homme de 69 ans, traité par MEDIATOR®, 2 cp/j pendant 11 jours pour désordre métabolique est admis à l'hôpital pour malaises avec **confusion** et amnésie. Le MEDIATOR® est arrêté, mais les troubles de mémoire continuent. Le scanner cérébral montre une atrophie cortico-souscorticale.
Le traitement associé est PREVISCAN® et CORDARONE®.

10345 : Une femme de 80 ans, avec des séquelles d'accident vasculaire cérébral, traité pur hypercholestérolémie par MEDIATOR® 3cp/j pendant 13 jours est hospitalisée pour **désorientation temporo-spatiale et obnubilation** avec hypotension artérielle. L'évolution est favorable à l'arrêt du MEDIATOR®. Le rechallenge est positif.
Le traitement associé est: KERLONE®, MOGADON®.

RE037148 : Une patiente de 66 ans, obèse et grabataire, est amenée à l'hopital en raison de l'apparition d'un syndrome confusionnel avec état stuporeux et une hyperthermie à 40°. Ses antécédents sont assez chargés avec entre autres, un état dépressif, un asthme et une cardiopathie hypertensive. Le traitement par MEDIATOR® (3cp/j) avait débuté 10 à 12 jours avant son hospitalisation à raison de 3 cp/j. Après l'arrêt du MEDIATOR®, on note une amélioration en quelques jours de la **désorientation temporo-spatiale**. Le traitement habituel de la patiente est : ASPEGIC®, COAPROVEL®, CORVASAL®, DIFFU K®, MONOTILDIEM®, MOVICOL®, SEROPRAM®, TRINIPATCH®, MEDIATENSYL®, VASTEN®, SERETIDE® et VENTOLINE®. (Imputabilité : C2,S1)

CN0000093 : Chez un homme de 76 ans, traité depuis 2 ans par 3cp/j de MEDIATOR®, est apparu une **désorientation temporo-spatiale** et agitation, dont le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR et la réadministration a été positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P. ® et FOZIRETIC®) *(dossier imputé «C3,S1 » décrit ci-dessus).*

RN9500096 : Une patiente de 59 ans, sans antécédent psychiatrique, en cure d'amaigrissement (perte de 10 kg) depuis 3 mois avec MEDIATOR® (3cp depuis 73j), LIPANTHYL®, AMFEPRAMONE®, Craetegus 100mg, PILOSURYL®, CANOL®, STRESAM®, OLIVIASE®, RELVENE® et TOP MAG® est hospitalisée pour **bouffée délirante aiguë** avec confusion, désorientation temporo-spatiale et agitation. L'évolution est favorable 8 jours après l'arrêt de tout le traitement et la mise sous neuroleptiques. (Imputabilité : C1,S2)

TO041306 : Une **bouffée délirante aiguë** à thème de persécution et de complot avec agitation extrême et opposition des soins a nécessité une hospitalisation sous contrainte chez un homme de 50 ans qui était traité par MEDIATOR® (1cp/j) depuis 29 mois, associé à COTAREG® et ZYLORIC®. Les troubles ont disparu en 24 h sous SOLIAN IM®, TERCIAN IM® ET RIVOTRIL®. Le patient est sorti de l'hôpital avec SOLIAN® 400mg 2 fois par jour. (Imputabilité : C1,S2)

S01000031 : Un homme de 63 ans a été hospitalisé à plusieurs reprises pour confusion mentale inexpliquée. Une recherche des médicaments sur l'urine par technique de polarisation de fluorescence révèle une réponse positive pour les

dérivés amphétaminiques et une chromatographie gazeuse couplée à une spectrométrie de masse ne confirmant pas l'abus d'amphétaminiques (Jordan, Pennsy).

Cependant, la norfenfluramine est retrouvée à des concentrations de 587 ng/ml dans l'urine et 3,4 ng/mg dans les cheveux.

La présence de norfenfluramine et l'absence de fenfluramine sont en faveur d'un abus illicite de MEDIATOR® (dose inconnue). L'évolution est inconnue. (Imputabilité : C1,S1)

(Cas publié :Norfenfluramine : usage thérapeutique ou toxicomanie ? V.CIRIMELE et coll. Journal de Médecine Légale Droit Médical, 2001, Vol.44, N°1, 23-26.

3. Tableau récapitulatif des observations : (voir pages suivantes)

Les nouveaux cas (9) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras**.

Annexe 3-68

3. Troubles psychiatriques apparaissant lors du sevrage

10 notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés, 6 par les CRPV, 4 par le laboratoire.

Ils concernent 2 hommes et 8 femmes, dont la moyenne d'âge est respectivement 30,5 ans (27-34) et 45,25 ans (30-65).

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 à 15 mois).

La durée de traitement par MEDIATOR® est de 1 mois à 8 ans.

Dans les 3 observations qui ont nécessité une hospitalisation (gravité = O), il existe un terrain ou des antécédents prédisposants :

- **LY0200303** : une femme de 36 ans, traitée par MEDIATOR® pendant 6 mois pour obésité avec hypercholestérolémie et PROZAC pendant 6 semaines pour syndrome dépressif est hospitalisée en psychiatrie pour **état anxiodépressif aigu** avec crise de panique 2 à 3 semaines après l'arrêt des 2 médicaments.
L'état de la patiente s'améliore rapidement sous SOLIAN® et STABLON®. (Imputabilité : C1,S1)

- **LY0200036** : chez une femme de 34 ans, avec des troubles dysthymiques, suivie pour difficultés psychologiques de type border line, en rupture de traitement neuroleptique depuis plusieurs mois, apparaît une **décompensation avec délire persécutif et anxiété**, environ 3 semaines après un traitement de 4 mois par MEDIATOR®.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

- **LY0200037** : une femme de 53 ans, diabétique non insulino-dépendante, ayant fait 2 épisodes maniaques en 1985 et 1996 (ce deuxième épisode étant survenu à la suite d'un régime amaigrissant accompagné peut-être au benfluorex) est hospitalisée pour **accès maniaque atypique** environ 3 semaines après l'arrêt d'un traitement de 15 mois par MEDIATOR®. Il est a noté un amaigrissement de 20 kg en 1 an.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

Les autres troubles sont identiques à ceux décrits pendant le traitement par MEDIATOR® :

- vertige (4), somnolence (2)
- cauchemar, angoisse (2)

Dans 1 cas, l'imputabilité de MEDIATOR® est « vraisemblable » :

- PA97355052 : il s'agit d'un syndrome de sevrage avec **excitation** chez un homme de 27 ans, sportif, qui consomme (sur prescription médicale) à doses croissantes (1cp/semaine au début jusqu'à 9 cp/j) du MEDIATOR® comme "dopant ».
Ce patient avait eu un épisode similaire quelques mois plus tôt. (Imputabilité : C3,S1)

Troubles psychiatriques apparaissant lors du sevrage

Les nouveaux cas (8) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras.**

N°	S/Age	Durée TTT	Poso/j	Imput. MEDIATOR	TTT associé/ imputabilité	Antécédents Terrain	Evol.	Gravité	Effets indésirables	sevrage

Annexe 3-68

Les nouveaux cas (4) notifiés depuis le rapport de juillet 1999 sont inscrits en gras.

12 notifications ont été rapportées, 9 par les CRPV, 3 par le laboratoire :
Elles concernent 8 hommes et 4 femmes :

- Convulsions : 2 cas

PA9223988 : Chez un homme de 60 ans, survient une **crise convulsive généralisée**, alors qu'il est traité par MEDIATOR 1cp/j (durée inconnue), TENSIONORME® depuis 10 ans et DIFFU K®. L'évolution est favorable à l'arrêt des 3 médicaments.

10060J47 : Une femme de 36 ans traitée par MEDIATOR® depuis 2 mois et DAONIL®, fait une **crise comitiale**, dont l'évolution est favorable.

- Neuropathies : 2 cas

MA8700716 : Chez un homme de 73 ans traité pour un diabète léger par MEDIATOR® pendant 9 ans apparaît une **neuropathie sensitivomotrice** des membres inférieurs. Une autre étiologie peut être envisagée. L'évolution est inconnue.

TS9300183 : Une **neuropathie** est rapportée chez un homme de 68 ans traité depuis 3 mois par MEDIATOR® et GLUCOPHAGE®, et 5 mois par AZANTAC®. Le traitement habituel est DIAMICRON®, SURBRONC® et CYCLOSPASMOL®.

- Paresthésies : 7 cas

Dans 3 cas (**PA0200221,** NC9300349, **MA03P0355**), il existe des symptômes associés cités ci-dessus : agitation, dépression, vertige et asthénie.

Le délai d'apparition est très court : de 1 à 8 jours dans la majorité des cas. Dans 1 cas, où la neuropathie est associée à une dépression et asthénie le délai est de 9 mois (NC9300349).

L'évolution, quand elle est connue, est favorable rapidement en quelques heures.

A noter que dans 2 cas, il s'agit de mésusage :

- **MA03P0355 :** prise de 6 comprimés en 1 fois, par une femme de 26 ans, qui a présenté des douleurs abdominales, des vertiges, une asthénie et des paresthésies au niveau des membres inférieurs.
- MA9700170 : automédication chez une femme de 42 ans, qui après le deuxième comprimé de MEDIATOR est survenue une sensation de chaleur accompagnée de picotements des extrémités et des palpitations. L'évolution est inconnue.

- Tremblements des mains

128F60 : un patient de 72 ans ayant débuté depuis 5 jours un traitement par MEDIATOR®, LIPANTHYL®, MONO-TILDIEM® et HYPERIUM® développe un **tremblement des mains.**
HYPERIUM® est remplacé par diltiazem puis trandolapril, LIPANTHYL® remplacé par atorvastatine et les doses de MEDIATOR® de 300 mg/j sont diminuées de moitié. Les tremblements régressent.
Le MEDIATOR® est arrêté ensuite.

Annexe 3-68

2 cas d'abus ont été rapporté :

- 1 cas rapporté par le laboratoire sans effet indésirable :

  Un homme de 42 ans, traité par MEDIATOR® 150 mg 2 fois par jour pour hypertriglycéridémie depuis décembre 1999, augmente les doses à 10 comprimés par jour de janvier à novembre 2001, puis retourne à une dose normale à 2 comprimés par jour ensuite.
  Le traitement associé était TERCIAN® et LEPTICUR®.
  Aucun effet indésirable n'est rapporté.

- 1 cas rapporté par un CRPV avec effet indésirable : (déjà cité page 7, paragraphe sevrage)

  - PA97355052 : il s'agit d'un syndrome de sevrage avec **excitation** chez un homme de 27 ans, sportif, qui consomme (sur prescription médicale) à doses croissantes (1cp/semaine au début jusqu'à 9 cp/j) du MEDIATOR® comme "dopant ».
  Ce patient avait eu un épisode similaire quelques mois plus tôt. (Imputabilité : C3,S1)

II – HYPERTENSIONS PULMONAIRES :

Suite à une notification d'hypertension artérielle pulmonaire (HTAP) rapportée par le CRPV de Montpellier lors du Comité Technique du 8 mars 2005 (MP0300189), l'enquête sur MEDIATOR® a été étendue aux hypertensions artérielles pulmonaires.

16 notifications (5 CRPV et 11 laboratoire) dont 1 doublon ont été rapportées :

1. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«hypertension artérielle pulmonaire » avaient été rapportées.
9 d'entre elles, expertisées par le Professeur WEITZENBLUM (Strasbourg) faisaient partie de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » présentée au Comité technique du 28 avril 1995 :

- 6 ont été classées en HTAP d'allure primitive
- 2 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR n'était jamais prescrit seul : il était présent en association à un ou plusieurs anorexigènes :

- ISOMERIDE® : 7 fois
- ISOMERIDE® + PONDERAL® : 2 fois
- ISOMERIDE ®+ FENPROPOREX® : 1 fois
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois

La durée de traitement par MEDIATOR® est précisée dans 7 cas sur 11 : elle est de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® est :

- concomitante dans 5 cas,
- antérieure dans 2 cas,
- postérieure dans 3 cas
- imprécise dans 1 cas.

840255 : Une femme, 57 ans, obèse depuis longtemps, ayant pris PONDERAL pendant 2 mois en 1978 et ISOMERIDE en 1986 (durée inconnue) est hospitalisée en janvier 1993 pour suspicion d'embolie pulmonaire. La scintigraphie pulmonaire est normale.
Le traitement habituel est VOLTARENE, FELDENE et DOLIPRANE pour lombalgies.

[illegible] d'insuffisance tricuspidienne. Des signes d'hypertrophie ventriculaire droite sont retrouvées à l'électrocardiogramme
La dyspnée s'aggravant progressivement, la patiente est hospitalisée en novembre 1993.
A noter que la patiente aurait pris MEDIATOR , VEINOBIASE, STILNOX et XANAX au cours du mois de septembre.
A l'échodoppler cardiaque, la PAP systolique est estimée à 73 mmHg.
Le cathétérisme cardiaque confirme l'HTAP précapillaire.
En février , l'échodoppler montre une aggravation de la PAPs à 95 mmHg, mais létat clinique de la patiente est légèrement amélioré début juin 1994..

840663 : Chez un homme de 48 ans, dont les antécédents sont une hypertension artérielle traitée par FLUDEX, des glycémies, cholestérolémie et uricémie aux limites supérieures de la normale, un syndrome restrictif post-traumatique, un tabagisme interrompu depuis 1987 et une obésité traitée par ISOMERIDE de septembre 1990 à avril 1991 est hospitalisé en février 1992 pour syndrome obstructif post-tabagique sévère et aggravation du syndrome restrictif. Une dyspnée d'effort est cotée stade 3-4.
Le traitement de sortie est : MEDIATOR, VECTARION, BRONCHODUAL et BRONILIDE. FLUDEX est remplacé par ECAZIDE puis LUMITENS.
Après une amélioration, la dyspnée s'est aggravée et le patient est hospitalisé à nouveau en mai 1993 pour bilan de l'hypoxémie.
A l'échocardiographie, les cavités droites sont très dilatées, comprimant les cavités gauches. La PAPs est estimée à 50 mmHg.
Le cathétérisme droit effectué en juin 1993 pose le diagnostic d'HTAP précapillaire avec une PAP systolique à 90 mmHg.
Le patient décède 24 mois plus tard.

840B19 : Une femme de 51 ans, ayant une HTA, une obésité après une première grossesse en 1966, traitée par PONDINIL en 1974 puis par ISOMERIDE de 1985 à 1989 (2 fois 3 mois), une hyperlipidémie traitée par MEDIATOR de 1989 à janvier 1995, est hospitalisée en août 1994 pour bilan d'un syndrome sec.
Une échocardiographie met en évidence une double atteinte aortique et mitrale et une HTAP. Le traitement antérieur comporte : LIPUR, SECTRAL, DEBRIDAT, PRAGMAREL, ENDOTELON.
En décembre 1994, lors d'une échocardiographie de contrôle, la PAPs est estimée à 60-65 mmHg.
Le traitement de la patiente est alors : SECTRAL, MODURETIC, KALEORID, RANIPLEX, PREPULSID.
En janvier 1995, l'état de la patiente est stable avec une PAPs évaluée à 55 mmHg.

2. Notifications où MEDIATOR® n'est pas associé à un anorexigène : 5 notifications

4 dossiers ont été expertisés par le Professeur WEITZENBLUM, le 5° étant trop succinct.

➢ PS9900385 :
Chez une femme de 50 ans, ayant comme antécédent une hypertension artérielle traitée par LOGIRENE®, 0,5 cp/j et TRIATEC® 2,5 cp/j et une hypercholestérolémie traitée par LIPANTHYL® 1 cp/j et MEDIATOR®, 1 cp/j, est découvert une hypertension artérielle pulmonaire.
Le début des symptômes remontent à décembre 1998 avec l'installation d'une dyspnée d'effort, qui s'est majorée après un an d'évolution.
Lors d'un bilan en mai 1999, la pression artérielle pulmonaire systolique (PAPs) est estimée à 91 mmHg à l'échographie cardiaque.
Un bilan en juin 1999 confirme une hypertension artérielle pulmonaire avec une coronarographie, une angiographie et une scintigraphie pulmonaire normales.
Au cathétérisme droit, la pression artérielle pulmonaire moyenne (PAPm) est à 51 mmHg.
Un traitement par FLOLAN® est instauré (21 juin 1999).

Un bilan réalisé à trois mois montre une réelle amélioration et la patiente reste stable cliniquement jusqu'en septembre 2001 où elle constate une réaggravation de la dyspnée d'effort mais la PAPm est alors stable à 55mmHG.

➢ **TO040278 :**

Annexe 3-68

Une femme de 36 ans traitée pendant 2 ans par MEDIATOR®, Depa, LEVOTHYROX®, ADIPOR Fort®, PRAXINOR®, PROZAC®, HEPTAMYL® et CANOL® est hospitalisée le 25 novembre 2003 suite à une détresse respiratoire aiguë. Le diagnostic est un syndrome alvéolo-interstitiel bilatéral. Il n'y a pas de syndrome inflammatoire.
Les antécédents sont une hypothyroidie, un tabagisme, un surpoids et une insuffisance aortique de grade 2 découverte un an auparavant.
L'échographie montre une fonction systolique ventriculaire gauche à 65%, avec un ventricule gauche dilaté, une insuffisance mitrale de grade 2 et une insuffisance aortique de grade 2.
Le doppler veineux ne montre pas de thrombose veineuse des membres inférieurs.
L'état de la patiente s'améliore sous ALDACTONE®, LASILIX® et RENITEC®. Le traitement associé est LEVOTHYROX®, PROZAC® et CANOL®.
Une échographie de contrôle réalisée après normalisation clinique et radiologique montre une oreillette gauche dilaté, des cavités droites non dilatées sans HTAP.
Conclusion du cardiologue: *« décompensation cardiaque associée à une probable infection virale broncho-pulmonaire ».*

Le 5 janvier, la patiente est hospitalisée à nouveau pour récidive d'un subOAP sur valvulopathies aortique et mitrale à la faveur d'une virose.
La valvulopathie est recontrôlée par échographie par voie transthoracique : il existe alors une élévation des pressions artérielles pulmonaires avec une PAPs estimée à 50mmHg (N :15 mmHg), le ventricule et l'oreillette gauches sont dilatées.
Le 23 janvier 2004, le remplacement des valves est effectué. On ne note aucun problème dans les suites de l'opération.
L'anatomopathologie des valves montre une lésion dégénérative aspécifique.

Le diagnostic différentiel élimine :
- une maladie rhumatismale : l'aspect échographique n'est pas en faveur ? ? ?
- une endocardite : la recherche est négative
- une maladie auto-immune : les autoanticorps et la recherche des phospholipides sont négatifs

Il est à noter que la soeur de la patiente est suivie pour valvulopathie.
Le traitement de sortie est PREVISCAN®, RENITEC®, PROZAC®, LEVOTHYROX®.

L'avis de l'expert est : *« cardiopathie valvulaire sévère, l'OAP ayant entrainé une HTAP post-capillaire. »*

➢ **MP0500189** :

Une femme de 55 ans, traitée par MEDIATOR®, 1cp/j, depuis 31 mois est hospitalisée en janvier 2005 pour suspicion d'embolie pulmonaire avec dyspnée d'effort importante, progressivement croissante depuis plusieurs mois.
A l'échographie cardiaque, une hypertension pulmonaire oscille entre 75 et 80 mmHg
L'angioscanner thoracique ne met pas en évidence de signe d'embolie pulmonaire, mais il semble exister un caillot dans l'artère sous segmentaire gauche.
Les D Dimères sont élevés à 12000.
La scintigraphie pulmonaire de ventilation perfusion montre des troubles perfusionnels avec vraisemblablement un petit épanchement pleural gauche, faisant suspecter des épisodes emboliques multiples partiellement reperfusés
Conclusion du cardiologue : *« possible embolie pulmonaire compliquée d'HTA pulmonaire importante avec à la scintigraphie des défects périphériques disséminés. Il s'agit possiblement de micro-embols d'installation progressive mais on ne peut exclure formellement une HTAP primitive de type veino-occlusif. »*

Dans les antécédents de la patiente, on note une embolie pulmonaire en 1981, suite à un accident de la voie publique, compliquée d'une phlébite, traitée par antivitamines K pendant un an, une HTA ancienne traitée par COTAREG et un tabagisme modéré.
Le 31 janvier, l'échographie cardiaque de contrôle met en évidence une diminution de la PAPs à 65 mmHg, le ventricule droit est dilaté, l'insuffisance tricuspide est relativement importante.

Le 1 février 2005, la patiente est sortie avec une HTAP à 65 mmHg, le traitement de sortie étant PREVISCAN® (en prévention d'une embolie pulmonaire), COTAREG® et MOPRAL®.
Le 22 février 2005, elle est hospitalisée à nouveau avec altération de l'état général, des douleurs thoraciques, des vomissements et une dyspnée.

La patiente [illegible] la nuit suivante à 6/5.
La patiente fait une asystolie et décède le lendemain par arrêt cardiocirculatoire.

L'avis de l'expert pneumologue : *« vraisemblable HTAP post-embolique »*

➢ **S02001877** :
Une patiente de 55 ans est traitée pendant un an (juillet 2001-septembre 2002) par MEDIATOR pour un diabète non insulino-dépendant et une dyslipidémie, associé à ALDACTONE®, LASILIX® et TERALITHE®.
En juin 2002, un cathétérisme cardiaque droit montre une hypertension précapillaire avec une PAP à 51 mmHg. L'échographie montre des cavités droites dilatées.
L'échodoppler des membres inférieurs et la scintigraphie pulmonaire sont normaux.

En octobre 2002, la patiente est hospitalisée avec une dyspnée de grade 3. Au cathétérisme cardiaque droit, la PAPm est à 40 mmHg.
Les différents traitements pris par la patiente sont :
PREVISCAN®, LESCOL®, AMAREL®, STABLON®, ATARAX®, TEMESTA®, LIPANTHYL®, LIPUR®, TOCO®, GLUCOPHAGE®.
L'évolution est inconnue.

➢ **S02001046** :
Une femme de 59 ans traitée par MEDIATOR® 450 mg/j pour un désordre métabolique lipidique depuis novembre 1992 associé à de nombreux médicaments est hospitalisée en mars ou avril 2002 pour dyspnée et malaise.
Une hypertension pulmonaire est diagnostiquée. Le MEDIATOR® est alors arrêté.
Les différents traitements associés sont : CAPTEA®, LOPRIL®, PROGYNOVA®, UTROGESTAN®, HUMORYL® et PRAXINOR®
L'évolution est inconnue et le dossier succinct.

3. Fréquence :

Depuis le début de la commercialisation de MEDIATOR®, le nombre de boites de 30 comprimés vendues est de : 110 693 331, correspondant à 45 515 349 mois de traitement*.

Après élimination des HTAP post-emboliques (2) et post-capillaires (3), il reste 11 cas HTAP idiopathique soit :
- 1 cas pour 10 063 030 boites vendues
- ou 1 cas pour 4 137 759 mois de traitement.

(*mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (mois de 30,4 jours).

COXIBS : L'EMEA LÉNIFIANTE

L'Agence européenne du médicament (EMEA) avait annoncé un réexamen des données de l'ensemble des coxibs pour janvier 2005 ; les conclusions ont été finalement rendues publiques fin juin 2005 (1,2). Selon l'EMEA, « *la balance bénéfices-risques reste positive pour ces inhibiteurs de la Cox-2 quand ils sont prescrits en accord avec les contre-indications et précautions d'emploi* », sauf pour le *valdécoxib* (Bextra°, jamais commercialisé en France), qui n'est plus autorisé sur le marché (2).

Une nouvelle contre-indication en cas de maladie artérielle périphérique s'ajoute à la liste précédente : angor, infarctus du myocarde, insuffisance cardiaque, antécédent d'accident vasculaire cérébral ou d'accident ischémique transitoire.

Au 21 juillet 2005, l'EMEA n'a publié aucune synthèse résumant les données étayant sa position.

Ces demi-mesures confirment que, pour l'EMEA, l'intérêt des firmes passe avant l'intérêt des patients, qui restent exposés aux dangers de médicaments qui n'apportent aucun progrès thérapeutique (3).

GABAPENTINE : RISQUE SUICIDAIRE ?

En mai 2005, un réseau de pharmacovigilance allemand a mis en garde quant à l'apparition d'idées suicidaires sous *gabapentine* (Neurontin° ou autre) (1). Une observation d'épisodes répétitifs d'idées suicidaires de survenue brutale, pouvant durer 10 minutes, a été signalée à ce centre, chez une femme de 63 ans prenant de la *gabapentine* pour des douleurs neuropathiques (1). Ces symptômes ont duré pendant plus de 2 ans et demi avant que le rôle de la *gabapentine* soit évoqué.

Selon le résumé des caractéristiques (RCP) étatsunien, dans des essais cliniques comparatifs chez des enfants de 3 ans à 12 ans, la fréquence de la labilité émotionnelle a été 6 % sous *gabapentine* versus 1,3 % sous placebo, celle de l'hostilité 5,2 % versus 1,3 %, celles des "troubles de la pensée" 1,7 % versus aucun cas sous placebo (2).

Au cours des essais dans les névralgies postzostériennes, des pensées anormales ont été rapportées chez 2,7 % des patients sous *gabapentine* versus aucun sous placebo (2).

La Food and Drug Administration étatsunienne a reçu 17 notifications de décès par suicide sous *gabapentine*, entre janvier et juin 2003 (3).

En pratique, la surveillance des effets indésirables psychiques chez les patients sous *gabapentine* est souhaitable.

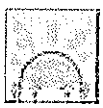
VÉRALIPRIDE : RETRAIT DU MARCHÉ EN ESPAGNE



Fin mai 2005, l'Agence espagnole du médicament a annoncé le retrait du marché du *véralipride* (Agréal°), qui a pris effet le 15 juin 2005 (1).

Le *véralipride* est en fait un neuroleptique (voisin du *sulpiride* (Dogmatil° ou autre)), commercialisé en France, comme il l'était en Espagne, pour le traitement symptomatique des bouffées de chaleur de la ménopause.

Des troubles psychiatriques, parfois graves, ont été notifiés en Espagne : dépression, anxiété, symptômes de sevrage. S'y ajoutent des troubles neurologiques : dyskinésies, troubles extrapyramidaux, syndromes parkinsoniens ; de tels effets indésirables ont aussi été observés en France, y compris des dyskinésies tardives (2).

La mise en évidence récente des effets indésirables, notamment cardiovasculaires et de cancer du sein, des traitements hormonaux substitutifs de la ménopause, ne doit pas être l'occasion d'utiliser des médicaments dont la balance bénéfices-risques est, elle aussi, défavorable.

1- Agencia española del medicamento "Suspensión de comercialización de veraliprida (Agreal°) (efectiva el 15 de junio 2005)" 20 mai 2005. Site internet http://www.agemed.es consulté le 30 juin 2005 (sortie papier disponible : 2 pages).

BENFLUOREX INTERDIT EN ESPAGNE

En juin 2005, l'Agence espagnole du médicament a annoncé une interdiction de préparations magistrales à base de divers produits amaigrissants, dont le *benfluorex* (Mediator°) (1).

Le *benfluorex* est commercialisé en France, comme traitement adjuvant des hypertriglycéridémies et du diabète avec surcharge pondérale, sans preuve d'efficacité clinique en terme de morbimortalité (2,3). C'est un dérivé de la *fenfluramine* (ex-Pondéral°) et de la *dexfenfluramine* (ex-Isoméride°), deux anorexigènes amphétaminiques retirés du marché du fait d'effets indésirables graves : hypertensions artérielles pulmonaires et valvulopathies cardiaques.

Une observation de valvulopathies multiples sous *benfluorex*, ayant conduit à la pose de prothèses mitrale et aortique chez une femme de 50 ans, a été publiée en Espagne en 2003 (1,2). Les lésions histologiques valvulaires étaient du même type que celles observées avec d'autres anorexigènes tels que la *fenfluramine* ou la *dexfenfluramine*. L'autorisation de mise sur le marché du *benfluorex* a été retirée en Espagne le 28 mars 2003.

Les autorités françaises seraient bien avisées de suivre l'exemple de l'Espagne.

Annexe 3-69

DIRECTION DE L'EVALUATION DES MÉDICAMENTS ET DES PRODUITS BIOLOGIQUES

Unité de Pharmacovigilance
Dossier suivi par Céline Dos Santos et Béatrice Porokhov

Saint-Denis, le 05 septembre 2005

Note pour Monsieur Jean MARIMBERT
Directeur Général de l'AFSSaPS

Objet : Eléments de réponse à l'article de PRESCRIRE concernant la spécialité MEDIATOR® (benfluorex)

MEDIATOR® (chlorhydrate de benfluorex), classe des amphétamines, a obtenu une AMM lors d'une procédure nationale en 1974, modifiée en 1987. Les indications acuelles sont :

- adjuvant du régime adapté dans les hypertriglycéridémies ;
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Ce médicament est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg.

En France, une mise au point des effets indésirables au Comité Technique du 11 juillet 1995 a conduit à une restriction de délivrance du produit classant le benfluorex comme une substance interdite dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes par crainte de mésusage.
Une présentation sur les données de cinétique et de ventes est faite au Comité Technique de Pharmacovigilance du 10 septembre 1998.
Une enquête officielle est mise en place lors du Comité Technique du 17 décembre 1998 et les résultats de celle-ci sont présentés en Comité Technique le 20 juillet 1999.
Cette enquête a entraîné des modifications de la rubrique « effets indésirables » du Résumé des Caractéristiques du Produit.

En décembre 2004 la notification de plusieurs cas d'effets indésirables pouvant évoquer un effet de type amphétaminique avec MEDIATOR®, a conduit à une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité pharmaceutique.
Par ailleurs, la notification d'un cas d'hypertension artérielle pulmonaire rapportée lors du Comité Technique du 8 mars 2005, a entraîné une extension de l'enquête aux hypertensions artérielles pulmonaires (HTAP).
Les résultats de l'actualisation de cette enquête officielle, présentés par le CRPV de Besançon en Comité Technique de Pharmacovigilance le 07 juin 2005 sont :
Neuf cas graves de troubles neuro-psychiatriques ont été rapportés pendant le traitement : confusion (4), désorientation temporo-spatiale (3), bouffées délirantes aiguës (2). Dix notifications de syndromes de sevrage ont été rapportées dont 3 graves ainsi que 2 cas d'abus, un sans effet indésirable et l'autre présentant un excitation lors du sevrage.

Onze cas d'hypertension artérielle pulmonaire ont été notifiés. Seuls deux cas ont été retenus comme étant d'allure primitive, non associés à la prise d'anorexigènes et/ou à des antécédents d'embolie pulmonaire ou de valvulopathie. Le taux de notification est donc très faible correspondant à 1 cas pour 55 346 666 boites vendues, soit 1 cas pour 22 757 675 mois de traitement.

En ce qui concerne le reste de l'Europe, MEDIATOR® est toujours commercialisé en Grèce, au Luxembourg et au Portugal.
En Italie, lors du programme de réévaluation des produits anciens en juillet 2003, la firme s'est retirée devant l'importance des données complémentaires requises.
En Espagne, le titulaire de l'AMM n'a pas demandé le renouvellement de l'AMM en 2003.

Les résultats de l'actualisation de cette enquête officielle seront présentés lors de la Commission Nationale de Pharmacovigilance de novembre 2005.

Prescrire EN QUESTIONS

L'Agence française des produits de santé est-elle avant tout au service des patients, ou au service des firmes pharmaceutiques ?

Le numéro de septembre de votre revue, et tout particulièrement l'éditorial intitulé « le mot de Gaspard » comporte un certain nombre d'affirmations et d'insinuations qui relèvent du procès d'intention et mettent gravement en cause tant la qualité du travail de l'Afssaps au service de la santé publique que l'honneur professionnel et les motivations de service public des agents et experts participant à l'évaluation des médicaments et à la prise de décision qui en découle.

La gravité de ces imputations développées selon des procédés qui ne sont pas à la hauteur d'un débat de santé publique comme des règles du débat scientifique, me conduit à exercer auprès de vous le droit de réponse en application de l'article 13 de la loi du 29 juillet 1881.

L'éditorial met en avant le cas de 4 produits ou groupes de produits dont au moins un, celui du Di-Antalvic®, n'est assorti d'aucune argumentation de fond faisant écho à celle que l'Agence a exprimée au soutien de sa position récente, et semble avoir été ajouté en « dernière minute », comme pour faire masse dans le tableau qu'entendait dresser le rédacteur.

Amalgame. *Par l'effet d'un amalgame, l'éditorial distille l'image d'une Agence dont les décisions seraient marquées ou tout le moins inhibées par le souci de ménager les ventes des laboratoires pharmaceutiques.*

Ne reculant devant aucun paradoxe pour nourrir cette vision, l'éditorial et l'article auquel il renvoie sur ce point vont jusqu'à présenter la décision de l'Agence sur l'arrêt de commercialisation des antibiotiques locaux par voie orale comme une illustration de sa pusillanimité et de sa complaisance supposées vis-à-vis des firmes concernées ! Comme le sens même de cette décision peut difficilement passer par une bonne manière faite aux firmes, le rédacteur croit pouvoir trouver des indices de la « faiblesse » de l'Agence dans la répartition entre les deux vagues de retrait de 2003 et 2005 et dans le délai d'instruction de cette décision par vague. Sur le premier point, l'Agence a explicitement formulé au moment de la première vague le critère de santé publique qui l'avait conduite à traiter en priorité le cas des produits susceptibles de présenter le plus de risques pour les patients parce que contenant des antibiotiques également administrés par voie générale, ce qui n'est pas le cas du Locabiotal® cité comme exemple par l'article. Quant au délai, les laboratoires pharmaceutiques peuvent, comme il se doit dans un État de droit, faire valoir leur point de vue en invoquant de nouveaux arguments et en produisant des études. En l'absence de risque immédiat pour la santé des patients, ces argumentations successives ont été examinées dans les règles du débat scientifique contradictoire par le groupe de travail compétent et la commission d'AMM. Cela n'a pas emporté la conviction de l'Agence ni entamé sa détermination de faire cesser la consommation de ces antibiotiques au nom d'un raisonnement de santé publique qui a d'ailleurs été salué par nombre de consommateurs impartiaux et peu suspects de complaisance chronique à l'égard des autorités sanitaires.

Di-Antalvic®. *S'agissant du Di-Antalvic®, l'Agence récuse tout automatisme selon lequel l'appréciation portée par une autre autorité nationale devrait la conduire à prendre une décision similaire sans évaluer sa pertinence dans le contexte sanitaire français. Et elle s'est expliquée clairement sur les raisons qui l'ont conduite à tenir ses propres conclusions sur la base des données relatives à l'utilisation de ces médicaments en France (cf. communiqué de presse du 28 juillet 2005 disponible sur le site internet de l'Agence).*

Agréal®. *S'agissant des deux produits retirés par l'Agence espagnole en 2003, je précise tout d'abord que pour la spécialité Agréal® (véralipride), l'Afssaps a lancé une enquête de pharmacovigilance en février 2005 et que la commission d'AMM a donné le 21 juillet dernier un avis favorable au maintien de l'AMM sous réserve d'une série de modifications du RCP (durée du traitement limitée à 3 mois, contre-indication de l'association aux neuroleptiques, antipsychotiques et anti-émétiques, mises en garde renforcées sur les risques de dyskinésies et de syndrome parkinsonien exigeant l'arrêt du traitement, mention de la possible survenue de troubles de l'humeur et d'anxiété, notamment entre deux cures ou à l'arrêt du traitement).*

Mediator®. *En ce qui concerne Mediator® (benfluorex), la notification en décembre 2004 de plusieurs cas d'effets indésirables pouvant évoquer un effet de type amphétaminique a conduit l'Agence à actualiser les données relatives aux troubles neuro-psychiatriques observés avec cette spécialité. Les résultats de l'enquête étendus dans l'intervalle aux hypertensions artérielles pulmonaires, ont été examinés par le Comité technique de pharmacovigilance en juin dernier et font ressortir des taux d'incidents notifiés très faibles, de l'ordre de 1 cas pour 55 millions de boîtes vendues en ce qui concerne les cas retenus d'hypertension artérielle pulmonaire. Ces résultats seront soumis en novembre prochain à la Commission nationale de pharmacovigilance.*

Coxibs. *Enfin, comment ne pas réagir à l'affirmation lapidaire selon laquelle l'Agence aurait « veillé à ne diffuser qu'au compte-gouttes » l'information sur les risques des coxibs. Le rédacteur semble ne pas avoir remarqué que c'est l'Afssaps qui a demandé à la mi-2002 une réévaluation à l'échelon européen. Il ne semble* ▷▷

pas non plus avoir gardé en mémoire les messages d'information et de mise en garde publiés par l'Agence entre juillet 2002 et aujourd'hui : pas moins d'une dizaine de communiqués, cinq lettres aux professionnels de santé et trois mises au point ou questions/réponses.

Secret. *Enfin, s'il est exact que la tradition pharmaceutique est fortement marquée par des préoccupations de secret et de confidentialité qui ont eu des répercussions sur le fonctionnement des agences compétentes dans le monde entier, l'Afssaps se prépare activement à la mise en oeuvre des nouvelles obligations de la Directive européenne de 2004. L'Afssaps avait en partie anticipé ces nouvelles obligations de transparence en commençant à publier des rapports publics d'évaluation, volontairement synthétiques pour être accessibles à un public éclairé mais pas nécessairement spécialiste.*

Ces obligations de transparence constitueront dans toute l'Europe un progrès. Elles ne changeront rien aux priorités de fond de l'Agence, exprimées notamment au travers de son projet d'établissement rendu public au printemps 2004, et sous-tendues par le souci d'assurer aux patients la satisfaction de leurs besoins thérapeutiques dans les meilleures conditions de sécurité. On trouve notamment parmi les axes de travail principaux le développement de l'effort déjà bien amorcé pour développer en continu l'information émanant de l'Afssaps sur les produits de santé, leurs effets et leur bon usage.

Ainsi, l'Agence travaille « au grand jour » au service de la santé publique et des patients. Elle ne se considère pas pour autant comme seule détentrice et émettrice d'une information pertinente sur le médicament, dont l'évaluation est par nature un processus évolutif, qui appelle pluralisme de l'expertise et contradiction. C'est dans cet esprit que beaucoup de ses agents et responsables savent être attentifs aux analyses d'une revue comme Prescrire. Ils pourront le rester pour peu qu'ils y trouvent en retour l'écho d'une décision prise sur la base d'un travail scientifique de qualité, et en tout cas qu'ils y lisent autre chose qu'une mise en cause systématique de leur volonté de servir la cause des patients et de la santé publique.

Jean Marimbert
Directeur général de l'Agence française de sécurité sanitaire des produits de santé

« *L'Afssaps au service de la santé publique* », « *les motivations de service public des agents et experts participant à l'évaluation des médicaments et à la prise de décision qui en découle* » : c'est bien là en effet que les résultats de l'action de l'Agence sont attendus par les citoyens, les patients, et les professionnels de santé.

Dextropropoxyphène + paracétamol. Des données d'évaluation ont été rappelées par la *revue Prescrire* : l'association *dextropropoxyphène + paracétamol* est illogique du point de vue pharmacologique (du fait de la grande différence de demi-vie d'élimination plasmatique entre les deux composants) ; l'évaluation clinique comparative n'a pas démontré de supériorité de l'association sur le *paracétamol* seul ; au Royaume-Uni, des centaines de morts chaque année par intoxication sont recensées (la toxicité du *dextropropoxyphène* s'ajoutant à celle du *paracétamol*), dont 20 % n'ont pas lieu dans un contexte d'intoxication volontaire, et ce malgré la limitation des conditionnements à 20 unités de prise, comme en France ; le constat est de même nature en Suède, des restrictions de conditions de prescription n'ont pas réglé le problème, et le retrait du marché est programmé là aussi ; discrètement mais efficacement, les autorités suisses ont retiré l'association en 2003 (1à5).

En somme, voilà un médicament pas plus efficace que le *paracétamol* mais plus dangereux : la balance bénéfices-risques est défavorable, sans ambiguïté.

Dans ces conditions, les données cliniques françaises devraient être fort probantes pour faire pencher la balance dans l'autre sens. Quelles sont-elles ? Au 30 septembre 2005, l'étude effectuée à partir des données des Centres antipoison mise en avant par le Directeur général de l'Afssaps n'est toujours pas publiée en détail. On ne sait pas combien de décès ont été étudiés en l'absence de contexte évident d'intoxication, en particulier chez les personnes âgées, qui sont nombreuses à être amenées à prendre cet antalgique banal, et sont aussi parmi les plus à risque de surdosage involontaire (par ralentissement de l'élimination du médicament). Combien de décès de patients âgés traités par *dextropropoxyphène* ont paru de cause « *naturelle* » ou ont été imputés à une affection cardiaque, sans que soit effectué un dosage sanguin de *dextropropoxyphène* ?

Surtout, quand bien même le résultat de cette étude serait exempt de toute sous-estimation, comment justifier ces 7 morts par an pour un médicament qui n'a pas d'avantage démontré sur l'antalgique de premier choix, le *paracétamol* ?

Où est le service public rendu quand les autorités laissent la population exposée aux risques avérés d'un médicament qui n'apporte aucun progrès thérapeutique ?

Véralipride. Au sujet de l'efficacité de ce neuroleptique en traitement des bouffées de chaleur de la ménopause, le résumé des caractéristiques (RCP) version dictionnaire Vidal 2005 reste laconique, faisant allusion à des propriétés in vitro, sans aucune donnée clinique (6). Le Martindale, ouvrage de référence en pharmacologie clinique, constate que le *véralipride* a été « *essayé* », sans mentionner de résultat probant (7). Le RCP version dictionnaire Vidal 1983 indique déjà que les effets indésirables sont « *ceux d'un neuroleptique* » (8). Le risque de troubles assez intenses pour motiver une dopathérapie au long cours est établi aussi (9). Les données et la décision espagnoles confirment que la balance bénéfices-risques du *véralipride* dans cette situation est suffisamment défavorable pour justifier le retrait du marché (10).

Dans ces conditions, quels résultats d'enquête de pharmacovigilance pourraient faire pencher la balance dans l'autre sens ? Quels changements du RCP pourraient supprimer tout risque de syndrome extrapyramidal, mentionné clairement par le RCP depuis plus de 20 ans ?

Où est le service public rendu quand les autorités laissent la population exposée aux risques avérés d'un médicament qui n'apporte aucun progrès thérapeutique ?

Benfluorex. Le *benfluorex* est un anorexigène amphétaminique (11). Il a été mis sur le marché français en 1976, « *proposé dans les hypercholestérolémies et hypertriglycéridémies* » et « *le diabète asymptomatique* », « *proposé dans* » signifiant que « *les indications thérapeutiques n'ont pu être mises en évidence par des essais cli-*

niques » (12). Près de 30 ans plus tard, son RCP version dictionnaire Vidal 2005 mentionne toujours que « *l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée* » (13). Les anorexigènes amphétaminiques sont impliqués dans la survenue d'hypertensions artérielles pulmonaires graves depuis la fin des années 1960 (14). Les risques de valvulopathies sont établis depuis la fin des années 1990 (14). Le *benfluorex* a été impliqué dans la survenue d'une valvulopathie motivant une chirurgie cardiaque (11,14). Les décisions espagnoles de 2003 et de 2005 confirment que la balance bénéfices-risques du *benfluorex* est assez défavorable pour justifier le retrait du marché et l'interdiction de préparations magistrales (15).

Dans ces conditions, quels résultats d'enquête de pharmacovigilance, même si elle incluait les valvulopathies qui ne sont pas évoquées par le Directeur général de l'Afssaps, pourraient faire pencher la balance dans l'autre sens ?

Où est le service public rendu quand les autorités laissent la population exposée aux risques avérés d'un médicament qui n'apporte aucun progrès thérapeutique ?

Coxibs. Les premières données cardiovasculaires inquiétantes de l'essai Vigor concernant le *rofécoxib* ont été publiées au printemps 2000 ; la *revue Prescrire* en a fait état en juillet 2000 (16). Des données détaillées ont été rendues publiques par la Food and Drug Administration en février 2001, de même que des données permettant de mettre à jour les manipulations des résultats de l'"essai Class" concernant le *célécoxib* (17). Le premier communiqué de presse de l'Afssaps concernant ces deux coxibs date d'août 2001 (18). C'est deux ans après les premiers signaux publiés que l'Afssaps a demandé une réévaluation au niveau européen fin juin 2002, demande que la *revue Prescrire* a signalée dans son numéro de septembre 2002 (19). L'Afssaps elle-même n'avait publié aucun rapport d'évaluation au moment de l'octroi d'AMM. Au 30 septembre 2005, l'Afssaps n'a pas publié de données françaises de pharmacovigilance détaillées concernant ces coxibs, ni d'estimation de l'incidence des dégâts cardiovasculaires du *rofécoxib* en France. Alors que l'essai APPROVe (mis en avant par la firme Merck Sharp et Dohme-Chibret pour justifier le retrait mondial du marché en 2004) s'est déroulé en partie en France, l'Afssaps a communiqué encore moins de données à ce sujet que l'Agence britannique (20,21,22).

Opacité. *Dextropropoxyphène, véralipride, benfluorex* : persévérant dans ses habitudes, l'Afssaps n'a publié aucun compte rendu des études évoquées par son Directeur général. Le rapport annuel 2004 de l'Afssaps fait état de 2 940 rapports périodiques de surveillance des effets indésirables d'un médicament (PSUR) transmis à l'Agence française, 43 dossiers présentés au Comité technique de pharmacovigilance, 18 dossiers présentés en Commission nationale de pharmacovigilance : elle n'en a rendu aucun public (23).

Alors que les déclarations de liens d'intérêts des experts sollicités par l'Afssaps occupent des dizaines et des dizaines de pages en annexe du bilan annuel d'activité 2004, l'Afssaps n'a publié aucun compte rendu de réunion de Commission d'AMM ni de pharmacovigilance, pas même de simple liste des participants ni d'ordre du jour qui permettraient à chacun de vérifier que les experts en situation de conflits d'intérêts sont exclus des réunions (24).

Est-ce cela travailler « *au grand jour* » ?

Lenteur. La *revue Prescrire* signale et salue des travaux et décisions de l'Agence qui vont dans le sens du service public, ainsi par exemple, et pour s'en tenir à 2005, en ce qui concerne la matériovigilance, la cosmétovigilance, les commercialisations sans AMM, les modifications de RCP motivées par la pharmacovigilance, le conditionnement des médicaments (25à31). Mais ce qui frappe en général dans ces décisions, c'est une lenteur impressionnante.

Ainsi, en septembre 2005, le Directeur général a annoncé le retrait du marché de plusieurs "immunostimulants", effectif fin octobre 2005 (lire dans ce numéro page 747). C'est une mesure très bienvenue. La *revue Prescrire* avait rendu compte en novembre 2001 de la présentation par le Centre régional de pharmacovigilance de Saint-Étienne de l'enquête de pharmacovigilance menée à ce sujet sur les notifications effectuées en France jusqu'en 1998, enquête qui montrait le risque d'effets indésirables rares mais graves (32).

Mais, alors que ces médicaments n'étaient pas plus efficaces qu'un placebo, comment expliquer que le retrait du marché soit annoncé 7 ans après les dernières notifications prises en compte par l'enquête, et 4 ans après les résultats de l'enquête ?

Dans le cas des antibiotiques locaux pris par voie orale, pourquoi avoir mis à part les quelques antibiotiques non utilisés par voie générale, alors qu'ils correspondent à seulement 12 spécialités, si ce n'est pour laisser un sursis supplémentaire aux firmes concernées ? Quel délai fallait-il accorder encore à celles-ci alors que par exemple Locabiotal° figurait déjà dans la liste des médicaments à service médical rendu insuffisant publiée en juin 2001 par la Commission de la transparence (33) ?

Au service de qui ? Dans chacun de ces exemples récents, le premier bénéficiaire de la lenteur excessive de l'Afssaps, de sa pusillanimité et de son opacité, c'est la firme pharmaceutique qui commercialise le médicament en cause, et dont les ventes continuent. Les premières victimes, ce sont les patients, qui restent exposés aux effets indésirables avérés de médicaments qui n'apportent aucun progrès thérapeutique ; viennent ensuite les soignants mal informés, et, parmi les personnels de l'Afssaps, ceux qui ont une réelle motivation de service public mais voient, au final, leurs efforts servir d'abord les intérêts particuliers de firmes pharmaceutiques qui repoussent durant des années les décisions qui leur sont défavorables, même quand ces décisions sont justifiées par la santé publique.

Dans un État de droit, l'Agence du médicament n'a pas à se laisser imposer les vues des lobbies industriels, ni celles des commissions consultatives d'experts, parfois sous influence, souvent timorés. La décision finale, au service du public, peut être contraire à celle suggérée par des commissions mal avisées. Ainsi au printemps 2005, une commission d'experts réunie par la FDA s'est prononcée notamment pour le maintien sur le marché du *valdécoxib* ; experts dont bon nombre avaient des liens financiers avec les firmes détenant des AMM pour des coxibs ; la FDA a cependant décidé du retrait de ce coxib (34). ▶▶

Prescrire EN QUESTIONS

Changer résolument. Une agence réellement au service premier de la santé publique et soucieuse du droit a tout intérêt à appliquer, dès le 30 octobre 2005, la Directive 2004/27/CE (transposée ou non en droit national) et notamment son article 126 ter : « *En outre, les États membres veillent à ce que l'autorité compétente rende accessibles au public son règlement interne et celui de ses comités, l'ordre du jour de ses réunions, les comptes rendus de ses réunions, assortis des décisions prises, des détails des votes et des explications de vote, y compris les opinions minoritaires* ». C'est une opportunité exceptionnelle de montrer sans ambiguïté que l'on œuvre pour une Agence qui choisit fermement le service aux patients, qui travaille visiblement pour eux, sans faux-semblants, opacités ni lenteurs qui profitent d'abord aux firmes les plus influentes. Et à long terme, cette exigence de règles du jeu claires est l'intérêt bien compris des firmes autant que des patients.

Prévention du BAA : quelle stratégie dans les "pays démunis" ?

Dans les pays démunis, l'incidence du staphylocoque doré résistant à la méticilline et des infections nosocomiales reste élevée. Il existe donc un problème de traiter les infections à staphylocoque doré résistant à la méticilline, dès lors que les signes cliniques sont en faveur d'une origine à staphylocoque doré et que les conditions locales le justifient (1 page + références).

Direction de l'Evaluation
des Médicaments et des Produits Biologiques
Unité de Pharmacovigilance

Saint-Denis, le 31 janvier 2006

COMMISSION NATIONALE DE PHARMACOVIGILANCE
(Procès-verbal de la réunion du mardi 29 novembre 2005)

Etaient présents :

M. CARON (président),
M. ANDREJAK (vice-président),
Mme AUTRET-LECA, Mme BARBAUD, M. BONNETERRE, M. BOULU, Mme BRUNET, M. CARLIER, Mme COSTAGLIOLA, M. DOUARD, M. ESCHALIER, M. BENICHOU (suppléant de Mme FOURRIER-REGLAT), M. GIROUD, M. HANSLIK, M. IMBS, M. JACQUES, Mme JEAN-PASTOR (suppléante de Mme JOLLIET), Mme JOUAN-FLAHAULT, M. LAGIER, Mme LAINE-CESSAC, Mme LEMER-MALLE, M. LIOTE, M. MERLE, M. MONTASTRUC, M. MUNERA, M. PELLETIER, M. SCHMITT, Mme SGRO, M. VIAL
Mme GUYOT (Représentant la Direction Générale de la Santé)
Mme CASTOT (Représentant le Directeur général de l'Agence Française de Sécurité Sanitaire des Produits de Santé).

Déclaration publique d'intérêts :

M. BOULU, ayant un conflit d'intérêts majeur avec les laboratoires SANOFI-AVENTIS, est sorti de la séance lors du traitement du dossier concernant l'enquête officielle relative aux atteintes hépatiques sous chloroquine et/ou proguanil

LABORATOIRES :

ASTRA ZENECA

Enquête officielle relative aux atteintes hépatiques sous chloroquine et / ou proguanil

GLAXO SMITH KLINE

Enquête officielle relative aux atteintes hépatiques sous chloroquine et / ou proguanil

JANSSEN CILAG

Enquête officielle relative aux effets indésirables neurologiques observés avec la spécialité VESADOL® (halopéridol, buzépide métiodure)

Résurgences de délires / échecs thérapeutiques sous RISPERDAL CONSTA® (rispéridone)

SANOFI AVENTIS

Enquête officielle relative aux atteintes hépatiques sous chloroquine et / ou proguanil

SERVIER

Enquête officielle relative aux hypertensions artérielles pulmonaires et aux troubles neuro-psychiatriques observés avec MEDIATOR® (benfluorex)

WYETH LEDERLE

Suivi national intensif et enquête de pharmacovigilance relatifs aux effets indésirables observés avec PREVENAR® (vaccin conjugué pneumococcique heptavalent)

Annexe 3-70

ANNEXES 16

I – ADOPTION DU PROCES-VERBAL DE LA SEANCE DU MARDI 27 SEPTEMBRE 2005

Le procès-verbal de la séance du mardi 27 septembre 2005 a été adopté sans modification.

II - ENQUETE OFFICIELLE RELATIVE AUX HYPERTENSIONS ARTERIELLES PULMONAIRES ET AUX TROUBLES NEURO-PSYCHIATRIQUES OBSERVES AVEC MEDIATOR® (BENFLUOREX).

Lors du Comité Technique de Pharmacovigilance du 7 décembre 2004, plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique ont été rapportées avec MEDIATOR® (benfluorex). Une actualisation des données relatives aux troubles neuro-psychiatriques observés avec cette spécialité pharmaceutique a alors été décidée. Par la suite, du fait d'une notification d'un cas d'hypertension artérielle pulmonaire associée à la prise de MEDIATOR® rapportée lors du Comité Technique du 8 mars 2005, l'enquête menée par le CRPV de BESANCON a été étendue aux hypertensions artérielles pulmonaires.
MEDIATOR® est commercialisé en France depuis 1976 par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés dosés à 150 mg.
Ses indications sont :
- adjuvant du régime adapté dans les hypertriglycéridémies ;
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

HISTORIQUE

Le benfluorex n'est pas classé parmi les anorexigènes, mais lors de l'enquête sur les effets indésirables de ces produits et étant donné les restrictions de leur délivrance, le Comité Technique de Pharmacovigilance a craint une dérive de l'utilisation du benfluorex comme anorexigène. Ainsi, le benfluorex a été inscrit sur la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes le 10 mai 1995.

Le dossier relatif aux effets indésirables du benfluorex a été présenté lors de différentes réunions du Comité Technique de Pharmacovigilance en 1998 et au groupe de travail européen de Pharmacovigilance le 30 novembre 2000, entraînant les modifications de la rubrique « effets indésirables » du Résumé des Caractéristiques du Produit (RCP) (ajout des effets indésirables en *italique* ci-dessous) :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, *confusion*, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles ;
- *très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke ;*
- *élévation des enzymes hépatiques, hépatite (très rare).*

RESULTATS DE L'ENQUETE

1.Troubles neuro-psychiatriques

A. Troubles psychiatriques pendant le traitement

Trente cinq cas ont été rapportés dont 10 déclarés depuis l'enquête présentée en juillet 1999. Ils concernent 18 hommes (âge moyen : 58,5 ans) et 17 femmes (âge moyen : 60 ans).

Les troubles psychiatriques sont variés :
- agressivité (4), nervosité (3), irritabilité (1) ;
- cauchemars (2), angoisse (1), stupeur (1), dépression (1) ;
- désorientation (7), confusion (5), aggravation des troubles cognitifs (1) ;
- agitation (3), troubles du comportement (3) ;
- délire (2), bouffées délirantes aiguës (1).

Les cas graves ayant nécessité une hospitalisation sont :
- 4 cas de confusion (dont un provenant de la littérature) chez des patients ayant des traitements associés ;
- 3 cas de désorientation temporo-spatiale ;
- 2 cas de bouffées délirantes aiguës, avec d'autres troubles associés, d'évolution rapidement favorable après traitement symptomatique par neuroleptiques.

B. Troubles psychiatriques au sevrage

Dix notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés. Ils concernent 2 hommes de 27 et 34 ans et 8 femmes de 30 à 65 ans (âge moyen : 45,25 ans).

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 mois, 6 mois ou 15 mois).
La durée de traitement par MEDIATOR® est très variable : de 1 mois à 8 ans.

Trois cas ont nécessité une hospitalisation chez des femmes ayant par ailleurs des antécédents de troubles psychiatriques. Une évolution favorable a été constatée dans un des cas après traitement symptomatique par neuroleptiques, les deux autres cas sont d'évolution inconnue.

C. Autres troubles neurologiques

Douze notifications ont été rapportées. Elles concernent 8 hommes et 4 femmes :
- 2 cas de convulsions d'évolution favorable ;
- 2 cas de neuropathie, chez deux patients diabétiques présentant de multiples autres étiologies possibles ;
- 7 cas de paresthésies, d'apparition rapide et d'évolution favorable en quelques heures, dont deux mésusages ;
- 1 cas de tremblement des mains.

D. Abus

Deux cas d'abus ont été rapportés :
- chez un homme augmentant les doses de MEDIATOR® à 10 comprimés par jour pendant 11 mois, sans effet indésirable associé ;
- chez un sportif, consommant (sur prescription médicale) des doses croissantes (1comprimé/semaine au début et jusqu'à 9 comprimés/jour) de MEDIATOR® comme « dopant » et présentant une excitation lors du sevrage.

2. Hypertension artérielle pulmonaire (HTAP) :

Dix-sept notifications dont 2 doublons ont été rapportées.

A. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«hypertension artérielle pulmonaire » avaient été rapportées (9 d'entre elles avaient été présentées lors de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » au Comité Technique du 28 avril 1995) :
- 7 ont été classées en HTAP idiopathique
- 3 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR® n'était jamais prescrit seul : il était associé à un ou plusieurs anorexigènes :
- ISOMERIDE® : 7 fois ;
- ISOMERIDE® + PONDERAL® : 2 fois ;
- ISOMERIDE ®+ FENPROPOREX® : 1 fois ;
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois ;

La durée de traitement par MEDIATOR® était précisée dans 7 cas sur 11 et allait de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® était :
- concomitante dans 5 cas ;
- antérieure dans 2 cas ;
- postérieure dans 3 cas ;
- imprécise dans 1 cas.

Sur les 3 cas où la prise de MEDIATOR® était postérieure à la prise d'anorexigènes, 2 cas présentaient une dyspnée avant la prise de MEDIATOR, et un cas une double atteinte valvulaire aortique et mitrale.

B. Notifications où MEDIATOR® n'est pas associé à la prise d'un anorexigène

Six notifications ont été rapportées chez des femmes (dont 2 présentaient une HTAP post capillaire sur valvulopathie et une autre une HTAP sur embolie pulmonaire) n'ayant pas de traitement anorexigène associé. Il est à noter que l'un des cas rapportés est très succinct et ne peut, dans ces conditions, être retenu.

C. Incidence des cas notifiés

Depuis le début de la commercialisation de MEDIATOR®, le nombre de boites de 30 comprimés vendues est de : 110 693 331, correspondant à 45 515 349 mois de traitement (estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés).

Après élimination des HTAP post-emboliques (2) et post-capillaires (5), il reste 10 cas d'HTAP idiopathique soit :
- 1 cas notifié pour 11 069 333 boîtes vendues ;
- ou 1 cas notifié pour 4 551 534 mois de traitement.

Si on considère uniquement les diagnostics d'hypertension artérielle pulmonaire idiopathique en excluant les cas associés aux anorexigènes et les antécédents d'embolie pulmonaire et de valvulopathie, il reste 2 cas soit une incidence très faible de :
- 1 cas notifié pour 55 346 666 boîtes vendues ;
- 1 cas notifié pour 22 757 675 mois de traitement.

Conclusion du rapporteur :

Troubles neuro-psychiatriques : cette enquête confirme la réalité du risque de survenue de « confusions » en présence de Médiator®. Il est proposé que cet effet, déjà mentionné dans le RCP soit détaillé comme suit :
« troubles des fonctions cognitives : désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception : hallucinations. »

Hypertensions artérielles pulmonaires : compte-tenu de l'incidence des HTAP idiopathiques (1 à 2 de cas par million et par an), le nombre de cas d'HTAP idiopathique rapportés dans l'enquête ne constitue pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardio-vasculaire.

DISCUSSION

Les ventes de MEDIATOR® en Europe sont réalisées en quasi totalité en France. Les données DOREMA d'avril 2005 montrent une utilisation dans 46,3% dans les dyslipidémies, dans 33,5% dans le diabète, dans 9,6% dans l'obésité, dans 2,3% dans la régulation métabolique et dans 8,3% dans d'autres indications. L'effet anorexigène du benfluorex n'a pas été démontré. Toutefois, les membres de la Commission nationale craignent un mésusage, en particulier dans l'obésité. Dans ce contexte, une étude d'utilisation/ de prescription serait utile.
Il est à noter que le renouvellement quinquennal du produit intervient dans 2 ans et que des données d'efficacité dans le diabète de type 2 existent mais restent limitées et mériteraient d'être réévaluées.

Le bilan de pharmacovigilance confirme les données de sécurité d'emploi du MEDIATOR® déjà connues. Les effets neuro-psychiatriques décrits actuellement dans le RCP sous le terme « confusion » doivent être détaillés. Il n'y a pas actuellement assez de données pour affirmer l'existence de syndrome de sevrage. Le faible nombre de cas décrits d'HTAP idiopathique associées au MEDIATOR® doit être interprété par rapport à la sous-notification habituelle en pharmacovigilance.

Afin d'évaluer au mieux les risques potentiels de l'utilisation de MEDIATOR®, la Commission nationale de pharmacovigilance a demandé la réalisation de :
- une étude d'utilisation / prescription de MEDIATOR® ;
- une étude expérimentale sur un modèle animal permettant d'évaluer le potentiel de MEDIATOR® à engendrer des HTAP ;

- une étude au niveau des Centres d'évaluation et d'information sur la pharmacodépendance (CEIP) afin d'évaluer un éventuel problème de pharmacodépendance. A ce titre, une saisine de la Commission nationale des stupéfiants et psychotropes sera effectuée.

Enfin, il a été proposé d'étudier la possibilité d'interroger les registres d'HTAP existant dans 17 centres, afin de rechercher, dans une étude rétrospective cas-témoins, le rôle éventuel du benfluorex.

CONCLUSION

Devant les différentes questions posées par l'enquête de pharmacovigilance, plusieurs membres de la commission ont souhaité un réévaluation du rapport bénéfice/risque du produit. La Commission s'est prononcée en faveur de cette réévaluation par 13 voix pour, 10 voix contre et 5 abstentions.

III - SUIVI NATIONAL INTENSIF ET ENQUETE DE PHARMACOVIGILANCE RELATIFS AUX EFFETS INDESIRABLES OBSERVES AVEC PREVENAR® (VACCIN CONJUGUE PNEUMOCOCCIQUE HEPTAVALENT)

Conformément à l'avis du Conseil Supérieur d'Hygiène Publique de France (CSHPF) du 14 septembre 2001 relatif à la vaccination des enfants par le vaccin conjugué pneumococcique heptavalent Prévenar®, l'unité de Pharmacovigilance de l'Afssaps a confié au CRPV de Tours la coordination d'un suivi national intensif de pharmacovigilance de ce vaccin.

Méthodologie

Ce suivi était basé sur une sollicitation de l'ensemble des pédiatres libéraux français à notifier systématiquement durant 19 mois (28 février 2003 – 30 septembre 2004), tout effet indésirable grave et/ou inattendu post-vaccinal. Cette étude avait pour objectif la détection d'effets indésirables non encore identifiés pouvant modifier le rapport bénéfice/risque du Prévenar®.

Le 28 février 2003, un total de 2462 pédiatres français ont reçu de l'Afssaps une lettre présentant l'étude accompagnée d'une demande de participation. Seuls 349 (14%) d'entre eux ont renvoyé leur accord de participation. Plus de 91% de ces pédiatres (n=319) ont indiqué le nombre de vaccinations par Prévenar® et par jour qu'ils estimaient effectuer, soit un total de 274 511 actes vaccinaux pendant la période d'étude.

Le CRPV de Tours a présenté une analyse globale du suivi national intensif de pharmacovigilance et des cas de pharmacovigilance notifiés au réseau national des CRPV et à la firme entre le 2 avril 2001 (date de commercialisation du Prévenar® en France) et le 30 septembre 2004.

Résultats

La répartition des cas graves et inattendus non graves rapportés durant l'enquête de pharmacovigilance et le suivi national intensif est présenté dans le tableau ci-dessous :

	ENQUETE (02/04/2001 – 30/09/2004)	SUIVI NATIONAL INTENSIF (28/02/2003 – 30/09/2004)
Durée	3,5 ans	19 mois
N° cas graves ou jugés graves	107	24
N° cas inattendus non graves	46	8
Total cas graves ou inattendus non graves	153	32*

* Enfants âgés entre 2 et 28 mois (médiane :13 mois)

Par ailleurs, 340 cas non graves et attendus ont été notifiés.

L'incidence des notifications d'effets indésirables graves rapportés après administration de Prevenar® seul est de l'ordre de 5.5/ 100 000 actes vaccinaux [IC $_{95\%}$: 2.7 – 8.7] pour le suivi national et, de 2.5 [IC $_{95\%}$: 1.9 – 3.2] pour l'enquête.

L'incidence des effets indésirables attendus rapportés durant le suivi national et l'enquête, à savoir fièvre élevée (> 38°C), éruption cutanée, urticaire, œdème de Quincke, érythème polymorphe, convulsions fébriles ou non et hypotonie (pouvant être assimilée au syndrome d'hypotonie-hyporéactivité) est inférieure à celle mentionnée dans le Résumé des Caractéristiques du Produit (RCP).

Les effets indésirables inattendus étaient :
- une hypertonie isolée (5 cas dont 4 après Prévenar® seul) ;
- des cris anormaux (5 cas dont 1 après Prévenar® seul) ;
- un œdème aigu hémorragique (3 cas dont 1 après Prévenar® seul) ;
- un purpura vasculaire (3 cas) ;
- un purpura thrombopénique (3 cas) ;
- une érythrose palmo-plantaire (2 cas dont 1 après Prévenar® seul) ;

- un eczéma (2 cas) ;
- un abcès (1 cas) et une cellulite (1 cas).

Leur incidence est également inférieure à celle mentionnée dans l'article de Wise RP et Coll. relatif à l'analyse globale des données de pharmacovigilance du Prévenar® recueillies aux Etats-Unis durant deux années (JAMA, 2004; 292 : 1702-10).

Parmi les 10 cas d'infections invasives à pneumocoque rapportés durant le suivi national et l'enquête, le sérotype est non vaccinal ou inconnu dans 7 cas.

Dans le cadre de l'enquête de pharmacovigilance, un total de trois cas de syndrome de Kawasaki ont été notifiés au réseau national des CRPV. Un bilan actualisé de pharmacovigilance fait état de quatre observations supplémentaires peu documentées rapportées dans le monde depuis mars 2000 jusqu'à ce jour. Le pronostic vital de cette vascularite artérielle infantile est liée à la constitution d'anévrismes coronaires dans 15 à 25% des cas.

Limites de ce suivi

Le suivi a concerné 13% des pédiatres libéraux et 14% des doses vendues pendant cette période en France (total = 2 002 386 doses) ce qui lui confère une représentativité a priori satisfaisante.
L'estimation du nombre d'actes vaccinaux réalisés par les pédiatres participant au suivi intensif (274 511 actes) permet d'estimer que seuls les effets indésirables graves apparaissant avec une fréquence supérieure à 0,001% ont pu être détectés.
Par ailleurs, le niveau d'exhaustivité du recueil n'a pas été parfait dans la mesure où certains pédiatres ne déclaraient que les manifestations pouvant justifier un arrêt de la vaccination.

Conclusions

Bien que l'analyse globale des cas de pharmacovigilance n'ait pas mis en évidence de signal particulier, le CRPV de Tours a suggéré une réactualisation du RCP actuel par l'ajout de certains effets indésirables inattendus (graves ou non) tels que : abcès et cellulite au site d'injection, purpura vasculaire et effets neurologiques à type de cris anormaux, hypertonie. Prevenar® étant enregistré selon une procédure centralisée, le Groupe de Travail de Pharmacovigilance Européen analysera cette proposition dès la mise à disposition par la firme de l'ensemble des cas similaires rapportés dans le monde jusqu'à ce jour.

Enfin, aux sept observations de maladie de Kawasaki post-vaccinales citées précédemment s'ajoutent les résultats préliminaires d'une étude post-marketing menée aux Etats-Unis sur 3 années à partir de mars 2000 avec la mise en évidence d'un risque relatif non ajusté de cette pathologie statistiquement significatif après administration du Prevenar® (RR=2.02 [$_{95\%}$CI : 1.16-3.63 ; p=0.012]) d'où la question posée par ce signal potentiel tant sur le plan national qu'européen.
Afin d'infirmer ou de confirmer ce signal dans les meilleurs délais, l'Afssaps a sollicité le concours de l'unité INSERM 149 et de la CNAM impliquées étroitement dans un suivi national d'une cohorte de 300 000 nourrissons exposés/non exposés au Prevenar®. Dans cette étude, commanditée par la Direction Générale de la Santé en 2002 pour l'évaluation à long terme de l'impact épidémiologique de la vaccination et du profil de sécurité d'emploi du Prevenar®, les sujets inclus sont identifiés à l'aide de la base de données ERASME de la CNAMTS.
Les représentants de l'Inserm récemment contactés, ont accepté d'analyser ce signal avec une mise à disposition de résultats préliminaires dans un délai de l'ordre de 2 à 3 mois, sous réserve de disposer de l'ensemble des données d'identification issues de la base de données ERASME.

IV - ENQUETE OFFICIELLE RELATIVE AUX ATTEINTES HEPATIQUES SOUS CHLOROQUINE ET/OU PROGUANIL

Objectifs de l'enquête

Le Centre Régional de Pharmacovigilance (CRPV) d'Angers a présenté les résultats de l'enquête concernant la survenue d'atteintes hépatiques sous chloroquine et proguanil.
Cette enquête fait suite à une notification d'atteinte hépatique mixte chez une patiente traitée par une association chloroquine-proguanil dans le cadre d'une prophylaxie antipalustre et à l'existence d'autres cas d'atteintes hépatiques enregistrées dans la Base Nationale de Pharmacovigilance alors que cet effet indésirable ne figure pas dans le résumé des caractéristiques du produit (RCP) des différents médicaments concernés.

La période de recueil remonte à 1985 pour la chloroquine, molécule la plus ancienne, et à la date de commercialisation pour les autres médicaments. La fin de la période de recueil a été fixée au 30/06/2004.

Une analyse a été faite de toutes les notifications spontanées d'atteinte hépatique associée à un traitement par chloroquine et/ou proguanil faites aux CRPV et aux firmes, et enregistrées au 30/06/2004.
L'incidence des notifications a été estimée par mois de traitement prophylactique.
Une analyse des données de la littérature a également été réalisée.

Cinq spécialités contiennent l'un ou l'autre des principes actifs : NIVAQUINE® (Sanofi-Aventis) - chloroquine, PALUDRINE® (Astra Zénéca) - proguanil, SAVARINE® (Astra Zénéca) - associant chloroquine et proguanil, MALARONE® (GSK) - associant atovaquone et proguanil, et NOPALU® (Pharmacie Centrale des Armées) - associant chloroquine et proguanil.
Toutes ont l'indication de prophylaxie antipalustre. NIVAQUINE® et MALARONE® sont également indiquées dans le traitement curatif de l'accès palustre.

Résultats

Au total, 69 observations françaises ont été analysées. Elles se répartissent selon le tableau suivant:

	Atteintes cytolytiques	Atteintes mixtes	Atteintes cholestatiques	Anomalies isolées du BBH	Total
Chloroquine seule	12	4	2	10	28
Proguanil seul	0	0	0	0	0
Chloroquine + proguanil	17	7	4	2	30
Proguanil + atovaquone	7	1	1	2	11
Total	36	12	7	14	69

BBH : Bilan Biologique Hépatique

Atteintes cytolytiques sous chloroquine seule :
Un seul cas plausible C_2S_2 pour lequel la chloroquine est le seul médicament suspect a été notifié. Il s'agit d'une femme de 21 ans traitée pour un accès palustre. L'évolution a été très rapidement favorable.
Atteintes mixtes sous chloroquine seule :
Un seul cas plausible C_2S_2 pour lequel la chloroquine est le seul médicament suspect a été notifié : il s'agit d'un homme de 48 ans traité pour un lupus, ayant eu une évolution favorable en moins d'un mois.
Atteintes cytolytiques sous chloroquine + proguanil :
Deux cas plausibles C_2S_2 pour lesquels l'association chloroquine-proguanil est le seul médicament suspect ont été notifiés. Il s'agit d'une femme de 23 ans ayant présenté un syndrome d'hypersensibilité à J8 d'un traitement prophylactique et d'une femme de 39 ans ayant présenté une cytolyse modérée à J28 du traitement avec récidive à la reprise.
Atteintes mixtes sous chloroquine + proguanil :
Trois cas plausibles C_2S_2 ont été notifiés où l'association chloroquine-proguanil est le seul médicament suspect. Dans ces 3 cas, un mécanisme immunoallergique est suspecté, soit du fait des signes cliniques associés, soit du fait d'éléments chronologiques.
Atteintes hépatiques sous proguanil + atovaquone :
Aucun cas plausible C_2S_2 n'a été notifié avec l'association atovaquone/proguanil comme seul médicament suspect.

Neuf cas, survenus hors France et issus des base des données des industriels, ont également été analysés. Parmi eux 3 cas sont survenus sous proguanil seul et 3 cas, survenus sous l'association chloroquine-proguanil, sont associés à des symptômes d'hypersensibilité.

L'analyse de la bibliographie fait apparaître qu'il existe une toxicité hépatique dose-dépendante de la chloroquine chez le patient atteint de porphyrie cutanée tardive (PCT), maladie dont la chloroquine à dose faible constitue par ailleurs un des traitements possibles (utilisation hors AMM). Dans les cas analysés pour l'enquête, cette pathologie sous-jacente n'est confirmée que chez un seul patient traité par chloroquine et suspectée chez un autre. Le proguanil, dont certains effets de nature immunoallergique sont déjà validés, semble être capable d'induire une atteinte hépatique dans un contexte d'hypersensibilité.

Discussion

Les observations où le médicament antipaludéen est le seul médicament suspect avec une imputabilité au moins plausible sont au nombre de 7 (2 sous chloroquine utilisée seule et 5 sous l'association chloroquine-proguanil). Il s'agit soit d'hépatites cytolytiques (3 cas), soit d'hépatites mixtes (4 cas). L'évolution, quand elle est connue, est favorable. Aucun cas d'hépatite fulminante n'a été rapporté en France.
L'analyse des observations fait souvent apparaître, lorsque le proguanil est présent, des manifestations évoquant une réaction d'hypersensibilité (fièvre, éruption, hyperéosinophilie...). Ces effets indésirables sont très rarement notifiés eu égard aux chiffres de vente des différentes spécialités étudiées.
La littérature fait état d'une toxicité hépatique dose-dépendante de la chloroquine en cas de PCT sous-jacente.
La chloroquine et le proguanil peuvent donc être responsables d'atteintes hépatiques de survenue exceptionnelle selon un mécanisme vraisemblablement différent.

Proposition et Conclusion

La rareté des effets indésirables hépatiques notifiés et l'absence de cas particulièrement sévères incitent à délivrer auprès des professionnels de santé une simple information sur la survenue possible de ce type d'effet indésirable.

Les modifications des rubriques « effets indésirables » et «mises en garde et précautions d'emploi » proposées consistent en :

- Rubrique « effets indésirables » du RCP des spécialités contenant de la chloroquine :

« très rares cas d'élévation des enzymes hépatiques ou d'hépatite survenant notamment chez les patients porteurs d'une porphyrie cutanée tardive (cf. mises en garde et précautions d'emploi) ».

- Rubrique « effets indésirables » du RCP des spécialités contenant du proguanil :

« très rares cas d'élévation des enzymes hépatiques ou d'hépatite survenant principalement dans un contexte d'hypersensibilité (fièvre, éruption cutanée, éosinophilie...) ».

- Rubrique « mises en garde et précautions d'emploi » du RCP des spécialités contenant de la chloroquine :

« Chez les sujets atteints de porphyrie cutanée tardive, la prise de chloroquine peut favoriser la survenue d'une atteinte hépatique et ce de façon dose-dépendante (cf. effets indésirables). »

Les membres de la Commission Nationale ont voté à l'unanimité pour l'adoption de ces modifications de RCP.

V - ENQUETE OFFICIELLE RELATIVE AUX EFFETS INDESIRABLES NEUROLOGIQUES OBSERVES AVEC LA SPECIALITE VESADOL® (HALOPERIDOL, BUZEPIDE METIODURE)

Le Centre Régional de Pharmacovigilance de Toulouse a présenté les résultats de l'enquête sur les effets indésirables neurologiques observés avec la spécialité VESADOL® (halopéridol, buzépide métiodure). Cette enquête a été mise en place à la suite du courrier d'un neurologue qui s'interrogeait sur le bien-fondé de l'utilisation de ce produit, pourvoyeur de mouvements iatrogènes anormaux, dans les troubles fonctionnels digestifs.
En accord avec l'Unité de Pharmacovigilance de l'AFSSAPS, il a été décidé que l'enquête porterait exclusivement sur les effets indésirables extrapyramidaux de ce médicament.

La spécialité VESADOL®, commercialisée en France et dans certains pays d'Afrique Noire par les Laboratoires JANSSEN-CILAG depuis 1970, est une association de buzépide métiodure et d'halopéridol. L'halopéridol est un neuroleptique, chef de file des butyrophénones, exerçant des effets extrapyramidaux puissants, des effets sédatifs et hypotenseurs faibles. Le buzépide est un ammonium quaternaire ayant des propriétés antimuscariniques. Ses effets sont similaires à ceux de l'atropine.
L'association d'un atropinique à un neuroleptique a, dans la spécialité VESADOL®, été proposée d'une part pour ses propriétés antispasmodiques digestives et d'autre part pour obtenir une réduction des effets extrapyramidaux du neuroleptique.

L'association halopéridol + buzépide est indiquée dans les «manifestations de l'anxiété associées à des troubles fonctionnels digestifs à composante spasmodique». L'AMM française indique que «cette spécialité contient un neuroleptique et doit être réservée aux cas d'inefficacité ou de mauvaise tolérance des thérapeutiques usuelles de l'anxiété». Dans cette indication, la posologie d'halopéridol est de 3 à 4 comprimés par jour, soit 0,9 ou 1,2 mg par jour d'halopéridol.

Bilan de l'enquête

Au total, 17 observations d'effets indésirables neurologiques extrapyramidaux ont été rapportés avec VESADOL® (14 observations étaient enregistrées dans la Base Nationale de Pharmacovigilance en date du mois d'avril 2005 et 3 observations supplémentaires ont été fournies par les Laboratoires JANSSEN-CILAG). Ces observations se répartissent comme suit :

- 12 observations, dont 6 graves, de syndrome parkinsonien survenant dans un délai de 24 heures à plusieurs années chez des patients d'âge moyen 73 ans traités à la dose de 0,3 mg/j le plus souvent. Dans tous les cas, VESADOL® est le seul médicament suspect. L'imputabilité est possible dans 9 cas et probable dans 1 cas.
- 3 observations de dyskinésies tardives survenant dans un délai de 9 semaines dans un cas et plusieurs années dans l'autre (donnée non documentée dans le dernier cas). Elles concernent des patients âgés de 49 et 80 ans (1 cas d'âge inconnu) traités à des posologies de 0,3 et 0,9 mg/j (donnée non documentée dans un cas). VESADOL® est le seul médicament suspect dans 1 cas et l'imputabilité est douteuse dans les 3 cas. Dans 2 cas, une interaction médicamenteuse est suspectée (avec un inhibiteur sélectif de la recapture de la sérotonine dans 1 cas, un autre neuroleptique dans l'autre cas).
- 1 observation grave de dyskinésies aiguës et 1 observation grave de dystonie aiguë survenant dans un délai de 48 heures chez des sujets jeunes (14 et 22 ans) traités dans les deux cas à la dose de 0,3 mg/j. Dans ces 2 cas, VESADOL® est le seul médicament suspect et l'imputabilité est possible.

A partir des chiffres de vente fournis par le laboratoire, le taux de notification des effets indésirables extra-pyramidaux peut être estimé à 1 pour 1.200.000 boîtes vendues. Ce chiffre doit bien sûr tenir compte d'une sous-notification notable, puisqu'il s'agit d'un effet indésirable « attendu ».

Discussion

Cette enquête montre que l'on retrouve, avec VESADOL®, les effets indésirables neurologiques habituellement décrits avec les neuroleptiques, c'est à dire des syndromes parkinsoniens, des dyskinésies tardives et enfin des dystonies-dyskinésies aiguës. Ces effets indésirables s'observent aux posologies usuelles malgré le faible dosage d'halopéridol présent dans VESADOL®. Comme attendu, les dyskinésies-dystonies aiguës se retrouvent plutôt chez les sujets jeunes et les syndromes parkinsoniens plutôt chez des sujets âgés. On constate que l'association d'un anticholinergique, le buzépide métiodure, à l'halopéridol n'empêche en rien la survenue du

syndrome parkinsonien induit par l'halopéridol. Enfin, la gravité de ces effets indésirables doit être soulignée: c'est en particulier le cas des dyskinésies tardives, dont on sait qu'il s'agit d'un tableau qui n'est jamais régressif à l'arrêt du médicament.
Le Résumé des Caractéristiques du Produit de VESADOL® semble suffisamment informatif puisqu'il précise très clairement la possibilité de survenue d'effets indésirables neurologiques dès les plus faibles doses, à type de syndrome extrapyramidal, de dyskinésies tardives ou encore précoces. On pourrait cependant ajouter le fait qu'en cas de survenue de syndrome parkinsonien, il convient d'arrêter le médicament. De même, la conduite à tenir devant les dyskinésies précoces (traitement par les médicaments anticholinergiques) devrait être précisée.
Par ailleurs, il a été rappelé que ce médicament qui contient de l'iode à raison de 0,8mg par comprimé expose les patients traités au long cours à un risque de surcharge iodé.

Au final, cette enquête a permis de rediscuter le rapport bénéfice / risque de ce médicament à la lumière des données actualisées. Le risque d'effets indésirables neurologiques graves et parfois irréversibles n'est plus acceptable au vu des alternatives thérapeutiques.

En date du 23 juin 2005, les laboratoires JANSSEN-CILAG ont informé le CRPV de Toulouse et l'Afssaps de leur décision d'arrêter la commercialisation de VESADOL®. Il convient de rappeler que cette spécialité s'est vue octroyer un Service Médical Rendu insuffisant en 2001 et que depuis janvier 2004, le médicament est déremboursé et que de ce fait le nombre de boîtes vendues continue à régresser significativement.

Dans le cadre de la décision de la cessation de la commercialisation de VESADOL®, les laboratoires JANSSEN-CILAG ont présenté le plan d'action suivant :
- information et arrêt de la distribution de VESADOL® aux grossistes : début décembre 2005
- information des professionnels de santé par un communiqué dans la presse médicale et pharmaceutique : courant décembre 2005
- arrêt de la commercialisation par les grossistes aux officines : 31 décembre 2005
- reprise des stocks existant chez les grossistes : janvier 2006
- écoulement des produits disponibles en officine au plus tard jusqu'au 30 septembre 2006 (l'écoulement des stocks ne devrait durer que 2 à 3 mois mais il sera possible jusqu'à la péremption du dernier lot produit).
- Radiation de l'AMM en septembre ou octobre 2006 lorsque la péremption du produit sera atteinte.

Conclusion de la Commission Nationale de Pharmacovigilance

Compte tenu de la cessation de commercialisation de VESADOL® par les laboratoires JANSSEN-CILAG avant la fin de l'année 2006, décision indépendante de l'enquête en cours, il n'apparaît pas nécessaire de ré-évaluer le bénéfice-risque de ce médicament. La Commission Nationale de Pharmacovigilance a pris acte du plan d'action proposé par les laboratoires JANSSEN-CILAG sous réserve que le communiqué destiné aux professionnels de santé rappelle le risque de survenue d'effets indésirables extrapyramidaux sous VESADOL®. Le document final devra être validé par l'Afssaps et le Centre Régional de Pharmacovigilance de Toulouse en charge de l'enquête avant sa diffusion.

Depuis la Commission nationale de pharmacovigilance, le laboratoire a cessé les ventes auprès des grossistes et effectué une reprise des stocks existants chez ceux-ci.
Enfin, l'Afssaps et le laboratoire JANSSEN-CILAG ont convenu d'une abrogation de l'AMM le 15 avril 2006.

VI – RESURGENCES DE DELIRES / ECHECS THERAPEUTIQUES SOUS RISPERDAL CONSTA®

Risperdal Consta® LP (rispéridone) est un antipsychotique atypique à action retard, bénéficiant d'une AMM nationale depuis octobre 2003, et commercialisé en France depuis mars 2005. Il est indiqué chez l'adulte dans le traitement des psychoses, en particulier des psychoses schizophréniques, en relais d'un traitement antipsychotique par rispéridone par voie orale. Le Risperdal Consta® LP doit être administré toutes les 2 semaines en injection intramusculaire profonde dans le muscle fessier. La posologie initiale de Risperdal Consta® LP doit être établie en tenant compte de la dose de rispéridone orale. La posologie habituelle est de 25 mg par voie intramusculaire toutes les 2 semaines. La posologie maximale ne doit pas dépasser 50 mg toutes les 2 semaines. L'administration de rispéridone par voie orale à posologie efficace doit être poursuivie pendant les 3 premières semaines de traitement par Risperdal Consta® LP, compte tenu de l'existence d'une période de latence de 3 semaines avant l'apparition de l'effet thérapeutique après la première injection de Risperdal Consta® LP.
La rispéridone est métabolisée par le cytochrome P450 2D6 en 9-hydroxy-rispéridone. L'ensemble rispéridone plus 9-hydroxy-rispéridone constitue la fraction active.

Un premier point relatif à Risperdal Consta® et résurgences des délires a été présenté en Comité Technique de Pharmacovigilance le 7 juin 2005.

Depuis mars 2004, 25 cas de résurgences de délires/hallucinations et d'échecs thérapeutiques ont été rapportés par notification spontanée en France chez des patients traités par Risperdal Consta® LP en relais d'un traitement oral par rispéridone. Dans 9 cas, aucun facteur de risque ni d'explication alternative à cette décompensation n'ont été retrouvés. Dans les autres cas, ont été notés un défaut d'observance, ou une absence de rispéridone orale en début de traitement par Risperdal Consta® LP, ou enfin un non-respect des recommandations concernant les doses de rispéridone orale/Risperdal Consta®.

Par ailleurs, le CRPV a analysé les observations notifiées dans le cadre de l'étude de phase IV DEPIST (Diagramme de l'Etat Psychotique utilisable par l'Infirmier dans la Schizophrénie Traitée au long cours). Sur 932 patients inclus, 3, 65% (34 observations) ont présenté des résurgences de délire/rechutes.

Plusieurs questions ont été soulevées par le CRPV pour expliquer ces observations : variabilité inter-individuelle ? Polymorphisme génétique au niveau de la métabolisation ? Modification de l'occupation des récepteurs ? Traitement de 3 semaines par rispéridone insuffisant en terme de durée ? Positionnement du Risperdal Consta® par rapport aux patients nécessitant de fortes doses de rispéridone orale ? Dosage plasmatique de rispéridone et de 9-hydroxy-rispéridone après l'arrêt de la rispéridone orale utile ?

Lors de la présentation, il a été décidé de transformer le point en enquête officielle de pharmacovigilance, et l'enquête a été officiellement mise en place sous la responsabilité du Centre Régional de Pharmacovigilance de Montpellier. Ce dossier doit être à nouveau présenté à la Commission nationale de Pharmacovigilance du 31 Janvier 2006.

ANNEXES

SUJETS ABORDES LORS DES SEANCES DU COMITE TECHNIQUE DE PHARMACOVIGILANCE DU 14 OCTOBRE 2005 ET 8 NOVEMBRE 2005 ET NON PRESENTES EN COMMISSION NATIONALE

1/ Comité technique du 14 octobre 2005

- Etude sur les conditions d'utilisation du misoprostol dans l'interruption de grossesse

A la suite de 4 cas mortels de septicémie aux Etats-Unis lors d'IVG utilisant 200 mg de mifépristone par voie orale et 800 µg de misoprostol par voie intravaginale, une lettre a été adressée par l'Afssaps aux gynécologues, obstétriciens et pharmaciens hospitaliers afin de rappeler les conditions d'utilisation de la mifépristone : 600 mg de mifépristone par voie orale, suivis 36 à 48 heures après de l'administration d'un analogue d'une prostaglandine, 400µg de misoprostol par voie orale ou 1 mg de géméprost par voie vaginale.
Cette lettre et le communiqué de presse sont accessibles sur le site internet de l'Afssaps depuis le 18 octobre 2005. Par ailleurs, un arbitrage européen a été déclenché en décembre 2005, où la question des doses et des voies d'administration de la mifépristone et du misoprostol à recommander lors d'une interruption de grossesse a été posée.

- Point sur les tendinopathies observées durant les traitements corticoïdes administrés par voie générale

Au cours du Comité technique de pharmacovigilance du 10 mai 2005, le centre régional de pharmacovigilance (CRPV) de Caen a présenté le cas d'un patient de 57 ans décrivant des douleurs bilatérales des tendons d'Achille au cours d'une corticothérapie par voie orale de 9 jours, suivies d'une rupture du tendon d'Achille droit 8 jours après le début d'un traitement par une fluoroquinolone administrée en solution auriculaire. Alors que ce type d'effet semblait connu, le CRPV de Caen a souligné qu'il ne figurait pas dans les différents Résumés des Caractéristiques du Produit (RCP) des corticoïdes administrés par voie générale.
A l'issue de la présentation de ce cas, un point portant sur les tendinopathies observées sous corticothérapie par voie générale a été demandé par le comité technique.
Ce point s'est appuyé sur une analyse de la base nationale de pharmacovigilance ainsi que sur l'analyse de la littérature.
Il apparaît que les corticoïdes systémiques peuvent favoriser la survenue de tendinopathies, en présence de facteurs de risque médicamenteux (fluoroquinolones) ou pathologiques (lupus érythémateux systémique, dialysés et greffés rénaux, maladies rhumatismales). Parallèlement, la vingtaine de cas recensée dans la littérature chez des patients sous corticothérapie le plus souvent prolongée pour une affection broncho-pulmonaire chronique ne semble pas expliquée par la pathologie traitée ayant justifié l'utilisation de corticoïdes.
Le risque de rupture tendineuse, au niveau de lésions préexistantes, trouve des explications pharmacologiques qui s'appuient sur des travaux expérimentaux. Les effets d'une corticothérapie locale sont ainsi mieux compris. Cependant, aucune étude expérimentale effectuée après corticothérapie systémique n'a été identifiée par la recherche bibliographique.
La présence dans la base nationale de pharmacovigilance de plusieurs cas de tendinites, éventuellement suivies de ruptures, dans des indications non réputées en relation avec ces complications, en particulier dans 1 cas d'otite, est un argument à souligner en faveur du rôle propre de cette classe de médicament dans le cadre d'une administration par voie générale.

Au total, le Comité technique a proposé les modifications suivantes dans les RCPs des corticoïdes systémiques :

- Rubrique Effets indésirables : « possibilité de ruptures tendineuses (et douleurs ?) »
- Rubrique Mises en garde et précautions particulières d'emploi : « préconiser la surveillance de l'apparition de signes tendineux pour mettre au repos les tendons et réévaluer la nécessité du traitement à un stade précoce »
- Rubrique Interactions : « à prendre en compte avec les fluoroquinolones »

La question reste en suspens pour les corticoïdes inhalés, les dermocorticoïdes et les autres formes locales (ophtalmiques, auriculaires).

2/ Comité technique du 8 novembre 2005

- Point sur les effets indésirables extrapyramidaux de la trimétazidine (Vastarel®, Centrophène® Gé)

A la suite de la notification spontanée d'un cas de syndrome parkinsonien au CRPV de Toulouse et de la publication dans la littérature de plusieurs observations, le CRPV de Toulouse a présenté à la demande de l'Afssaps un point sur les effets extrapyramidaux de la trimétazidine.

La trimétazidine est un dérivé pipérazinique dont le mécanisme d'action reste mal connu. Elle est indiquée dans :
- la prophylaxie de la crise d'angor (Service Médical Rendu « modéré »)
- le traitement symptomatique d'appoint des vertiges et des acouphènes (Service Médical Rendu « modéré »)
- le traitement d'appoint des baisses d'acuité et des troubles du champ visuel d'origine vasculaire (Service Médical Rendu « insuffisant »).

L'analyse des données de la littérature et des notifications spontanées, permet de mettre en évidence un signal, certes faible mais certain de survenue de syndrome parkinsonien sous trimétazidine. Le mécanisme reste inconnu mais une action sur les neurones dopaminergiques n'est pas exclue du fait de la structure chimique pipérazinique de la trimétazidine.

Le Comité Technique propose que la survenue exceptionnelle de syndrome parkinsonien soit ajoutée dans la monographie de la trimétazidine dans la rubrique « effets indésirables ». Une demande de modification de l'information a été envoyée par l'unité pharmacovigilance aux laboratoires concernés.

BESANCON
CHU Saint-Jacques – 25030 BESANCON Cedex

MEDIATOR® (benfluorex)

ENQUETE OFFICIELLE

Troubles neuropsychiatriques

Hypertensions artérielles pulmonaires

Commission Nationale du 29 novembre 2005

Confidentiel

M. DAVID-LAROCHE
J.P. KANTELIP

Annexe 3-70

Lors du Comité Technique de Pharmacovigilance du 7 décembre 2004 plusieurs notifications d'effets indésirables pouvant évoquer un effet de type amphétaminique ayant été rapportés, il a été décidé d'analyser les données relatives aux troubles neuro-psychiatriques avec MEDIATOR®

Suite à une notification d'hypertension artérielle pulmonaire rapportée lors du Comité Technique du 8 mars 2005, l'enquête a été étendue aux hypertensions artérielles pulmonaires.

Le MEDIATOR® (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg.

Ses indications sont :
- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité Technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène. (Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Historique :
Une première mise au point des effets indésirables du benfluorex a été présentée lors du Comité Technique du 11 juillet 1995, suivie d'une enquête officieuse dont les rapports ont été présentés aux Comités Techniques:
- du 30 avril 1998 sur les effets indésirables du benfluorex, rapportés aux CRPV
- du 10 septembre 1998 sur le métabolisme et les chiffres de ventes du benfluorex

et de l'enquête officielle présentée aux Comités Techniques des 17 décembre 1998 et 20 juillet 1999.

Le Résumé des Caractéristiques du Produit a été modifié suite à une Demande de Modification de l'Information Médicale expertisée par le CRPV de Besançon en juin 2000 d'une part, et une réunion de Pharmacovigilance à l'EMEA le 30 novembre 2000 d'autre part (pour choc et effets hépatiques).
(Les modifications sont inscrites en gras dans le paragraphe ci-dessous)

Les effets indésirables sont :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, **confusion**, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles
- **très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke**
- **élévation des enzymes hépatiques, hépatite (très rare)**

Métabolisme :

➢ In vivo : Chez l'homme, le MEDIATOR® est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases en S422 (dérivé alcool), puis transformé en 8 métabolites majeurs identifiés parmi lesquels, par oxydation (S1475, dérivé acide) ou désalkylation (S585, norfenfluramine).
Le métabolite majoritaire est le dérivé carboxylique : S1475.
Le métabolite primaire S422 et la norfenfluramine sont retrouvés à des taux très inférieurs.

Après administration de benfluorex radioactif, on retrouve 87 à 99% de la radioactivité après 72 heures dans les urines. L'absence de quantité significative dans les fécès montre que le produit est bien absorbé.
Il n'existe pas de phénomène d'accumulation.

L'élimination se fait en 2 phases :
- une première phase rapide (60% en 3 ou 4 heures)
- une seconde phase lente de 36 heures environ.

➢ In vitro : Les travaux faits in vitro après incubation d'hépatocytes frais humains montrent que les principaux cytochromes P450 jouent un rôle très minoritaire dans le métabolisme du benfluorex.

Annexe 3-70

TROUBLES NEURO-PSYCHIATRIQUES

A. Asthénie, somnolence ou états vertigineux sont mentionnés dans les RCP

B. Troubles psychiatriques lors du traitement

35 cas ont été rapportés dont 10 déclarés depuis l'enquête présentée en juillet 1999.
Remarque : Les nouveaux cas (10) notifiés depuis le rapport de juillet 1999 sont inscrits ***en gras.***
Elles concernent 18 hommes (âge moyen : 58,5 ans) et 17 femmes (âge moyen : 60 ans).

Les troubles psychiatriques sont divers :
- agressivité (4), nervosité (3), irritabilité
- cauchemars (2), angoisse, stupeur, dépression
- désorientation (7), *confusion* (5),* aggravation des troubles cognitifs
- agitation (3), trouble du comportement (3)
- délire (2), bouffée délirante aiguë

(*)confusion est inclus dans le dernier RCP

Remarque : La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue, dans la plupart des notifications.

1. Imputabilité :

4 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise de 1 comprimé de MEDIATOR®.

- **128E22** : chez un homme de 72 ans , traité pour démence, prenant pendant plusieurs années MEDIATOR® pour troubles métaboliques et MODOPAR® pour maladie de Parkinson, est observée une amélioration de ses troubles cognitifs lors d'un arrêt fortuit du MEDIATOR® et une aggravation lors de la reprise du MEDIATOR®.

- S10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 jours. Une réadministration ultérieure a été positive (traitement associé : KERLONE® et MOGADON®).

- **CN0000093** : désorientation temporo-spatiale et agitation chez un homme de 76 ans. Le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR® et la réadministration est positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P®. et FOZIRETIC®). *(cas décrit également paragraphe suivant « gravité »)*

5 cas sont imputés « plausible »

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR®, pendant 6 jours. Disparition des symptômes 12 heures après l'arrêt du MEDIATOR®.
- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.
- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2 heures après avoir ingéré 4 comprimés de MEDIATOR®.
- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.
- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR®, HALDOL®, SERESTA®, ZESTRIL®, CATAPRESSAN®, PRAXILENE®, SERMION®. L'évolution est favorable à l'arrêt de tous les médicaments.

26 cas ont été imputés « douteux » dont 13 (C2, S1).

2. Gravité :

Les effets indésirables ont nécessité une hospitalisation dans 9 cas.

a) Confusion : 4 cas

SE9500017 : Un **état confusionnel** ayant duré 12 h est survenu chez une femme de 41 ans après 83 jours de traitement par MEDIATOR® (1cp/j) et INCITAL®, et 2 ans par LEXOMIL®. Elle avait été retrouvée errante sur la voie publique après une dispute avec son mari. (Imputabilité : C1,S1)

010326 : Un homme de 61 ans, traité par MEDIATOR® (dose et durée inconnues), FONZYLANE® et SINTROM®, est hospitalisé pour déshydratation avec fièvre et **confusion**. L'évolution est favorable après réhydratation et arrêt du MEDIATOR®.

120M85 : Un homme de 69 ans, traité par MEDIATOR®, 2 cp/j pendant 11 jours pour désordre métabolique est admis à l'hôpital pour malaises avec **confusion** et amnésie. Le MEDIATOR® est arrêté, mais les troubles de mémoire continuent. Le scanner cérébral montre une atrophie cortico-souscorticale.
Le traitement associé est PREVISCAN® et CORDARONE®.

S01000031 : Un homme de 63 ans a été hospitalisé à plusieurs reprises pour confusion mentale inexpliquée. Une recherche des médicaments sur l'urine par technique de polarisation de fluorescence révèle une réponse positive pour les dérivés amphétaminiques et une chromatographie gazeuse couplée à une spectrométrie de masse ne confirme pas l'abus d'amphétamines usuels (incluant l'ecstasy).
Cependant, la norfenfluramine est retrouvée à des concentrations de 687 ng/ml dans l'urine et 8.4 ng/mg dans les cheveux.
La présence de norfenfluramine et l'absence de fenfluramine sont en faveur d'un abus illicite de MEDIATOR® (dose inconnue). L'évolution est inconnue. (Imputabilité : C1,S1)
(Cas publié :Norfenfluramine : usage thérapeutique ou toxicomanie ? V.CIRIMELE et coll. Journal de Médecine Légale Droit Médical, 2001, Vol.44, N°1, 23-26.

b) Désorientation temporo-spatiale : 3 cas

10345 : Une femme de 80 ans, avec des séquelles d'accident vasculaire cérébral, traitée pour hypercholestérolémie par MEDIATOR® 3cp/j pendant 13 jours est hospitalisée pour **désorientation temporo-spatiale et obnubilation** avec hypotension artérielle. L'évolution est favorable à l'arrêt du MEDIATOR®. Le rechallenge est positif.
Le traitement associé est: KERLONE®, MOGADON®.

RE037148 : Une patiente de 66 ans, obèse et grabataire, est amenée à l'hôpital en raison de l'apparition d'un syndrome confusionnel avec état stuporeux et une hyperthermie à 40°. Ses antécédents sont assez chargés avec entre autres, un état dépressif, un asthme et une cardiopathie hypertensive. Le traitement par MEDIATOR® (3cp/j) avait débuté 10 à 12 jours avant son hospitalisation à raison de 3 cp/j. Après l'arrêt du MEDIATOR®, on note une amélioration en quelques jours de la **désorientation temporo-spatiale**. Le traitement habituel de la patiente est : ASPEGIC®, COAPROVEL®, CORVASAL®, DIFFU K®, MONOTILDIEM®, MOVICOL®, SEROPRAM®, TRINIPATCH®, MEDIATENSYL®, VASTEN®, SERETIDE® et VENTOLINE®. (Imputabilité : C2,S1)

CN0000093 : Chez un homme de 76 ans, traité depuis 2 ans par MEDIATOR®, 3 cp/j, est apparu une **désorientation temporo-spatiale** et agitation, dont le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR® et la réadministration a été positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P.® et FOZIRETIC®) *(dossier imputé «C3,S1 » décrit paragraphe précédent).*

Annexe 3-70

RN9500096 : Une patiente de 59 ans, sans antécédent psychiatrique, en cure d'amaigrissement (perte de 10 kg) depuis 3 mois avec MEDIATOR® (3cp depuis 73j), LIPANTHYL®, Amfépramone®, Craetegus 100mg, PILOSURYL®, CANOL®, STRESAM®, OLIVIASE®, RELVENE® et TOP MAG® est hospitalisée pour **bouffée délirante aiguë** avec confusion, désorientation temporo-spatiale et agitation. L'évolution est favorable 8 jours après l'arrêt de tout le traitement et la mise sous neuroleptiques. (Imputabilité : C1,S2)

TO041306 : Une **bouffée délirante aiguë** à thème de persécution et de complot avec agitation extrême et opposition des soins a nécessité une hospitalisation sous contrainte chez un homme de 50 ans qui était traité par MEDIATOR® (1cp/j) depuis 29 mois, associé à COTAREG® et ZYLORIC®. Les troubles ont disparu en 24h sous SOLIAN IM®, TERCIAN IM® ET RIVOTRIL®. Le patient est sorti de l'hôpital avec SOLIAN® 400mg, 2 fois par jour. (Imputabilité : C1,S2)

3. Tableau récapitulatif des observations : (voir pages suivantes)

Les nouveaux cas (10) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras**.

3. Troubles psychiatriques apparaissant lors du sevrage

10 notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés, 6 par les CRPV, 4 par le laboratoire.

Ils concernent 2 hommes et 8 femmes, dont la moyenne d'âge est respectivement 30,5 ans (27-34) et 45,25 ans (30-65).

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 à 15 mois).

La durée de traitement par MEDIATOR® est de 1 mois à 8 ans.

Dans les 3 observations qui ont nécessité une hospitalisation (gravité = O dans le tableau page 10), il existe un terrain ou des antécédents prédisposants :

- **LY0200303** : une femme de 36 ans, traitée par MEDIATOR® pendant 6 mois pour obésité avec hypercholestérolémie et PROZAC pendant 6 semaines pour syndrome dépressif, est hospitalisée en psychiatrie pour **état anxiodépressif aigu** avec crise de panique, 2 à 3 semaines après l'arrêt des 2 médicaments.
L'état de la patiente s'améliore rapidement sous SOLIAN® et STABLON®. (Imputabilité : C1,S1)

- **LY0200036** : chez une femme de 34 ans, avec des troubles dysthymiques, suivie pour difficultés psychologiques de type border line, en rupture de traitement neuroleptique depuis plusieurs mois, apparaît une **décompensation avec délire persécutif et anxiété**, environ 3 semaines après un traitement de 4 mois par MEDIATOR®.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

- **LY0200037** : une femme de 53 ans, diabétique non insulino-dépendante, ayant fait 2 épisodes maniaques en 1985 et 1996 (ce deuxième épisode étant survenu à la suite d'un régime amaigrissant accompagné peut-être du benfluorex) est hospitalisée pour **accès maniaque atypique** environ 3 semaines après l'arrêt d'un traitement de 15 mois par MEDIATOR®. Il est a noté un amaigrissement de 20 kg en 1 an.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

Les autres troubles sont identiques à ceux décrits pendant le traitement par MEDIATOR® :

- vertige (4), somnolence (2)
- cauchemar, angoisse (2)

Dans 1 cas, l'imputabilité de MEDIATOR® est « vraisemblable » :

- PA97355052 : il s'agit d'un syndrome de sevrage avec **excitation** chez un homme de 27 ans, sportif, qui consomme (sur prescription médicale) à doses croissantes (1cp/semaine au début jusqu'à 9 cp/j) du MEDIATOR® comme "dopant ».
Ce patient avait eu un épisode similaire quelques mois plus tôt. (Imputabilité : C3,S1)

Troubles psychiatriques apparaissant lors du sevrage

Les nouveaux cas (8) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras.**

N°	S/Age	Durée TTT	Poso/j	Imput. MEDIATOR	TTT associé/ imputabilité	Antécédents Terrain	Evol.	Gravité	Effets indésirables	sevrage

Annexe 3-70

4. Troubles neurologiques

Les nouveaux cas (4) notifiés depuis le rapport de juillet 1999 sont inscrits **en gras**.

12 notifications ont été rapportées, 9 par les CRPV, 3 par le laboratoire :
Elles concernent 8 hommes et 4 femmes :

- Convulsions : 2 cas

PA9223988 : Chez un homme de 60 ans, survient une **crise convulsive généralisée**, alors qu'il est traité par MEDIATOR® 1cp/j (durée inconnue), TENSIONORME® depuis 10 ans et DIFFU K®. L'évolution est favorable à l'arrêt des 3 médicaments.

10060J47 : Une femme de 36 ans traitée par MEDIATOR® depuis 2 mois et DAONIL®, fait une **crise comitiale**, dont l'évolution est favorable.

- Neuropathies : 2 cas

MA8700716 : Chez un homme de 73 ans, traité pour un diabète léger par MEDIATOR® pendant 9 ans apparaît une **neuropathie sensitivomotrice** des membres inférieurs. Une autre étiologie peut être envisagée. L'évolution est inconnue.

TS9300183 : Une **neuropathie** est rapportée chez un homme de 68 ans traité depuis 3 mois par MEDIATOR® et GLUCOPHAGE®, et 5 mois par AZANTAC®. Le traitement habituel est DIAMICRON®, SURBRONC® et CYCLOSPASMOL®.

- Paresthésies : 7 cas

Dans 3 cas (**PA0200221,** NC9300349, **MA03P0355**), il existe des symptômes associés cités ci-dessus agitation, dépression, vertige et asthénie.

Le délai d'apparition est très court : de 1 à 8 jours dans la majorité des cas. Dans 1 cas, où la neuropathie est associée à une dépression et asthénie, le délai est de 9 mois (NC9300349).

L'évolution, quand elle est connue, est favorable rapidement en quelques heures.

A noter que dans 2 cas, il s'agit de mésusage :

- **MA03P0355 :** prise de 6 comprimés en 1 fois, par une femme de 26 ans, qui a présenté des douleurs abdominales, des vertiges, une asthénie et des paresthésies au niveau des membres inférieurs.
- MA9700170 : automédication chez une femme de 42 ans, qui après le deuxième comprimé de MEDIATOR® est survenue une sensation de chaleur accompagnée de picotements des extrémités et des palpitations. L'évolution est inconnue.

- Tremblements des mains

128F60 : un patient de 72 ans ayant débuté depuis 5 jours un traitement par MEDIATOR®, LIPANTHYL® MONO-TILDIEM® et HYPERIUM® développe un **tremblement des mains.**
HYPERIUM® est remplacé par diltiazem puis trandolapril, LIPANTHYL® remplacé par atorvastatine et les doses de MEDIATOR® de 300 mg/j sont diminuées de moitié. Les tremblements régressent.
Le MEDIATOR® est arrêté ensuite.

Annexe 3-70

5. Abus

2 cas d'abus ont été rapportés :

- 1 cas rapporté par le laboratoire sans effet indésirable :
  - S01001135 : Un homme de 42 ans, traité par MEDIATOR® 150 mg 2 fois par jour pour hypertriglycéridémie depuis décembre 1999, augmente les doses à 10 comprimés par jour de janvier à novembre 2001, puis retourne à une dose normale à 2 comprimés par jour ensuite.
  Le traitement associé était TERCIAN® et LEPTICUR®.
  Aucun effet indésirable n'est rapporté.

- 1 cas rapporté par un CRPV avec effet indésirable : (déjà cité page 9, paragraphe sevrage)
  - PA97355052 : il s'agit d'un syndrome de sevrage avec **excitation** chez un homme de 27 ans, sportif, qui consomme (sur prescription médicale) à doses croissantes (1cp/semaine au début jusqu'à 9 cp/j) du MEDIATOR® comme « dopant ».
  Ce patient avait eu un épisode similaire quelques mois plus tôt. (Imputabilité : C3,S1)

II – HYPERTENSIONS PULMONAIRES :

Suite à une notification d'hypertension artérielle pulmonaire (HTAP) rapportée par le CRPV de Montpellier (MP0300189) lors du Comité Technique du 8 mars 2005, l'enquête sur MEDIATOR® a été étendue aux hypertensions artérielles pulmonaires.

17 notifications (6 CRPV et 13 laboratoire) dont 2 doublons, ont été rapportées :

1. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«Hypertension artérielle pulmonaire » avaient été rapportées.
(9 d'entre elles faisaient partie de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » présentée au Comité technique du 28 avril 1995)
Elles ont été expertisées par le Professeur WEITZENBLUM (Strasbourg) :
- 7 ont été classées en HTAP d'allure idiopathique
- 3 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR® n'était jamais prescrit seul : il était présent en association à un ou plusieurs anorexigènes :
- ISOMERIDE® : 7 fois
- ISOMERIDE® + PONDERAL® : 2 fois
- ISOMERIDE ®+ FENPROPOREX® : 1 fois
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois

La durée de traitement par MEDIATOR® est précisée dans 7 cas sur 11 : elle est de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® est :
- concomitante dans 5 cas,
- antérieure dans 2 cas,
- imprécise dans 1 cas.
- **postérieure dans 3 cas** *(voir détail page suivante) :*

➢ 840425 :
Une femme, 57 ans, obèse depuis longtemps, ayant pris PONDERAL® pendant 2 mois en 1978 et ISOMERIDE® en 1986 (durée inconnue) est hospitalisée en janvier 1993 pour suspicion d'embolie pulmonaire. La scintigraphie pulmonaire est normale.
Le traitement habituel est VOLTARENE®, FELDENE® et DOLIPRANE® pour lombalgies.

En septembre 1993, lors d'une consultation cardiologique, on note une dyspnée stade 3 et un souffle systolique d'insuffisance tricuspidienne. Des signes d'hypertrophie ventriculaire droite sont retrouvées à l'électrocardiogramme.
La dyspnée s'aggravant progressivement, la patiente est hospitalisée en novembre 1993.
A noter que la patiente aurait pris MEDIATOR® , VEINOBIASE®, STILNOX® et XANAX® au cours du mois de septembre 1993.
A l'échodoppler cardiaque, la PAP systolique (PAPs) est estimée à 73 mmHg.
Le cathétérisme cardiaque confirme l'HTAP précapillaire.

En février 1994, l'échodoppler montre une aggravation de la PAPs à 95 mmHg, mais l'état clinique de la patiente est légèrement amélioré début juin 1994.

→ *Avis de l'expert : « HTAP d'allure idiopathique »*

➢ 840663 :
Chez un homme de 48 ans, dont les antécédents sont une hypertension artérielle traitée par FLUDEX®, des glycémie, cholestérolémie et uricémie aux limites supérieures de la normale, un syndrome restrictif post-traumatique, un tabagisme interrompu depuis 1987 et une obésité traitée par ISOMERIDE® de septembre 1990 à avril 1991, est hospitalisé en février 1992 pour syndrome obstructif post-tabagique sévère et aggravation du syndrome restrictif. Une dyspnée d'effort est cotée stade 3-4.
Le traitement de sortie est : MEDIATOR®, VECTARION®, BRONCHODUAL® et BRONILIDE®. FLUDEX® est remplacé par ECAZIDE®, puis LUMITENS®.

Après une amélioration, la dyspnée s'est aggravée et le patient est hospitalisé à nouveau en mai 1993 pour bilan de l'hypoxémie.
A l'échocardiographie, les cavités droites sont très dilatées, comprimant les cavités gauches. La PAPs est estimée à 50 mmHg.
Le cathétérisme droit effectué en juin 1993 pose le diagnostic d'HTAP précapillaire avec une PAP systolique à 90 mmHg. Le patient décède 24 mois plus tard.

→ *Avis de l'expert : « HTAP d'allure idiopathique »*

➢ 840B19 :
Une femme de 51 ans, ayant une HTA, une obésité après une première grossesse en 1966, traitée par PONDINIL® en 1974, puis par ISOMERIDE® de 1985 à 1989 (2 fois 3 mois), une hyperlipidémie traitée par MEDIATOR® de 1989 à janvier 1995, est hospitalisée en août 1994 pour bilan d'un syndrome sec.

Une échocardiographie met en évidence une double atteinte aortique et mitrale et une HTAP. Le traitement antérieur comporte : LIPUR®, SECTRAL®, DEBRIDAT®, PRAGMAREL®, ENDOTELON®.

En décembre 1994, lors d'une échocardiographie de contrôle, la PAPs est estimée à 60-65 mmHg.
Le traitement de la patiente est alors : SECTRAL®, MODURETIC®, KALEORID®, RANIPLEX®, PREPULSID®.

En janvier 1995, l'état de la patiente est stable avec une PAPs évaluée à 55 mmHg.

→*Avis de l'expert : « probable HTAP secondaire à une cardiopathie gauche ».*

Annexe 3-70

2. Notification où MEDIATOR® n'est pas associé à un anorexigène : 5 notifications

Les nouveaux cas (5) notifiés depuis le rapport de juillet 1999 sont inscrits ***en gras***

4 dossiers ont été expertisés par le Professeur WEITZENBLUM, le cinquième étant trop succinct, le sixième nous étant parvenu récemment.

➢ **TO040278 :**

Une femme de 36 ans, traitée pendant 2 ans par MEDIATOR®, 3cp/j, LEVOTHYROX®, GINKOR Fort®, PRAXINOR®, PROZAC®, HEPTAMYL® et CANOL® est hospitalisée le 25 novembre 2003 suite à une détresse respiratoire aiguë. Le diagnostic est un syndrome alvéolo-interstitiel bilatéral. Il n'y a pas de syndrome inflammatoire.
Les antécédents sont une hypothyroïdie, un tabagisme, un surpoids et une insuffisance aortique de grade 2 découverte un an auparavant.
L'échographie montre une fonction systolique ventriculaire gauche à 65%, avec un ventricule gauche dilaté, une insuffisance mitrale de grade 2 et une insuffisance aortique de grade 2.
Le doppler veineux ne montre pas de thrombose veineuse des membres inférieurs.
L'état de la patiente s'améliore sous ALDACTONE®, LASILIX® et RENITEC®. Le traitement associé est LEVOTHYROX®, PROZAC® et CANOL®.
Une échographie de contrôle réalisée après normalisation clinique et radiologique montre une oreillette gauche dilaté et des cavités droites non dilatées sans HTAP.
Conclusion du cardiologue: *« Décompensation cardiaque associée à une probable infection virale broncho-pulmonaire ».*
Le 5 janvier, la patiente est hospitalisée à nouveau pour récidive d'un subOAP sur valvulopathies aortique et mitrale à la faveur d'une virose.
La valvulopathie est recontrôlée par échographie par voie transthoracique : il existe alors une élévation des pressions artérielles pulmonaires avec une PAPs estimée à 50mmHg (N :15 mmHg), le ventricule et l'oreillette gauches sont dilatées.
Le 23 janvier 2004, le remplacement des valves est effectué. On ne note aucun problème dans les suites de l'opération.
L'anatomopathologie des valves montre une lésion dégénérative aspécifique.

Le diagnostic différentiel élimine :
- une maladie rhumatismale : l'aspect échographique n'est pas en faveur
- une endocardite : la recherche est négative
- une maladie auto-immune : les autoanticorps et la recherche des phospholipides sont négatifs.

Il est à noter que la soeur de la patiente est suivie pour valvulopathie.
Le traitement de sortie est PREVISCAN®, RENITEC®, PROZAC®, LEVOTHYROX®.

→*Avis de l'expert* : *« cardiopathie valvulaire sévère, l'OAP ayant entrainé une HTAP post-capillaire. »*

➢ **MP0500189 :**

Une femme de 55 ans, traitée par MEDIATOR®, 1cp/j, depuis 31 mois est hospitalisée en janvier 2005 pour suspicion d'embolie pulmonaire, avec dyspnée d'effort importante, progressivement croissante depuis plusieurs mois.
A l'échographie cardiaque, la PAPs oscille entre 75 et 80 mmHg.
L'angioscanner thoracique ne met pas en évidence de signe d'embolie pulmonaire, mais il semble exister un caillot dans l'artère sous segmentaire gauche.
Les D Dimères sont élevés à 12000.
La scintigraphie pulmonaire de ventilation perfusion montre des troubles perfusionnels avec vraisemblablement un petit épanchement pleural gauche, faisant suspecter des épisodes emboliques multiples partiellement reperfusés
Conclusion du cardiologue : « *Possible embolie pulmonaire compliquée d'HTA pulmonaire importante avec à la scintigraphie des défects périphériques disséminés. Il s'agit possiblement de micro-embols d'installation progressive mais on ne peut exclure formellement une HTAP primitive de type veino-occlusif.* »

Dans [illegible] la patiente [illegible] embolie pulmonaire [illegible] publique, compliquée d'une phlébite, traitée par antivitamines K pendant un an, une HTA ancienne traitée par COTAREG® et un tabagisme modéré.
Le 31 janvier, l'échographie cardiaque de contrôle met en évidence une diminution de la PAPs à 65 mmHg, le ventricule droit est dilaté, l'insuffisance tricuspide est relativement importante.

Le 1 février 2005, la patiente est sortie avec une PAPs à 65 mmHg, le traitement de sortie étant PREVISCAN® (en prévention d'une embolie pulmonaire), COTAREG® et MOPRAL®.
Le 22 février 2005, elle est hospitalisée à nouveau avec altération de l'état général, des douleurs thoraciques, des vomissements et une dyspnée.
La pression artérielle pulmonaire est à 80-85 mmHG, Sa tension artérielle est à 120/90, mais elle chute dans la nuit suivante à 8/5.
La patiente fait une asystolie et décède le lendemain par arrêt cardio-circulatoire.

→*Avis de l'expert* : *« Vraisemblable HTAP post-embolique »*

➢ PS9900385 :
Chez une femme de 50 ans, ayant comme antécédent une hypertension artérielle traitée par LOGIRENE®, 0,5 cp/j et TRIATEC® 2,5 cp/j et une hypercholestérolémie traitée par LIPANTHYL® 1 cp/j et MEDIATOR®, 1 cp/j, est découvert une hypertension artérielle pulmonaire.
Le début des symptômes remontent à décembre 1998 avec l'installation d'une dyspnée d'effort, qui s'est majorée après un an d'évolution.
Lors d'un bilan en mai 1999, la pression artérielle pulmonaire systolique (PAPs) est estimée à 91 mmHg à l'échographie cardiaque.
Un bilan en juin 1999 confirme une HTAP avec une coronarographie, une angiographie et une scintigraphie pulmonaire normales.
Au cathétérisme droit, la pression artérielle pulmonaire moyenne (PAPm) est à 51 mmHg.
Un traitement par FLOLAN® est instauré (21 juin 1999).

Un bilan réalisé à trois mois montre une réelle amélioration et la patiente reste stable cliniquement jusqu'en septembre 2001, où elle constate une réaggravation de la dyspnée d'effort mais la PAPm est alors stable à 55mmHg.

→ *Avis de l'expert : « HTAP d'allure idiopathique »*

➢ **S02001877** :
Une patiente de 55 ans est traitée pendant un an (juillet 2001-septembre 2002) par MEDIATOR® pour un diabète non insulino-dépendant et une dyslipidémie, associé à ALDACTONE®, LASILIX® et TERALITHE®.
En juin 2002, un cathétérisme cardiaque droit montre une hypertension précapillaire avec une PAP à 51 mmHg. L'échographie montre des cavités droites dilatées.
L'échodoppler des membres inférieurs et la scintigraphie pulmonaire sont normaux.

En octobre 2002, la patiente est hospitalisée avec une dyspnée de grade 3. Au cathétérisme cardiaque droit, la PAPm est à 40 mmHg.
Les différents traitements pris par la patiente sont :
PREVISCAN®, LESCOL®, AMAREL®, STABLON®, ATARAX®, TEMESTA®, LIPANTHYL®, LIPUR®, TOCO®, GLUCOPHAGE®.
L'évolution est inconnue.

➢ **S02001046** :
Une femme de 59 ans traitée par MEDIATOR® , 3 cp/j pour un désordre métabolique lipidique depuis novembre 1992 associé à de nombreux médicaments est hospitalisée en mars ou avril 2002 pour dyspnée et malaise.
Une hypertension pulmonaire est diagnostiquée. Le MEDIATOR® est alors arrêté.
Les différents traitements associés sont : CAPTEA®, LOPRIL®, PROGYNOVA®, UTROGESTAN®, HUMORYL® et PRAXINOR®
L'évolution est inconnue et le dossier succinct. *(dossier non expertisé)*

Un homme de 74 ans, avec un BMI = 31, a comme antécédents : une cardiopathie hypertensive diagnostiquée en 1982 avec des épisodes de tachycardie paroxystique depuis 1977, une arythmie par fibrillation auriculaire et un souffle systolique mitral et aortique depuis 1982. Il est traité par MODURETIC® ET SELOKEN® depuis 1982, puis par KERLONE®, HYTACAND®, CHRONO-ADALATE® depuis plusieurs années (au moins 2003) et PREVISCAN® depuis 2001. D'autre part, ce patient prend du MEDIATOR®, 3cp/j pour dyslipidémie depuis 1996.
En 1982, il existe un souffle systolique avec foyers mitral, aortique et aux 2 carotides.

En 2004, lors d'une consultation cardiologique pour dyspnée d'effort et toux sèche persistante signalée depuis février 2003, et apparition récente d'œdèmes des membres inférieurs, la PAPs est estimée à 52 mmHg à l'échocardiographie. L'insuffisance mitrale est de grade I, les cavités droites sont dilatées avec une insuffisance tricuspidienne de grade II.

En juin 2005, la dyspnée s'est aggravée. L'échocardiographie est stable par rapport à 2004, l'insuffisance mitrale est peu importante, l'insuffisance tricuspidienne est importante, la PAPs est estimée à 55 mmHg.
Le 4 août 2005, le patient consulte un pneumologue, car il se plaint de toux survenant dans le primo-décubitus, qui ne semble qu'en partie liée à la cardiopathie, pour discuter du maintien des antihypertenseurs, notamment béta-bloquants et antagoniste de l'angiotensine II. On évoque la possibilité d'un reflux gastro-oesophagien, qui sera traité par OGAST® pendant 1 mois.

Le 30 août 2005, le MEDIATOR® est arrêté. L'état du patient s'améliore très rapidement avec disparition de la toux et de l'essoufflement.(le lendemain de l'arrêt du MEDIATOR®, selon le patient). *(dossier non expertisé)*

3. Fréquence :

Depuis le début de la commercialisation de MEDIATOR®, le nombre de boites de 30 comprimés vendues est de : 110 693 331, correspondant à 45 515 349 mois de traitement*.
(Le nombre de patients traités est évalué à 3 390 459 patients).

Après élimination des HTAP post-emboliques (2) et post-capillaires (5), il reste 10 cas HTAP d'allure idiopathique soit :
- 1 cas pour 11 069 333 boites vendues
- ou 1 cas pour 4 551 534 mois de traitement.

(*) mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (1 mois = 30,4 jours).

Après élimination des HTAP d'allure idiopathique (7) survenues lors de traitement par MEDIATOR associé à un anorexigène et un dossier trop succinct (S02001046), il reste 2 cas d'HTAP d'allure idiopathique soit :
- 1 cas pour 55 346 666 boites vendues
- ou 1 cas pour 22 757 674 mois de traitement.

III – CONCLUSIONS :

- Troubles neuropsychiatriques :
Cette enquête de Pharmacovigilance permet de confirmer la réalité des *confusions* qui peuvent apparaître sous MEDIATOR. Cet effet est déjà présent dans le RCP, mais il paraît judicieux de développer le terme *« confusion »* en détaillant les symptômes tels que : Troubles des fonctions cognitives : *désorientation temporo-spatiale,* troubles du comportement *: agitation, délire,* troubles de la perception : *hallucinations*

-Hypertensions artérielles pulmonaires :

Compte tenu de l'incidence des HTAP d'aooure idiopathique (1 à 2 cas par millions et par an), le nombre de cas d'HTAP d'allure idiopathique rapporté dans l'enquête ne constitue pas un signal significatif de toxicité du MEDIATOR dans la classe organe cardiovasculaire.

COMPTE-RENDU REUNION MEDIATOR /AFSSAPS 13.10.06

Objectif :

Examen des modalités pratiques de mise en œuvre des études demandées (courrier AFSSAPS du 16.03.06, suite au rapport de la Commission Nationale de Pharmacovigilance du 29.11.05) :

- étude d'utilisation-prescription
- étude expérimentale sur modèle animal d'HTAP

N.B. : Etude au niveau des Centres d'Evaluation et d'Information sur la Pharmaco-dépendance (CEIP) : à mettre en œuvre par l'AFSSAPS.

Représentants AFSSAPS :

- Mme CASTOT (Surveillance des risques, du Bon Usage et de l'Information sur les Médicaments)
- Mme KREFT-JAIS (Pharmacovigilance)
- Professeur CARON (Président Commission Pharmacovigilance)
- Mme POROKHOV (Pharmacovigilance, Gamme métabolisme)
- Mme REY-QUINIO (Evaluation thérapeutique, Pharmaco-toxico-clinique 2)
- Mme DAVID (Rapporteur Centre régional Pharmacovigilance Besançon)

Délégation Servier :

- Francis WAGNIART (Pharmacovigilance)
- Marie FRANCILLARD (Division thérapeutique métabolisme)
- Marie PARAIRE (Division thérapeutique métabolisme)
- Guyslaine CLEMENT-BAUDENA (Etudes utilisation-prescription)
- Pierre MONTES (Affaires pharmaceutiques France)

Rappel du contexte :

Evaluation du rapport bénéfice/risque rejoignant la demande en cours de la HAS en vue de la réévaluation du SMR de la spécialité.

Présentation des résultats d'étude d'utilisaton-prescription :

Etude menée par l'Institut Thalès sur la période mai 2004 / avril 2005 et mai 2005 / avril 2006, montrant qu'environ 80 % des prescriptions de Médiator sont réalisées chez des patients dyslipidémiques et/ou diabétiques, 11,5 % chez des patients obèses et 8,5 % pour d'autres diagnostics. Ces chiffres restent stables. L'AFSSAPS demande de préciser les caractéristiques de la population obèse.

Présentation du synopsis de l'étude modèle animal envisagée :

- Grandes classes de modèles animaux utilisés
- Rationnel du choix du rat Fawn Hooded
- Schéma de l'étude : les représentants de l'AFSSAPS envisagent de soumettre cette proposition au Groupe de travail pré-clinique de la Commission d'AMM.

Prochaines étapes :

- Réévaluation du bénéfice/risque envisagée le 23 novembre par le Groupe de travail interne / diabète
- Proposition d'étude modèle animal à soumettre au Groupe de travail pré-clinique si possible en novembre ou décembre, puis à la Commission de pharmacovigilance.

Modèle animal
Hypertension artérielle pulmonaire (HTAP)

- Rappel caractéristiques HTAP
- Modèles animaux HTAP - Choix du modèle
- Projet d'étude

1

Rappel caractéristiques HTAP

- Résistance vasculaire pulmonaire élevée et insuffisance ventriculaire droite
- « Remodeling » vasculaire des petites artères pulmonaires
  - prolifération anarchique des cellules endothéliales et musculaires lisses
  - muscularisation des artérioles et épaississement de la media

2

Modèles animaux d'HTAP

- Stimuli (patho)physiologiques :
  - ex. rat en hypoxie chronique
- Stimuli chimiques et toxiques :
  - ex. rat monocrotaline
- Modèles génétiques :
  - ex. rat Fawn-Hooded

3

Modèles animaux d'HTAP : choix du modèle

Rat Fawn-Hooded (FH) : modèle retenu

- Déficit de stockage de la sérotonine dans les plaquettes
- Susceptibilité de développer spontanément une HTAP
- HTAP accélérée si exposition en altitude (hypoxie légère)

4

Projet étude rat Fawn-Hooded (FH)

- Rats FH (n=80) : 8 groupes contrôles ou traités 6 mg/kg
- Normoxie ou hypoxie chronique
- Traitement par voie orale en chronique (3 semaines + réversibilité)
- Paramètres évalués :
  - Hémodynamiques : Pression artérielle pulmonaire
    Pression artérielle systémique
  - Index d'hypertrophie ventriculaire droite : poids VD/VG+septum
  - Histologie : prolifération cellulaire et degré de muscularisation des artérioles

Annexe 3-71

PROJET D'ETUDE MODELE ANIMAL HYPERTENSION ARTERIELLE PULMONAIRE

Introduction

L'hypertension artérielle pulmonaire (HTAP) est caractérisée par une résistance vasculaire pulmonaire élevée et une insuffisance ventriculaire droite. Elle est associée à des modifications vasculaires.
Le « remodeling » vasculaire consiste en des altérations structurales et fonctionnelles des cellules endothéliales et musculaires lisses dans les petites artères pulmonaires, le mécanisme pathogène précis de ce « remodeling » vasculaire pulmonaire n'étant pas encore complètement élucidé.
Histologiquement, la maladie est caractérisée par une prolifération anarchique des cellules endothéliales et musculaires lisses avec une muscularisation des artérioles non préalablement muscularisées et un épaississement de la media des artérioles normalement muscularisées.

Justification du modèle

Une grande variété de modèles animaux a été développée afin d'essayer de comprendre les mécanismes physiopathologiques de l'HTAP idiopathique et de pouvoir évaluer des stratégies thérapeutiques.
Trois grandes classes de modèles expérimentaux in vivo ont été utilisées :

- Les modèles utilisant des stimuli (patho)physiologiques comme l'hypoxie aiguë et chronique chez le rat et la souris principalement (1). En réponse à une hypoxie aiguë, il est observé une vasoconstriction des artères pulmonaires, à la différence des artères systémiques qui se dilatent, et une exposition chronique à l'hypoxie conduit à une HTAP.
- Les modèles utilisant des stimuli chimiques et toxiques comme la monocrotaline chez le rat (2). La monocrotaline est une phytotoxine qui induit une lésion endothéliale avec une toxicité sélective pour les vaisseaux pulmonaires, sans effet sur les vaisseaux systémiques.
- Les modèles dits génétiques comme le rat Fawn-Hooded (FH) (3). Le rat FH, qui présente un déficit de stockage de la sérotonine dans les plaquettes, a une susceptibilité génétique de développer une HTAP soit spontanément, soit de façon accélérée et plus sévère par une exposition en altitude donc à un facteur environnemental (ici l'hypoxie légère).

Tous ces modèles expérimentaux partagent à des degrés divers les caractéristiques de l'atteinte vasculaire observée dans l'HTAP, sachant qu' aucun modèle animal ne reproduit complètement l'ensemble des modifications observées sur les prélèvements de poumons de patients atteints d'HTAP idiopathique. De plus, il est à noter que tous ces modèles ont été développés dans le but d'étudier des thérapeutiques spécifiques de l'HTAP et non pour évaluer le potentiel toxique de médicaments.
Les modèles expérimentaux qui ont été les plus utilisés sont ceux cités précédemment, à savoir le rat en hypoxie, le rat monocrotaline et le rat Fawn-Hooded (FH).

Parmi ces trois modèles, le rat FH a été retenu. Chez l'Homme, le facteur sérotoninergique semble très important dans la prédisposition à développer une HTAP idiopathique.

Proposition d'étude

L'effet de benfluorex serait évalué sur différents groupes de rats FH en conditions de normoxie ou d'hypoxie. Cela permettrait d'étudier deux situations : développement d' une HTAP chez un animal présentant une susceptibilité génétique d'en développer ; potentialisation d'une HTAP induite par une exposition à une hypoxie chronique.
En pratique, benfluorex sera administré par voie orale en traitement chronique.

Différents paramètres seront évalués à l'issue de ce traitement chronique et après arrêt du traitement dans un groupe de réversibilité:

1. Paramètres hémodynamiques : après anesthésie, un cathéter sera inséré dans l'artère pulmonaire pour mesure de la pression artérielle pulmonaire (PAP) et dans l'artère carotide droite pour mesure de la pression artérielle systémique (PAS).

2. Index d'hypertrophie ventriculaire droite : après prélèvement du cœur le ratio du poids du ventricule droit sur le poids du ventricule gauche plus le septum sera évalué.

3. Remodeling vasculaire pulmonaire : après prélèvement et fixation, des coupes sont effectuées sur le poumon droit et examinées après coloration pour l'évaluation du degré de remodeling vasculaire (muscularisation des artérioles)

Objectif de l'étude

Recherche d'un éventuel mésusage de MEDIATOR par l'analyse de son utilisation / prescription

Choix méthodologique : observatoire THALES

- L'observatoire épidémiologique permanent THALES :
  - est fondé sur l'activité régulière d'un échantillon national de médecins généralistes libéraux (1 200 MG) informatisés équipés du logiciel Doc'ware
  - permet de recueillir et d'analyser longitudinalement des données issues de dossiers patients en étudiant précisément le contexte de la prescription dans la pratique courante
  - la procédure permet de remonter en continu via le réseau informatique des données anonymes et codées

Choix méthodologique : observatoire THALES (suite)

- La représentativité de l'échantillon est établie sur 3 critères
  - répartition par région
  - répartition par sexe
  - répartition par tranche d'âge
- Cette garantie de représentativité sur les critères usuels considérés comme ayant un impact sur les pratiques de prescriptions, permet de procéder à des extrapolations nationales sur les paramètres mesurés.
- Par ailleurs, il est vérifié :
  - que l'observatoire recouvre des réalités proches des référentiels connus pour le secteur conventionnel (secteur 1 et secteur 2) et le potentiel T.V.F
  - que la population des patients suivis par les médecins THALES a les mêmes caractéristiques que la population des patients du régime général d'Assurance Maladie suivie en médecine de ville (âge, sexe, taux ALD)

Méthodologie de l'étude MEDIATOR

- Analyse de la prescription de MEDIATOR chez les médecins généralistes en fonction des indications pour lesquelles il a été prescrit.
- Période analysée :
  - mai 2004 – avril 2005
  - mai 2005 – avril 2006
- Nous avons distingué 5 groupes exclusifs de patients :

A : Patients diagnostiqués **dyslipidémiques** dans l'année (non diagnostiqués diabétiques)

B : Patients diagnostiqués **diabétiques** dans l'année (non diagnostiqués dyslipidémiques)

C : Patients diagnostiqués **diabétiques et dyslipidémiques** dans l'année

D : Patients **non diabétiques, non dyslipidémiques** ayant reçu un diagnostic « **obèses** », « **surcharge pondérale** », « **prise de poids** », associé à la prescription de MEDIATOR

E : **Autres patients non diabétiques, non dyslipidémiques** ayant reçu d'**autres diagnostics** associés à la prescription de MEDIATOR

Répartition du nombre de prescriptions et de patients traités par MEDIATOR en fonction du diagnostic

		de mai 2004 à fin avril 2005			de mai 2005 à fin avril 2006		
		Nombre de patients MEDIATOR	Nombre de prescriptions MEDIATOR générales	Nombre de prescriptions par patient	Nombre de patients MEDIATOR	Nombre de prescriptions MEDIATOR générales	Nombre de prescriptions par patient
A	Patients dyslipidémiques	270 302	609 998	2,3	286 909	668 490	2,3
		50,8%	44,8%		51,6%	45,5%	
B	Patients diabétiques	63 161	203 395	3,2	64 909	213 551	3,3
		11,9%	14,9%		11,7%	14,5%	
C	Patients dyslipidémiques et diabétiques	81 349	306 222	3,8	80 662	301 170	3,7
		15,3%	22,5%		14,5%	20,5%	
D	Patients avec diagnostic obésité / surcharge pondérale / prise de poids associé à la prescription	76 443	172 527	2,3	73 193	157 679	2,2
		14,3%	12,7%		13,2%	10,7%	
E	Patients avec d'autres diagnostics associés à la prescription du MEDIATOR	43 049	121 230	2,8	43 615	127 264	2,9
		8,1%	8,1%		7,8%	8,7%	
Total MEDIATOR		534 330	1 463 378	2,8	553 328	1 468 153	2,7
		100,0%	100,0%		100,0%	100,0%	

CONCLUSION

- Environ 80 % des prescriptions de MEDIATOR sont réalisées chez des patients dyslipidémiques et / ou diabétiques

  (mai 04 – avril 05 : 80,3 % / mai 05 – avril 06 : 80,5 %)

- 11,5 % chez des patients « obèses »

  (mai 04 – avril 05 : 11,5 % / mai 05 – avril 06 : 10,7 %)

- Ces taux restent stables au cours du temps

Destinataire : ,
Date : Mar, Mars 20, 2007 20:48
Objet : SERVIER- Mediator- Compte-rendu de réunion de concertation du 13 mars/ Diaporamas
CC : , ,
Pièces jointes : , ,

Mesdames,

Comme convenu lors de notre réunion de concertation mardi dernier, au cours de laquelle nous avons fait le point sur Mediator, je vous prie de bien vouloir trouver ci-joint une proposition de compte-rendu des points discutés. Sont également jointes les présentations Powerpoint préparées en vue de la réunion de la Commission nationale de PV de mardi prochain, le 27 mars.

Afin de m'assurer de la bonne transmission du message, je vous serai reconnaissante de bien vouloir m'en confirmer réception. Je reste à votre disposition pour toute question ou information complémentaire.

Veuillez agréer, Mesdames, l'expression de mes sincères salutations.

Florence MAHLBERG-GAUDIN

COMPTE-RENDU DE REUNION

Mardi 13 mars 2007, de 18h à 19h, à l'AFSSAPS- Saint-Denis

Objet : Réunion de concertation - Point sur MEDIATOR®

Ordre du jour : En prévision de la réunion de la Commission nationale de pharmacovigilance du mardi 27 mars 2007 :

- Mise à jour sur la pharmacovigilance
- Résultats de la réévaluation du B/R
- Résultats de l'étude d'utilisation

Participants :

Représentants AFSSAPS :

- Pr J. CARON (Président de la Commission nationale de pharmacovigilance)
- Dr JP. KANTELIP (Directeur du centre régional de pharmacovigilance de Besançon)
- Dr M. DAVID-LAROCHE (CRPV Besançon) *Présente au téléphone*
- Dr C. KREFT-JAIS (Chef de département délégué à la pharmacovigilance)
- Mme B. POROKHOV (Unité de pharmacovigilance, Gamme métabolisme)

Représentants SERVIER :

- Dr G. CLEMENT-BAUDENA (Directeur- Etudes d'utilisation/prescription)
- Dr M. FRANCILLARD (Directeur division thérapeutique métabolisme)
- Mme F. MAHLBERG-GAUDIN (Directeur adjoint affaires pharmaceutiques France)
- M. P. MONTES (Directeur affaires pharmaceutiques France)
- Mme M. PARAIRE (Chef de département préclinique- Division métabolisme)
- Dr F. WAGNIART (Directeur de la pharmacovigilance)

Déroulement de la réunion :

1. ***Rappel des conclusions de la Commission de pharmacovigilance de novembre 2005, par le Pr Caron,*** et la décision d'une réévaluation de la balance bénéfice/risque de MEDIATOR® (13 voix pour, 10 voix contre, 5 abstentions) et mise en œuvre des études suivantes :
   i. Etude d'utilisation/prescription
   ii. Réévaluation de l'efficacité de MEDIATOR® dans le diabète de type 2.
   iii. Etude expérimentale sur modèle animal permettant d'évaluer le potentiel de MEDIATOR® à engendrer des HTAP
   iv. Etude au niveau des CEIP par saisine de la Commission nationale des stupéfiants et psychotropes, afin d'évaluer un éventuel problème de pharmacodépendance.

2. ***Mise à jour de la pharmacovigilance (Dr DAVID-LAROCHE, téléphone)***

   a. HTAP

Trois nouveaux cas ont été discutés :

- Un cas provenant du CRPV de Toulouse : patiente de 50 ans, avec obésité (92 kg- 156 cm, IMC = 38 kg/m²), diabète et HTA. Traitée entre 2000 et 2003 à 3 cp/j. Présente une dyspnée, hypoxémie, sans apnée du sommeil. Cathétérisme en sept 2005. Instauration d'un antagoniste calcique. En 2006, découverte d'une communication inter-auriculaire.

- Deux cas très récents, provenant du CRPV de Brest :
  - 1 patiente de 51 ans, obèse (110 kg-163 cm ; IMC= 41 kg/m²)), avec diabète, phlébite, apnées du sommeil, BPCO tabagique, ayant pris Mediator pendant 3 mois il y a 10 ans. En décembre 2006 : PAPm= 60mmHg
  - 1 femme de 58 ans, obèse (127 kg - 161 cm ; IMC= 49 kg/m²) avec diabète et HTA, et traitement par Mediator pendant 10 ans. En décembre 2006 : PAPm=46 mmHg

Il a été proposé de faire évaluer ces cas par un expert, si possible avant la Commission nationale du 27 mars.

b. Troubles neuro-psychiatriques

- 2 cas de bouffées délirantes
- 1 cas de dépression chez une femme dépressive avant l'initiation du traitement.

Conclusion :

- Au total, 18 notifications d'HTAP, sans compter les 2 cas très récents de Brest (7 par CRPV, 13 par le laboratoire, 2 doublons), dont 11 avec prise associée d'anorexigène.
- La fréquence est donc de 1 cas/11 411 298 boîtes (*vs.* 1 cas/11 069 333 en 2005), soit 1 cas/ 4 692 145 mois de traitement (*vs.* 1/ 4 555 534 en 2005).

Pas de modification depuis la Commission nationale de 2005 : bilan comparable à 2005, pas d'éléments nouveaux.

3. Etude d'utilisation/ prescription

Présentation des résultats par G. Clément-Baudena (Servier).

- Rappel des résultats présentés en réunion de concertation du 13 octobre 2006 :
  - Méthodologie : observatoire Thalès
  - Résultats de prescriptions stables sur les périodes mai 2004-avril 2005 et mai 2005-avril 2006 : ~80% chez les patients ayant une dyslipidémie et/ou diabète, 10.7% chez des patients obèses ou avec surcharge pondérale, et 8.7 % pour autres diagnostics.
- Typologie des patients du groupe obésité (analyses demandées lors de la réunion de concertation du 13/10/2006) :
  - Le groupe de prescription pour obésité/surcharge pondérale (représentant 10.7% des prescriptions), inclut principalement des femmes (85%, *vs.* 66% du total de prescriptions),
  - L'analyse n'a pas montré de différence de saisonnalité entre le groupe « obésité » et le total patients MEDIATOR.

Conclusion : l'information apportée correspond à la demande. Données claires et précises.

4. Etude expérimentale

Le groupe de travail préclinique a été chargé d'évaluer le projet proposé par le laboratoire. Le groupe a conclu à l'absence de modèle animal validé permettant l'exploration d'un mécanisme potentiateur/déclencheur d'HTAP. La démarche active du laboratoire dans la recherche d'un modèle a été reconnue.

5. *Réévaluation bénéfice/risque*

L'étude Moulin a été évaluée par le groupe de travail DEUG. Dans l'attente du relevé d'avis définitif, les conclusions n'ont pas été discutées plus en détails.

6. *Enquête de pharmacodépendance au niveau des CEIP*

Enquête non réalisée.

CONCLUSION :

Pas d'éléments nouveaux en termes de pharmacovigilance depuis 2005 : bilan comparable.
Tous les éléments à préparer pour l'évaluation par la Commission nationale de pharmacovigilance sont disponibles.

Plan d'action :

- **Envoi par Servier (*semaine précédant la réunion de la Commission nationale de pharmacovigilance du 27 mars ; adresser à Mme Porokhov) :***
  - **Compte-rendu de la réunion de concertation du 13 mars ;**
  - **Présentation Powerpoint préparée pour le 27 mars, incluant :**
    - **Les résultats de l'étude de prescription**
    - **4-5 diapos résumant l'étude Moulin,**
    - **1-2 diapos sur le modèle animal**
- **Envoi par le département de Mme Rey-Quinio ou de Mme Kreft-Jays, d'ici la fin de semaine, du relevé d'avis du groupe de travail DEUG et du calendrier de passage en Commission d'AMM (*adresser au contact Servier : B. Dehesdin ou F. Mahlberg-Gaudin)***
- **Le résumé de la PV sera préparé par le rapporteur**

COMMISSION NATIONALE DE PHARMACOVIGILANCE

Compte rendu de la réunion du mardi 27 mars 2007

Etaient présents :

Membres de la Commission nationale de pharmacovigilance :

M. CARON (président)
M. ANDREJAK (vice-président)
M. BALLU (représentant de la Direction Générale de la Santé, membre de droit)
Mme BARBAUD
Mme BAVOUX suppléante de Mme LAINE-CESSAC
M. BLAYAC suppléant de M. MONTASTRUC (pour les dossiers ZYBAN® et ARIXTRA®)
M. BONNETERRE
M. BOULU
Mme BOUXIN-METRO (représentant l'INSERM)
Mme BRUNET
M. CARLIER
M. GALEZOWSKI suppléant de M. HANSLIK
M. GIROUD
M. IMBS
M. JACQUES
Mme JOLLIET
Mme JONVILLE-BERA suppléante de Mme AUTRET-LECA
Mme JOUAN-FLAHAULT
M. KANTELIP suppléant de M. MERLE
Mme LEMER MALLE
Mme LILLO LE LOUET suppléante de Mme SGRO
Mme MIREMONT-SALAME suppléante de Mme COSTAGLIOLA
M. MONTASTRUC (pour les dossiers MEDIATOR®, CELANCE® et ZYVOXID®)
M. MUNERA
M. PELLETIER
M. SCHMITT
Mme SGRO
M. VIAL

Unité de Pharmacovigilance :
Mme KREFT-JAIS
Mme CARDONA
Mme HALLE
Mme OUARET
Mme PAGE-LECOMPTE
Mme POROKHOV
Mme ROBINE

GESTION DES CONFLITS D'INTERETS

Aucune situation de conflit d'intérêt important, susceptible de faire obstacle à la participation des experts à la délibération, n'a été identifiée ni déclarée au cours de la séance de la Commission nationale de pharmacovigilance du 27 mars 2007.

II –MEDIATOR® (CHLORHYDRATE DE BENFLUOREX) : MISE A JOUR DES DONNEES DE PHARMACOVIGILANCE, RESULTATS DE LA REEVALUATION DU BENEFICE/RISQUE ET RESULTATS DE L'ETUDE D'UTILISATION

1 – Introduction

Nom commercial	MEDIATOR®
DCI	Chlorhydrate de benfluorex
Formes pharmaceutiques	Comprimé pelliculé à 150 mg
Classe pharmacologique	Hypolipidémiant
Procédure d'enregistrement	Procédure nationale
Titulaire de l'AMM	Laboratoires Servier

Date(s) de passage en Comité technique de pharmacovigilance : 13 mars 2007
Passage en Commission nationale de pharmacovigilance à la demande du Comité technique de pharmacovigilance
Nom(s) du(des) rapporteur(s) : Pr. J.P. KANTELIP / Dr M. DAVID-LAROCHE – Centre Régional de pharmacovigilance (CRPV) de Besançon

MEDIATOR® (chlorhydrate de benfluorex) a obtenu une AMM lors d'une procédure nationale d'enregistrement en 1974, modifiée en 1987 et 1990. Les indications actuelles sont :
- adjuvant du régime adapté dans les hypertriglycéridémies ;
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Ce médicament est commercialisé en France depuis 1976.

2 – Contexte

En décembre 2004, la notification de plusieurs cas d'effets indésirables, pouvant évoquer un effet de type amphétaminique avec MEDIATOR®, a conduit à une actualisation des données relatives aux effets indésirables neuro-psychiatriques observés avec cette spécialité. Par ailleurs, la notification d'un cas d'hypertension artérielle pulmonaire, rapportée lors du Comité Technique du 8 mars 2005, a justifié une extension de l'enquête aux hypertensions artérielles pulmonaires (HTAP).

Les résultats de cette enquête officielle ont été présentés par le CRPV de Besançon au Comité Technique de Pharmacovigilance le 07 juin 2005 et à la Commission Nationale de Pharmacovigilance le 29 novembre 2005. La Commission avait demandé la réévaluation de la balance bénéfice/risque de Médiator®, une étude d'utilisation/prescription, une étude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à engendrer des HTAP et une étude au niveau des Centres d'Evaluation et d'Information sur la Pharmacodépendance (CEIP) afin d'identifier un éventuel problème de pharmacodépendance. La réalisation de cette dernière étude n'a pas été jugée immédiatement nécessaire à cette étape de l'évaluation du dossier en raison du fondement théorique de cette demande (substance de type amphétaminique) et de l'absence d'un signal clairement identifié dans les données notifiées.
Les données disponibles ont été présentées au Comité technique de pharmacovigilance du 13 mars 2007 puis à la Commission nationale de pharmacovigilance du 27 mars 2007.

3 - Actualisation de l'enquête de pharmacovigilance sur les HTAP et les troubles neuropsychiatriques

Le CRPV de Besançon a actualisé les données de pharmacovigilance du benfluorex concernant les HTAP et les effets indésirables neuropsychiatriques. Concernant les effets neuro-psychiatriques, 39 cas avaient été notifiés jusqu'à novembre 2005 auxquels s'ajoutent 4 nouveaux cas : 1 cas de dépression, 1 cas d'agitation et 2 cas de délire. Concernant les cas de délire, le premier concerne une femme de 33 ans sans antécédent psychiatrique, traitée par MEDIATOR® 3 comprimés par jour puis 2 comprimés par jour pendant 5 mois, qui a présenté sous traitement un délire de persécution avec confusion, traité par ZYPREXA®, TERCIAN® et XANAX®, d'imputabilité douteuse. Le deuxième cas de délire concerne un homme de 31 ans, avec psychose chronique, traité par MEDIATOR® 2 comprimés par jour pendant 3 ans, qui a présenté un délire avec agressivité, régressif à l'arrêt du traitement, d'imputabilité douteuse.

Concernant les HTAP, 3 nouveaux cas potentiels ont été notifiés et ont fait l'objet d'une expertise :

- Le premier cas concerne une femme de 50 ans avec un indice de masse corporelle (IMC) à 38kg/m2, un diabète de type 2, une hypothyroïdie et une HTA, traitée par MEDIATOR® 3 comprimés par jour de 2000 à 2003. En 2003, apparaît une dyspnée d'aggravation progressive. En octobre 2005, une HTAP pré-capillaire est mise en évidence et est jugée moyennement sévère avec une pression artérielle pulmonaire systolique (PAPs) à 79 mmHg. Une origine multifactorielle est évoquée car, à la prise de benfluorex, s'ajoutent une obésité et un déficit ventilatoire restrictif sur paralysie de la coupole diaphragmatique droite. L'expertise conclut à une HTAP idiopathique ;
- Le deuxième cas concerne une femme de 51 ans avec un IMC de 41 kg/m2, avec un syndrome d'apnée du sommeil, une BPCO post-tabagique, un diabète de type 2 et des antécédents de phlébite. Cette patiente, traitée par MEDIATOR® durant 3 mois 10 ans auparavant, présente en décembre 2006 une pression artérielle pulmonaire moyenne (PAPm) à 60 mmHg avec à la scintigraphie pulmonaire des séquelles minimes post-emboliques. L'expertise conclut à une possible HTAP idiopathique, mais, en l'état et compte tenu de la chronologie, les pathologies associées et les données sont insuffisantes pour retenir ce dossier.
- Le troisième cas concerne une femme de 58 ans avec un IMC à 49 kg/m2, un diabète de type 2 et une HTA. Cette patiente, traitée par MEDIATOR® pendant 10 ans, présente en décembre 2006 une PAPm à 46 mmHg. L'expertise considère que l'HTAP idiopathique est possible mais que le dossier est beaucoup trop succinct pour permettre de statuer.

Par ailleurs, un cas de valvulopathie a été notifié au CRPV de Toulouse.

Les conclusions de l'enquête concernant les troubles neuro-psychiatriques ne sont pas modifiées par les données additionnelles. Elles confirment la réalité de la survenue de confusions sous MEDIATOR® et la nécessité de détailler dans la rubrique « Effets indésirables » du RCP, le terme de confusion, comme cela a été proposé à la Commission nationale du 29 novembre 2005.
Le nombre de cas notifiés d'HTAP idiopathiques, après expertise et prise en compte des nouveaux cas d'HTAP rapportés depuis 2005, est de 3, soit 1 cas pour 41 841 426 boites vendues ou 1 cas pour 17 204 533 mois de traitement. L'incidence naturelle l'HTAP idiopathique est quant à elle de 1 à 2 cas par million et par an. Ainsi, selon l'avis du rapporteur et compte tenu de l'incidence naturelle des HTAP idiopathiques, le nombre de cas d'HTAP d'allure idiopathique retrouvés dans l'enquête ne constitue pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardiovasculaire.

4 - Etude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à engendrer des HTAP

Concernant le projet de modèle expérimental chez l'animal, le laboratoire a déposé un projet d'étude chez le rat Fawn-hooded, modèle génétique susceptible de développer spontanément une HTAP (accélérée par l'hypoxie). Après analyse de ce projet d'étude, les conclusions rendues par le groupe de travail préclinique de la Commission d'AMM ont été qu'il n'existe pas de modèle expérimental animal adapté à la question posée.

5 - Revue des données d'efficacité. Conclusion du groupe DEUG

Le Département de l'évaluation thérapeutique des demandes d'AMM de l'Afssaps a présenté aux membres de la Commission nationale de pharmacovigilance une revue des données d'efficacité de MEDIATOR®, reflet des conclusions du Groupe de Travail Diabétologie/ Endocrinologie/ Urologie/ Gynécologie (GT DEUG) de la Commission d'AMM.

L'AMM de MEDIATOR® a été octroyée en plusieurs étapes, en 1987 pour les hypertriglycéridémies et en 1990 pour le diabète.

Action hypolipémiante
Le mécanisme d'action sur les lipides est difficile à préciser malgré les données soumises. *In vitro*, le benfluorex inhiberait la synthèse des acides gras entraînant une baisse des triglycérides (TG). *In vivo* chez l'animal, le benfluorex inhiberait l'acyl-coenzyme A cholestérol : acyltranférase (ACAT), mais le retentissement clinique n'est pas démontré (pas de baisse du LDL-cholestérol) de même que l'effet indépendant de la prise alimentaire.
Dix études cliniques ont été soumises :

- six études versus placebo réalisées entre 1978 et 2006 (au total 394 patients), anciennes à l'exception de l'étude Moulin. Méthodologiquement, il y a un faible nombre de patients, une grande variabilité de la dyslipidémie selon les études et le LDL-cholestérol n'est pas toujours disponible. Dans l'étude Moulin, la plus récente, on observe une diminution de 7% des TG et de 6% du LDL-cholestérol ;

- quatre études versus produits de référence, les fibrates, comprenant au total 163 patients avec une dyslipidémie (IIa, IIb et IV).

Une méta-analyse de l'efficacité de MEDIATOR® sur les TG a été réalisée ; elle comporte 6 études (Louvet, Tomassi, Moulin, Velusi, Del Prato et Biancchi), d'effectif varié de 10 à 242 patients, contre placebo avec tirage au sort. L'efficacité du benfluorex est très modeste sur les TG et non démontrée sur les autres paramètres lipidiques.

Action hypoglycémiante

Plusieurs mécanismes d'action sont évoqués : effet insulino-sensibilisateur chez l'Homme avec effet sur les transporteurs de glucose, effet direct sur le foie et réduction du contenu musculaire en TG.

Les études analysées en 1990, lors de la validation de l'indication dans le diabète sont anciennes: 3 études *versus* placebo où l'on observe une diminution de l'HbA1c de 0,8% (Tomassi) sous régime seul, de 0,9% sous régime seul et sulfamide (Velussi) et de 1,7% (Louvet) sous MEDIATOR® et sulfamide versus placebo et sulfamide. Une étude plus récente (1998), l'étude de Del Prato *versus* placebo et *versus* metformine montre une baisse de 0,86% entre le groupe placebo et le groupe benfluorex mais la qualité de tous ces essais est médiocre.

Finalement, l'étude Moulin est la plus récente. Il s'agit d'une étude multicentrique, randomisée en double aveugle de 18 semaines qui étudie l'efficacité et la sécurité d'emploi de 450 mg/jour de benfluorex *versus* placebo chez 325 patients diabétiques de type 2 en surpoids (IMC entre 25 et 40 kg/~~m2~~m^2) mal équilibrés (HbA1c entre 7 et 10%) par un sulfamide à dose maximale tolérée depuis au moins 2 mois et intolérants ou ayant une contre-indication à la metformine. Trois sous-groupes ont été définis : HbA1c>8%, âge >65 ans et clairance de la créatinine < 80 ml/min. Cette étude comporte 2 phases : une période en double aveugle de 18 semaines pour démontrer la supériorité du benfluorex *versus* placebo sur l'HbA1c et une période en ouvert de 16 semaines centrée sur le profil de sécurité à long terme en association à un sulfamide ou à l'acarbose.

Les résultats ont montré une diminution de l'HbA1c de 0,82% dans le groupe benfluorex par rapport à la valeur de base et de 1% par rapport au placebo ($p< 0,001$). Cette baisse est significative dès la quatrième semaine et est maintenue jusqu'à 6 mois. On observe également une diminution significative de la glycémie à jeun dès la quatrième semaine sous benfluorex par rapport au placebo. Il existe une perte de poids respectivement de 1,3 kg et de 0,7 kg sous benfluorex et placebo avec une efficacité sur l'HbA1c indépendante de l'évolution pondérale. La baisse de l'HbA1c sous benfluorex par rapport à la valeur de base est plus importante pour les patients dont l'HbA1c de base est > 8% par rapport aux patients dont l'HbA1c ≤ 8%. Lors de la phase en ouvert, l'effet est reproductible dans le groupe initialement traité par placebo.

Au total, l'étude est conforme aux recommandations pour le développement des antidiabétiques oraux (EMEA 2002), et l'effet hypoglycémiant est notable avec une diminution de l'HbA1c de 1% *versus* placebo. Ces résultats sont par ailleurs cohérents avec les études antérieures. L'efficacité en seconde intention en association à un sulfamide semble donc démontrée et ceci indépendamment de la perte de poids, mais les experts ont soulevé des réserves méthodologiques. Par ailleurs, l'efficacité en prévention primaire et secondaire des complications de l'athérosclérose n'est pas démontrée.

En conclusion, le GT DEUG de la Commission d'AMM propose le retrait de l'indication de MEDIATOR® dans les dyslipidémies par insuffisance d'efficacité avec maintien de l'indication « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » dans l'attente de la soumission de résultats complémentaires d'études en cours devant permettre de positionner plus précisément ce produit dans l'arsenal thérapeutique du diabète de type 2.

6 – Résultats de l'étude de prescription/utilisation

Les laboratoires Servier ont présenté aux membres de la Commission les résultats de l'étude de prescription basée sur l'exploitation de l'observatoire Thalès. Deux périodes de 1 an ont été analysées : mai 2004 à mai 2005 et mai 2005 à mai 2006. Il apparaît que 80,3% des prescriptions de MEDIATOR® en 2004-2005 et 80,5% en 2005-2006 sont réalisées dans le cadre de l'AMM chez des patients dyslipidémiques et/ou diabétiques, et qu'environ 11% des prescriptions concernent des patients obèses, hors du cadre de l'AMM (11,5% en 2004-2005 et 10,7% en 2005-2006).Ces taux restent donc stables au cours du temps. Par ailleurs, il n'y a pas de saisonnalité des prescriptions, qu'elles soient destinées aux obèses seulement ou à l'ensemble des patients. Enfin, sur les deux périodes, le profil des patients concernés reste stable (âge, sexe, IMC).

7 - Discussions de la Commission nationale de pharmacovigilance

Les membres de la Commission considèrent que le libellé de l'indication retenue par le GT DEUG dans le diabète n'est ni clair, ni conforme aux données des études cliniques. Ils ont d'autre part tenu à souligner que les laboratoires SERVIER n'ont pas déposé de demande de renouvellement de l'AMM de benfluorex en Espagne et en Italie. Ils estiment par ailleurs nécessaire, par rapport à une efficacité du produit jugée modeste

par certains membres de la commission nationale, et étudie sur un critère principal (baisse de l'HbA1c) dans la seule étude méthodologiquement acceptable (étude Moulin), de tenir compte dans la réévaluation du rapport bénéficie risque du MEDIATOR® : i) du métabolisme du benfluorex, conduisant à la formation d'un dérivé fenfluraminique, ii) de ses effets indésirables neuropsychiatriques, iii) des rares cas d'HTAP et de valvulopathies notifiés ou décrits pouvant faire évoquer un problème qualitatif similaire à celui ayant amené au retrait du marché des anorexigènes fenfluraminiques sérotoninergiques, iv) d'une utilisation du produit essentiellement en France (88% des ventes). Certains membres de la Commission nationale ont par ailleurs tenu à faire connaître leur opinion en se prononçant pour un rapport bénéfice/risque défavorable du MEDIATOR®. Ce dossier sera présenté en Commission d'AMM le 5 avril 2007.

MEDIATOR® (benfluorex)

ENQUETE OFFICIELLE

Troubles neuropsychiatriques

Hypertensions artérielles pulmonaires

Commission Nationale du 27 mars 2007

Confidentiel

M. DAVID-LAROCHE
J.P. KANTELIP

Le MEDIATOR® (chlorhydrate de benfluorex) est commercialisé en France depuis 1976 par les laboratoires SERVIER (Gidy/Orléans), sous forme de comprimés dosés à 150 mg.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité Technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène. (Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Métabolisme :

- In vivo : Chez l'homme, le MEDIATOR® est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases en S422 (dérivé alcool), puis transformé en 8 métabolites majeurs identifiés parmi lesquels, par oxydation (S1475, dérivé acide) ou désalkylation (S585, norfenfluramine).
  Le métabolite majoritaire est le dérivé carboxylique : S1475.
  Le métabolite primaire S422 et la norfenfluramine sont retrouvés à des taux très inférieurs.

Après administration de benfluorex radioactif, on retrouve 87 à 99% de la radioactivité après 72 heures dans les urines. L'absence de quantité significative dans les fécès montre que le produit est bien absorbé.
Il n'existe pas de phénomène d'accumulation.

L'élimination se fait en 2 phases :
- une première phase rapide (60% en 3 ou 4 heures)
- une seconde phase lente de 36 heures environ.

- In vitro : Les travaux faits in vitro après incubation d'hépatocytes frais humains montrent que les principaux cytochromes P450 jouent un rôle très minoritaire dans le métabolisme du benfluorex.

Les effets indésirables mentionnés dans le RCP sont :

- troubles digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, **confusion**, somnolence, état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles
- très rares cas de réactions anaphylactiques, hypotension, choc, rash cutané, urticaire, œdème de Quincke
- élévation des enzymes hépatiques, hépatite (très rare)

Cette enquête officielle concernant les troubles neuro-psychiatriques et l'hypertension artérielle pulmonaire a été présentée à la Commission Nationale de Pharmacovigilance du 29 novembre 2005 dont les conclusions étaient:

- *les effets neuro-psychiatriques décrits dans le RCP sous le terme de « confusion » doivent être détaillées*
- *les données ne sont pas suffisantes pour affirmer l'existence d'un syndrome de sevrage*
- *le faible nombre de cas décrits d'HTAP idiopathique ne justifie pas sa mention dans le RCP*

Nous présentons ici une actualisation de cette enquête, le numéro des nouveaux cas étant inscrit en gras.

I - TROUBLES NEURO-PSYCHIATRIQUES :

A. Troubles psychiatriques lors du traitement

39 cas ont été rapportés, dont 4 déclarés depuis l'enquête présentée novembre 2005 :

- dépression : TO060262
- agitation : S06001505 : *non grave*
- délire de persécution : SE0600351
- délire : TO060409

Elles concernent 19 hommes (âge moyen : 57 ans) et 20 femmes (âge moyen : 58,3 ans).

Les troubles psychiatriques sont divers :

- agressivité (4), nervosité (3), irritabilité
- dépression (2), cauchemars (2), angoisse, stupeur,
- désorientation (7), *confusion* (5),* aggravation des troubles cognitifs
- agitation (4), trouble du comportement (3)
- délire (3), bouffée délirante aiguë (2)

(*) « confusion » est inclus dans le dernier RCP

Remarque : La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue dans la plupart des notifications.

1. Imputabilité :

4 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise de 1 comprimé de MEDIATOR®.

- 128E22 : chez un homme de 72 ans , traité pour démence, prenant pendant plusieurs années MEDIATOR® pour troubles métaboliques et MODOPAR® pour maladie de Parkinson, est observée une amélioration de ses troubles cognitifs lors d'un arrêt fortuit du MEDIATOR® et une aggravation lors de la reprise du MEDIATOR®.

- S10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 jours. Une réadministration ultérieure a été positive (traitement associé : KERLONE® et MOGADON®).

- CN0000093 : désorientation temporo-spatiale et agitation chez un homme de 76 ans. Le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR® et la réadministration est positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P®. et FOZIRETIC®). *(Cas décrit également paragraphe suivant « gravité »)*

5 cas sont imputés « plausible »

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR® pendant 6 jours. Disparition des symptômes 12 heures après l'arrêt du MEDIATOR®.
- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.
- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2 heures après avoir ingéré 4 comprimés de MEDIATOR®.
- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR®. L'évolution est favorable à l'arrêt du médicament.
- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR®, HALDOL®, SERESTA®, ZESTRIL®, CATAPRESSAN®, PRAXILENE®, SERMION®. L'évolution est favorable à l'arrêt de tous les médicaments.

30 cas ont été imputés « douteux » dont 13 (C2, S1).

2. Gravité

Les effets indésirables ont nécessité une hospitalisation dans 12 cas.

a) Confusion : 4 cas

SE9500017 : Un état confusionnel ayant duré 12 h est survenu chez une femme de 41 ans après 83 jours de traitement par MEDIATOR® (1cp/j) et INCITAL®, et 2 ans par LEXOMIL®. Elle avait été retrouvée errante sur la voie publique après une dispute avec son mari. (Imputabilité : C1, S1)

010326 : Un homme de 61 ans, traité par MEDIATOR® (dose et durée inconnues), FONZYLANE® et SINTROM®, est hospitalisé pour déshydratation avec fièvre et confusion. L'évolution est favorable après réhydratation et arrêt du MEDIATOR®.

120M85 : Un homme de 69 ans, traité par MEDIATOR®, 2 cp/j pendant 11 jours pour désordre métabolique est admis à l'hôpital pour malaises avec confusion et amnésie. Le MEDIATOR® est arrêté, mais les troubles de mémoire continuent. Le scanner cérébral montre une atrophie cortico-souscorticale.
Le traitement associé est PREVISCAN® et CORDARONE®.

S01000031 : Un homme de 63 ans a été hospitalisé à plusieurs reprises pour confusion mentale inexpliquée. Une recherche des médicaments sur l'urine par technique de polarisation de fluorescence révèle une réponse positive pour les dérivés amphétaminiques et une chromatographie gazeuse couplée à une spectrométrie de masse ne confirme pas l'abus d'amphétamines usuels (incluant l'ecstasy).
Cependant, la norfenfluramine est retrouvée à des concentrations de 687 ng/ml dans l'urine et 8.4 ng/mg dans les cheveux.
La présence de norfenfluramine et l'absence de fenfluramine sont en faveur d'un abus illicite de MEDIATOR® (dose inconnue). L'évolution est inconnue. (Imputabilité : C1, S1)
(Cas publié : Norfenfluramine : usage thérapeutique ou toxicomanie ? V.CIRIMELE et coll. Journal de Médecine Légale Droit Médical, 2001, Vol.44, N°1, 23-26.

b) Désorientation temporo-spatiale : 3 cas

10345 : Une femme de 80 ans, avec des séquelles d'accident vasculaire cérébral, traitée pour hypercholestérolémie par MEDIATOR® 3cp/j pendant 13 jours est hospitalisée pour désorientation temporo-spatiale et obnubilation avec hypotension artérielle. L'évolution est favorable à l'arrêt du MEDIATOR®. Le rechallenge est positif.
Le traitement associé est: KERLONE®, MOGADON®.

RE037148 : Une patiente de 66 ans, obèse et grabataire, est amenée à l'hôpital en raison de l'apparition d'un syndrome confusionnel avec état stuporeux et une hyperthermie à 40°. Ses antécédents sont assez chargés avec entre autres, un état dépressif, un asthme et une cardiopathie hypertensive. Le traitement par MEDIATOR® (3cp/j) avait débuté 10 à 12 jours avant son hospitalisation à raison de 3 cp/j. Après l'arrêt du MEDIATOR®, on note une amélioration en quelques jours de la désorientation temporo-spatiale. Le traitement habituel de la patiente est : ASPEGIC®, COAPROVEL®, CORVASAL®, DIFFU K®, MONOTILDIEM®, MOVICOL®, SEROPRAM®, TRINIPATCH®, MEDIATENSYL®, VASTEN®, SERETIDE® et VENTOLINE®. (Imputabilité : C2, S1)

CN0000093 : Chez un homme de 76 ans, traité depuis 2 ans par MEDIATOR®, 3 cp/j, est apparu une désorientation temporo-spatiale et agitation, dont le délai d'apparition des troubles est inconnu, mais les signes cliniques se sont améliorés à l'arrêt du MEDIATOR® et la réadministration a été positive. Les autres médicaments ne sont pas arrêtés (DAONIL®, LASILIX®, SINTROM®, MONICOR L.P.® et FOZIRETIC®) *(dossier imputé «C3, S1 » décrit paragraphe précédent).*

c) Bouffée délirante aiguë : 2 cas

RN9500096 : Une patiente de 59 ans, sans antécédent psychiatrique, en cure d'amaigrissement (perte de 10 kg) depuis 3 mois avec MEDIATOR® (3cp depuis 73j), LIPANTHYL®, Amfépramone®, Craetegus 100mg, PILOSURYL®, CANOL®, STRESAM®, OLIVIASE®, RELVENE® et TOP MAG® est hospitalisée pour bouffée délirante aiguë avec confusion, désorientation temporo-spatiale et agitation. L'évolution est favorable 8 jours après l'arrêt de tout le traitement et la mise sous neuroleptiques. (Imputabilité : C1, S2)

TO041306 : Une bouffée délirante aiguë à thème de persécution et de complot avec agitation extrême et opposition des soins a nécessité une hospitalisation sous contrainte chez un homme de 50 ans qui était traité par MEDIATOR® (1cp/j) depuis 29 mois, associé à COTAREG® et ZYLORIC®. Les troubles ont disparu en 24h sous SOLIAN IM®, TERCIAN IM® ET RIVOTRIL®. Le patient est sorti de l'hôpital avec SOLIAN® 400mg, 2 fois par jour. (Imputabilité : C1, S2)

d) Délire : 2 cas

SE0600351 : En avril 2006, un délire de persécution accompagné d'une inversion du rythme nycthéméral conduisant à une hospitalisation est apparu chez une femme de 33 ans sans antécédent psychiatrique. Elle était traitée par MEDIATOR, 3 cp/j depuis novembre 2005 puis 2 cp/j depuis mars 2006, alors qu'elle avait présenté en janvier 2006 un épisode de dépression.
Le MEDIATOR est arrêté. Le traitement est ZYPREXA, TERCIAN et XANAX. L'évolution est favorable et le traitement à visée psychiatrique est interrompu ensuite. (Imputabilité : C1, S1)

TO060409 : Un homme de 31 ans, avec des antécédents de psychose chronique traitée par halopéridol débute un traitement par MEDIATOR, 2 cp/j en 2002. En 2005, son état délirant augmente, il est accompagné d'excitation psychomotrice avec hétéro et auto-agressivité. Il est admis en mars 2006 à l'hôpital psychiatrique, son état psychique revient à l'état de base alors que le MEDIATOR est arrêté. On s'aperçoit que le patient se procure du MEDIATOR par lui-même, en augmentant a priori les doses. (Imputabilité : C1, S1)

e) Dépression:

TO060262 = Une femme de 37 ans dont les antécédents sont : diabète non insulino-dépendant traité par MEDIATOR, troubles dépressifs traités par SEROPRAM , DEPAKOTE et NEULEPTIL et hystérectomie, hypothyroïdie, est admise au Urgences en octobre 2005 pour décompensation dépressive, avec recrudescence des idéations suicidaires, fléchissement thymique et dévalorisation. L'évolution est inconnue (Imputabilité : C1, S2)

3. Tableau récapitulatif des observations : (voir pages suivantes)

Les nouveaux cas (5) notifiés depuis le rapport de novembre 2005 sont inscrits **en gras**.

Troubles psychiatriques lors du traitement (1)

N°	S/Age	Durée TTT	Posologie/j	Imput. MEDIATOR	TTT associé/ imputabilité	Antécédents Terrain	Evol.	Gravité	Effets indésirables

Annexe 3-72

Troubles psychiatriques apparaissant lors du sevrage

Aucune nouvelle notification n'a été rapportée depuis la Commission Nationale du 29 novembre 2005

10 notifications de troubles psychiatriques apparaissant lors du sevrage ont été rapportés, 6 par les CRPV, 4 par le laboratoire.

Ils concernent 2 hommes et 8 femmes, dont la moyenne d'âge est respectivement 30,5 ans (27-34) et 45,25 ans (30-65).

Le délai d'apparition des troubles après l'arrêt du MEDIATOR® est très variable : de 1 jour (après un traitement de 8 ans) à 3 semaines (après un traitement de 4 à 15 mois).

La durée de traitement par MEDIATOR® est de 1 mois à 8 ans.

Dans les 3 observations qui ont nécessité une hospitalisation (gravité = O dans le tableau page 10), il existe un terrain ou des antécédents prédisposants :

- LY0200303 : une femme de 36 ans, traitée par MEDIATOR® pendant 6 mois pour obésité avec hypercholestérolémie et PROZAC pendant 6 semaines pour syndrome dépressif, est hospitalisée en psychiatrie pour état anxiodépressif aigu avec crise de panique, 2 à 3 semaines après l'arrêt des 2 médicaments.
L'état de la patiente s'améliore rapidement sous SOLIAN® et STABLON®. (Imputabilité : C1,S1)

- LY0200036 : chez une femme de 34 ans, avec des troubles dysthymiques, suivie pour difficultés psychologiques de type border line, en rupture de traitement neuroleptique depuis plusieurs mois, apparaît une décompensation avec délire persécutif et anxiété, environ 3 semaines après un traitement de 4 mois par MEDIATOR®.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

- LY0200037 : une femme de 53 ans, diabétique non insulino-dépendante, ayant fait 2 épisodes maniaques en 1985 et 1996 (ce deuxième épisode étant survenu à la suite d'un régime amaigrissant accompagné peut-être du benfluorex) est hospitalisée pour accès maniaque atypique environ 3 semaines après l'arrêt d'un traitement de 15 mois par MEDIATOR®. Il est a noté un amaigrissement de 20 kg en 1 an.
La patiente sera traitée pour troubles psychotiques, l'évolution est inconnue. (Imputabilité : C1,S1)

Les autres troubles sont identiques à ceux décrits pendant le traitement par MEDIATOR® :

- vertige (4), somnolence (2)
- cauchemar, angoisse (2)

Dans 1 cas, l'imputabilité de MEDIATOR® est « vraisemblable » :

- PA97355052 : il s'agit d'un syndrome de sevrage avec excitation chez un homme de 27 ans, sportif, qui consomme (sur prescription médicale) à doses croissantes (1cp/semaine au début jusqu'à 9 cp/j) du MEDIATOR® comme "dopant ».
Ce patient avait eu un épisode similaire quelques mois plus tôt. (Imputabilité : C3,S1)

Troubles psychiatriques apparaissant lors du sevrage

N°	S/Age	Durée TTT	Poso/j	Imput. MEDIATOR	TTT associé/ imputabilité	Antécédents Terrain	Evol.	Gravité	Effets indésirables	sevrage

2010

Annexe 3-72

B. HYPERTENSIONS PULMONAIRES

20 notifications (9 CRPV et 13 laboratoire) dont 2 doublons, ont été rapportées (dont **3 rapportées depuis la Commission Nationale du 29 novembre 2005**) :

1. Notifications où MEDIATOR® est associé à un anorexigène :

Lors de la présentation du rapport MEDIATOR® en décembre 1998, 11 notifications d'«Hypertension artérielle pulmonaire » avaient été rapportées.
(9 d'entre elles faisaient partie de l'enquête « Anorexigènes et hypertensions artérielles pulmonaires » présentée au Comité technique du 28 avril 1995)
Elles ont été expertisées par le Professeur WEITZENBLUM (Strasbourg) :

- 7 ont été classées en HTAP d'allure idiopathique
- 3 en HTAP post-capillaire
- 1 en HTAP post-embolique

Le MEDIATOR® n'était jamais prescrit seul : il était présent en association à un ou plusieurs anorexigènes :

- ISOMERIDE® : 7 fois
- ISOMERIDE® + PONDERAL® : 2 fois
- ISOMERIDE ®+ FENPROPOREX® : 1 fois
- DININTEL® + TENUATE DOSPAN® + FRINGANOR® : 1 fois

La durée de traitement par MEDIATOR® est précisée dans 7 cas sur 11 : elle est de plusieurs mois à 5 ans.

Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® est :

- concomitante dans 5 cas,
- antérieure dans 2 cas,
- imprécise dans 1 cas.
- postérieure dans 3 cas *(voir détail page suivante) :*

➢ 840255 :
Une femme, 57 ans, obèse depuis longtemps, ayant pris PONDERAL® pendant 2 mois en 1978 et ISOMERIDE® en 1986 (durée inconnue) est hospitalisée en janvier 1993 pour suspicion d'embolie pulmonaire. La scintigraphie pulmonaire est normale.
Le traitement habituel est VOLTARENE®, FELDENE® et DOLIPRANE® pour lombalgies.

En septembre 1993, lors d'une consultation cardiologique, on note une dyspnée stade 3 et un souffle systolique d'insuffisance tricuspidienne. Des signes d'hypertrophie ventriculaire droite sont retrouvés à l'électrocardiogramme.
La dyspnée s'aggravant progressivement, la patiente est hospitalisée en novembre 1993.
A noter que la patiente aurait pris MEDIATOR® , VEINOBIASE®, STILNOX® et XANAX® au cours du mois de septembre 1993.
A l'échodoppler cardiaque, la PAP systolique (PAPs) est estimée à 73 mmHg.
Le cathétérisme cardiaque confirme l'HTAP précapillaire.

En février 1994, l'échodoppler montre une aggravation de la PAPs à 95 mmHg, mais l'état clinique de la patiente est légèrement amélioré début juin 1994.

→ *Avis de l'expert : « HTAP idiopathique »*

➢ 840B65 :
Chez un homme de 48 ans, dont les antécédents sont une hypertension artérielle traitée par FLUDEX®, des glycémie, cholestérolémie et uricémie aux limites supérieures de la normale, un syndrome restrictif post-traumatique, un tabagisme interrompu depuis 1987 et une obésité traitée par ISOMERIDE® de septembre 1990 à avril 1991, est hospitalisé en février 1992 pour syndrome obstructif post-tabagique sévère et aggravation du syndrome restrictif. Une dyspnée d'effort est cotée stade 3-4.
Le traitement de sortie est : MEDIATOR®, VECTARION®, BRONCHODUAL® et BRONILIDE®. FLUDEX® est remplacé par ECAZIDE®, puis LUMITENS®.

Après une amélioration, la dyspnée s'est aggravée et le patient est hospitalisé à nouveau en mai 1993 pour bilan de l'hypoxémie.
A l'échocardiographie, les cavités droites sont très dilatées, comprimant les cavités gauches. La PAPs est estimée à 50 mmHg.
Le cathétérisme droit effectué en juin 1993 pose le diagnostic d'HTAP précapillaire avec une PAP systolique à 90 mmHg. Le patient décède 24 mois plus tard.

→ *Avis de l'expert : « HTAP idiopathique »*

➢ 840B19 :
Une femme de 51 ans, ayant une HTA, une obésité après une première grossesse en 1966, traitée par PONDINIL® en 1974, puis par ISOMERIDE® de 1985 à 1989 (2 fois 3 mois), une hyperlipidémie traitée par MEDIATOR® de 1989 à janvier 1995, est hospitalisée en août 1994 pour bilan d'un syndrome sec.

Une échocardiographie met en évidence une double atteinte aortique et mitrale et une HTAP. Le traitement antérieur comporte : LIPUR®, SECTRAL®, DEBRIDAT®, PRAGMAREL®, ENDOTELON®.

En décembre 1994, lors d'une échocardiographie de contrôle, la PAPs est estimée à 60-65 mmHg.
Le traitement de la patiente est alors : SECTRAL®, MODURETIC®, KALEORID®, RANIPLEX®, PREPULSID®.

En janvier 1995, l'état de la patiente est stable avec une PAPs évaluée à 55 mmHg.

→*Avis de l'expert : « probable HTAP secondaire à une cardiopathie gauche ».*

« Indications du MEDIATOR® n'est pas associé à un anorexigène » (modifié)

3 nouveaux cas notifiés depuis le rapport de novembre 2005 sont inscrits ***en gras.***

4 dossiers sont en cours d'expertise par le Professeur WEITZENBLUM, qui avait expertisé les cas précédents.

➢ PS9900385 :

Chez une femme de 50 ans, ayant comme antécédent une hypertension artérielle traitée par LOGIRENE®, 0,5 cp/j et TRIATEC® 2,5 cp/j et une hypercholestérolémie traitée par LIPANTHYL® 1 cp/j et MEDIATOR®, 1 cp/j, est découvert une hypertension artérielle pulmonaire.
Le début des symptômes remonte à décembre 1998 avec l'installation d'une dyspnée d'effort, qui s'est majorée après un an d'évolution.
Lors d'un bilan en mai 1999, la pression artérielle pulmonaire systolique (PAPs) est estimée à 91 mmHg à l'échographie cardiaque.
Un bilan en juin 1999 confirme une HTAP avec une coronarographie, une angiographie et une scintigraphie pulmonaire normales.
Au cathétérisme droit, la pression artérielle pulmonaire moyenne (PAPm) est à 51 mmHg.
Un traitement par FLOLAN® est instauré (21 juin 1999).

Un bilan réalisé à trois mois montre une réelle amélioration et la patiente reste stable cliniquement jusqu'en septembre 2001, où elle constate une réaggravation de la dyspnée d'effort mais la PAPm est alors stable à 55mmHg.

→ *Avis de l'expert : « HTAP idiopathique »*

➢ S02001877 :

Une patiente de 55 ans (BMI=32) est traitée pendant un an (juillet 2001-septembre 2002) par MEDIATOR® pour un diabète non insulino-dépendant et une dyslipidémie, associé à ALDACTONE®, LASILIX® et TERALITHE®.
En juin 2002, un cathétérisme cardiaque droit montre une hypertension précapillaire avec une PAP à 51 mmHg. L'échographie montre des cavités droites dilatées.
L'échodoppler des membres inférieurs et la scintigraphie pulmonaire sont normaux.

En octobre 2002, la patiente est hospitalisée avec une dyspnée de grade 3. Au cathétérisme cardiaque droit la PAPm est à 40 mmHg.
Les différents traitements pris par la patiente sont :
PREVISCAN®, LESCOL®, AMAREL®, STABLON®, ATARAX®, TEMESTA®, LIPANTHYL®, LIPUR®, TOCO®, GLUCOPHAGE®.
L'évolution est inconnue.

→ *Avis de l'expert : « probable HTAP idiopathique »*

➢ TO040278 :
Une femme de 36 ans, traitée pendant 2 ans par MEDIATOR®, 3cp/j, LEVOTHYROX®, GINKOR Fort®, PRAXINOR®, PROZAC®, HEPTAMYL® et CANOL® est hospitalisée le 25 novembre 2003 suite à une détresse respiratoire aiguë. Le diagnostic est un syndrome alvéolo-interstitiel bilatéral. Il n'y a pas de syndrome inflammatoire.
Les antécédents sont une hypothyroïdie, un tabagisme, un surpoids (BMI = 24) et une insuffisance aortique de grade 2 découverte un an auparavant.
L'échographie montre une fonction systolique ventriculaire gauche à 65%, avec un ventricule gauche dilaté, une insuffisance mitrale de grade 2 et une insuffisance aortique de grade 2.
Le doppler veineux ne montre pas de thrombose veineuse des membres inférieurs.

L'état de la patiente s'améliore [illegible] LEVOTHYROX®, PROZAC® et CANOL®.
Une échographie de contrôle réalisée après normalisation clinique et radiologique montre une oreillette gauche dilatée et des cavités droites non dilatées sans HTAP.
Conclusion du cardiologue: *« Décompensation cardiaque associée à une probable infection virale broncho-pulmonaire ».*
Le 5 janvier, la patiente est hospitalisée à nouveau pour récidive d'un subOAP sur valvulopathies aortique et mitrale à la faveur d'une virose.
La valvulopathie est recontrôlée par échographie par voie transthoracique : il existe alors une élévation des pressions artérielles pulmonaires avec une PAPs estimée à 50mmHg (N : 15 mmHg), le ventricule et l'oreillette gauches sont dilatées.
Le 23 janvier 2004, le remplacement des valves est effectué. On ne note aucun problème dans les suites de l'opération.
L'anatomopathologie des valves montre une lésion dégénérative aspécifique.

Le diagnostic différentiel élimine :
- une maladie rhumatismale : l'aspect échographique n'est pas en faveur
- une endocardite : la recherche est négative
- une maladie auto-immune : les autoanticorps et la recherche des phospholipides sont négatifs.

Il est à noter que la soeur de la patiente est suivie pour valvulopathie.
Le traitement de sortie est PREVISCAN®, RENITEC®, PROZAC®, LEVOTHYROX®.

→*Avis de l'expert*: *« cardiopathie valvulaire sévère, l'OAP ayant entraîné une HTAP post-capillaire. »*

➢ MP0500189 :

Une femme de 55 ans (BMI=35), traitée par MEDIATOR®, 1cp/j, depuis 31 mois est hospitalisée en janvier 2005 pour suspicion d'embolie pulmonaire, avec dyspnée d'effort importante, progressivement croissante depuis plusieurs mois.
A l'échographie cardiaque, la PAPs oscille entre 75 et 80 mmHg.
L'angioscanner thoracique ne met pas en évidence de signe d'embolie pulmonaire, mais il semble exister un caillot dans l'artère sous segmentaire gauche.
Les D Dimères sont élevés à 12000.
La scintigraphie pulmonaire de ventilation perfusion montre des troubles perfusionnels avec vraisemblablement un petit épanchement pleural gauche, faisant suspecter des épisodes emboliques multiples partiellement reperfusés
Conclusion du cardiologue : « *Possible embolie pulmonaire compliquée d'HTA pulmonaire importante avec à la scintigraphie des défects périphériques disséminés. Il s'agit possiblement de micro-embols d'installation progressive mais on ne peut exclure formellement une HTAP primitive de type veino-occlusif.* »

Dans les antécédents de la patiente, on note une embolie pulmonaire en 1981, suite à un accident de la voie publique, compliquée d'une phlébite, traitée par antivitamines K pendant un an, une HTA ancienne traitée par COTAREG® et un tabagisme modéré.
Le 31 janvier, l'échographie cardiaque de contrôle met en évidence une diminution de la PAPs à 65 mmHg, le ventricule droit est dilaté, l'insuffisance tricuspide est relativement importante.

Le 1 février 2005, la patiente est sortie avec une PAPs à 65 mmHg, le traitement de sortie étant PREVISCAN® (en prévention d'une embolie pulmonaire), COTAREG® et MOPRAL®.
Le 22 février 2005, elle est hospitalisée à nouveau avec altération de l'état général, des douleurs thoraciques, des vomissements et une dyspnée.
La pression artérielle pulmonaire est à 80-85 mmHG, Sa tension artérielle est à 120/90, mais elle chute dans la nuit suivante à 8/5.
La patiente fait une asystolie et décède le lendemain par arrêt cardio-circulatoire.

→*Avis de l'expert : « Vraisemblable HTAP post-embolique »*

Une femme de 59 ans, pesant 86 kg, traitée par MEDIATOR®, 3 cp/j pour un désordre métabolique lipidique depuis novembre 1992 associé à de nombreux médicaments est hospitalisée en mars ou avril 2002 pour dyspnée et malaise.
Une hypertension pulmonaire est diagnostiquée. Le MEDIATOR® est alors arrêté.
Les différents traitements associés sont : CAPTEA®, LOPRIL®, PROGYNOVA®, UTROGESTAN®, HUMORYL® et PRAXINOR®
L'évolution est inconnue et le dossier succinct.

- NT0500397 = S05001666 :

Un homme de 74 ans, avec un BMI=31, a comme antécédents : une cardiopathie hypertensive diagnostiquée en 1982 avec des épisodes de tachycardie paroxystique depuis 1977, une arythmie par fibrillation auriculaire et un souffle systolique mitral et aortique depuis 1982. Il est traité par MODURETIC® ET SELOKEN® depuis 1982, puis par KERLONE®, HYTACAND®, CHRONO-ADALATE® depuis plusieurs années (au moins 2003) et PREVISCAN® depuis 2001. D'autre part, ce patient prend du MEDIATOR®, 3cp/j pour dyslipidémie depuis 1996.
En 1982, il existe un souffle systolique avec foyers mitral, aortique et aux 2 carotides.

En 2004, lors d'une consultation cardiologique pour dyspnée d'effort et toux sèche persistante signalée depuis février 2003, et apparition récente d'œdèmes des membres inférieurs, la PAPs est estimée à 52 mmHg à l'échocardiographie. L'insuffisance mitrale est de grade I, les cavités droites sont dilatées avec une insuffisance tricuspidienne de grade II.
En juin 2005, la dyspnée s'est aggravée. L'échocardiographie est stable par rapport à 2004, l'insuffisance mitrale est peu importante, l'insuffisance tricuspidienne est importante, la PAPs est estimée à 55 mmHg.
Le 4 août 2005, le patient consulte un pneumologue, car il se plaint de toux survenant dans le primo-décubitus, qui ne semble qu'en partie liée à la cardiopathie, pour discuter du maintien des antihypertenseurs, notamment béta-bloquants et antagoniste de l'angiotensine II. On évoque la possibilité d'un reflux gastro-oesophagien, qui sera traité par OGAST® pendant 1 mois.

Le 30 août 2005, le MEDIATOR® est arrêté. L'état du patient s'améliore très rapidement avec disparition de la toux et de l'essoufflement. (le lendemain de l'arrêt du MEDIATOR®, selon le patient). *(expertise en cours)*

- **TO060957:**
-

Une femme de 50 ans présente une dyspnée qui parait avoir débuté en 2003. Celle-ci est devenue rapidement invalidante au moindre effort. Elle est présente dès la marche à allure normale en terrain plat et s'accompagne d'une désaturation en oxygène avec un passage de 92% à 84% en juillet 2005. Les antécédents sont une obésité (BMI=38) et un diabète non insulino-dépendant traités par MEDIATOR®, 3 cp/j pendant 3 ans (de 2000 à 2003), une hypothyroïdie et une hypertension artérielle.

En octobre 2005, l'HTAP précapillaire est moyennement sévère avec une PAPs à 79 mmHg au cathétérisme cardiaque. Une origine multifactorielle a été évoquée : obésité, hypoventilation, syndrome ventilatoire restrictif sur paralysie phrénique ou cause médicamenteuse.
En janvier 2006, l'échographie cardiaque montre une dilatation des cavités droites, ainsi que de l'oreillette gauche. Les valves mitrale et aortique sont morphologiquement normales. En avril 2006, le cœur droit parait normal par rapport au degré de l'HTAP, la PAPs est à 82 mmHg.
En mai 2006, un diagnostic de communication intra-auriculaire est porté avec : il existerait une ouverture entre les 2 oreillettes de 12 mm environ. *(expertise en cours).*

A la mi-décembre 2006, une HTAP précapillaire sévère à 60 mmHg de moyenne sans réponse au NO est diagnostiquée chez une femme de 51 ans, aux antécédents d'obésité (BMI= 41), syndrome d'apnée du sommeil, BPCO post-tabagique, diabète non insulino-dépendant et phlébites en 2002-2003.
Son traitement habituel est : NOVONORM®, HYTACAND®, ZYPREXA®, SYMBOCORT® et BRICANYL®.
Elle a pris du MEDIATOR® pendant 3 mois, 10 ans auparavant.
Les signes cliniques au moment du diagnostic sont une dyspnée d'effort (stade fonctionnel NYHA III) associé à un test de marche de 6 minutes à 265 m.
Le traitement institué comprend PREVISCAN®, 0,75 mg/j associé à TRACLEER® 62,5 mg, 2 cp/j. *(expertise en cours).*

➢ BR0700051:

Une HTAP, avec une PAPm à 46 mmHg, est découverte fortuitement à la mi-décembre 2006, au décours d'un bilan pulmonaire systématique, chez une femme de 58 ans, diabétique, qui a une obésité morbide (BMI= 49) et une hypertension artérielle.
Il n'est pas retrouvé d'argument en faveur d'une embolie pulmonaire. Un petit syndrome interstitiel fait évoquer une insuffisance cardiaque gauche. Un traitement diurétique améliore la PO_2 et l'image radiologique.
La scintigraphie (ventilation et perfusion) est normale, ainsi que le scanner thoracique et l'endoscopie bronchique. L'échocardiographie s'est dégradée depuis 2002. Au moment du diagnostic, la patiente prenait : LANTUS® , metformine, TEMERIT® APROVEL® LASILIX® et MEDIATOR® (depuis 10 ans).
Le traitement institué comprend PREVISCAN®, 1 cp/j associé à TRACLEER® 62,5 mg, 2 cp/j. *(expertise en cours).*

Depuis le début de la commercialisation de MEDIATOR© à décembre 2006, le nombre de boites de 30 comprimés vendues est de : 125 524 279 correspondant à 51 613 601 mois de traitement*.

Les 2 derniers cas (BR0700050 et BR0700051) nous ayant été rapportés récemment, le 13 mars 2007, ils sont en cours d'expertise auprès de Monsieur le Professeur WEITZENBLUM, ainsi que le cas de Toulouse. La fréquence de survenue des HTAP idiopathiques vous sera donc présentée lors de la Commission Nationale du 27 mars 2007.

Lors du précédent rapport de novembre 2005, elle était de :

- 1 cas pour 11 069 333 boites vendues
- ou 1 cas pour 4 551 534 mois de traitement

(*) Mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (1 mois = 30,4 jours).

III – CONCLUSIONS :

- **Troubles neuropsychiatriques :**

Cette actualisation de l'enquête de Pharmacovigilance n'apporte rien de nouveau par rapport à l'enquête présentée le 29 novembre 2005.
Il permet de confirmer la réalité des *confusions* qui peuvent apparaître sous MEDIATOR. Cet effet est déjà présent dans le RCP, mais il avait été demandé lors de cette Commission Nationale de novembre 2005 de développer le terme *« confusion »* en détaillant les symptômes tels que : Troubles des fonctions cognitives : *désorientation temporo-spatiale,* troubles du comportement *: agitation, délire,* troubles de la perception : *hallucinations*

- **Hypertensions artérielles pulmonaires :**

Compte tenu de l'incidence des HTAP d'allure idiopathique (1 à 2 cas par millions et par an), le nombre de cas d'HTAP d'allure idiopathique rapporté dans l'enquête, *en attendant l'avis de l'expert pneumologue*, ne constitue pas un signal significatif de toxicité du MEDIATOR dans la classe organe cardiovasculaire.

Objectif de l'étude

Étude d'utilisation / prescription de MEDIATOR

2021

Annexe 3-72

Choix méthodologique : observatoire THALES

- L'observatoire épidémiologique permanent THALES :

  - est fondé sur l'activité régulière d'un échantillon national représentatif de médecins généralistes libéraux (1 200 MG) informatisés équipés du logiciel Doc'ware

  - permet de recueillir et d'analyser longitudinalement des données anonymes et codées issues de dossiers patients en étudiant précisément le contexte de la prescription dans la pratique courante

Méthodologie de l'étude MEDIATOR

- Analyse de la prescription de MEDIATOR chez les médecins généralistes en fonction des indications pour lesquelles il a été prescrit.
- Période analysée :
  - mai 2004 – avril 2005
  - mai 2005 – avril 2006
- Nous avons distingué 5 groupes exclusifs de patients :

A : Patients diagnostiqués **dyslipidémiques** dans l'année (non diagnostiqués diabétiques)

B : Patients diagnostiqués **diabétiques** dans l'année (non diagnostiqués dyslipidémiques)

C : Patients diagnostiqués **diabétiques et dyslipidémiques** dans l'année

D : Patients **non diabétiques**, **non dyslipidémiques** ayant reçu un diagnostic « **obèses** », « **surcharge pondérale** », « **prise de poids** », associé à la prescription de MEDIATOR

E : **Autres patients non diabétiques**, **non dyslipidémiques** ayant reçu d '**autres diagnostics** associés à la prescription de MEDIATOR

Répartition du nombre de prescriptions et de patients traités par MEDIATOR en fonction du diagnostic

(Valeurs extrapolées à partir des données brutes)

		de mai 2004 à fin avril 2005		de mai 2005 à fin avril 2006	
		Nombre de patients MEDIATOR	Nombre de prescriptions MEDIATOR générées	Nombre de patients MEDIATOR	Nombre de prescriptions MEDIATOR générées

*** Liminaire méthodologique : l'IMC a été calculé chez les patients ayant eu à une même date le poids et la taille de renseignés**

Profil signalétique des patients MEDIATOR selon l'âge et le sexe

(base : total patients MEDIATOR en médecine générale)

	Mai 2004 à Avril 2005			
	Total patients MEDIATOR		Groupe D Patients obèses / surcharge pondérale	
	Nbre	%	Nbre	%
Hommes	182 654	34,2%	11 116	14,5%
Hommes de moins de 50 ans	52 988	9,9%	6 782	8,9%
Hommes de 50 ans et plus	129 666	24,3%	4 333	5,7%
Femmes	351 696	65,8%	65 328	85,5%
Femmes de moins de 50 ans	150 720	28,2%	44 086	57,7%
Femmes de 50 ans et plus	200 976	37,6%	21 242	27,8%
Total patients MEDIATOR	**534 350**	**100,0%**	**76 443**	**100,0%**

	Mai 2005 à Avril 2006			
	Total patients MEDIATOR		Groupe D Patients obèses / surcharge pondérale	
	Nbre	%	Nbre	%
Hommes	177 803	34,0%	10 645	14,5%
Hommes de moins de 50 ans	51 527	9,8%	7 065	9,7%
Hommes de 50 ans et plus	126 275	24,1%	3 580	4,9%
Femmes	345 526	66,0%	62 549	85,5%
Femmes de moins de 50 ans	141 300	27,0%	41 589	56,8%
Femmes de 50 ans et plus	204 226	39,0%	20 960	28,6%
Total patients MEDIATOR	**523 328**	**100,0%**	**73 193**	**100,0%**

CONCLUSION

- Environ 80 % des prescriptions de MEDIATOR sont réalisées chez des patients dyslipidémiques et / ou diabétiques

  (80,3 % en 2004-2005 / 80,5 % en 2005-2006)

  Environ 11 % des prescriptions MEDIATOR sont réalisées chez des patients « obèses »

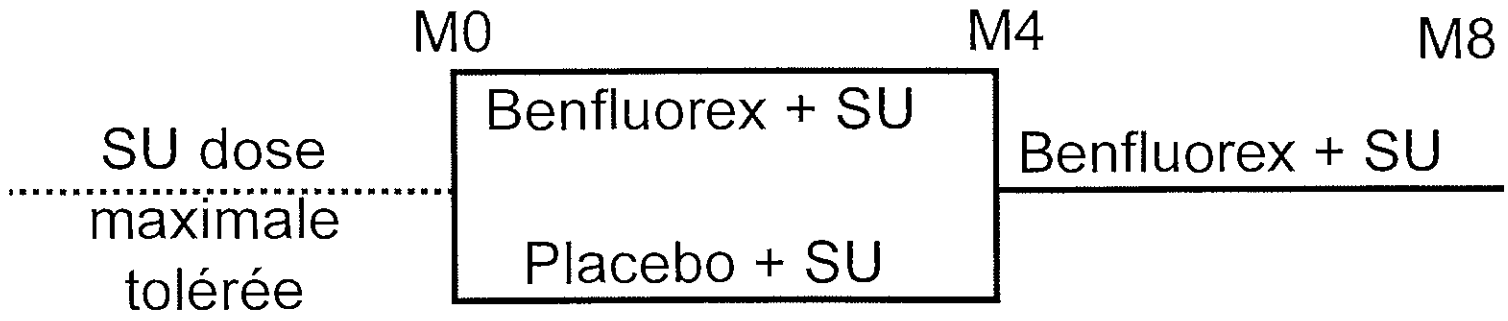
  (11,5 % en 2004-2005 / 10,7 % en 2005-2006)

  Ces taux restent stables au cours du temps

- Concernant la saisonnalité des prescriptions de MEDIATOR, l'analyse n'a pas montré de différences entre le groupe « obésité » et le total patients MEDIATOR

- Le profil des patients MEDIATOR (âge/sexe/IMC) reste stable sur les deux périodes

MEDIATOR EN ASSOCIATION AUX SULFONYLURÉES CHEZ DES PATIENTS AVEC UN DÉSÉQUILIBRE GLYCÉMIQUE IMPORTANT ET UNE INTOLÉRANCE OU CONTRE-INDICATION A LA METFORMINE



Inclusion : diabétiques de type 2

Age > 18 ans

Surpoids : IMC de 25 à 40 kg/m^2

Insuffisamment contrôlés : HbA1c de 7 à 10 %

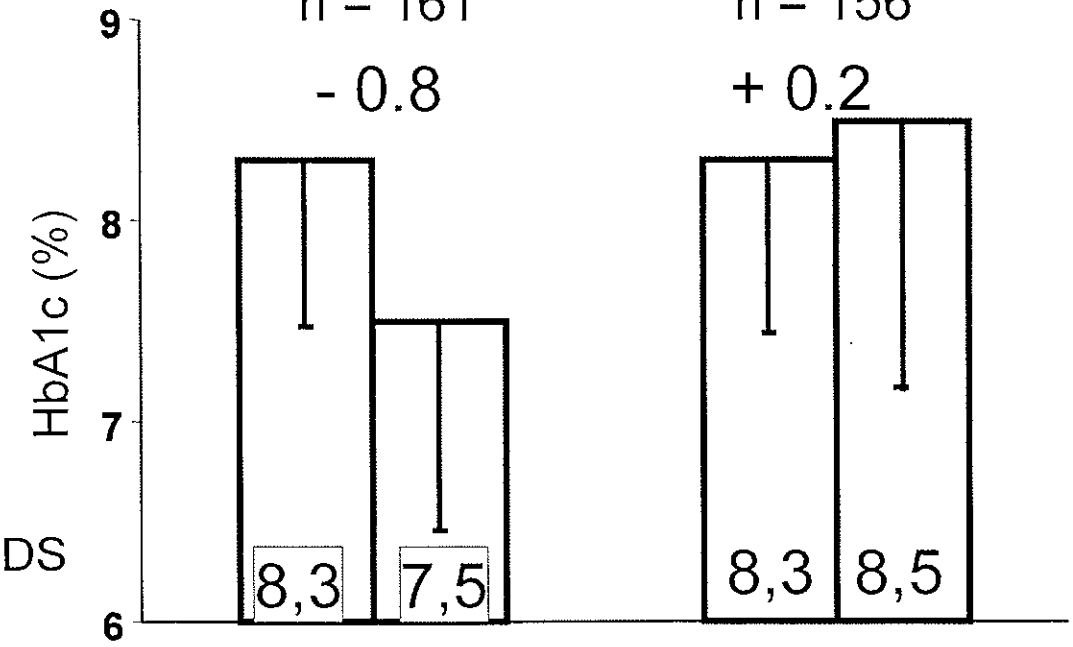
Sous dose maximale tolérée sulfonylurées depuis 2 mois

Intolérance ou contre-indication à la metformine

EFFICACITE : HBA1C – ITT

benfluorex versus placebo
en ITT : 97% des inclus

Δ HbA1c: - 1.0%
p < 0,001

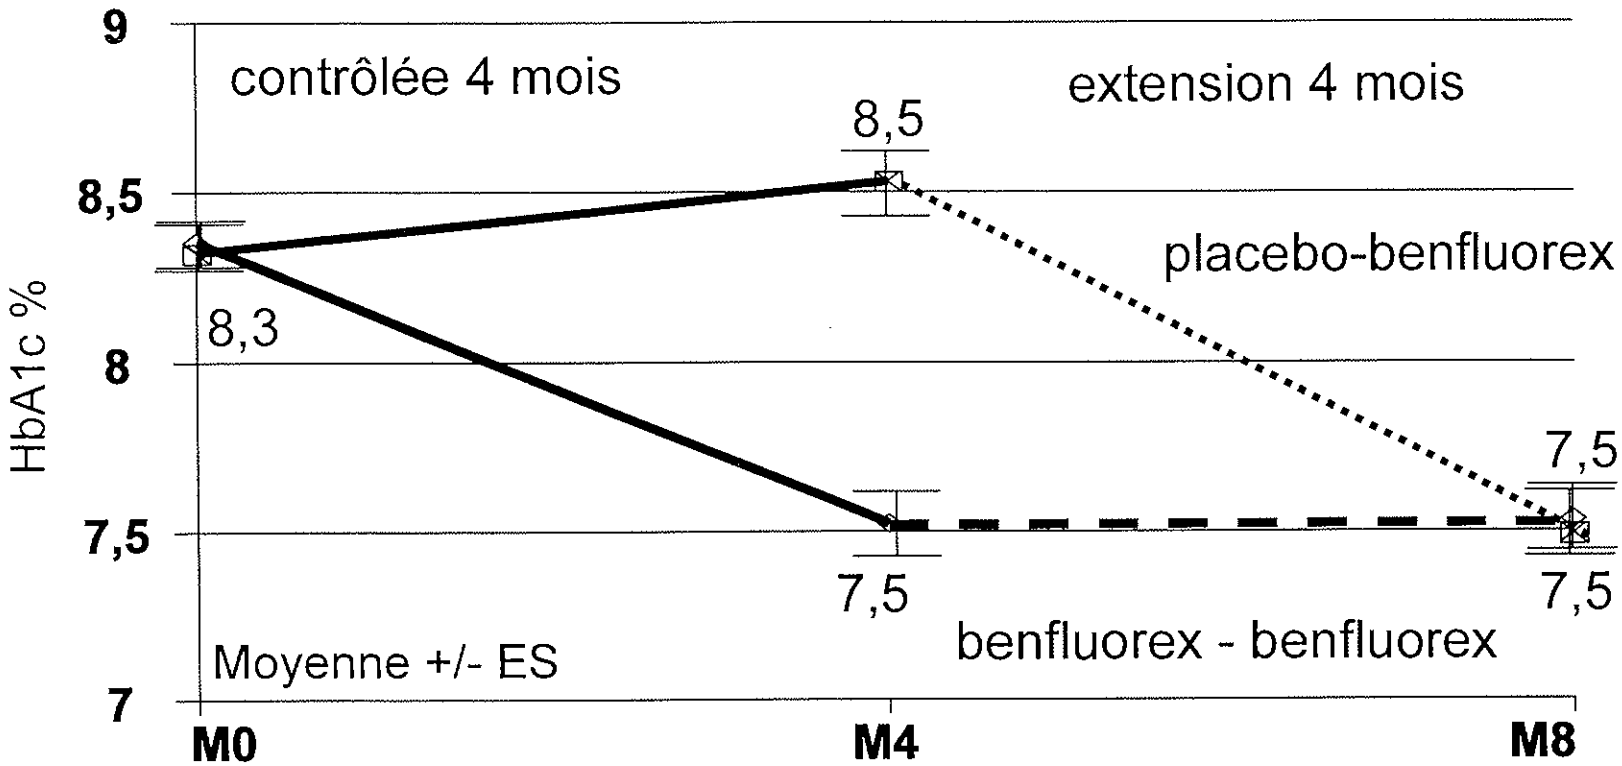


Moyenne +/- DS

	n	HbA1c initiale	Δ vs placebo
Per Protocol :	265	8.3	- 1.1
Age > 65 ans	152	8.3	- 0.8
HbA1c > 8%	182	**8.9**	- 1.1

EVOLUTION DE L'HbA1c

Effet maintenu jusqu'à 8 mois



L'effet de benfluorex est reproductible dans le groupe initialement traité par placebo

TOLERANCE

- Evènements indésirables

  Troubles gastro-intestinaux :

  - Total 15% versus 10%
  - Patients avec intolérance digestive à la metformine 15% versus 15%

  ⇒ <u>Pas d'intolérance croisée avec la metformine</u>

- Poids : - 0.6 Kg versus placebo

  ⇒ <u>Efficacité indépendante de l'évolution pondérale</u>

  HbA1c : différence versus placebo ajustée sur la variation pondérale – 0.96 %, p < 0,001
  (analyse principale non ajustée – 1.01%)

- Pression artérielle et fréq. cardiaque : stables
- ECG, biologie standard : pas de modifications

CONCLUSIONS DE L'ETUDE

- Données valides et pertinentes
  - Méthodologie rigoureuse, résultats robustes, population de diabétiques de type 2 représentative
- Quantité d'effet hypoglycémiant importante
  - HbA1c : diminution de 1% versus placebo,
    y compris chez les patients sévères
  - Cohérent avec les études antérieures
- Pas d'effet cliniquement pertinent sur le poids
  - Cohérent avec les études antérieures :
    Δ : - 0.4 à -1.0 Kg versus placebo

Modèle animal d'HTAP (1)

❑ Modèles développés pour étudier les mécanismes physiopathologiques et des thérapeutiques de l'HTAP :

1) stimuli pathophysiologiques :

ex. rat en hypoxie chronique

2) stimuli chimiques et toxiques :

ex. rat monocrotaline

3) modèles génétiques :

ex. rat Fawn-hooded

❑ Pas de modèle validé pour évaluer le potentiel d'un médicament à engendrer une HTAP

Modèle animal d'HTAP (2)

Rat Fawn-Hooded (FH) a été proposé :

- Rat susceptible de développer spontanément une HTAP (accélérée par l'hypoxie)

- Protocole :

  Rats FH traités en chronique (3 sem. + réversibilité)

  En normoxie ou hypoxie

  Evaluation : - hémodynamique (PAP, PAS)
  - hypertrophie ventriculaire droite
  - histologie (prolifération cellulaire et degré muscularisation artérioles)

2039

Jean MARIMBERT - Rép. : Projet compte rendu de la Commission nationale de pharmacovigilance du 27 mars 2007

De : Jean-Hugues TROUVIN
À : Catherine REY-QUINIO; Jean MARIMBERT; Sophie FORNAIRON
Date : Mercredi 9 Mai 2007 07:23
Objet : Rép. : Projet compte rendu de la Commission nationale de pharmacovigilance du 27 mars 2007
CC : Anne CASTOT; Carmen KREFT-JAIS; Eric ABADIE

Concernant MEDIATOR, nous allons effectivement procéder par étape, avec en première priorité faire adopter par la commission d'AMM la recommandation de supprimer l'indication "triglycérides", et le démarrage de la procédure contradictoire y afférente, avec en sus la notification des questions résiduelles sur l'indication "diabète de type 2".
Une fois la procédure contradictoire achevée sur l'indication litigieuse, et le RCP rectifié en conséquence, nous pourrons alors libérer l'AMM du générique de Médiator, générique qui est actuellement "bloqué" dans sa notification et qui risque, si nous tardons trop à lui octroyer son AMM, de monter au créneau et soulever, à juste titre, un traitement inéquitable puisque le princeps continue à exploiter son médicament, avec le RCP actuel, et que lui ne peut pas exploiter le produit, qui est actuellement ouvert à la générication.
C'est pourquoi je crois plus prudent d'agir par étape, et de rectifier les AMM du princeps et du générique au fur et à mesure que les données sur Médiator se complètent.
Le retrait de l'indication triglycéride étant le sujet qui fait actuellement l'objet d'un consensus, c'est cette "décision" qu'il convient de mettre en oeuvre maintenant sans délai (mais dans le respect des formes et des procédures pour éviter le contentieux avec le titulaire du princeps !!) et notifier au génériqueur l'AMM ainsi "rectifiée", en l'informant que d'autres modifications sont en cours sur l'AMM du Médiator et qu'il aura à les mettre en oeuvre dès qu'elles seront notifiées aux titulaires des AMM.
JH

>>> Jean MARIMBERT 07/05/07 18.40 >>>
J'ai pris connaissance du document tramsmis par Catherine à la suite de mes remarques sur l'avant-projet de compte-rendu de la CNPHV du 27 mars.
Il faut que nous puissions dans le courant du mois de mai, en amont de la validation finale et de la publication du compte-rendu de PHV, valider et déclencher les suites de l'avis de la Commission d'AMM, notamment la procédure contradictoire de suppression d'une indication, la modification du RCP pour ajouter des EI en 4.8, et la préparation de la communication sur l'indication qui resterait ainsi que-et c'est peut-être plus épineux- sur l'usage hors-AMM.
J.M.

>>> Catherine REY-QUINIO 02/05/2007 10:23 >>>
Monsieur,

Faisant suite à vos remarques sur le compte rendu de la CNPV au sujet de MEDIATOR, veuillez trouver ci joint le relevé d'avis tél qu'il a été rédigé après la COM d'AMM du 5 avril dernier. Lors de cette COM , les conclusions de la CNPV et celles du groupe DEUG ont été présentées.
Voir essentiellement pages 18 et 19.

Cordialement,

C Rey-Quinio

>> Jean MARIMBERT 05/01/07 8:22 >>>
Quelques remarques sur ce projet de compte-rendu bien étoffé.
S'agissant de MEDIATOR,la mention en termes trés nets aux lignes 55 et 56 de la page 8 d'un désaccord entre la CNPHV et le GT DEUG quant au libellé de lindication, mais aussi du fait que le renouvellement de l'autorisation de Benfluorex n'a pa été accordé en Espagne et en Italie, rend indispensable de pouvoir

compléter le compte-rendu avant sa publication par l'exposition de la position prise par la Comission d'AMM et de préférence aussi de la décision de l'Agence, sachant qu'à ce jour je n'ai pas de visibilité sur les termes du choix tel qu'il se présente aprés examlen par la Commission d'AMM.
S'agissant de Pergolide, il me semble qu'il y a eu au moment de la CNPHV ou juste aprés une communication de l'EMEA que nous avons reprise.Le compte-rendu devrait si tel a bien été le cas être complété par une mention de ce message.
S'agissant du Zyban, j'ai été un peu intrigué par l'écart apparent entre l'affirmation de la ligne 16 de a page 16 suivant laquelle"L'étude n'a as montré d'augmentation du risque suicidaire en résence de Zyban par rapport au placebo mais les effectifs sont insuffisants" et le chiffre d'OR de 3, 27 qui figure en première ligne/dernière colonne du tableau pour les actes suicidaires dans l'indication de dépression.
Par ailleurs, il faudra que nous nous voyions un moment avant la publication pour voir si l'Agence suit la proposition unanime de la Commission tendant à arrêter le suivi national , afin de pouvoir faire état de la décision dans le CR.
S'agissant d'Arixtra, écrire"pallier les problèmes" en première ligne de la page 19.Par ailleurs, pourrait-on expliquer en français ce qu'est une "line listing" (ligne 20) ?
A la ligne 46 de la page 20, je suppose qu'il manque un vingt entre quatre et six.
Sur le fond, le lecteur est frappé par la fréquence nettement plus élevée semble-t-il en France des accidents hémorragiques.Das ce contexte, il paraît souhaitable de diffuser rapidement aux professionnels de santé l 'information que la Commision appelle de ses voeux, sans attendre sans doute l'aboutissement de l'évaluation au niveau européen de la demande d'extension d'indication pour l'infarctus du myocarde.
J.M.

IX – TOUR DE TABLE DES CAS MARQUANTS

N° des cas	Date de survenue	Sexe / Age	Médicaments suspects	Effets observés	Evol.	Imput	EI présent dans le RCP (ou le VIDAL)	G	N	E	Inter. BNPV	Commentaires Interaction
CRPV de BORDEAUX												
BX080 0191 BX080 0192 BX080 0193			Hypnovel® midazolam	Mesusage, erreur EI : bradypnée	A		Sans objet	O	?	N		Utilisation en prémédication pré-opératoire po (ou sublingual ?) Erreur d'administration (ampoule à 50mg au lieu de 5 mg) S'utiliserait aussi en intra-nasal ???
	Dans ces cas le midazolam, forme injectable, a été utilisé en prémédication anesthésique par voie orale. Une conférence de consensus datant de 2002, utilisant la méthodologie ANAES, recommande l'utilisation du midazolam *per os* mais également par voie intra-nasale. Les recommandations de cette conférence de consensus provenant de la Société française d'anesthésie et de réanimation (en collaboration avec la Société française d'oto-rhino-laryngologie) seraient trés suivies par un certain nombre d'hôpitaux. **=> Le Groupe de Travail Neuro-Psy-Anesthésiste (GTNPA) va être saisi afin de savoir s'il s'agit d'un problème fréquent ou d'un cas particulier de la Réunion.**											
CRPV de BREST												
BR200 80051	juin-07	F 50 A	MEDIATOR NUTROPINAQ	Insuffisance mitro-aortique	Guérison avec séquelles	C1S1 C1S1	Non	Oui	N on	No n	Oui 2 cas en 2007: - MP20070034 - TO070121	Prise courte d'Isoméride (1 à 3 mois) il y a 20 ans. Echocardiographie quasi- normale en 2001 dans le cadre d'un bilan diabétique. Absence de symptomatologie cardio-respiratoire entre 2001 et 2006. Mise en route du ttt par somatotropine en mars 2007. Début de symptomatologie respiratoire (dyspnée) en mai-juin 2007. A noter que la somatotropine est poursuivie. Facteurs de risques cardio-vasculaires : -DNID - tabac
	A la suite de la décision de la commission d'autorisation de mise sur le marché, le MEDIATOR® n'est plus indiqué dans les dyslipidémies depuis le 25 juillet 2007. Deux autres cas d'insuffisance mitro-aortique sous MEDIATOR® avaient été précédemment déclarés. Les résultats de l'anatomopathologie seraient concluants. **=> le CRPV doit récupérer le compte-rendu de l'anatomopathologie qui permettrait de confirmer le diagnostic.**											

2041

Annexe 3-74

	survenue	Age	suspects				le RCP (ou le VIDAL)					Interaction
CRPV de LIMOGES												
LM0800063	22/02/2008	F/54	OCTAGAM 50 mg/mL	Neutropénie	F	C1S1	N	O	N	Discussion lors d'un tour de table des cas marquants au CT du 07/11/06	BS0500429 (neutropénie) PP20070164 (leucopénie) BX0600311 (leucopénie)	Traitement associé : RIVOTRIL, INEGY, Insuline/pompe. Neutropénie survenant au 3ème jour de la 1ère cure d'OCTAGAM Lots injectés pendant la cure : 9 flacons B751E8431 et un flacon B748C8431. Les perfusions sont bien tolérées. Pas d'administration d'immunoglobulines auparavant.
	En 2006, une DMI a été déposé par le laboratoire LFB pour la TEGELINE® à la suite de la description de 17 cas de neutropénies dont 7 cas dans la BNPV. La rubrique "Effets indésirables" du RCP de la TEGELINE® comprend maintenant la mention suivante :"Une leuconeutropénie asymptomatique, de survenue précoce et rapidement réversible, peut être observée, en particulier chez les patients traités par de fortes doses." Cependant le RCP d'Octagam® ne comporte pas cette mention. **=> Le Comité Technique propose une surveillance des cas de leuconeutropénies sous OCTAGAM®.**											
LM0800045	2007	M/62	GLIVEC (imatinib)	Hypoglycémie	F	C1S1	N	O	O	?	N	Patient diabétique insulino-dépendant depuis 28 ans, bien équilibré, traité par GLIVEC depuis juin 2007. Depuis l'instauration du ttt, il présente des hypoglycémies à 0,25 g/L. En janvier 2008, posologie GLIVEC augmentée à 400 mg/J et aggravation hypoglycémies.
	=> Le CRPV de Limoges vérifiera dans quelle indication, le GLIVEC® était ici utilisé car les hypoglycémies sont fréquentes lors de tumeurs gastriques. De plus, les CRPV de Limoges et de Montpellier étudieront ensemble quel pourrait être le mécanisme d'action du GLIVEC® responsable d'hypoglycémie.

DIRECTION DE L'EVALUATION
DES MEDICAMENTS ET DES PRODUITS BIOLOGIQUES
DEPARTEMENT DE PHARMACOVIGILANCE

Saint-Denis, le 02 Juin 2009

COMITE TECHNIQUE DE PHARMACOVIGILANCE
COMPTE RENDU DE LA REUNION DU MARDI 5 MAI 2009

Etaient présents :

Membres du Comité Technique de pharmacovigilance :

M. MERLE (président)
Mme LAINE-CESSAC (vice-présidente)
Mme KREFT-JAIS (représentant la Direction Générale de l'AFSSAPS)
Mme BOUXIN-METRO (représentant le Directeur général de l'INSERM)
Mme ALLAIN-VEYRAC (suppléante de Mme JOLLIET)
M. ANDREJAK
Mme BALDIN (suppléante de Mme CHICHMANIAN)
Mme BAVOUX
M. BIOUR
M. CARON
Mme DE LA GASTINE (suppléante de M. COQUEREL)
Mme EFTEKHARI
M. ESCHALIER
M. GILLET
Mme HILLAIRE-BUYS (suppléante de M. BLAYAC)
Mme JEAN-PASTOR
Mme JONVILLE-BERA (suppléante de Mme AUTRET-LECA)
M. KANTELIP
Mme LATES (suppléante de Mme WELSCH)
Mme LEBELLER (suppléante de Mme LILLO-LE LOUET)
M. LE LOUET
M. MALLARET
Mme MIREMONT-SALAME (suppléante de Mme HARAMBURU)
M. MONTASTRUC
Mme PERAULT-POCHAT
M. RICHE
M. TRENQUE
M. VIAL
Mme WAROT (suppléante de Mme LEBRUN-VIGNES)

Département de Pharmacovigilance :
Mme DELEAU
Mme OUARET
Mme PAGE

AFSSAPS :
M. BOUCAUD-MAITRE
Mme COURNE
Mme DEGUINES
Mme REY-QUINIO
Mme VILLANOVA

Internes :
Mme CAVEE
Mme RIBEIRO-CRESPEL

Etaient excusés :
Mme DELOFFRE
Mme NOBLET
M. OLLAGNIER

Stagiaire :
Mme PIZZOGLIO

CRPV :
Mme BOUTARD
Mme DAVID-LAROCHE
Mme DEVOTI
Mme GOURAUD
Mme GINISTY
Mme MOACHON
Mme VALNET-RABIER

EXPERTS :

5 GESTION DES CONFLITS D'INTERETS

Aucune situation de conflit d'intérêt n'a été retenue ni déclarée au cours de la séance du Comité technique de pharmacovigilance du 5 mai 2009.

Ligne 5 : remplacer « désormais réservé en pas première intention dans le traitement de l'arthrose, PR et SpA » par « désormais le piroxicam ne doit pas être utilisé en première intention dans le traitement de l'arthrose, PR et SpA, lorsqu'un traitement par AINS est indiqué ».

II - POINT SUR LE SUIVI NATIONAL DE PHARMACOVIGILANCE DU METHYLPHENIDATE

Dossier suivi par : Claire Ferard
CRPV rapporteur : Dr Thierry Trenque– CRPV Reims

DCI	Méthylphénidate
Nom commercial / Titulaire AMM / Procédure	Ritaline® 10 mg*, Ritaline LP® 20 mg, 30 mg et 40 mg / Novartis Pharma / Procédure nationale Concerta LP® 18 mg, 27mg (non commercialisée), 36 mg, 54 mg / Janssen Cilag / Reconnaissance Mutuelle Méthylphénidate Rubio® 5mg, 10mg, 20mg (non commercialisées) /Rubio SA / Reconnaissance Mutuelle Quasym LP® 10mg, 20mg, 30 mg (non commercialisées) / UCB Pharma / Reconnaissance Mutuelle
Indication	Trouble déficitaire de l'attention avec hyperactivité (TDAH) chez l'enfant de plus de 6 ans. Narcolepsie avec ou sans cataplexie, en cas d'inefficacité du modafinil, chez l'adulte et l'enfant de plus de 6 ans*.
Conditions de prescription et de délivrance	Prescription limitée à 28 jours Prescription initiale hospitalière annuelle réservée aux spécialistes en neurologie, psychiatrie et pédiatrie, et aux centres du sommeil

I. Introduction

Un point sur le suivi national de pharmacovigilance du méthylphénidate avec une mise à jour des données françaises de sécurité d'emploi a été souhaité dans le cadre de l'arbitrage européen déclenché en juillet 2007 et concernant la réévaluation du rapport bénéfice/risque de l'ensemble des produits à base de méthylphénidate. Cet arbitrage a donné lieu à une évaluation par l'Agence Européenne (EMEA) de l'ensemble des données disponibles de sécurité concernant le méthylphénidate, et plus particulièrement les effets indésirables cardiaques, psychiatriques et neurologiques, les effets à long terme sur la croissance et la maturation sexuelle. Suite à cette évaluation européenne, de nouvelles recommandations ont été établies par l'EMEA afin de limiter les risques liés à l'administration du méthylphénidate (cf point d'information Afssaps 23 janvier 2009), et les résumés des caractéristiques du produit (RCPs) de l'ensemble des spécialités à base de méthylphénidate ont été harmonisés.

Ce point fait suite à celui du 19 décembre 2000 (Ritaline®), et du 7 février 2006 (Ritaline®, Ritaline LP®, Concerta LP®).

II. Méthode

Le CRPV de Reims a analysé :
- les données enregistrées dans la base nationale de pharmacovigilance (BNPV) sur la période du 07 février 2006 au 31 décembre 2008 (méthylphénidate considéré 'suspect' selon les critères d'imputabilité de l'OMS)
- les données nationales et internationales pour la période du 01 janvier 2006 au 31 décembre 2008 fournies par les laboratoires commercialisant le méthylphénidate (Novartis, Janssen-Cilag).

Résultats et discussion :

- **Cas notifiés en France depuis le 01 janvier 2006**

	Cas notifiés aux CRPVs du 07/02/06 au 31/12/08	Cas notifiés aux laboratoires du 01/01/06 au 31/12/08	Total
Ritaline® et Ritaline LP®	21	113 (49 graves)	134
Concerta LP®	20	66 (20 graves)	86
Total	41	179 (dont 10 doublons avec la BNPV)	220

Les effets indésirables les plus fréquents sont essentiellement de type neuropsychiatrique, cutané, et cardiovasculaire.

- **Données de la BNPV**

Les effets indésirables neuropsychiatriques sont les plus fréquents (n=17) et généralement d'évolution favorable : tics, troubles du sommeil, hallucinations, crise tonico-clonique, céphalées, convulsions, vertiges, agitation psychomotrice ; sauf un cas de suicide chez un garçon de 11 ans notifié avec Concerta LP®. Les données françaises mettent aussi en évidence 8 cas de toxicité cardiovasculaire (majoration d'extrasystoles ventriculaires, tachycardie, hypertension artérielle, dyspnée d'effort), une toxicité cutanée (n=11), une toxicité hématologique (n=2) et un cas de retard de croissance avec cassure de la courbe de poids et âge osseux diminué. Un cas de dépendance est notifié avec Ritaline® et Ritaline LP®. Par ailleurs, sur les 41 notifications, 15 concernent des indications hors AMM.

- **Données des laboratoires Novartis et Janssen-Cilag**

Les effets indésirables neuropsychiatriques sont les plus fréquents (n=62) avec 36 cas de troubles psychiatriques : dépression, phobie, angoisse, agitation, comportement impulsif, tics, troubles du sommeil, agitation psychomotrice, hallucinations, logorrhée. Les effets cardiovasculaires rapportés (n=9) sont essentiellement : tachycardie et hypertension artérielle. Les troubles cutanés correspondent à des érythèmes, alopécies, anomalies des ongles, éruptions, avec 1 cas de syndrome de Stevens-Johnson d'évolution favorable à l'arrêt du traitement.
Pour Ritaline® et Ritaline LP®, il est à noter aussi des atteintes thyroïdiennes (n=3), des abus médicamenteux (n=3), des retards de croissance (n=2), un syndrome de Wolff Parkinson White. Pour Concerta LP®, on note aussi des atteintes thyroïdiennes (n=2), des atteintes hépatiques biologiques (n=2), des cas d'abus (n=4), et un accident vasculaire cérébral d'évolution favorable chez un enfant de 14 ans aux antécédents cardiovasculaires.
Par ailleurs, sur les 179 notifications, 38 concernent des indications hors AMM.

- **Cas notifiés en France depuis la commercialisation du méthylphénidate**

Depuis le début de la commercialisation du méthylphénidate (1991) jusqu'au 31 décembre 2008 :

- 90 notifications ont été enregistrées dans la base nationale de pharmacovigilance, chez 61 garçons et 13 filles de moins de 18 ans (âge moyen de 10 ans +/- 3 ans) et 16 adultes (9 hommes, 7 femmes).
- 437 notifications ont été enregistrées par les laboratoires Novartis et Janssen-Cilag.

Le profil d'effet indésirable est similaire pour les deux formes de méthylphénidate (forme à libération rapide et forme à libération prolongée). Les effets indésirables rapportés sont des effets attendus. Les manifestations neuropsychiatriques sont les plus fréquentes avec en particulier des convulsions, des troubles du comportement, des hallucinations et des syndromes dépressifs.

- **Données d'utilisation**

En terme de chiffres de vente, les données GERS (ville et hôpital) montrent, pour Ritaline® et Ritaline LP®, une baisse du nombre de boîtes vendues en 2005 (de 227 263 en 2004 à 186 033 boîtes vendues en 2005) puis une progression constante entre 2006 et 2008 (de 218 213 à 282 939 boîtes vendues). Cette baisse de 2004 à 2005 n'est pas expliquée. Le nombre de boîtes vendues dans les établissements de soins a diminué d'environ 13% en 10 ans. Le nombre de patients traités pendant la période étudiée a évolué de 10 119 patients-années en 2004 à 18 106 patients-années en 2007.
Les données GERS concernant Concerta LP ® n'ont pas été communiquées au CRPV.
En termes de remboursement (données des organismes de base de l'Assurance Maladie), le nombre de boîtes de méthylphénidate remboursées par l'Assurance Maladie a augmenté de 33% de 2004 à 2007 avec une progression de la forme à libération prolongée au détriment de la forme à libération immédiate
Une différence existe entre le nombre de boîtes remboursées par l'Assurance Maladie et le nombre de boîtes vendues qui varie de 20% à 27% en fonction des années (22% en 2007 soit 57 955 boîtes). Normalement, cette différence devrait être inférieure à 10% vu les modalités de prescription de ces spécialités.

III. <u>Conclusions et propositions du rapporteur :</u>

Les précédents rapports ont permis de mettre l'accent sur différents points concernant la sécurité d'emploi du méthylphénidate, comme les manifestations psychiatriques, cardiovasculaires, les conduites addictives, les retards de croissance, et l'éventualité d'apparition d'accidents vasculaires cérébraux ou de toxicité tumorale. Ces deux derniers points ne sont pas confirmés par cette mise à jour des données de pharmacovigilance du méthylphénidate. Par ailleurs, les atteintes thyroïdiennes apparaissent comme un nouveau signal à surveiller.

Une modification des RCPs des différentes spécialités à base de méthylphénidate a été adoptée à la suite de l'arbitrage européen, avec élaboration de recommandations concernant les pathologies et les antécédents cardiaques, les manifestations psychiatriques, ainsi que la surveillance de la croissance. Ainsi, les données de pharmacovigilance provenant de la notification française sont en accord avec le RCP de l'ensemble des spécialités à base de méthylphénidate harmonisé lors de l'arbitrage européen, ainsi qu'avec le PGR européen qui comprend l'élaboration d'études à long terme et la surveillance des effets indésirables psychiatriques, cardiovasculaires, addictifs, et le retentissement sur la croissance et la maturation sexuelle.

Cependant, certaines interrogations formulées dans les deux précédents rapports restent identiques et concernent :

- la prescription du méthylphénidate (croissance des prescriptions chez l'adulte qui paraît associée à un glissement des prescriptions vers des indications hors AMM ; indication pour une pathologie dont les critères diagnostiques sont basés sur deux classifications différentes, dont la population cible reste à être précisée et aux facteurs de comorbidité confondants)
- sa délivrance (différence entre le nombre de boîtes vendues et remboursées)

Le CRPV de Reims propose la mise en place d'un plan de gestion des risques national, en complément du PGR européen, comprenant :

- La poursuite du suivi national de pharmacovigilance.
- La mise en place d'un suivi prospectif des enfants traités par méthylphénidate L'élaboration de recommandations sur le bon usage des traitements du TDAH (Trouble Déficitaire de l'Attention avec Hyperactivité)
- La mise en place d'études d'utilisation (prescription et délivrance)

IV. Conclusions du comité technique :

Le comité technique du 05 mai 2009 a adopté les conclusions et propositions du CRPV de Reims, et souligne la nécessité d'obtention de données françaises d'utilisation du méthylphénidate, et de données sur les effets à long terme (retentissement sur la croissance, risque de pharmacodépendance, effets cardiovasculaires…). Le CT souhaite que la possibilité de mettre en place sur une longue période une cohorte française d'enfants traités par méthylphénidate soit étudiée, et que soit mis en place par l'Afssaps un groupe d'experts chargé d'élaborer des recommandations sur le bon usage du méthylphénidate.

III - SUIVI NATIONAL DE MINIRIN® (DESMOPRESSINE) : TROISIEME RAPPORT

Dossier suivi par Béatrice POROKHOV

1 – Introduction

Nom commercial	MINIRIN®, MINIRIN SPRAY®, MINIRINMELT®
DCI	desmopressine
Forme pharmaceutique	Comprimé, solution pour administration endonasale, lyophilisat oral
Classe pharmacologique	Hormone antidiurétique
Procédure d'enregistrement	Procédures nationales
Titulaire de l'AMM	FERRING SAS

Le suivi national concernant les effets indésirables graves observés sous desmopressine fait suite à une enquête réalisée en 2004 qui avait conduit à retirer l'indication énurésie nocturne primaire pour les formes intra-nasales. De plus, des informations pour une meilleure prévention et un dépistage plus précoce des intoxications par l'eau avaient été ajoutées dans les RCP de Minirin®.

Ce suivi était justifié par :

- la nécessité d'évaluer l'impact des mesures prises après l'enquête et diffusées par une lettre aux prescripteurs (avril 2006)
- la commercialisation en juillet 2006, d'une forme d'administration sublinguale de desmopressine, le Minirinmelt® dosé à 60 et 120 µg, puis en avril 2007 de la spécialité dosée à 240 µg.

Ce troisième rapport de suivi a porté sur la notification entre avril 2008 et mars 2009 de:

- toutes les observations concernant la desmopressine notifiées en France provenant de la BNPV et du laboratoire Ferring.
- les observations internationales graves transmises par le laboratoire Ferring.

Afin de disposer d'éléments relatifs à l'indication « nycturie », ont été réalisées 1) une enquête de prescription dans cette indication auprès des urologues de Basse-Normandie (BN) et 2) une analyse des données de la CNAM en Haute-Normandie (HN) et BN, relatives à tous les patients de 45 ans et plus ayant eu une prescription de desmopressine entre août 2006 et septembre 2008.

2 – Résultats du troisième rapport de suivi national de pharmacovigilance

a) Données générales :

- Au total: dans la BNPV, 10 notifications concernant la desmopressine dont 6 intoxications par l'eau certaines et 3 possibles, dont 7 cas graves (tous des intoxications par l'eau).
- Et dans la base de données Ferring, 64 observations dont 46 intoxications par l'eau (32 certaines et 14 possibles), 51 cas graves dont 40 intoxications par l'eau (31 certaines, 9 possibles).
- Pour l'ensemble des cas français : **23 observations** dont 7 intoxications par l'eau prouvées et 8 possibles, et au total 7 effets graves. Cela fait une incidence moyenne de 2 notifications par mois pour la desmopressine dont au moins une intoxication par l'eau (incidence identique à celle des deux précédents suivis).
- 16 observations concernant le Minirinmelt® dont 6 françaises. Parmi ces observations, 10 cas graves ; 15 cas d'intoxication par l'eau dont 9 graves (5 certaines et 10 possibles).

b) Observations en rapport avec une intoxication par l'eau :

- pour la France : 7 cas avérés d'intoxication et 8 cas possibles avec par ordre de fréquence décroissant les indications suivantes : 8 énurésie (dont 2 cas d'intoxications par l'eau avérés), 6 nycturies (dont 4 intoxications par l'eau avérés), 1 indication diabète insipide. La voie d'administration le plus souvent retrouvée est la voie sublinguale (6 cas sur 15), suivie des voies orale et intra-nasale (4 cas pour chacune).
- pour les autres pays : 40 cas graves dont 31 cas d'intoxication par l'eau avérés et 9 cas possibles, l'indication majoritaire est le diabète insipide (18 cas) suivie de l'énurésie (12 cas) et de la nycturie (5 cas). La voie d'administration le plus souvent en cause reste la voie intra-nasale (15 cas) suivie de la voie sublinguale (9 cas) et orale (6 cas).
- *concernant le traitement de l'énurésie* : en France, 2 cas d'intoxication par l'eau avérés (dont un grave), 6 possibles. Aucun cas ne concernait la voie intra-nasale. La voie sublinguale était retrouvée dans 6 cas non graves (dont 1 cas avéré), les deux autres cas concernant la forme comprimé. Dans les autres pays, 12 observations graves dont 5 avec la voie intra-nasale (soit 42%, versus 65% dans le précédent rapport de suivi). Trois mises en jeu du pronostic vital (2 avec la voie IN et une avec le Minirinmelt®). Sept cas étaient des intoxications avérées et 5 possibles.

- *concernant le traitement de la nycturie* : en France, 6 cas d'intoxication par l'eau dont 5 graves (2 mises en jeu du pronostic vital), 100% correspondaient à un usage hors AMM (patients de plus de 65 ans) parmi lesquels 4 doubles mésusages (utilisation de la forme IN). Pour les autres pays, 5 cas graves dont 3 concernaient la forme comprimé et 2 le Minirinmelt®. L'âge était supérieur à 65 ans chez tous les patients.
  Une association à un autre médicament inducteur d'hyponatrémie était retrouvée chez 4 patients français sur 6 et 4 sur 5 pour les autres pays.

c) Enquête de prescription dans la nycturie auprès des urologues de Basse-Normandie : envoi de 17 questionnaires, 8 réponses: 2 prescrivent parfois la desmopressine dans cette indication, 2 exceptionnellement, 4 jamais. Un seul médecin la prescrit parfois malgré l'âge des patients dépassant 65 ans. Deux sont assez satisfaits de ce médicament dans cette indication, 1 un peu et 2 pas du tout.

d) Analyse des données de la CPAM en Haute et Basse-Normandie: 340 patients en HN et 264 en BN ont été traités par desmopressine, parmi lesquels respectivement 146 (43%) et 119 (45%) avaient 65 ans ou plus. Les résultats qui suivent concernent les patients de plus de 65 ans. L'indication nycturie est vraisemblable chez 134 patients de HN et 111 de BN. La forme galénique la plus prescrite dans cette indication est le comprimé (72% en HN, 63% en BN) suivie du Minirinmelt® (16% et 23%) et du spray intra-nasal à 10 µg (12% et 14%). La durée moyenne de traitement est de 7,4 mois en HN et 6,8 mois en BN. Une proportion importante de patients est traitée pour instabilité vésicale ou hypertrophie de prostate: en HN, respectivement 50% des patients et 62% des hommes; en BN, 44% et 60%. Soixante cinq pourcent (65%) des patients en HN et 76% en BN reçoivent au moins une famille d'anti-HTA. Soixante dix sept (77) % des patients en HN et 85% en BN sont traités par au moins un autre médicament inducteur d'hyponatrémie, au premier rang desquels les anti-inflammatoires non stéroïdiens (AINS) (50% des patients en HN, 53% en BN), suivis des diurétiques (44% et 40%) et des inhibiteurs sélectifs de recapture de la sérotonine (ISRS) (23% et 31%).

e) Evolution des ventes : Poursuite d'une discrète diminution des ventes des formes intra-nasales par rapport à celles des formes orales et sublinguales. Augmentation des prescriptions des formes sublinguales qui sont en tête dans l'énurésie (47% chez les généralistes, 85% chez les pédiatres). Persistance de la baisse du nombre absolu de patients traités par desmopressine dans l'indication énurésie par les médecins généralistes (45 452 en 2008 versus 54 024 en 2007, soit moins 16%).

3 - Discussion et synthèse du CRPV Rapporteur

En France, l'estimation de l'incidence des cas graves d'intoxication par l'eau est de 8,5 pour 100 000 patients traités (8,9 pour 100 000 lors du deuxième rapport de suivi).
Dans l'indication *énurésie*, il n'y a pas de cas français d'intoxication par l'eau avec la forme intra-nasale. Avec le Minirinmelt®, la majorité des cas sont non graves (en augmentation), le nombre de cas graves étant stable. Il y a encore une prépondérance de cas graves avec la voie intra-nasale dans les autres pays, bien que la proportion diminue.
Le risque d'intoxication par l'eau lors du traitement de la *nycturie* semble en grande partie lié au mésusage qui concerne 100 % des notifications dans cette indication. Les intoxications sont souvent graves en raison du risque de chute lors d'une hyponatrémie, mettant parfois en jeu le pronostic vital des patients âgés.
Les données de la CNAM montrent l'importance des prescriptions hors AMM (près de la moitié des patients ont plus de 65 ans), l'utilisation probablement inadaptée de la desmopressine pour de nombreux patients (notamment en cas d'hypertrophie de prostate ou de vessie instable), le risque de déséquilibre d'une HTA puisque la majorité des patients sont hypertendus, et enfin le risque d'hyponatrémie majoré par le grand âge et l'utilisation fréquente d'autres médicaments inducteurs d'hyponatrémie.
De plus, l'utilisation de la desmopressine dans la nycturie avait été déconseillée à deux reprises lors des commissions de transparence de mars 2004 et janvier 2006, sur la base d'un effet seulement symptomatique, d'une indication chez les patients de moins de 65 ans en contradiction avec le terrain de la nycturie (la nycturie étant plus fréquente en vieillissant), d'une efficacité non démontrée et d'un risque important d'hyponatrémie. De plus, la place de ce médicament dans la stratégie thérapeutique a été jugée marginale, justifiant l'octroi d'un niveau de Service Médical Rendu (SMR) insuffisant et le refus du remboursement par la HAS.

4 - Propositions du rapporteur

- Réévaluation du rapport bénéfice / risque de la desmopressine dans l'indication nycturie
- Arrêt du suivi national compte tenu de la stabilité des résultats par rapport aux deux précédents rapports de suivi.

5 – Discussion et conclusions du Comité technique de pharmacovigilance

Les mesures de prévention et de précocité du diagnostic d'intoxication par l'eau et leur support de communication ont eu un impact positif sur la sécurité d'utilisation du Minirin®. Cependant, concernant l'indication nycturie, on ne dispose pas de l'évolution des ventes ni de la répartition selon l'âge, avant ou après 65 ans, des patients traités pour nycturie. Ces données seront demandées au laboratoire Ferring (base IMS).
La poursuite de l'étude observationnelle (MENUI) accompagnant la mise sur le marché du MinirinMelt® sera discutée compte-tenu de l'insuffisance des inclusions et de l'impossibilité d'atteindre les objectifs.

Ce troisième rapport de suivi national de pharmacovigilance de la desmopressine sera présenté à la Commission Nationale de pharmacovigilance. Des données complémentaires concernant la nycturie y seront présentées.

IV - ENQUETE OFFICIELLE RELATIVE AUX HYPERTENSIONS ARTERIELLES PULMONAIRES ET AUX VALVULOPATHIES OBSERVEES AVEC MEDIATOR® (CHLORYDRATE DE BENFLUOREX): MISE A JOUR DES DONNEES DE PHARMACOVIGILANCE

Dossier suivi par Béatrice POROKHOV / Virginie RIBEIRO-CRESPEL

1 – Introduction

Nom commercial	MEDIATOR®
DCI	Chlorhydrate de benfluorex
Formes pharmaceutiques	Comprimé pelliculé à 150 mg
Classe pharmacologique	Antidiabétique
Procédure d'enregistrement	Procédure nationale
Titulaire de l'AMM	Laboratoires Servier

MEDIATOR® (chlorhydrate de benfluorex) a obtenu une AMM lors d'une procédure nationale d'enregistrement en 1974 et est commercialisé en France depuis 1976.
Sa seule indication est: « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ».
L'indication « adjuvant du régime adapté dans les hypertriglycéridémies » a été supprimée suite aux conclusions de la Commission Nationale de Pharmacovigilance du 27 mars 2007.

2 – Contexte

En décembre 2004, la notification de plusieurs cas d'effets indésirables, évoquant un effet de type amphétaminique avec MEDIATOR®, a conduit à une actualisation des effets indésirables neuropsychiatriques observés. Par ailleurs, la notification d'un cas d'hypertension artérielle pulmonaire, présenté au Comité Technique du 8 mars 2005, a justifié une extension de l'enquête aux hypertensions artérielles pulmonaires (HTAP).

Les résultats de cette enquête officielle ont été présentés par le CRPV de Besançon au Comité Technique de Pharmacovigilance du 07 juin 2005 et à la Commission Nationale de Pharmacovigilance du 29 novembre 2005. La Commission a alors demandé : i) la réévaluation de la balance bénéfice/risque de MEDIATOR®, ii) une étude d'utilisation/prescription, iii) une étude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à induire des HTAP et iiii) une étude au niveau des Centres d'Evaluation et d'Information sur la Pharmacodépendance (CEIP) afin d'identifier un éventuel problème de pharmacodépendance.
Ces données, hormis l'interrogation des CEIPs, ont été présentées au Comité Technique de pharmacovigilance du 13 mars 2007 puis à la Commission Nationale de pharmacovigilance du 27 mars 2007. Les conclusions de la Commission Nationale ont conduit à la suppression de l'indication « adjuvant du régime adapté dans les hypertriglycéridémies » par la Commission d'AMM du 5 avril 2007.

Ce rapport présente les résultats actualisés de l'enquête sur le risque d'HTAP et de valvulopathie cardiaque sous MEDIATOR® ainsi que les données d'une publication récente sur ce sujet : K.Boutet et coll. *« Fenfluramine-like cardiovascular side-effects of benfluorex »* en mars 2009, rapportant 5 cas d'hypertension artérielle pulmonaire (HTAP) et un cas de valvulopathie cardiaque chez des patients ayant été exposés au benfluorex.

3 - Actualisation des données de l'enquête sur les HTAP

28 cas d'HTAP ont été notifiés, dont 8 nouveaux depuis la Commission Nationale du 27 mars 2007.

3.1 – Notifications où Médiator® est associé à un anorexigène : 13 cas

• 11 cas déjà présentés lors de la CN du 27 mars 2007 et expertisés par le Pr. Weitzenblum, dont 7 cas d'HTAP jugés d'allure idiopathique.

• 2 nouveaux cas d'allure idiopathique ont été rapportés *BR20080383* (publication de Boutet et Al., cas n°5) : Femme de 55 ans, BMI=41 kg/m^2, HTAP modérée. Prise d'ISOMERIDE® très ancienne et pendant moins de 3 mois et de MEDIATOR® pendant plusieurs années, arrêté 1 an avant le diagnostic.

PB0700302 (cas rétrospectif de 2002) : Femme de 65 ans. Prise d'ISOMERIDE® de 1992 à 1993, et de MEDIATOR® de 1996 à 1999.

3.2 – Notifications où Médiator® est non associé à un anorexigène: 15 cas

- 9 cas déjà présentés à la CN du 27 mars 2007 et expertisés par le Pr. Weitzenblum. Aux 3 cas jugés alors idiopathiques (*PS9900385, PB20090105, TO060957*), s'ajoute un cas incomplet en 2007 et confirmé depuis :
  BR0700051 (publication Boutet et Al., cas n°4) : Femme de 58 ans, DNID, HTA et BMI=49 kg/m². Prise de MEDIATOR® pendant 10ans.

- 6 nouveaux cas ont été rapportés. Leur analyse ne permet de retenir aucun cas d'HTAP d'allure idiopathique.

- 3 de ces 15 cas d'HTAP non idiopathiques sont associés au développement, après exposition au benfluorex, d'une valvulopathie. Ils seront donc classés comme valvulopathies sous MEDIATOR®.

3.3 – Conclusions sur les cas d'HTAP

Depuis le dernier rapport de 2007, le nombre d'HTAP d'allure idiopathique sous Mediator® non associé à un autre anorexigène passe de 3 à 4 (*PS9900385, PB20090105, TO060957* et *BR0700051*).
La fréquence des HTAP imputables au MEDIATOR® reste donc stable par rapport à 2007 (1 cas sur 8 738 542 boîtes vendues contre 1 cas sur 9 655 713 boîtes vendues en 2007).
Compte tenu de l'incidence des HTAP d'allure idiopathique dans la population générale (1 à 2 cas par millions et par an), le nombre de cas d'HTAP d'allure idiopathique rapporté dans l'enquête ne constitue pas un signal significatif de la toxicité du MEDIATOR®.

4 - Actualisation de l'enquête sur les valvulopathies

En France, 30 cas ont été notifiés entre 1998 et 2009 :
- 19 notifications spontanées (NS) : dont 3 cas rapportés également dans les HTAP post-capillaires.
- 11 cas identifiés par le CRPV de Brest par l'intermédiaire de l'interrogation du PMSI (Programme de médicalisation des systèmes d'information).

4.1 – Caractéristiques des patients atteints de valvulopathie

	NS : 19	**Brest PMSI : 11**
Sexe	Femmes : 24, hommes : 6	
Age moyen de survenue (ans) *Femmes* : 54,6 *Hommes* : 62,2	 53,7 54,6	 56,4 69,7
BMI (kg/m²) *18,5 à 24,9* : 5 cas *25 à 29,9* : 7 cas *≥ 30* : 8 cas	 3 5 4	 ~~3~~ 2 2 4
Durée moyenne de traitement (ans) 5,3	5,6	4,6
Antécédents / Terrain (nombre) *Tabac* : 13 *Hypothyroïdie* : 9	 10 7	 3 2
Antécédent/Terrain cardiaque (nombre)	15	

Médicaments associés (nombre) *Levothyroxine* *Antidépresseur IRS*	 9 7

4.2 – Type et localisation des valvulopathies

Concernant la nature des valvulopathies (30 cas), elles sont monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Par ailleurs, en terme de localisation, une insuffisance mitrale est présente dans 28 cas (sévère dans 17 cas), une insuffisance aortique dans 24 cas et une insuffisance tricuspide dans 11 cas (sévère dans 4 cas).

4.3 – Aspects anatomo-pathologiques des valvulopathies opérées

Des données anatomo-pathologiques précises sont disponibles chez 6 patients opérés : 5 cas de patients français, ainsi qu'un cas espagnol rapporté dans une publication (Rafel Ribera J.) par le laboratoire Servier *S03000422*.

a) 4 cas dont l'aspect anatomo-pathologique serait compatible avec celui décrit avec les anorexigènes

TO060355 (Publication Noize 2006) : femme de 48 ans, BMI=25 kg/m^2, MEDIATOR® pendant 7 ans pour intolérance aux glucides.

BR20080051 (Publication de Boutet, cas n°6) : femme de 50 ans, diagnostic en novembre 2007, BMI=34 kg/m^2, diabète de type 2, MEDIATOR® de 2001 à septembre 2007, ISOMERIDE® pendant 1 à 3 mois 20 ans auparavant.

BR20090080 (Brest PMSI) : femme de 54 ans, BMI=30 kg/m^2, MEDIATOR® de septembre 2007 à décembre 2008, diagnostic en décembre 2007, prise d'amphetamine 7 à 8 ans jusqu'en 1986.

S03000422 (Cas espagnol publié par R. Ribera J. 2003) : femme de 50 ans, 12 mois par intermittence sous MEDIATOR®.

b) Autres cas

Dans 2 cas l'anatomopathologie n'est pas spécifique : TO051212 TO0400278

Les autres cas ne disposent que de données échographiques insuffisantes.

4 – Discussion et conclusions du Comité Technique

La fréquence des cas d'HTAP idiopathiques sous MEDIATOR® est stable par rapport aux données présentées en mars 2007. De plus, celle-ci n'est pas supérieure à l'incidence naturelle des cas d'HTAP idiopathiques. Les membres du CT recommandent une surveillance simple des notifications spontanées des cas d'HTAP dans la population générale.

L'identification de 30 cas de valvulopathies à partir de la notification spontanée et de la recherche dans le PMSI effectuée par le CRPV de Brest, constitue un signal de sécurité d'emploi du MEDIATOR® qui doit être exploré. La rareté de cet évènement et la non-spécificité des données anatomopathologiques et cliniques, conduisent à choisir plutôt une étude rétrospective cas/témoins plutôt qu'une étude prospective. Dans cette optique l'exploitation du codage PMSI est une possibilité intéressante, mais qui reste à être modélisée avant validation afin de la rendre reproductible et extrapolable à d'autres problématiques. A cette fin, ce projet sera présenté lors de la deuxième réunion du groupe de pharmaco-épidémiologie du 3 juin 2009.

Ce rapport ainsi que les propositions du groupe de pharmaco-épidémiologie qui se réunira le 3 juin feront l'objet d'une présentation en Commission Nationale de Pharmacovigilance.

MEDIATOR® (benfluorex)

Enquête officielle

Hypertensions artérielles pulmonaires

Et

Point sur

Valvulopathies

Comité technique du 5 mai 2009

Confidentiel

M. DAVID-LAROCHE
J.P. KANTELIP

Suite à la publication de K. Boutet et coll. *« Fenfluramine-like cardiovascular side-effects of benfluorex »,* rapportant 5 cas d'hypertension artérielle pulmonaire (HTAP) et un cas de valvulopathies cardiaques chez des patients ayant été exposés au benfluorex, le Comité Technique a demandé d'actualiser l'enquête officielle sur les HTAP sous benfluorex.
Un cas de valvulopathie étant rapporté dans cette article, nous faisons également le point sur les cas de valvulopathies dans lesquelles, il a été retrouvé un traitement par benfluorex.
Nous y avons ajouté les cas d'HTAP post-capillaires, lorsque la valvulopathie parait être postérieure à la prise de benfluorex.

Le MEDIATOR® (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par les laboratoires SERVIER (BIOPHARMA), sous forme de comprimés, dosés à 150 mg.

La seule indication est : « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale », car l'indication, « adjuvant du régime adapté dans les hypertriglycéridémies » a été supprimée, suite aux conclusions de la Commission Nationale de Pharmacovigilance du 27 mars 2007.

Le nombre d'HTAP d'allure idiopathique retrouvé dans l'enquête présentée à cette commission, ne constituait pas un signal significatif de toxicité du MEDIATOR® dans la classe organe cardiovasculaire.

Métabolisme : (rappel)

- In vivo : Chez l'homme, le MEDIATOR® est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases en S422 (dérivé alcool), puis transformé en 8 métabolites majeurs, par oxydation (S1475, dérivé acide) ou désalkylation (S585, norfenfluramine).
  Le métabolite majoritaire est le dérivé carboxylique : S1475.
  Le métabolite primaire S422 et la norfenfluramine sont retrouvés à des taux très inférieurs.

Après administration de benfluorex radioactif, on retrouve 87 à 99% de la radioactivité après 72 heures dans les urines. L'absence de quantité significative dans les fécès montre que le produit est bien absorbé.
Il n'existe pas de phénomène d'accumulation.

L'élimination se fait en 2 phases :
- une première phase rapide (60% en 3 ou 4 heures)
- une seconde phase lente de 36 heures environ.

- In vitro : Après incubation d'hépatocytes frais humains, il a été montré que les principaux cytochromes P450 jouent un rôle très minoritaire dans le métabolisme du benfluorex.

Annexe 3-75

I. Hypertensions Artérielles Pulmonaires

28 notifications ont été rapportées (dont 8 depuis la Commission Nationale du 27 mars 2007) :

1. Notifications où MEDIATOR® est associé à un anorexigène :

13 notifications d'«Hypertension artérielle pulmonaire » ont été rapportées.

- 11 d'entre elles, expertisées par le Professeur WEITZENBLUM (Strasbourg), faisaient partie de l'enquête «Anorexigènes et hypertensions artérielles pulmonaires» présentée à la Commission Nationale du 27 mars 2007
Par rapport à la prise d'anorexigènes, la prise de MEDIATOR® est :

- antérieure dans 2 cas : 1 HTAP post-capillaire (10052733)
  1 HTAP post-embolique (10840770)

- concomitante dans 5 cas : 5 HTAP d'allure idiopathique (PP890081, NC9300007, 10052455, 10840193, 10840D01)

- inconnue dans 1 cas : 1 HTAP post-capillaire (10840954)

- postérieure dans 3 cas : 2 HTAP d'allure idiopathique (10840255, 10840663)
  1 HTAP post-capillaire (1084B19)

- 2 nouveaux cas ont été rapportés :

BR20080383 : (cas n°5 de la publication de K. Boutet et al)

Femme de 55 ans, obèse (BMI= 41), diabétique et dépressive, prise en charge pour une dyspnée d'effort associée à un syndrome d'obésité/hypoventilation et d'apnée du sommeil, appareillée en avril 2006.
Lors d'une visite de suivi, on découvre à l'échocardiographie une dilatation des cavités droites.
La PAPs est évaluée à 59 mmHg.
Le cathétérisme (janvier 2007) montre une PAPm à 28 mmHg. L'HTAP modérée est prise en charge sans traitement médical.
En 2008, l'état clinique de la patiente est stable.
Le dossier médical retient une prise d'ISOMERIDE®, très ancienne, pendant moins de 3 mois et de MEDIATOR® pendant plusieurs années, arrêté 1 an avant le diagnostic d'HTAP.

PB0700302 :

Ce cas, très succinct, datant de 2002 est rapporté rétrospectivement.
Diagnostic d'HTAP précapillaire, chez une femme de 65 ans, alors qu'elle avait pris de l'ISOMERIDE® de 1992 à 1993 et du MEDIATOR® de 1996 à 1999. Au moment de la notification, la patiente n'était pas rétablie.

Annexe 3-75

2. Notifications où MEDIATOR® n'est pas associé à un anorexigène :

15 notifications d'«Hypertension artérielle pulmonaire » ont été rapportées.

- 9 d'entre elles, expertisées par le Professeur WEITZENBLUM (Strasbourg), faisaient partie de l'enquête «Anorexigènes et hypertensions artérielles pulmonaires» présentée à la Commission Nationale du 27 mars 2007.

  - 1 HTAP post-embolique
    - MP0500189 →*Avis de l'expert : « Vraisemblable HTAP post-embolique »*

  - 2 HTAP post-capillaires :

    - TO040278 :

    →*Avis de l'expert*: *« cardiopathie valvulaire sévère, l'OAP ayant entraîné une HTAP post-capillaire. »*

    - NT0500397 = S05001666 :

    → *Avis de l'expert : « HTAP probablement post-capillaire, peu documentée »*

  - 6 HTAP d'allure idiopathique

    - 2 cas non pris en compte lors de la Commission Nationale (CN) du 27 mars 2007 :

    - S02001046 : dossier trop succinct.
    - BR0700050 (publication K. Boutet, cas n°3) : → *Avis de l'expert : « HTAP idiopathique »*, mais la patiente a été traitée par MEDIATOR® pendant 3 mois, 10 ans auparavant.

    - Les 3 cas retenus lors de la CN du 27 mars 2007 sont :

    - PS9900385 : cas n° 1 de la publication de K. Boutet et coll.
    - S02001877 = PB20090105 : cas n° 2 de la publication de K. Boutet et coll.
    - TO060957

    - Le cas de BR0700051 (publication K. Boutet, cas n°4) était incomplet lors de la CN et l'avis de l'expert *était : « probable HTAP idiopathique mais documentation incomplète » (manque cathétérisme cardiaque)*
    Depuis nous avons reçu, le résultat du cathétérisme cardiaque droit retrouvant une pression artérielle pulmonaire moyenne à 46 mmHg (systolique à 98 mmHg et diastolique à 30 mmHg).
    Il s'agit d'une femme de 58 ans, ayant un DNID, une HTA et une obésité morbide (BMI= 49), qui la fait passer du lit au fauteuil toute la journée et ce depuis plusieurs années.
    Elle a pris du MEDIATOR® pendant 10 ans. Au moment du diagnostic, la patiente prenait LANTUS®, metformine, TEMERIT®, APROVEL® et LASILIX®.
    Elle sort de l'hôpital avec un traitement comportant en plus TRACLEER® et DIAMOX®.

- 6 nouveaux cas notifiés depuis le rapport de mars 2007.

Ces cas n'ont pas été expertisés par le Professeur Weitzenblum, comme les cas antérieurs, mais :

- dans 1 cas, (MA20070346), il s'agit d'une patiente de 52 ans, ayant un BMI = 25,8, traitée pour une hypercholestérolémie par MEDIATOR® depuis 8 ans avec adjonction ensuite de LIPANTHYL®, qui souffre d'une dyspnée d'effort depuis 1 an. L'échocardiographie montre un ventricule droit non dilaté, la pression pulmonaire systolique (PAPs) est estimée à 45 mmHg. Le MEDIATOR® est arrêté. Une échographie cardiaque de contrôle, moins de 3 mois plus tard, montre la normalisation des PAPs, ainsi que l'absence d'insuffisance cardiaque clinique. Un cathétérisme cardiaque n'a pas été effectué.
Il est donc difficile de retenir ce cas comme HTAP d'allure idiopathique.

- dans 1 cas, une HTAP post-embolique est évoquée, (MA20070231) : la patiente âgée de 37 ans est hospitalisée pour péricardite chronique et pneumopathie interstitielle. Elle avait été traitée pendant 1 an par MEDIATOR®, qui a été arrêté 6,5 ans avant la survenue de l'HTAP. La scintigraphie pulmonaire est en faveur d'embolies pulmonaires.

- dans 4 cas, il existe une valvulopathie associée à l'HTAP.

Remarque : parmi ces 4 cas, lorsque le traitement par MEDIATOR semble antérieur à la valvulopathie : MP0700281 et BX20080964, ces cas seront repris dans la partie « II. Valvulopathies » (avec le cas *TO040278 rapporté antérieurement).*

Le nombre d'HTAP d'allure idiopathique passe de 3 à 4, depuis le dernier rapport de mars 2007, en comptant le cas BR0700051.

3. Fréquence :

Depuis le début de la commercialisation de MEDIATOR® à décembre 2008, le nombre de boites de 30 comprimés vendues est de : 139 816 678 correspondant à 57 490 410 mois de traitement*.

En prenant en compte toutes les HTAP, avec ou sans anorexigènes associés, et après élimination des HTAP post-emboliques (3) et post-capillaires (9), il reste 16 cas d'HTAP idiopathique soit :

- 1 cas pour 8 738 542 boites vendues
- ou 1 cas pour 3 593 150 mois de traitement.

Lors du précédent rapport de mars 2007, elle était de :

- 1 cas pour 9 655 713 boites vendues
- ou 1 cas pour 3 970 277 mois de traitement.

(*) Mois de traitement : estimation établie sur la base d'une posologie quotidienne moyenne à 2,4 comprimés (1 mois = 30,4 jours).

Après élimination des 9 HTAP idiopathiques survenues lors de traitement par MEDIATOR® associé à un anorexigène, 3 dossiers succincts ou de chronologie douteuse :S02001046, MA20070346 (évolution favorable en 3 mois) et BR0700050 (3 mois de traitement par MEDIATOR®, 10 ans auparavant), il reste 4 cas d'HTAP d'allure idiopathique (PS9900385, S02001877, TO060957 et BR0700051) soit :

- 1 cas pour 34 954 169 boites vendues
- ou 1 cas pour 14 372 602 mois de traitement.

Lors du précédent rapport de mars 2007, elle était de :

- 1 cas pour 41 841 426 boites vendues
- ou 1 cas pour 17 204 533 mois de traitement.

4. Conclusion :

Compte tenu de l'incidence des HTAP d'allure idiopathique (1 à 2 cas par millions et par an), le nombre de cas d'HTAP d'allure idiopathique rapporté dans l'enquête, ne constitue pas un signal significatif de toxicité du MEDIATOR dans la classe organe cardiovasculaire.

Annexe 3-75

II. Valvulopathies

En France, 30 notifications ont été rapportées entre 1998 et 2009:
(Un cas espagnol rapporté par le laboratoire sera pris en compte dans la partie «8. Aspect des valves, page 15»: publication de Rafel Ribera J.)

- 19 notifications spontanées : 16 valvulopathies + 3 HTAP post-capillaires rapportées ci-dessus
- 11 notifications recueillies intensivement par le CRPV de Brest par l'intermédiaire du PMSI.

A. Notifications

1. Sexe/ Age :

Les notifications de valvulopathies concernent 24 femmes et 6 hommes.

a) Femmes :

La moyenne d'âge de survenue des valvulopathies est de 54,6 ans:
- 53,7 ans (de 34 à 78 ans) pour les notifications spontanées
- 56,4 ans (de 49 à 72 ans) pour les cas de Brest (PMSI)

b) Hommes

La moyenne d'âge de survenue des valvulopathies est de 62,2 ans:
- 54,6 ans (43, 54 et 67 ans) pour les notifications spontanées
- 69,7 ans (60, 70 et 79 ans) pour les cas de Brest (PMSI)

2. BMI : connu dans 20 cas

Dans 3/4 des cas, le BMI indique un surpoids ou une obésité.

BMI entre 18,5-24,9 : 5 cas
- Notifications spontanées : 3 femmes
- Brest PMSI: 2 (1homme, 1 femme)

Entre 25-29,9 (surpoids) : 7 cas
- Notifications spontanées : 5 cas (1 homme, 4 femmes)
- Brest PMSI: 2 femmes

Supérieur à 30 (obésité) : 8 cas
- Notifications spontanées : 4 (1 homme, 3 femmes)
  - BMI = 33 et 34 concernant 2 valvulopathies
  - BMI = 35 et 36 concernant 2 HTAP
- Brest PMSI: 4 femmes
  - BMI : 30, 32, 34, 44

3. Durée de traitement : (dates imprécises dans 4 cas)

La moyenne des durées de traitement est de 5,3
- 5,6 ans (8 mois à 15 ans) pour les notifications spontanées
- 4,6 ans (de 1 à 10 ans) pour les cas de Brest (PMSI)

4. Antécédents et terrain:

a) Tabac :

Un tabagisme est connu chez 13 patients :
- 10 fois dans les notifications spontanées. Il concerne 9 femmes et 1homme
- 3 fois dans les cas de Brest PMSI. Il concerne 2 femmes et 1 homme.

b) Hypothyroïdie

Une hypothyroïdie traitée par levothyroxine est connue dans 9 cas:
- 7 cas pour les notifications spontanées
- 2 cas pour les cas de Brest (PMSI)

c) Antécédents ou terrain cardiaque :

- Hypertension artérielle: rapportée 9 fois
- Infarctus du myocarde : 2 cas
- Angine de poitrine : 1 cas
- Thrombo-embolie : 1 cas
- Cardiomyopathie dilatée (avec HTA) : 1 cas
- Décompensation cardiaque sur bronchopathie (avec HTA) : 1 cas
- Insuffisance cardiaque non précisé mais traitement cardiaque connu dans 2 cas

d) divers

- Angines dans l'enfance sans RAA connu : rapportées 4 fois
- Polyarthrite rhumatoïde : 2 cas
- BPCO : 1 cas

5. Médicaments associés :

- Levothyroxine (9 fois : cf. ci-dessus)
- Antidépresseurs inhibiteurs de la recapture de la sérotonine (IRS)
  - Fluoxétine : 3 fois
  - Paroxétine : 2 fois
  - Vinlafaxine : 2 fois

Remarque : un antidépresseur (IRS) est connu dans 5 cas sur 11 pour Brest PMSI.

6. Insuffisances valvulaires :

a) Localisation :

En ce qui concerne les notifications spontanées, sur 19 cas:

- Insuffisance mitrale dans 4 cas
- Insuffisance aortique dans 2 cas
- Insuffisances mitrale + aortique dans 9 cas
- Insuffisances mitrale + tricuspide dans 1 cas
- Insuffisances mitrale + aortique + tricuspide dans 3 cas

En ce qui concerne les cas de Brest PMSI, sur 11 cas :

- Insuffisances mitrale + aortique dans 5 cas
- Insuffisances mitrale + tricuspide dans 1 cas
- Insuffisances mitrale + aortique + tricuspide dans 5 cas

b) Gravité :

- Une insuffisance mitrale (IM) est présente dans 28 cas sur 30.
  Remarque: Une IM sévère de grade 2-3 à 3 est rapportée dans 9 cas sur 15 pour les notifications spontanées et dans 8 cas sur 11 pour Brest (PMSI)
- Une insuffisance aortique (IAO) est présente dans 24 cas sur 30.
  Remarque :
  Une IAO de grade 1 et 2 est rapportée dans 11 cas sur 14 pour les notifications spontanées et dans 6 cas sur 11 pour Brest (PMSI)
  Dans 2 cas, il n'existe qu'une insuffisance aortique isolée, modérée.
- Une insuffisance tricuspide (IT) est présente dans 11 cas sur 28.
  Remarque : Une IT de grade 1 à 2 est rapportée dans 7 cas : (2 cas de valvulopathies et dans 5 cas sur 11 de Brest (PMSI))
  Une IT sévère de grade 3 est rapportée dans 4 cas : (2 cas de valvulopathies et dans 2 cas 11 de Brest PMSI)

7. Evolution des valvulopathies

- 4 valvulopathies sont bien tolérées sans traitement (dont 3/11de Brest PMSI), 5 ont nécessité un traitement médical ou changement du traitement.

- Dans 4 dossiers, l'évolution est inconnue et 5 dossiers sont en cours.

- Une chirurgie valvulaire a été effectuée dans 10 cas (dont 5 cas sur 11 pour les dossiers de Brest PMSI), elle est prévue dans 2 cas (cf. BR20090086 et GR20090107) décrits ici:

GR20090107
Une échographie cardiaque, début décembre 2008, découvre une HTAP de repos à près de 75 mmHG, chez une femme de 57 ans, pesant 105 Kg, qui a une HTA, une hypothyroïdie, une insuffisance mitrale et une fibrillation auriculaire, traitée par cardioversion externe. Son traitement habituel est HEMIGOXINE®, LEVOTHYROX®, LOGIRENE®, CORDARONE®, PREVISCAN® et FLECAINE®.
Elle a pris du MEDIATOR® d'octobre à décembre 2002, de janvier à avril 2004 et en 2008.
Le cathétérisme cardiaque réalisé en janvier 2009 retrouve une PAPs à 60 mmHG. L'insuffisance mitrale de grade 2 est plutôt centrale, la fuite va jusque dans les veines pulmonaires. L'oreillette gauche est dilatée en rythme sinusal. L'insuffisance mitrale sera traitée dans un premier temps avec des IEC et un diurétique en attendant un remplacement valvulaire.

BR20090086 (Brest PMSI)
Il s'agit d'une femme de 60 ans, ayant un BMI=27, qui présente à l'échocardiographie en mars 2008, un rétrécissement mitral avec insuffisance mitrale de grade 3, une insuffisance aortique de grade 1 et une HTAP. La pression artérielle pulmonaire systolique (PAPs) est égale à 44 mmHg). La valve mitrale est notée de mobilité réduite, épaissie et remaniée.
L'examen clinique retrouve un épanchement pleural droit récidivant de type transsudat. Dans ses antécédents, on retrouve des angines fréquentes sans RAA, une hypothyroïdie, une dépression, un alcoolisme sevré et un tabagisme. Son traitement habituel est LEVOTHYROX®, TAHOR®, PROZAC®, NEULEPTIL®, LAROXYL®, NOCTRAN®, ART 50®. Elle a pris du MEDIATOR® pendant une dizaine d'années (jusqu'en 2008)

Le bilan d'auto-immunité retrouve des IgM antihistones positives mais pas d'anticorps antiphospholipides.

La décision opératoire est en attente, elle permettra d'éliminer une maladie rhumatismale.

8. Aspects morphologique, macroscopique et microscopique des valves :

8.1. Valvulopathies opérées:

Nous rapportons ici les 10 cas de patients français ayant subi une chirurgie valvulaire, ainsi que le cas espagnol, publication de Rafel Ribera J, qui est rapporté par le laboratoire (S03000422).

a) cas où l'anatomo-pathologie serait compatible avec les anorexigènes : 4 cas

- TO060355=S06001104: Cas publié par P. Noize (2006)

Femme de 48 ans, dont le BMI est de 25, traitée par MEDIATOR® pendant 7 ans, dans le cadre d'une intolérance au sucre responsable d'hypoglycémies répétées jusqu'à décembre 2005. Dans ces antécédents, on note une BPCO et un tabagisme important depuis l'âge de 19 ans, sevré fin octobre 2005 avec la survenue d'une dyspnée.
L'échodoppler montre une insuffisance mitrale de grade 3, une insuffisance tricuspide de grade 2 et pas d'insuffisance aortique. L'échographie montre un épaississement de la grande valve qui reste bien mobile et rétraction de la valve postérieure.

Anatomopathologie, histologie :
1° avis : *« Sclérose collagénique englobant cordages et pilier*
Lésions histologiques inhabituelles. Sclérose dense, pauci cellulaire, fortement collagénisée, remaniée par des microfissures.
Valve : fibrose associée à de petits territoires d'œdème mixoïde.
Tissu sous-valvulaire : fibrose particulièrement dense qui englobe en monobloc des cordages mal identifiés et le pilier charnu ».

2° avis : « *Valve épaissie par une fibrose constituée d'accumulation de matrice extra-cellulaire avec peu de cellules fusiformes dans le territoire de l'endocarde, sans inflammation, sans néo-vaisseaux, sans calcifications, sans altération des tuniques sous-jacentes :*
Aspect non spécifique dans l'absolu de la toxicité des anorexigènes, mais correspondant parfaitement aux lésions décrites dans l'atteinte valvulaire des anorexigènes ».

- BR20080051= S08002916: Cas n°6 de la publication de Boutet K. (2009)

Femme de 50 ans, avec un BMI = 34, découverte en novembre 2007 d'une valvulopathie fuyante mitro-aortique responsable d'une décompensation cardiaque. Dans ses antécédents, on note une insuffisance hypophysaire, un DNID et un tabagisme. Elle est traitée par levothyroxine, ramipril, somatropine et depuis 6 ans (de 2001 à septembre 2007) par MEDIATOR®. L'insuffisance mitrale est de grade 3 et l'insuffisance aortique de grade 3. Il existe une HTAP (PAPs= 49 mmHg). L'histoire clinique de la patiente retient qu'elle a pris de l'ISOMERIDE® pendant 1 à 3 mois, 20 ans auparavant.

Anatomopathologie, histologie:
« Epaississement et rétraction des valves (particulièrement de la valve mitrale)
Fibrose dense, faite de myofibroblastes dans une matrice de mucopolysaccharides sans infiltration inflammatoire ».

BR20090080 (Brest PMSI)

Femme de 54 ans, avec un BMI = 30, traitée pendant 15 mois par MEDIATOR® (de septembre 2007 à décembre 2008) et pour une dépression par LAROXYL® en 2006 et par EFFEXOR® en 2001 et 2008. Le traitement associé est : CARDENSIEL®, TRIATEC®, LASILIX®, HEMIGOXINE® ET ATARAX®.
En octobre 2005, l'échographie cardiaque était normale avec absence de valvulopathie.
En décembre 2007, 3 mois après le début du traitement par MEDIATOR®, l'échocardiographie montre une insuffisance mitrale et une insuffisance aortique de grade 1.
En octobre 2008, une nouvelle échocardiographie conclut à une altération de la fonction ventriculaire gauche (52%), une insuffisance mitrale de grade 3, une insuffisance aortique de grade 3 et une insuffisance tricuspide de grade 1. La PAPs est à 44 mmHg.
En mars 2009, la dyspnée de grade IV entraîne la décision opératoire avec double remplacement valvulaire.
Il est a noté que la patiente avait pris des amphétamines (biphetamine) pour contrôle du poids pendant 7 à 8 ans jusqu'en 1986.

Anatomopathologie, histologie :
Valve mitrale : Lésions valvulaires intéressant essentiellement les cordages sous la forme d'un épaississement fibromyxoïde sans caractère de spécificité mais compatible avec une origine toxique.
Valve aortique :remaniements myxoïdes d'intensité modérée des sigmoïdes aortiques. Présence d'un petit foyer de calcification non spécifique.

S03000422 : Cas espagnol publié par Rafel Ribera J (2003)

Ce cas rapporte une atteinte des 3 valves mitrale, aortique et tricuspide, associée à une HTAP (PAPs: 72 mmHg) chez une femme de 50 ans (BMI non précisé) qui a été traitée pendant 12 mois par intermittence par benfluorex.

Anatomopathologie, histologie :
« Fibrose diffuse avec raccourcissement des cordages de la valve mitrale, une valve tricuspide épaissie et des sigmoïdes aortiques rétractées.
Les valves présentent des plaques fibreuses composées de myofibroblastes avec une matrice de mucopolysaccharides et de collagène, causant la rétraction des valves ».

b) 2 cas où l'anatomopathologie n'est pas spécifique :

TO051212=S05002371

Femme de 49 ans, (BMI inconnu), ayant une hypothyroïdie traitée par LEVOTHYROX® ayant débuté un traitement par MEDIATOR® en 2002.
Pendant ses vacances en Egypte apparaît alors une dyspnée.
En août 2005, elle est hospitalisée pour pneumopathie de la base droite.
En octobre 2005, elle présente une insuffisance mitrale de grade 3, sans rupture de cordage, qui est opérée en novembre 2005. La PAPm est à 22 mmHg. MEDIATOR® est alors arrêté.
Conclusion du cardiologue : *« il s'agit vraisemblablement d'une insuffisance mitrale qui a évoluée à bas bruits pendant de nombreuses années et qui devient symptomatique actuellement »*
Une pathologie post-rhumatismale est évoquée.

Anatomopathologie, histologie :
Les valves sont légèrement indurées sans végétations.
Les remaniements tissulaires associent des plages de fibrose cicatricielle dense, fortement collagénisée, à des territoires oedémateux et myxoïdes de caractère dégénératif, occupés par de nombreux fibroblastes.
On observe des micro-fissures et de rares îlots adipocytaires.
Il n'y a ni dépôt calcique, ni infiltrat inflammatoire, ni bourgeonnement capillaire.
Absence de lésions spécifiques.

S04000348= TO0400278 (dossier classé également dans les HTAP post-capillaires)

Il s'agit d'une femme de 36 ans, avec un BMI = 24, des antécédents d'hypothyroïdie traitée par LEVOTHYROX®, d'HTA et de tabagisme. Elle est traitée par MEDIATOR® de 2002 à 2004 et par PROZAC®, CANOL®, GINKOR FORT®, PRAXINOR®, HEPT A MYL®.
8 mois après l'introduction de MEDIATOR® (2003), est découverte une insuffisance aortique de grade 2 avec insuffisance mitrale minime.
La patiente est hospitalisée en décembre 2003 pour décompensation cardiaque avec une double insuffisance mitrale grade 3 et aortique grade 2, qui sera opérée en janvier 2004. La PAPs est à 50 mmHg.

Remarque : la sœur de la patiente est suivie également pour valvulopathie.

Anatomopathologie, histologie :
Lésions dégénératives non spécifiques.

c) 5 cas sans résultat d'anatomopathologie:

GR20090108

Une insuffisance mitrale de grade 3, associée à une HTAP (PAPs évaluée à 70-75 mmHg) est découverte chez une femme de 56 ans, (BMI inconnu) qui a été traitée pendant 14 ans (1994-2009) par MEDIATOR® pour dyslipidémie et diabète de type 2 associé à fenofibrate, GLUCOPHAGE® et CORDARONE®. Dans ses antécédents, on trouve une dépression, un tabagisme actif et des angines à 20 ans traitées par perfusion intraveineuse.

Aspect des valves :
Valve mitrale remaniée, épaissie, non calcifiée
Grande valve mitrale : aspect en crosse de hockey

BR20090084 (Brest PMSI)

Une double valvulopathie (mitrale et aortique) est découverte en 1998, chez une femme de 51 ans, ayant un BMI=32, qui a pris ISOMERIDE® pendant au moins un an en 1989, MEDIATOR® en 1988, 1999, et quelques mois en 2004. Elle a été traitée également pour état dépressif par PROZAC® pendant 4 ou 5 ans jusqu'en 1995.
En août 2004, l'examen cardiologique relève une valve aortique remaniée avec insuffisance aortique de grade 3, une insuffisance mitrale de grade 3 non calcifiée. Une insuffisance tricuspide et une ACFA sont rapportées.
Un double remplacement valvulaire est réalisé en novembre 2004.

BR20090079 (Brest PMSI)

Il s'agit d'un homme de 60 ans, diabétique chez lequel on a découvert une insuffisance mitrale sévère en septembre 2002. Un traitement par CARDENSIEL®, TRIATEC®, DIGOXINE®, LASILIX® et KALEORID® est instauré.
En mars 2003 l'échographie montre une insuffisance mitrale de grade 3 et une insuffisance aortique de grade 2, sans HTAP. Le traitement chirurgical est réalisé en mai 2003.
Le patient aurait pris du MEDIATOR® pendant une dizaine d'années jusqu'en mars 2003.
Il est suivi en 2009 pour insuffisance tricuspide.

Aspect des valves :
Petite valve mitrale rétractée

BR20090087 (Brest PMSI)

Début 2003, chez un homme de 79 ans, ayant un BMI = 24, une coronarographie réalisée dans le cadre d'une angine de poitrine conduit à une angioplastie et pontage de IVA. Ses antécédents sont un diabète, une hypercholestérolémie, une pancréatite et un tabagisme.
Son traitement habituel (durée inconnue) est PLAVIX®, KARDEGIC®, ZYLORIC®, TRIATEC®, LIPANTHYL®, LASILIX®, CARDENSIEL® et MEDIATOR®.

En juin 2003, lors d'un OAP, l'échographie cardiaque montre une insuffisance mitrale de grade 3, une insuffisance aortique de grade 1, une insuffisance tricuspide de grade 1 et une HTAP (PAPs: 77 mmHg). Une hypothèse rhumatismale non ischémique est évoquée.
Une intervention chirurgicale pour plastie et reconstruction valvulaire est réalisée en octobre 2003.
En février 2005, les bons résultats de la plastie sont notés, la valve aortique parait remaniée et une insuffisance tricuspide de grade 2 est rapportée.

Aspect des valves :
2003 : Cordages de la petite valve uniformément rétractées, mais encore souples et bien individualises
Le mécanisme de l'insuffisance mitrale est un basculement de la petite valve dans le VG. Elle est attirée par des cordages raccourcis.

BR20090078 (Brest PMSI)

En 2002, lors d'une consultation pour hypertension artérielle est noté une insuffisance mitrale de grade1 chez une femme de 53 ans, ayant un BMI= 21, traitée par LIPANTHYL® pour une hypercholestérolémie. Un diabète découvert en 2002 est traité par MEDIATOR® et GLUCOPHAGE® ;
En juin 2004, une échocardiographie met en évidence une insuffisance mitrale de grade 3, une insuffisance aortique de grade 2, une insuffisance tricuspide de grade 3 et une HTAP (PAPs: 90 mmHg).
Un double remplacement valvulaire est réalisé en août 2004.
On note dans ses antécédents, une amygdalectomie à l'âge de 18 ans, suite à de nombreuses angines et une dépression. Son traitement habituel comprend également LASILIX®, DIFFU K®, APROVEL®, PREVISCAN®, DIANTALVIC®, XANAX®, IMOVANE®, ELISOR® et DEROXAT®.

Aspect des valves :
Mitrale :
Epaississement fibreux des grandes et petites valves
Soudure de la commissure antérieure
Rétraction importante de l'appareil sous-valvulaire avec des valves et cordages irrécupérables.
Aortique :
Epaississement des sigmoïdes
Athérome minime à la coronarographie

8.2. Valvulopathies non opérées

TO020331 :

Il s'agit d'une femme de 60 ans, avec comme antécédents : diabète de type 2, hypercholestérolémie, macroadénome hypophysaire, hypothyroïdie, syndrome dépressif, obésité ancienne et dipsomanie, traitée par de nombreux médicaments dont MEDIATOR®, depuis 3 ans, LEVOTHYROX® et EFFEXOR®.
Lors de l'exploration d'un souffle cardiaque, est découvert une insuffisance aortique de grade 2, ainsi qu'une insuffisance mitrale de grade 1-2, et une faible insuffisance tricuspide.
L'évolution est inconnue.

Aspect des valves :
Grande valve mitrale légèrement ballonisée
Décalcification des sigmoïdes aortiques avec diminution de leur mobilité
Ouverture sigmoïdienne mesurée à 16 mm
Pas de rétrécissement aortique

TO070121 :

Femme de 44 ans, en surpoids (BMI= 25), tabagique modérée, traitée pour hypercholestérolémie par MEDIATOR® pendant 9 mois, hospitalisée pour décompensation cardiaque gauche. L'échocardiographie permet de découvrir une insuffisance aortique de grade 4 et une insuffisance mitrale de grade 3. Il existe un minime épanchement péricardique sans HTAP. L'angio-scanner élimine une embolie pulmonaire mais note une infiltration des septas pulmonaires. La patiente sort avec un traitement par LASILIX®, COVERSYL®, MOPRAL® et régime peu salé. Le MEDIATOR® est arrêté.

Aspect des valves :
Echocardiographie : Epaississement valvulaire sur la grande valve mitrale avec une image compatible avec une végétation mesurant environ 10 mm.
Echographie trans-oesophagienne : insuffisance mitrale de grade 2, centrale et commissure antérieure sur restriction du jeu valvulaire avec une rigidité du feuillet antérieur et une restriction du feuillet postérieur.
L'appareil sous-valvulaire est d'aspect brillant.
On note une insuffisance aortique centrale sur une valve à trois cuspides de grade 2 sur 4.

MP20080857 :

Patiente de 77 ans, obèse (BMI= 32,9), hypertendue, ayant une hypercholestérolémie et une hypertriglycéridémie, de multiples antécédents chirurgicaux (colectomie partielle, 4 éventrations, cholécystectomie, hernie et prolapsus) hospitalisée en octobre 2008 pour aggravation d'une dyspnée. Son traitement habituel est HYTACAND®, pravastatine, PLAVIX® et MEDIATOR® depuis plusieurs années. L'aortographie trouve une fuite aortique de grade 2-3 et une insuffisance mitrale de grade 2 confirmée par le cathétérisme. Un éventuel remplacement valvulaire est discuté, vu l'âge de la patiente.

Aspect des valves :
Rétraction de la petite valve mitrale
Calcification sur l'anneau

BR20090085 (Brest PMSI)

Femme de 49 ans, (BMI= 28), ayant dans ses antécédents, un AVC, une splénectomie, un tabagisme et un PTI. Son traitement habituel est : LIORESAL®, OGAST®, NEURONTIN®, URBANYL® et CORTANCYL®. Elle a pris du MEDIATOR® en 2002 et en 2003.
En 2002, lors d'une transfusion pour PTI, une suspicion d'OAP entraîne la réalisation d'une échographie cardiaque qui montre une insuffisance mitrale de grade 2 et une insuffisance aortique de grade 2.
En août 2003, suite à un OAP brutal, l'échocardiographie retrouve cette double valvulopathie avec un rétrécissement mitral non serré ainsi qu'une insuffisance tricuspide.

Aspect des valves :
Remaniement valvulaire au niveau des sigmoïdes et de la mitrale
Valve mitrale un peu épaissie et sténosante
Rétrécissement mitral lâche avec petite valve immobile.

BR20090092 (Brest PMSI)

Femme de 55 ans, hospitalisée en urgence en 2001 pour aggravation d'une dyspnée et suspicion d'OAP. Elle a une insuffisance aortique de grade 1. L'évolution est favorable sous diurétiques. Ses antécédents sont une obésité (BMI= 34), une HTA traitée par CELECTOL® et une cholécystectomie.
Un bilan en 2003 trouve une double fuite aortique et mitrale de grade 2.
En mars 2009, l'échocardiographie montre un aspect stable de la double valvulopathie.
La patiente prend du MEDIATOR® depuis au moins 1998 pour contrôler son poids et ne désire pas arrêté.

Aspect des valves :
Remaniement et rétraction de l'appareil sous-valvulaire sans calcification (en 2003)

S06001337 :

Homme, 54 ans traité pour dyslipidémie par MEDIATOR® de mars 2003 à septembre 2005. Le traitement associé est VASTEN®, KARDEGIC® et TENORMINE®. Suite à un épisode de tachycardie avec insuffisance cardiaque en septembre 2005, une coronarographie et une échocardiographie montrent une insuffisance mitrale de grade 2-3, une insuffisance aortique modérée, une sténose de 70% de l'artère coronaire droite et une hypokinésie du ventricule gauche. Le patient subit une angioplastie de l'artère coronaire avec insertion d'un stent.

Aspect des valves :
Pas d'anomalie sur valves à l'échocardiographie.

Remarque : dans 12 cas, nous n'avons aucune information sur les valves

9. Aspects des valves dans la publication de H. Conolly et coll. intitulée « Valvular heart disease associated with fenfluramine-phentermine».

La valve mitrale est scintillante et épaisse. La valve antérieure a une mobilité préservée tandis que la valve postérieure est immobile. Les cordages sont épaissis et raccourcis.
La valve aortique est épaisse.
L'histopathologie montre des plaques de myofibroblastes dans une matrice extracellulaire abondante de collagène.
L'aspect est semblable aux valvulopathies dues ergotamine et aux maladies valvulaires carcinoïdes.

Estimation du risque d'HTAP pour les patients exposés au benfluorex
au regard des données présentées lors du CTPV du 5 mai 2009

J'ai donc repris les calculs « d'incidence » d'hypertension artérielle pulmonaire (HTAP) figurant dans le compte-rendu de la réunion du Comité Technique de Pharmacovigilance du 5 mai 2009.
Si l'on s'en tient au nombre de cas retenus (je ne peux me prononcer sur ce point car je n'ai pas les dossiers mais il est évident que dans une stratégie d'enquête à objectif d'alerte il ne faut pas être trop conservateur et plutôt privilégier la sensibilité à la spécificité), on retrouve :

- une estimation de 1 cas d'HTAP pour 8 738 542 boites vendues en 2007 (ce qui correspond donc, sur la base de 3 cas retenus, à 26,2 millions de boites vendues sur la période),
- une estimation de 1 cas d'HTAP pour 9 655 713 boites vendues en 2009 (ce qui, sur la base de 4 cas retenus, correspond, pour la période cumulée, à 38,6 millions de boites vendues).

On peut noter que, sans considérer une très probable sous-notification d'une partie des cas survenus, l'estimation de 2007 dépasse légèrement (sans considérer non plus la fluctuation statistique) la fourchette haute de ce qui est admis comme risque de base de l'HTAP en population générale (2 cas par million et par an, soit 2 cas par million d'année de suivi). En effet, 26,2 millions de boites de 30 comprimés avec une posologie moyenne de 1,6 comprimé par jour (calcul également utilisé par Catherine Hill) aboutit à un temps d'exposition cumulé (en considérant que tout ce qui a été vendu a été consommé) de 1,346 million d'années d'exposition au benfluorex et donc à un « risque » de 3/1,346 million, soit 2,23 cas d'HTAP par million d'année de traitement.
Pour l'estimation 2009, le même calcul amène à une estimation de 2,02 cas par million d'année de traitement.
Il est évident qu'une analyse de sensibilité considérant plusieurs hypothèses de sous-notification aurait été bienvenue ici ; un facteur de sous-notification réaliste de 4 ou 5 (25 à 20% des cas survenus étant notifiés) faisant passer l'estimation à 9 ou 11 par million d'année d'exposition, soit largement au dessus du risque de base.
Le rapporteur écrit par ailleurs que « *le nombre de cas d'HTAP rapportés dans l'enquête ne constitue pas un signal significatif de la toxicité du MEDIATOR°* ». Il est difficile de savoir si « significatif » est utilisé ici dans le sens subjectif de « fort » ou de « statistiquement significatif ». Cette dernière hypothèse serait contestable car de nature à retarder grandement le processus de décision. En effet, un calcul fondé sur la loi de Poisson ou la loi binomiale (seules utilisables ici du fait du faible nombre de cas) montre que pour conclure à un risque significativement différent du risque de base (2 par million), il aurait fallu, sur la base des ventes disponibles en 2009, un nombre de cas d'HTAP retenus de 9 au lieu de 4 pour un test bilatéral (avec une erreur de première espèce de 5%) et de 8 en hypothèse unilatérale, soit le double ou plus du double du nombre de cas retenus jusqu'à lors ce qui, en conservant la même approche, ne serait attendu qu'au bout de plusieurs années supplémentaires.

Réunion du groupe de travail « PGR et étude pharmaco-épidémiologiques »n°2 3 juin 2009

Mise en place d'une étude pharmaco-épidémiologique afin d'évaluer le risque de valvulopathies associé à la prise de benfluorex
Présentation Martine David-Laroche (CRPV de Besançon), Irène Frachon(hôpital Cavale Blanche/CHU de Brest)
De 1998 à 2009, 19 notifications spontanées de valvulopathies (16 valvulopathies, 3 HTAP post capillaire) ont été enregistrées dans la base nationale de pharmacovigilance. Récemment une requête effectuée via le PMSI dans les services de cardiologie et de chirurgie cardiaque du CHU de Brest a permis de retrouver 14 cas supplémentaires
Le CTPV lors de la séance du 2 mai dernier a conclu que ces données qui constituent un signal de sécurité d'emploi, devaient être explorées et a souhaité que la problématique sot exposée au groupe « PGR-PEPI ».
Il convient de rappeler que l'hypothèse d'une telle association semble cohérente, le benfluorex possédant un métabolite commun avec la fenfluramine (Isoméride) et la dexfenfluramine (Ponderal), substances dont les AMM en 1997 ont été suspendues suite à ces mêmes effets indésirables.
Afin de mesurer l'association entre risque de valvulopathie et prise de benfluorex, les membres du groupe PGR PEPI proposent d'effectuer une étude cas-témoin rétrospective.
Dans la mesure où les cas sont déjà identifiés, restent à définir les témoins

Post meeting notes :
Suite à la réunion, un sous-groupe s'est constitué afin de pouvoir poursuivre la réflexion. Lors d'une réunion téléphonique organisée le 15 juin, il a été décidé de mener une étude cas-témoin :
dans les régions de Brest et d'Amiens, dans lesquelles l'identification des cas est très avancée :
la définition des cas est la suivante : insuffisance mitrale inexpliquée par diagnostic d'exclusion
le choix des témoins a été abordé mais doit être davantage discuté de même que les critères d'appariement (âge, genre). L'appariement des témoins sur le diabète et le surpoids/obésité est remis en question car ils motivent la prescription de benfluorex.

Réunion PGR et étude pharmacoépidémiologiques du 2 décembre 2009

Retour sur la réévaluation du B/R des médicaments contenant du benfluorex
Présentation Carmen Kreft-Jaïs
L'historique du Mediator a été brièvement rappelé ainsi que l'origine de la surveillance des valvulopathies sous benfluorex. Le signal de cardiotoxicité (atteintes valvulaires) détecté par l'analyse de la notification spontanée et des données issues du PMSI du CHU de Brest avait été précédemment abordé lors d'une réunion du groupe et la nécessité de conduire une étude cas-témoin avait alors été exprimée.
Lors de la CNPV de juillet 2009, une nouvelle réévaluation du bénéfice de benfluorex compte tenu des nouvelles données de sécurité a été envisagée mais pour cela la CNPV souhaitait disposer des résultats de 2 études pharmaco épidémiologiques qui étaient en cours :
L'étude du groupe HTAP de Brest

L'étude Regulate, mise en place par les laboratoires Servier dans laquelle des échographies cardiaques étaient réalisées avant et après un an de traitement par Mediator.
D'autres cas de valvulopathies sous benfluorex ont alors été rapportés et les résultats de l'étude cas-témoin conduite par le CHU de brest ont conclu à une augmentation du riqpr

GESTION DES CONFLITS D'INTERETS

Deux situations de conflit d'intérêt majeur concernant deux points à l'ordre du jour (Propacétamol/ paracétamol injectable et benfluorex) ont été déclarées et évaluées préalablement à la séance de la Commission nationale de pharmacovigilance. Le Professeur Eschalier (Responsable du CRPV de Clermont Ferrand) ayant déclaré une activité régulière auprès du laboratoire BMS, et le Professeur Farinotti (Chef de service, Pharmacie, Groupe hospitalier Pitié-Salpêtrière) ayant déclaré une activité régulière auprès des laboratoires Servier, ont quitté la séance lors du traitement des dossiers concernés.

IV – ENQUETE SUR LES HTAP / VALVULOPATHIES ET BENFLUOREX, MEDIATOR®, BENFLUOREX MYLAN®, BENFLUOREX QUALIMED®

Dossier suivi par Béatrice POROKHOV

1 – Introduction :

Nom commercial	MEDIATOR®
DCI	Chlorhydrate de benfluorex
Formes pharmaceutiques	Comprimé pelliculé à 150 mg
Classe pharmacologique	Hypoglycémiant
Procédure d'enregistrement	Procédure nationale
Titulaire de l'AMM	Laboratoires Servier

MEDIATOR® (chlorhydrate de benfluorex) a obtenu une AMM en 1974 par une procédure d'enregistrement nationale. Il est commercialisé en France depuis 1976.
MEDIATOR® est indiqué comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale ». Il est à noter que l'indication comme « adjuvant du régime adapté dans les hypertriglycéridémies » a été supprimée à la suite de l'avis émis par la Commission Nationale de Pharmacovigilance (CNPV) du 27 mars 2007.

2 – Contexte :

En décembre 2004, la notification de plusieurs cas d'effets indésirables « *amphétamine-like* » sous MEDIATOR® a conduit à une actualisation des données neuropsychiatriques.
Par ailleurs, lors du Comité Technique de pharmacovigilance du 8 mars 2005, la présentation d'un cas d'hypertension artérielle pulmonaire a justifié une extension de l'enquête, incluant alors les hypertensions artérielles pulmonaires (HTAP).
Les résultats de cette enquête officielle ont été présentés par le CRPV de Besançon au Comité Technique de Pharmacovigilance (CTPV) du 7 juin 2005 et à la CNPV du 29 novembre 2005. La CNPV a alors demandé : i) la réévaluation du rapport bénéfice/risque de MEDIATOR®, ii) une étude d'utilisation/prescription, iii) une étude expérimentale sur un modèle animal permettant d'étudier le potentiel du benfluorex à induire des HTAP et iiii) une étude au niveau des Centres d'Evaluation et d'Information sur la Pharmacodépendance (CEIP) afin d'identifier un potentiel d'abus et de pharmacodépendance.

En 2007, suite à la revue des données d'efficacité de Mediator®, le groupe DEUG a proposé la suppression de l'indication «adjuvant du régime adapté dans les hypertriglycéridémies », avec maintien de l'indication chez les diabétiques. Cet avis a été entériné par la Commission Nationale d'AMM en avril 2007.

En mai 2009, le Comité technique de Pharmacovigilance a examiné les résultats actualisés de cette enquête, notamment les données relatives au risque d'HTAP et de valvulopathie cardiaque sous MEDIATOR® ainsi que les données d'une publication[1] récente sur ce sujet.

Depuis le dernier passage en Commission Nationale de Pharmacovigilance du 27 mars 2007, 8 nouveaux cas d'HTAP ont été notifiés, soit un total de 28 cas, parmi lesquels le nombre d'HTAP d'allure idiopathique sous MEDIATOR® non associés à un autre anorexigène, est passé de 3 à 4. Le taux de notification des HTAP imputables au MEDIATOR® reste donc stable par rapport à 2007 (1 cas sur 34 954 169 boîtes vendues, soit 1 cas pour 14 372 602 mois de traitement). De même, la fréquence des cas d'HTAP idiopathiques sous MEDIATOR® est stable par rapport aux données présentées en mars 2007.

Compte tenu de l'incidence des HTAP d'allure idiopathique dans la population générale (1 à 2 cas par millions et par an), le Comité Technique a considéré que le nombre de cas d'HTAP d'allure idiopathique associés à l'utilisation de MEDIATOR® ne semblait pas constituer un signal significatif de la toxicité pulmonaire du Médiator®. Les membres du Comité Technique ont recommandé la poursuite d'une surveillance des notifications spontanées des cas d'HTAP dans la population générale.

Concernant les valvulopathies, nous disposons d'une trentaine de cas entre 1998 et 2009 sous MEDIATOR® ce qui constitue un signal qu'il convient d'explorer.

L'ensemble de ces résultats a également fait l'objet d'une présentation en groupe pharmaco-épidémiologie de l'Afssaps afin de définir un modèle d'étude permettant d'explorer le signal relatif aux valvulopathies. Une étude rétrospective cas-témoins des cas de valvulopathies issus du PMSI a été proposée.

Les conclusions de ce groupe ainsi que les données actualisées de cette enquête sur le risque de valvulopathie cardiaque ont été présentées à la Commission Nationale de Pharmacovigilance du 7 juillet 2009.

3 - Actualisation de l'enquête sur les valvulopathies :

En France, 30 cas sont rapportés entre 1998 et 2009 :

- 19 cas issus de la notification spontanée (NS) dont 3 cas concernant également les HTAP post-capillaires
- 11 cas identifiés par le CRPV de Brest à la suite de l'interrogation du PMSI (Programme de médicalisation des systèmes d'information).

3.1 – Caractéristiques des patients :

	NS : 19	PMSI : 11
Sexe	Femmes : 24, hommes : 6	
Age moyen de survenue (ans) *Femmes* : 54,6 *Hommes* : 62,2	 53,7 54,6	 56,4 69,7
BMI (kg/m^2) *18,5 à 24,9* : 5 cas *25 à 29,9* : 7 cas ≥ *30* : 8 cas	 3 5 4	 ~~3~~ 2 2 4
Durée moyenne de traitement (ans) 5,3	5,6	4,6
Antécédents / Terrain (nombre) *Tabac* : 13 *Hypothyroïdie* : 9 *Diabète* : 9 *Dyslipidémie* : 12 *Polyarthrite rhumatoïde* : 2	 10 7 5 10 1	 3 2 4 2 1
Antécédent/Terrain cardiaque (nombre)	15	
Médicaments associés (nombre) *Levothyroxine* *Antidépresseur IRS*	 9 7	

3.2 – Type et localisation des valvulopathies :

Les 30 valvulopathie rapportées sont monovalvulaires dans 6 cas, bivalvulaires dans 16 cas et trivalvulaires dans 8 cas. Concernant la localisation de ces valvulopathies, 28 cas sont des insuffisances mitrales (sévères dans 17 cas), 24 cas sont des insuffisances aortiques et 11 cas sont des insuffisances tricuspides (sévères dans 4 cas).

3.3 – Aspects anatomo-pathologiques des valvulopathies opérées

Des diagnostics anatomo-pathologiques sont effectués chez 6 patients opérés : 5 patients français et un cas espagnol rapporté dans une publication (Rafel Ribera J.).

a) 4 cas dont l'aspect anatomo-pathologique serait compatible avec celui décrit sous anorexigène :

TO060355 (Noize[1] 2006) : une femme de 48 ans, avec un BMI=25 kg/m^2, sous MEDIATOR® pendant 7 ans pour intolérance aux glucides.

BR20080051 (Boutet[2], cas n°6) : une femme de 50 ans ayant un diabète de type 2, avec un BMI=34 kg/m^2, sous MEDIATOR® de 2001 à 2007 et sous ISOMERIDE® pendant 1 à 3 mois 20 ans auparavant.

BR20090080 (Brest PMSI) : une femme de 54 ans, avec BMI=30 kg/m^2, sous MEDIATOR® de septembre 2007 à décembre 2008, ayant pris des amphétamines 7 à 8 ans jusqu'en 1986.

S03000422 (R. Riber[3] J. 2003) : une femme de 50 ans, sous MEDIATOR® pendant 12 mois par intermittence.

b) Autres cas

Dans 2 cas, l'anatomopathologie n'est pas spécifique.
Dans les autres cas, seules les données échographiques sont disponibles.

4- Conclusions du rapporteur :

Le CRPV de Besançon, rapporteur de cette enquête, a conclu à l'existence d'un signal de cardiotoxicité détecté par la notification spontanée et les données du PMSI. Il convient alors de confirmer ce signal par une étude épidémiologique (cas-témoin).
Le rapporteur souligne que la pharmacologie du benfluorex et de son métabolite, la nor-fenfluramine, devra être prise en compte dans l'analyse du mécanisme de la cardiotoxicité.

Compte tenu de ces nouvelles données de sécurité, le rapporteur propose une réévaluation du bénéfice/risque de benfluorex.

5- Présentation du Dr. Frachon (praticien, CHU de Brest):

Lors de cette réunion, le Docteur Frachon, du groupe HTAP de Bretagne Occidentale (CHU de Brest) a présenté la méthodologie appliquée à Brest pour l'identification des cas de valvulopathies associées au benfluorex.

L'identification des cas de valvulopathies a reposé sur :

i) le signalement spontané de 4 cas par des médecins brestois,
ii) l'interrogation du PMSI en utilisant le codage « valvulopathies et diabète » qui a mis en évidence 240 dossiers dont 3 cas compatibles et le codage « valvulopathies et Médiator® » qui a rapporté 23 dossiers dont 11 compatibles,
iii) une surveillance prospective avec 3 nouveaux cas.

Sur les 15 patients identifiés « compatibles » (dont 11 rapportés par le CRPV de Besançon et 4 très récents à l'étude), 12 étaient des femmes et 3 des hommes. L'âge moyen est de 58 ans (49-78). 6 patients sur 12 étaient diabétiques. La durée moyenne d'exposition est de 53 mois (12-144) avec un délai entre la première prise du médicament et le diagnostic de 97 mois (13-384). L'échographie cardiaque antérieure est normale dans 5 cas sur 7. L'exposition à d'autres anorexigènes concerne 5 patients sur 12, et à un antidépresseur de type inhibiteur de recapture de la sérotonine (IRSI) concerne 8 patients sur 10.
Les valves atteintes sont la valve mitrale et la valve aortique dans 100% des cas, avec une atteinte de la valve tricuspide dans 7 cas et de la valve pulmonaire dans un cas. Une chirurgie de remplacement valvulaire a été effectuée dans 8 cas.

Une analyse systématique de toutes les insuffisances mitrales (IM), isolées ou associées, examinées au CHU de Brest depuis 2003, est actuellement en cours. Plus de 600 dossiers d'IM sont classés en 3 groupes: 1) IM dans un contexte étiologique bien identifié 2) IM inexpliquées 3) IM non classables.
Une recherche de l'exposition au benfluorex sur un modèle de cas témoins est réalisée pour les cas identifiés par le PMSI et par une enquête téléphonique auprès du médecin et du patient.
Les résultats de cette étude sont attendus pour fin juillet 2009.

6- Présentation du laboratoire :
