Enquête sur le MEDIATOR®

RAPPORT DEFINITIF
TOME ANNEXES

Établi par

Dr Anne-Carole BENSADON, Etienne MARIE et Dr Aquilino MORELLE
Membres de l'Inspection générale des affaires sociales

- Janvier 2011 -

Sommaire

PREMIERE PARTIE

ANNEXE 1-1 : LISTE DES PERSONNES AUDITIONNEES 11

ANNEXE 1-2: THE PHARMACOLOGIST (21-25 AOUT 1960 – VOL.2, N°2) 15

ANNEXE 1-3 : THE PHARMACOLOGIST (29 AOUT – 1 SEPTEMBRE 1961 – VOL.3, N°2) 16

ANNEXE 1-4 : INTERNATIONAL SYMPOSIUM ON AMPHETAMINES AND RELATEED COMPOUNDS (1970) 18

ANNEXE 1-5 : BREVET D'INVENTION P.V. N° 101.584 N°1.517.587 41

ANNEXE 1-6 : THESE PRESENTEE ET SOUTENUE LE 1 JUILLET 1963 PAR JEAN-CLAUDE LE DOUAREC 47

ANNEXE 1-7 : COMPARAISON PHARMACOLOGIQUE DE SEPT MEDICAMENTS ANOREXIGENES, PAR J-C LE DOUAREC ET H. SCHMIT 51

ANNEXE 1-8 : PSYCHOPHARMACOLOGIA (1973), "THE EFFECTS OF CHRONIC FENFLURAMINE ADMINISTRATION ON BEHAVIOUR AND BODY WEIGHT (22 JANVIER 1973)" 66

ANNEXE 1-9 : PSYCHOPHARMACOLOGIA (1974), "TIME SAMPLING OF RAT EXPLORATORY BEHAVIOUR 6 JUIN 1973)" 79

ANNEXE 1-10 : EFFECT OF A FENFLURAMINE DERIVATIVE (S992) ON LIPIP AND SUGGER METABOLISM 91

ANNEXE 1-11 : MEDIATOR (NOTE DU FABRICANT) 96

ANNEXE 1-12 : SUPPLEMENT TO S.A MEDICAL JOURNAL "19 JUIN 1971" (SEMINAR ON FENFLURAMINE AND OBESITY 22-26 FÉVRIER 1971 À NASSAU) 97

ANNEXE 1-13 : PSYCHOPHARMACOLOGIA (1974), (CHRONIC ANOREXIC AND BEHAVIOURAL EFFECTS OF THE FENFLURAMINE DERIVATIVE SE 780 IN RATS) 114

ANNEXE 1-14 : POSTGRADUATE MEDICAL JOURNAL (1975 - SUPPLEMENT "1" VOL.51) 119

ANNEXE 1-15 : LES LABORATOIRES SERVIER "INSCRIPTION DU BENFLUOREX (MEDIATOR) AU TABLEAU A DES SUBSTANCES VENENEUSES 156

ANNEXE 1-16 : J-C LE DOUAREC (DIFFERENTES STRUCTURES CHIMIQUES) 159

ANNEXE 1-17 : LES LABORATOIRES SERVIER (COURRIER DU 3 DECEMBRE 2010) 162

ANNEXE 1-18 : SUPPLEMENT TO S.A. MEDICAL JOURNAL (19 JUIN 1971) 165

ANNEXE 1-19 : JOURNAL OF PHARMACY AND PHARMACOLOGY (1972) 166

ANNEXE 1-20 : PSYCHOPHARMACOLOGIA (1974) " CHRONIC ANOREXIC AND BEHAVIOURAL EFFECTS OF THE FENFLURAMINE METABOLITE, NORFENFLURAMINE" 174

ANNEXE 1-21 : JOURNAL OF PHARMACY AND PHARMACOLOGY "VOLUME 27" (8-12 SEPTEMBRE 1975)

(BRITISH PHARMACEUTICAL CONFERENCE) 182

ANNEXE 1-22 : PSYCHOPHARMACOLOGY (1977), (DISCRIMINATIVE STIMULUS PROPERTIES OF FENFLURAMINE IN AN OPERANT TASK : AN ANALYSIS OF ITS CUE FUNCTION) 185

ANNEXE 1-23 : PSYCHOPHARMACOLOGY (1985), (ANORECTIC EFFECT OF FENFLURAMINE ISOMERS AND METABOLITES: RELATIONSHIP BETWEEN BRAIN LEVELS AND IN VITRO POTENCIES ON SEROTONERGIC MECHANISMS) 191

ANNEXE 1-24 : ARCHIVES OF PHARMACOLOGY (JANVIER 1991) (COMPARATIVE STUDIES ON THE ANORECTIC ACTIVITY OF D-FENFLURAMINE IN MICE, RATS, AND GUINEA PIGS) 195

ANNEXE 1-25 : ARTICLE DU NAUNYN-SCHMIEDEBERG'S ARCH PHARMACOL (1998), (IN VITRO STUDIES ON THE MECHANISM BY WHICH (+) – NORFENFLURAMINE INDUCES SEROTONIN AND DOPAMINE RELEASE FROM THE VESICULAR STORAGE POOL "DE MM. GOBBI – PARAZZOLI – MENNINI ") 203

ANNEXE 1-26 : EXTRAITS DE « THE MERCK INDEX » (2006) 208

ANNEXE 1-27 : PROGRAMME ON INN – THE USE OF COMMON STEMS IN THE SELECTION OF INN FOR PHARMACEUTICAL SUBSTANCES (2002) 210

ANNEXE 1-28 : EXTRAIT DE « CHRONIQUE OMS » (VOL 25, N°3 MARS 1971) 216

ANNEXE 1-29 : LES LABORATOIRES SERVIER (30 AOUT 1973), « DEMANDE DE CHANGEMENT DE DENOMINATION COMMUNE » 218

ANNEXE 1-30 : SERVICE CENTRALE DE LA PHARMACIE ET DES MEDICAMENTS (29 NOVEMBRE 1973), « DEMANDE DE CHANGEMENT DE DENOMINATION COMMUNE » 220

ANNEXE 1-31 : SERVICE CENTRALE DE LA PHARMACIE ET DES MEDICAMENTS - BUREAU PH.4 (25 JUILLET 1974), « DENOMINATION COMMUNE : BENFLUOREX » 221

ANNEXE 1-32 : SERVICE CENTRALE DE LA PHARMACIE ET DES MEDICAMENTS « DOSSIER N°10008 / LABORATOIRES SERVIER » 222

ANNEXE 1-33 : NOTE (NOMENCLATURE DES MEDICAMENTS – BENFLUOREX) POUR M. NARGEOLET, « 14 NOVEMBRE 1975 » 223

ANNEXE 1-34 : WHO (ATC/DDD) - EXTRAIT DU « INTRODUCTION TO DRUG UTILIZATION RESEARCH (2003) » 224

ANNEXE 1-35 : MAIL DE CAROLE FOSSET (28 JUIN 2007 – CODE ATC MEDIATOR) 232

ANNEXE 1-36 : WHO DRUG INFORMATION (VOL22, N°. 1,2008) 236

ANNEXE 1-37 : PROPRIETES PHARMACOLOQIQUES DU BENFLUOREX (DR LECHAT "31 DECEMBRE 2010"). 238

ANNEXE 1-38 : BENFLUOREX (II PHARMACOKINETICS AND METABOLISM CLINICAL STUDIES) 272

ANNEXE 1-39 : LES LABORATOIRES SERVIER "MEDIATOR 150MG" (DOSSIER VNL 10008) 282

ANNEXE 1-40 : PRATIQUES OU LES CAHIERS DE LA MEDICINE UTOPIQUE (FEVRIER 1977) 292

ANNEXE 1-41 : DICTIONNAIRE CRITIQUE DES MEDICAMENTS (1978-1979) 299

ANNEXE 1-42 : ARTICLE DU « BRITISH MEDICAL JOURNAL » (VOLUME 283 – 3 OCTOBRE 1981) 302

ANNEXE 1-43 : EXTRAIT DE "THE LANCET", (VOL 339, N°8790 DU 15 FEVRIER 1992)" 304

ANNEXE 1-44 : COURRIER DU PR DUROUX (23 SEPTEMBRE 1991) 307

ANNEXE 1-45 : IRIS : COURRIER DU DR. L.PERRET DU 16 SEPTEMBRE 1991 308

ANNEXE 1-46 : AP-HP ANTOINE BECLERE : COURRIER DU PR. G. SIMONNEAU DU 27 FEVRIER 1992 310

ANNEXE 1-47 : PROTOCOL – IPPHS « 1 DECEMBRE 1992 » 312

ANNEXE 1-48 : COURRIER DU PR. ABENHAIM (4 JANVIER 2011) 346

ANNEXE 1-49 : COMPTE RENDU DE LA REUNION A STRASBOURG DU 5 MAI 1993 - (DECRIRE LES RAPPORTS ENTRE L'IPPHS ET LE RESEAU FRANÇAIS DE PHARMACOVIGILANCE) 353

ANNEXE 1-50 : AGENCE DU MEDICAMENT « 4 FEVRIER 1994 » : REUNION D'INFORMATION « DEXFENFLURAMINE, FENFLURAMINE ET HYPERTENTION ARTERIELLE PULMONAIRE DU 31 JANVIER 1994 354

ANNEXE 1-51 : INTERNATIONAL PRIMARY PULMONARY HYPERTENSION STUDY (IPPHS) « 5 AVRIL 1994 » 360

ANNEXE 1-52 : AGENCE DU MEDICAMENT, CONCLUSIONS DE LA REUNION "STRATEGIE THERAPEUTIQUE DE L'OBESITE » (31 MAI 1994) 398

ANNEXE 1-53 : AGENCE DU MEDICAMENT, COMPTE-RENDU DE LA COMMISSION NATIONALE DE PHARMACOVIGILANCE DU 10 MAI 1994 403

ANNEXE 1-54 : INTERNATIONAL PRIMARY PULMONARY HYPERTENSION STUDY (IPPHS) "7 MARS 1995" 407

ANNEXE 1-55 : AGENCE DU MEDICAMENT (3 MAI 1995) : SYNTHESE DES DONNEES DISPONIBLES SUR LE RAPPORT BENEFICE/RISQUE DES ANOREXIGENES A LA SUITE DE LA COMMISSION NATIONALE DU 28 AVRIL 1995 535

ANNEXE 1- 56 : AGENCE DU MEDICAMENT (ENQUETE NATIONALE DE PHARMACOVIGILANCE ET ANOREXIGENES « DOSSIER TECHNIQUE » 9 MAI 1994) 545

ANNEXE 1- 57 : AGENCE DU MEDICAMENT (12 MAI 1995) 570

ANNEXE 1-58 : JOURNAL OFFICIEL DE LA REPUBLIQUE FRANÇAISE DU 16 MAI 1995 (N°8215) 573

ANNEXE 1-59 : REUNION ISOMERIDE – ANOREXIGENES DU 29 MAI 1995 574

ANNEXE 1-60 : AGENCE DU MEDICAMENT (06 OCTOBRE 1995) : COMMISSION NATIONALE DE PHARMACOVIGILANCE « PROCES-VERBAL DE LA REUNION DU 19 JUIN 1995 ») 576

ANNEXE 1-61 : NOTE A L'INTENTION DE M. TABUTEAU (16 JUILLET 1995) DE M. ALEXANDER 587

ANNEXE 1-62 : NOTE DE MME. H. SAINTE MARIE (OBJET : ANOREXIGENES) 595

ANNEXE 1-63 : JOURNAL OFFICIEL DE LA REPUBLIQUE FRANÇAISE DU 31 OCTOBRE 1995 (N°15937) .....

ARRETE DU 25 OCTOBRE 1995 597

ANNEXE 1-64 : AGENCE DU MEDICAMENT (DIRECTION DE L'EVALUATION – UNITE DE PHARMACOVIGILANCE), (NOTE DU 20 DECEMBRE 1996) 598

ANNEXE 1-65 : THE NEW ENGLAND JOURNAL OF MEDECINE (VOL 337, N°9 - 28 AOUT 1997) 614

DEUXIEME PARTIE

ANNEXE 2-1 : COURRIER DU 29 NOVEMBRE 1973 DU LABORATOIRE SERVIER AU MINISTRE DE LA SANTE .. 628

ANNEXE 2-2 : SYNTHESE DE LA REGLEMENTATION APPLICABLE A L'AUTORISATION DE MISE SUR LE MARCHE D'UN MEDICAMENT, SELON UNE PROCEDURE NATIONALE, 1970 A 2010 634

ANNEXE 2-3 : DOSSIER DE PRESENTATION MEDIATOR 646

ANNEXE 2-4 : COURRIER DU 1 AVRIL 1974 LABORATOIRE SERVIER AU MINISTRE DE LA SANTE 651

ANNEXE 2-5 : COURRIER DU 16 JUILLET 1974 DECISION DU MINISTRE DE LA SANTE 652

ANNEXE 2-6 : COURRIER DU 16 JUILLET 1974 AU PROFESSEUR QUERAUVILLIER 654

ANNEXE 2-7 : COURRIER DU 16 JUILLET 1974 DU SERVICE CENTRAL DE LA PHARMACIE ET DES MEDICAMENTS AU PHARMACIEN RESPONSABLE DES LABORATOIRES SERVIER 655

ANNEXE 2-8 : COURRIER DU 23 SEPTEMBRE 1974 DECISION DU MINISTRE DE LA SANTE 656

ANNEXE 2-9 : COURRIER DU 29 OCTOBRE 1979 DU SERVICE CENTRAL DE LA PHARMACIE ET DES MEDICAMENTS AU MINISTRE DE LA SANTE 657

ANNEXE 2-10 : NOTE DE L'AGENCE FRANÇAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE 662

ANNEXE 2-11 : COURRIER DU 22 AVRIL 1987 DU MINISTRE DES AFFAIRES SOCIALES ET DE L'EMPLOI AU TITULAIRE DE L'AUTORISATION DE MISE SUR LE MARCHE 692

ANNEXE 2-12 : COURRIER DU 1 SEPTEMBRE 1987 DU MINISTRE DES AFFAIRES SOCIALES ET DE L'EMPLOI AU PHARMACIEN RESPONSABLE DES LABORATOIRES SERVIER 699

ANNEXE 2-13 : COURRIER DU 7 JUILLET 1987 DES LABORATOIRES SERVIER AU DIRECTEUR DE LA PHARMACIE ET DU MEDICAMENT 700

ANNEXE 2-14 : COURRIER DU 29 JUILLET 1987 DES LABORATOIRES SERVIER AU DIRECTEUR DE LA PHARMACIE ET DU MEDICAMENT 702

ANNEXE 2-15 : COURRIER DU 2 AOUT 1989 DU MINISTERE DE LA SOLIDARITE DE LA SANTE ET DE LA PROTECTION SOCIALE AU PHARMACIEN RESPONSABLE DES LABORATOIRES SERVIER 704

ANNEXE 2-16 : COURRIER DU 19 JANVIER 1990 DU PHARMACIEN RESPONSABLE DES LABORATOIRES SERVIER AU MINISTERE DE LA SOLIDARITE DE LA SANTE ET DE LA PROTECTION SOCIALE 705

ANNEXE 2-17 : COURRIER DU 23 MARS 2000 DU LABORATOIRE SERVIER A L'AFSSAPS ET COPIE DU PV DU 12/07/91 708

ANNEXE 2-18 : COPIE DU COURRIER DU 2 AOUT 1994 DU LABORATOIRE SERVIER A L'AFSSAPS..... 714

ANNEXE 2-19 : COURRIER DU 2 AOUT 1994 DU LABORATOIRE SERVIER A L'AFSSAPS..... 716

ANNEXE 2-20 : COURRIER DU 13 JANVIER 1995 DU LABORATOIRE SERVIER A L'AFSSAPS 718

ANNEXE 2-21 : REUNION COMMISSION N°199 DU 3 FEVRIER 1995 720

ANNEXE 2-22 : RELEVE D'AVIS COMMISSION D'AUTORISATION DES MEDICAMENTS N°199 DU 3 FEVRIER 1995 722

ANNEXE 2-23 : COURRIER DU 16 MARS 1995 DE L'AFSSAPS AU TITULAIRE DE L'AUTORISATION DE MISE SUR LE MARCHE LABORATOIRE SERVIER 726

ANNEXE 2-24 : COMPTE-RENDU DE LA REUNION DE CONCERTATION MEDIATOR DU 22 SEPTEMBRE 1995 A L'AGENCE DU MEDICAMENT 727

ANNEXE 2-25 : REUNION GTI N°53 DU 5 DECEMBRE 1995..... 730

ANNEXE 2-26 : COURRIER DU 24 JANVIER 1997 DU LABORATOIRE SERVIER A L'AFSSAPS 731

ANNEXE 2-27 : AUTORISATION DE MISE DUR LE MARCHE RECTIFICATIF 733

ANNEXE 2-28 : COURRIER DU 28 AVRIL 1997 DE L'AFSSAPS AU TITULAIRE DE L'AUTORISATION DE MISE SUR LE MARCHE LABORATOIRE SERVIER 744

ANNEXE 2-29 : COURRIER DU 5 JUIN 1997 DE L'AFSSAPS AU PHARMACIEN RESPONSABLE DES LABORATOIRES SERVIER 750

ANNEXE 2-30 : COURRIER DU 4 AOUT 1997 DE L'AFSSAPS AU TITULAIRE DE L'AUTORISATION DE MISE SUR LE MARCHE LABORATOIRE SERVIER 751

ANNEXE 2-31 : HISTORIQUE DE LA SPECIALITE MEDIATOR VNL10008 DE L'AMM A ANNEE 2000..... 757

ANNEXE 2-32 : COURRIER DU 29 MAI 1998 DU LABORATOIRE SERVIER A L'AFSSAPS 758

ANNEXE 2-33 : DEMANDE DU LABORATOIRE SERVIER D'INDICATION DU MEDIATOR 150MG POUR LE TRAITEMENT DU DIABETE DE TYPE II 761

ANNEXE 2-34 : REUNION COMMISSION N°273 DU 2 OCTOBRE 1998 763

ANNEXE 2-35 : COMPTE-RENDU DE LA REUNION INTERNE CONCERNANT MEDIATOR (AFSSAPS, 18 MARS 1999) 769

ANNEXE 2-36 : REUNION COMMISSION N°289 DU 8 JUILLET 1999 773

ANNEXE 2-37 : NOTE A L'ATTENTION DE M.J.M. ALEXANDRE, DIRECTEUR DE L'EVALUATION DES MEDICAMENTS ET DES PRODUITS BIOLOGIQUES 25 AOUT 1999 781

ANNEXE 2-38 : REUNION COMMISSION N°296 DU 9 DECEMBRE 1999 787

ANNEXE 2-39 : DECISION DU DIRECTEUR GENERAL DE L'AGENCE FRANÇAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE DU 25 AVRIL 2000 797

ANNEXE 2-40 : COURRIER DU 9 FEVRIER 2000 DE L'AGENCE FRANÇAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE AU PHARMACIEN RESPONSABLE 799

ANNEXE 2-41 : COURRIER DU 31 MARS 2000 LES LABORATOIRES SERVIER AU PRESIDENT DE LA COMMISSION D'AMM 802

ANNEXE 2-42 : INFORMATION ACCORD SIGNATURE DU 25 AVRIL 2000 803

ANNEXE 2-43 : REUNION GT PTC2 N°1 DU 21 SEPTEMBRE 2000 804

ANNEXE 2-44 : COURRIER DU 11 DECEMBRE 2000 DE L'AFFSSAPS AU PHARMACIEN RESPONSABLE LABORATOIRE SERVIER 817

ANNEXE 2-45 : COURRIER DU 12 JUIN 2001 DE L'AFFSSAPS AU TITULAIRE DE L'AUTORISATION DE MISE DUR LE MARCHE LABORATOIRE SERVIER 819

ANNEXE 2-46 : RESUME DES CARACTERISTIQUES DU PRODUIT 835

ANNEXE 2-47 : COURRIER DU 28 NOVEMBRE 2002 DECISION DE L'AGENCE FRANÇAISE DE SECURITE SANITAIRE DES PRODUITS DE SANTE 852

TROISIEME PARTIE

ANNEXE 3-1 : DESCRIPTION DU SYSTEME DE PHARMACOVIGILANCE (EXTRAIT DU SITE DE L'AFSSAPS) 859

ANNEXE 3-2 : DOCUMENT PREPARATOIRE AU CTPV DU 20 JUILLET 1999, ELABORE PAR LE CRPV DE BESANÇON 869

ANNEXE 3-3 : COMPTE- RENDU DU CTPV DU 18 MAI 1995 897

ANNEXE 3-4 : COMPTE- RENDU DU CTPV DU 11 JUILLET 1995 919

ANNEXE 3-5 : COMPTE- RENDU DU CTPV DU 30 AVRIL 1998 967

ANNEXE 3-6 : COURRIER DU 11 MAI 1998 AUX LABORATOIRES SERVIER LES INFORMANT DE L'OUVERTURE D'UNE ENQUETE DE PHARMACOVIGILANCE OFFICIELLE SUR LE MEDIATOR® 999

ANNEXE 3-7 : COMPTE- RENDU DU CTPV DU 10 SEPTEMBRE 1998 1001

ANNEXE 3-8: COMPTE- RENDU DU CTPV DU 22 OCTOBRE 1998 1035

ANNEXE 3-9 : COMPTE- RENDU DU CTPV DU 17 DECEMBRE 1998 1075

ANNEXE 3-10 : ANALYSE COMPARATIVE DES COMPTES-RENDUS DES CTPV DES 10 SEPTEMBRE 1998 ET 17 DECEMBRE 1998 REALISEE, A LA DEMANDE DE LA MISSION, PAR LE CRPV DE BESANÇON 1121

ANNEXE 3-11 : COMPTE- RENDU DE LA CNPV DU 7 JUILLET 1999 1123

ANNEXE 3-12 : LETTRE DU PR GARATTINI A L'EMEA DU 25 SEPTEMBRE 1998 1143

ANNEXE 3-13: MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 24 NOVEMBRE 1998 1145

ANNEXE 3-14 : COURRIER DU MINISTERE DE LA SANTE ITALIEN DU 14 DECEMBRE 1998 A L'AGENCE DU MEDICAMENT 1147

ANNEXE 3-15 : COURRIER DU 12 JANVIER 1999 DU LABORATOIRE SERVIER A L'AFSSAPS 1149

ANNEXE 3-16: ENVOI DU RAPPORT DU CRPV DE BESANÇON PAR L'AFSSAPS LE 21 JANVIER 1999 1173

ANNEXE 3-17 : REPONSE DU 9 FEVRIER 1999 DE L'AGENCE DU MEDICAMENT A L'ITALIE MENTIONNANT LE SOUHAIT DE VOIR LES FICHES SUR LES CAS MENTIONNES DANS LE RAPPORT 1207

ANNEXE 3-18 : ENVOI PAR L'AFSSAPS LE 19 FEVRIER 2009 DU LISTING DES CAS FRANÇAIS 1211

ANNEXE 3-19 : MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 3 MARS 1999 ET DRAFT DU RAPPORT DU MINISTERE DE LA SANTE ITALIEN 1344

ANNEXE 3-20 : RAPPORT REVISE DU MINISTERE DE LA SANTE ITALIEN DU 6 MAI 1999 1352

ANNEXE 3-21 : RAPPORT REVISE DU MINISTERE DE LA SANTE ITALIEN DU 27 MAI 1999 1365

ANNEXE 3-22 : RAPPORT REVISE DU MINISTERE DE LA SANTE ITALIEN DU 31 MAI 1999 1367

ANNEXE 3-23 : MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE 10 JUIN 1999 ET 30 SEPTEMBRE 1999 1381

ANNEXE 3-24 : INFOFAX DE PHARMACOVIGILANCE DU 18 JUIN 1999 SUR LE CAS D'HTAP..... 1383

ANNEXE 3-25 : COMPTE- RENDU DU CTPV DU 22 JUIN 1999..... 1386

ANNEXE 3-26 : RAPPORT REVISE DU MINISTERE DE LA SANTE ITALIEN DU 12 OCTOBRE 1999..... 1390

ANNEXE 3-27 : COMPTE RENDU TELEPHONIQUE DU 22 SEPTEMBRE 1999 1396

ANNEXE 3-28 : COURRIER DU 22 NOVEMBRE 1999 DE L'AFSSAPS AUX LABORATOIRES SERVIER..... 1397

ANNEXE 3-29 : COMPTE- RENDU DU CTPV DU 7 DECEMBRE 1999 1399

ANNEXE 3-30 : INFORMATION DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 24 JANVIER 2000 1403

ANNEXE 3-31 : REPONSE DES LABORATOIRES SERVIER A L'AGENCE DU 18 FEVRIER 2000 ET COURRIER DE L'AFSSAPS DU 17 MARS 2000..... 1405

ANNEXE 3-32 : INFORMATION DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DES 19 JUILLET 2000 ET 11 OCTOBRE 2000..... 1408

ANNEXE 3-33 : COURRIER DE RELANCE DE L'AFSSAPS AUX LABORATOIRES SERVIER DU 25 OCTOBRE 2000 1411

ANNEXE 3-34 : COMPTE-RENDU DE LA REUNION DU 28 NOVEMBRE 2000 ENTRE L'AFSSAPS ET LES LABORATOIRES SERVIER 1415

ANNEXE 3-35 : MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 29 NOVEMBRE 2000 1417

ANNEXE 3-36 : MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 30 NOVEMBRE 2000 1421

ANNEXE 3-37 : PROTOCOLE D'ETUDE ADRESSE A L'AFSSAPS PAR LES LABORATOIRES SERVIER LE 1ER FEVRIER 2001 1427

ANNEXE 3-38 : MINUTES DU GROUPE EUROPEEN DE PHARMACOVIGILANCE DU 6 MARS 2001..... 1453

ANNEXE 3-39 : COMMENTAIRES ADRESSES PAR LE CRPV DE BESANÇON SUR LE PROTOCOLE 1455

ANNEXE 3-40 : INFORMATION NON URGENTE ENVOYEE PAR LE MINISTERE DE LA SANTE ESPAGNOL SUR LE CAS DE VALVULOPATHIE ESPAGNOL ASSOCIE A L'UTILISATION DE BENFLUOREX DU 03 OCTOBRE 2003..... 1461

ANNEXE 3-41: RETRAIT DU BENFLUOREX DU MARCHE EN ESPAGNE ET EN ITALIE 1463

ANNEXE 3-42 : DOCUMENT PREPARE PAR LE PR RICHE (PRESIDENT DE LA CNPV DE JUILLET 1998 A JUILLET 2001) POUR LA MISSION IGAS..... 1471

ANNEXE 3-43 :COMPTE-RENDU DU CTPV DU 13 FEVRIER 2001 1638

ANNEXE 3-44 : COMPTE-RENDU DU CTPV DU 15 MAI 2001 1666

ANNEXE3-45 :COMPTE-RENDU DU CTPV DU 7 DECEMBRE 2004..... 1668

ANNEXE 3-46: COURRIER DU 24 FEVRIER 1997 DE L'ASSURANCE MALADIE – SERVICE MEDICAL DE SAINT-ETIENNE ET REPONSE DE L'AFSSAPS..... 1690

ANNEXE 3-47 : NOTE DU PR ALEXANDRE DU 20 JUILLET 1998 A F FLEURETTE 1700

ANNEXE 3-48 : NOTE DE F FLEURETTE AU PR ALEXANDRE D'OCTOBRE 1998 1702

ANNEXE 3-49 : COURRIER DES 3 MEDECINS CONSEILS NATIONAUX DU 11 SEPTEMBRE 1998, ECHANGES AFFERENTS ET DOSSIER DE PRESENTATION DE L'UCAM BOURGOGNE SUR LE MEDIATOR..... 1722

ANNEXE 3-50 : « REPONSE » AUX COURRIERS DES 3 MEDECINS CONSEILS NATIONAUX..... 1770

ANNEXE 3-51: ECHANGE DE FAX DE DECEMBRE 1998 SUR LE MESUSAGE DU BENFLUOREX AVEC UN MEDECIN DE MONTPELLIER ET LE CRPV DE BESANÇON..... 1772

ANNEXE 3-52 : RAPPORT REDIGE PAR LE CRPV DE BESANÇON POUR LE GROUPE TECHNIQUE SUR LE DIABETE DU 23 SEPTEMBRE1998..... 1776

ANNEXE 3-53 : REVUE PRESCRIRE DE 1997..... 1788

ANNEXE 3-54 : NOTE INTERNE DE L'AFSSAPS DU 19 FEVRIER 1999 SUR LE PREMIER CAS D'INSUFFISANCE AORTIQUE SOUS MEDIATOR® ET NOTIFICATION..... 1793

ANNEXE 3-55: COMPTE-RENDU DU CTPV DU 23 FEVRIER 1999 1797

ANNEXE 3-56 : ECHANGES ENTRE LE DR CHICHE ET LE CRPV DE MARSEILLE SUR LA VALVULOPATHIE AORTIQUE ET NOTIFICATION..... 1800

ANNEXE 3-57 : NOTE INTERNE DE L'AFSSAPS DU 17 JUIN 1999 SUR VALVULOPATHIE AORTIQUE ET HTAP L'HTAP 1819

ANNEXE 3-58 : RESUME POUR LA COMMISSION D'AMM DU 8 JUILLET 1999 ELABORE PAR L'UNITE DE PHARMACOVIGILANCE..... 1820

ANNEXE 3-59 : NOTE MANUSCRITE DU 19 JUILLET 1999..... 1824

ANNEXE 3-60 : POINT SUR LE MEDIATOR® DU 4 OCTOBRE 1999 REALISE PAR L'UNITE DE PHARMACOVIGILANCE..... 1825

ANNEXE 3-61 : COMPTE-RENDU DE LA REUNION DU CTPV DU 12 OCTOBRE 1999 1827

ANNEXE 3-62 : EXTRAIT DU COMPTE-RENDU DE LA REUNION DU CTPV DU 4 NOVEMBRE 2003 1829

ANNEXE 3-63 : EXTRAIT DU COMPTE-RENDU DE LA REUNION DU CTPV DU 16 AVRIL 2002..... 1830

ANNEXE 3-64 : COMPTE-RENDU DE CTPV DE LA REUNION DU CTPV DU 9 DECEMBRE 2003..... 1833

ANNEXE 3-65 : EXTRAIT DU COMPTE-RENDU DE LA REUNION DU CTPV DU 7 DECEMBRE 2004 1849

ANNEXE 3-66 : EXTRAIT DU COMPTE-RENDU DE LA REUNION DU CTPV DU 11 JANVIER 2005..... 1870

ANNEXE 3-67 : COMPTE-RENDU DE LA REUNION DU CTPV DU 8 MARS 2005..... 1872

ANNEXE 3-68 : COMPTE-RENDU DE LA REUNION DU CTPV DU 7 JUIN 2005..... 1891

ANNEXE 3-69 : ARTICLE DE LA REVUE PRESCRIRE DE SEPTEMBRE 2005, ELEMENTS DE REPONSE..... 1937

ANNEXE 3-70 : COMPTE-RENDU DE LA REUNION DE LA CNPV DU 29 NOVEMBRE 2005..... 1944

ANNEXE 3-71 : COMPTES-RENDUS DES REUNIONS DE CONCERTATION DU 13 OCTOBRE 2006 ET DU 13 MARS 2007 1982

Beaumont House Washington, D.C.

THE EFFECT OF METHAMINODIAZEPOXIDE (LIBRIUM) ON EXPERIMENTALLY INDUCED CONFLICT IN THE RAT. Irving Geller and Joseph Seifter. Wyeth Institute for Medical Research, Radnor, Pa.

Recently we reported an attenuation of experimentally induced conflict with meprobamate, urethanes, barbiturates and other C.N.S. depressants with anti-convulsant properties. Opposite effects upon conflict were obtained with phenothiazines. Here we report our findings with Librium, a compound of known clinical utility. Conflict was induced by simultaneously rewarding with food and punishing with shock all lever responses made in the presence of a tone stimulus. Between tone periods the rats worked only for food, permitting control observation for non-specific behavioral depression. Appropriate setting of the shock intensity resulted in a low but stable output of responses during the tone. Librium was administered in doses which ranged from 7.5 to 30 mg/kg. Most pronounced attenuation of the conflict occurred at the 15 mg/kg. dose. Lower doses generally were less effective and higher doses produced severe ataxia; the rats were unable to work in either the conflict trials or the control periods between tones. These findings are in accord with clinical studies which report some incidence of ataxia when Librium is administered at high therapeutic doses.

SOME FACTORS DETERMINING THE BEHAVIORAL EFFECTS OF CHLORPROMAZINE. W. H. Morse, Dept. of Pharmacology, Harvard Medical School, Boston, Massachusetts.

Experiments were conducted to determine the extent to which the behavioral effects of chlorpromazine are dependent upon the parameter values of some schedules of reinforcement. Food-deprived pigeons, previously trained to peck a key for food reinforcement, were studied under the following procedure: After a period of x seconds without a response, a white stimulus light appeared. Once every 3 minutes, on the average, a response in the presence of the white light was reinforced, otherwise a response simply terminated the stimulus. If no additional responses were made, the stimulus reappeared x seconds later, but each response prior to the appearance of the stimulus postponed its onset by x seconds. Other experiments were similar, except that the white light remained on all the time. Both of these procedures produced fairly steady control responding at rates which depended upon the value of x. At the parameter values studied, the average rate of responding was much higher when the white light was always present. For both procedures the tendency for chlorpromazine to decrease the output of behavior was greater when the animals were responding at higher rates. Increasing the value of x by 10-fold sometimes reversed the behavioral effect of a 10 mg dose from a decrease to an increase in the output of behavior. (Supported by U. S. P. H. S. Grant MY-2094.)

THE EFFECT OF HUMAN SERUM ON AVOIDANCE BEHAVIOR. Douglas Anger (intr. by P. H. Seay). Dept. of Pharmacology, The Upjohn Co., Kalamazoo, Mich.

With the classical avoidance procedure, appropriate doses of chlorpromazine eliminate the response of rats to the warning stimulus while leaving the response to electric shock. Intravenous injection of human serum into rats also produces this selective effect on the response to the warning stimulus, like chlorpromazine. A modification of the avoidance procedure is described that increases the sensitivity to serum. With the improved procedure there is a fairly consistent effect at 10 ml/kg of fresh serum, and a highly consistent effect at 20 ml/kg. The serum seldom kills the animal quickly until above 50 ml/kg, but at lower doses many animals die 2 - 6 days later. Human plasma has essentially the same effect. I.V. injections of rat and horse serum have only a slight effect at doses of 40 to 80 ml/kg. The activity is lost after standing 60 hours at room temperature, and declines by about one-half during 6 months at -30°C. The activity is centrifuged down at 105,000 xg, and does not dialyze, so apparently the active component is a large molecule. I.V. injections of trypsin do not show this effect except occasionally at or close to doses that kill immediately. However, crystalline egg albumin does show an effect rather similar to human serum.

INTERFERENCE BY NITROUS OXIDE WITH THE ABILITY OF MONKEYS TO DELAY A CHOOSING RESPONSE. Murray E. Jarvik. Dept. of Pharmacology, Albert Einstein Coll. of Med., New York City.

It has been demonstrated that administration of 80% nitrous oxide in oxygen could impair performance by monkeys in a 2 second delayed response test (Jarvik and Adler, The Pharmacologist, 1:51, 1959). In order to determine whether factors related to the delay are susceptible to the action of this gas or whether pre- and post-delay factors are entirely responsible for the effect monkeys were tested with two randomly presented delays. On a given day trials involving a one second delay were always interspersed among trials involving either a five or fifteen second delay. Five monkeys were employed in this task and tested with air, 20%, 50%, and 80% nitrous oxide in oxygen. The results with 20% were essentially the same as those obtained with air. With the higher concentrations of nitrous oxide there was a greater impairment of performance immediately following a long delay (five or fifteen seconds) than after a short delay (one second). It is concluded that mechanisms responsible for retention during the delay period are susceptible to the disrupting effect of nitrous oxide.

(Supported by PHS Grant M-1225 (C3).

SOME ANORECTIC AND BEHAVIORAL PROPERTIES OF P-1727, THE p-TRIFLUOROMETHYL ANALOGUE OF AMPHETAMINE. Albert Weissman* and Jurg A. Schneider. Dept. of Macrobiology, Chas. Pfizer & Co., Inc., Groton, Conn.

P-1727 (dl-β[-p-Trifluoromethylphenyl] Isopropylamine Hydrochloride) was examined in rats and dogs for anorectic potency. In rats it depressed food intake at 5-20 mg./kg. P.O., having about 1/2 the potency of d-amphetamine. In dogs its comparative potency was less than 1/12 that of d-amphetamine, activity beginning at about 3.5 mg./kg. P.O. When compared against phenmetrazine, however, P-1727 was significantly more potent in dogs and had a longer duration of activity. In both rats and dogs significant depression of food intake was not accompanied by observable CNS stimulation. When tested behaviorally in rats, oral doses of 8 mg./kg. of P-1727 on a simple CRF schedule, and 10 mg./kg. I.P. on a multiple schedule with a CRF component (Weissman: J. Exp. Anal. Behav. 2: 271, 1959.) were active in suppressing CRF responding. Behavioral changes suggesting stimulation (i.e. increased S$^{\Delta}$ rates and responses per reinforcement) were produced by d-amphetamine, but not by P-1727, on these schedules. Similarly, d-amphetamine, unlike P-1727, disrupted DRL performance by causing marked rate increases and much shorter interresponse times. It is concluded that P-1727 retains much of the anorectic potency of amphetamine in rats without concomitant behavioral stimulation, as measured by operant conditioning techniques.

PROLONGATION OF ANOREXIA IN DOGS BY SUSTAINED-RELEASE D-AMPHETAMINE. H. Wendel, F. M. Sturtevant, and I. Shemano*. Pharmacology Section, Smith Kline & French Labs., Philadelphia

Offering 1/24th pound of food to starving dogs every 10 min. keeps the animals hungry for hours while still allowing frequently repeated food offerings to test for drug-induced anorexia. Refused offerings are removed from the cage and re-offered. Percent refusals of the total of 72-90 offerings per hour to 12-15 dogs were plotted against hours after drug administration. D-amphetamine was given in capsules in the first food offering. In doses with about the same peak effects sustained-release drug caused a 4-5 hours effect plateau and 50% or more refusals (= anorexia) per hour for 3-5 hours longer than ordinary drug. After equal weight doses 50% or more anorexia lasted about the same time with the 2 drug forms, but the peak effect of the ordinary drug was considerably higher. Besides demonstrating the utility of this test in determining time-action curves of sustained-release anorexigenic preparations the data show that the sustained-release d-amphetamine tested possesses the two desired advantages of such preparations over ordinary drug forms: prolonged effect and plateau effect without excessive peak action.

THURSDAY AFTERNOON

NEUROPHARMACOLOGY II

NEUROPHARMACOLOGY OF dl -α-METHYL-p-TRIFLUOROMETHYLPHENETHYLAMINE HYDROCHLORIDE (SK&F No. 7410-A). C.A.Leonard*, T. Fujita*, D.H.Tedeschi, and R.J.Fellows, Smith Kline and French laboratories, Philadelphia, Pennsylvania.

SK&F No. 7410-A was evaluated for anorexigenic activity and concomitant effects in rats, dogs and monkeys. In the anorexia tests 7410 was approximately 3/8 as potent as d-amphetamine in the rat and 1/7 as potent in the dog and monkey. Dogs and monkeys receiving 7410 did not show increased motor activity even at maximum tolerated dosages. In other tests 7410 was found to be approximately equal in potency to d-amphetamine in producing a blockade of the conditioned avoidance response in rats. Analgesia and in vivo inhibition of monoamine oxidase were not manifested in the rat. Anticonvulsant effects in the mouse maximal electroshock test were present but only in doses in the order of the LD_5. No antagonism to pentobarbital-induced depression in rats and dogs was observed with 7410. The oral LD50's compared with those of d-amphetamine showed that 7410 is only 1/3 as toxic in the rat and 1/6 in the mouse. In the unanesthetized dog only a slight hypotensive effect was noted and EKG effects were similar to those of d-amphetamine. Glucose tolerance studies in dogs showed no difference from d-amphetamine and controls.

DIFFERENTIAL EFFECTS OF DILANTIN ON VARIOUS COMPONENTS OF THE PYRAMIDAL RESPONSE. Baruch Blum*. Montreal Neurol. Inst., Montreal, Canada.

Motor cortex stimulation produces in the pyramidal tract an electrical response, composed of an initial "D wave", supposedly the direct response of the excited cells, and longer latency "I waves", thought to be synaptic, resulting from reexcitation of other Betz cells through collaterals of interneurones. Sensorimotor cortex or Thalamic VL stimulation produces "relayed" pyramidal responses. Different motor cortex cells appear to be involved in the elaboration of these responses. The anti-epileptic drug diphenylhydantoin (Dilantin) applied topically depressed all the above responses, but with regulation of dosage, it depressed first the D wave exerting later a stronger depression on the I waves, leaving almost unaffected the other responses. I.V. Dilantin 18 mg/kg markedly depressed the I wave with moderate effect on the D wave, whereas 24 mg/kg markedly depressed both. These dosages left unaffected the sensorimotor elicited response with small effect on the relayed thalamic-elicited ones. Larger doses (30 mg/kg), used in studies on after-discharges, depressed indiscriminantly all the above responses. It was concluded that the differential effect of the drug as shown here may be related to its specificity as a non-hypnotic, anti-epileptic drug.

AUTONOMIC AGENTS THAT CAUSE DEATH AFTER SUPRA-MAXIMAL ELECTROSHOCK IN MICE. C. D. Hendley, T. M. Mikiten*, and S. Irwin. Dept. of Neuropharmacology, Schering Corp., Bloomfield, N.J.

In some strains of mice there is a high mortality from respiratory depression shortly after the tonic extensor component (TE) of maximal electroshock seizures. This does not appear to occur in CF#1 male mice, 18-24 grams (40 ma., 0.2 sec., AC stimulus). The animals die under these conditions, however, if pretreated i.p. with dopamine (100 mg/kg) or iproniazid followed by dopamine (50 mg/kg). The same is observed after atropine or scopolamine alone (1 mg/kg), or other anticholinergics including scopolamine methylbromide, atropine methylnitrate, JB-329, or propantheline. Dibenzylene (2.5 mg/kg) reduces the mortality after dopamine; arecoline (10 mg/kg) or physostigmine (3 mg/kg), the mortality after atropine. Anticonvulsant drugs protect if they block the TE component of the seizures. Artificial respiration, until normal breathing returns, also prevents death. The data suggest that a mechanism involving catechol amines in the brain may delay recovery of the respiratory center after electroshock, and that a cholinergic mechanism may have the opposite effect. Thus, if the balance between these is upset, respiration may fail after TE. The extent to which peripheral or central mechanisms are involved is under investigation.

EFFECT OF ELECTRICAL STIMULATION ON THE NEURAL SYNTHESIS OF NORADRENALINE FROM L-TYROSINE-C^{14}. W.G. Clark, F.J. Kotichas*, H.F. Schott*, D.T. Masuoka*, and W. Drell*. VA Hosp., Sepulveda and Med. Ctr., U. Calif., Los Angeles.

Paired thoracic sympathetic chains of cats were extirpated under pentobarbital, placed in specially designed chambers at 37° and perfused with Krebs solution containing uniformly labelled L-tyrosine-C^{14}. One nerve was continually stimulated (0.5-0.8 volts, 30 C.P.S.) and the other used as an unstimulated control. After 2 to 3 hours the nerves were removed from the solution and the tissue extract and perfusion fluid separately analyzed by chromatography on alumina, and CG-50 resin. C^{14}-noradrenaline but no adrenaline and little or no dopamine appeared regularly in the tissue fraction. An as yet unidentified non-catechol amine appeared in the fluid fraction. The extract of the stimulated nerve regularly yielded 2 to 5 times as much labeled noradrenaline as that of the unstimulated nerve, and about twice as much total radioactivity. Similar results were obtained when the nerves were pretreated with C^{14}-tyrosine and then immersed in plain Krebs solution before commencing the stimulation. (Supported by N.I.H., Am. Heart Assoc. and Nat. Assoc. Mental Health).

SENSITIVITY OF THE NICTITATING MEMBRANE AFTER DENERVATION AND AFTER VARIOUS DRUGS. U. Trendelenburg and N. Weiner. Dept. of Pharmacology, Harvard Medical School, Boston, Massachusetts.

The sensitivity of nictitating membrane of spinal cats to norepinephrine (NE), tyramine (TYR) and acetylcholine (ACH) was studied after the following procedures: (a) chronic denervation, (b) chronic decentralization, (c) pretreatment with single, large dose of reserpine (3 mg/kg 24 hr prior to experiment), (d) 14 daily injections of 0.1 mg/kg reserpine, (e) 7 days of 10 mg/kg TM 10 per day, and (f) 7 days of ganglion blockade with chlorisondamine (2-5 mg/kg, twice daily). Supersensitivity to NE and ACH was observed in all groups of cats with the exception of (c); subsensitivity to TYR appeared in (a), (c) and (d), supersensitivity to TYR in (b), (e) and (f). Catecholamines in heart, aorta, iris, nictitating membrane and adrenal medulla were measured by fluorimetric method; they were normal in group (f), slightly reduced in (e) and severely reduced in (c) and (d). There is thus no relation between depletion of NE stores and supersensitivity to NE, which seems to be the result of interruption of tonic impulses for 7 days. Subsensitivity to TYR is related to depletion of NE stores. (Supported by USPHS grants B-1713 and B-2947 and US AF 41(657)-197.)

MODIFICATION OF AFFERENT INTERACTION PATTERNS BY CHLORPROMAZINE, MEPROBAMATE, MORPHINE AND PENTOBARBITAL. C.L. Mitchell*, S.D. Nelson* and K.F. Killam. Stanford Univ. School of Med., Palo Alto, Calif.

In cats surgically prepared under ether anesthesia and subsequently immobilized with gallamine triethiodide responses were evoked in mesoncephalic, thalamic, rhinencephalic and neocortical structures by pairing of photic and tooth pulp stimulation. Stimulus trains, programmed to be presented at random intervals of 50 to 95 seconds, consisted of 3 flashes of light 100 msec. apart followed in 350 msec. by a single stimulus to the tooth pulp (TPS). 25 control responses to the flash sequence alone followed by 100 or more responses to the flash plus TPS were elicited before drug administration. Evoked responses to TPS decreased with repetition. Chlorpromazine at 1, 2, and 5 mg/kg, pentobarbital at 5, 10 and 15 mg/kg, meprobamate at 10, 20 and 50 mg/kg and morphine sulfate at 0.5, 1, and 2 mg/kg were administered intravenously. In general, all drugs enhanced responses to photic stimulation in lateral geniculate and optic cortex. Responses to TPS were differentially affected by the various drugs in the specific and nonspecific systems. (Supported by NIH grants MY3241 and MY3374)

STRUCTURE-ACTIVITY RELATIONSHIPS IN CF_3 SUBSTITUTED PHENETHYLAMINES

L. G. Beregi, P. Hugon, J. C. Le Douarec, M. Laubie and J. Duhault

Groupe de Recherches des Laboratoires Servier, Paris

More than a decade ago when our study started on this series of compounds, the problem of antiobesity drugs appeared to be rather simple. On the one hand, amphetamine was the choice drug in spite of its prominent side effects; on the other hand, very little was known on the mechanism of hunger inhibition by drugs. Since it is beyond the scope of this paper to relate the history of amphetamine-like substances, we shall limit ourselves to a few surveys which display an over-all picture of the state of knowledge in the late fifties.

The general subject of beta-phenethylamine derivatives has been brilliantly reviewed by W. H. Hartung (1945) and by K. H. Beyer (1945). The relationship between chemical structure and analgesic action was exhaustively surveyed by E. J. Fellows (1951) who concluded that in most of these derivatives, marked pain-threshold elevation was found near the toxic levels, accompanied always by central stimulation.

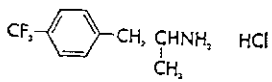
The clinical importance of amphetamine in the treatment of obesity was outlined by H. Gold (1945) who was the first to insist on its toxic reactions and the need for compounds with more selective actions.

Under these circumstances, a vast research effort was deployed in this field in our laboratory, without much hope of practical application. It was anticipated that a systematic study of fluorine and CF_3 substituted phenethylamines would reveal some relationship, thus giving us a better understanding of the problem. At the same time, we hypothesized that the CNS stimulant and anorexigenic activities of amphetamine were not necessarily linked in other structurally related compounds.

An early confirmation of the correctness of the above "working hy-

pothesis" came from Holm *et al.* (1960) who, while searching for a new anorexigenic agent, reported the low level of central stimulating effect of chlorophentermine (α,α-dimethyl-4-chlorophenethylamine).

While our work was in progress, Weisman (1960) and C. A. Leonard *et al.* (1961) disclosed independently of each other their results stating that the primary amine:



is anorexic and has little CNS stimulant effect.

At this time we were already convinced of the indisputable superiority of the secondary amines in this series. This option indeed proved to be rewarding and opened new vistas.

The unusual pharmacological properties and clinical usefulness of fenfluramine (1-(3-trifluoromethyl-phenyl)-2-ethylamino-propane) have stimulated further study of a large number of related compounds, and in this paper we propose to draw some generalizations from our work and also to illustrate some examples of structural specificities.

To the chemist working in medicinal chemistry, a pharmacologically active series whose similarities in basic structure are responsible for biological activity is an excellent tool for the development of a structure-activity rationale. But can we speak of structure-activity relationships in our case, when out of 280 new compounds, more than 50 of them presented almost equal anorexic effect without attaining the potency of amphetamine? Perhaps the title, *Choice of anorexic compounds considering their therapeutic indexes,* would more closely cover the scope of this study.

Before going into a detailed discussion of the structural modifications and their effect on anorexigenic activity, it is of interest to show the steps in the development of our work. These phases were the following:

1) separation of anorexigenic and CNS stimulant effects (successful at the very beginning);
2) diminution in acute toxicity, well demonstrated by the esterified hydroxyethyl compounds;
3) decrease in the hypertensive effect, beautifully shown in secondary amines;

4) possible development of analgesics;
5) comparison between trifluoromethylated phenylisopropylamine and phentermine derivatives.

COMPOUNDS TESTED FOR ANOREXIC ACTIVITY

The compounds covered in this paper can be divided broadly in primary, secondary and tertiary beta-phenylisopropylamines. A further division of the secondary amines into acylated, hydroxyalkyl and amino acid derivatives has been made.

Finally, a comparison between beta-phenylisopropylamine and phentermine derivatives was attempted.

CHEMISTRY

The synthesis of CF_3 substituted beta-phenylisopropylamine (Rocca, 1964) is outlined in Scheme 1.

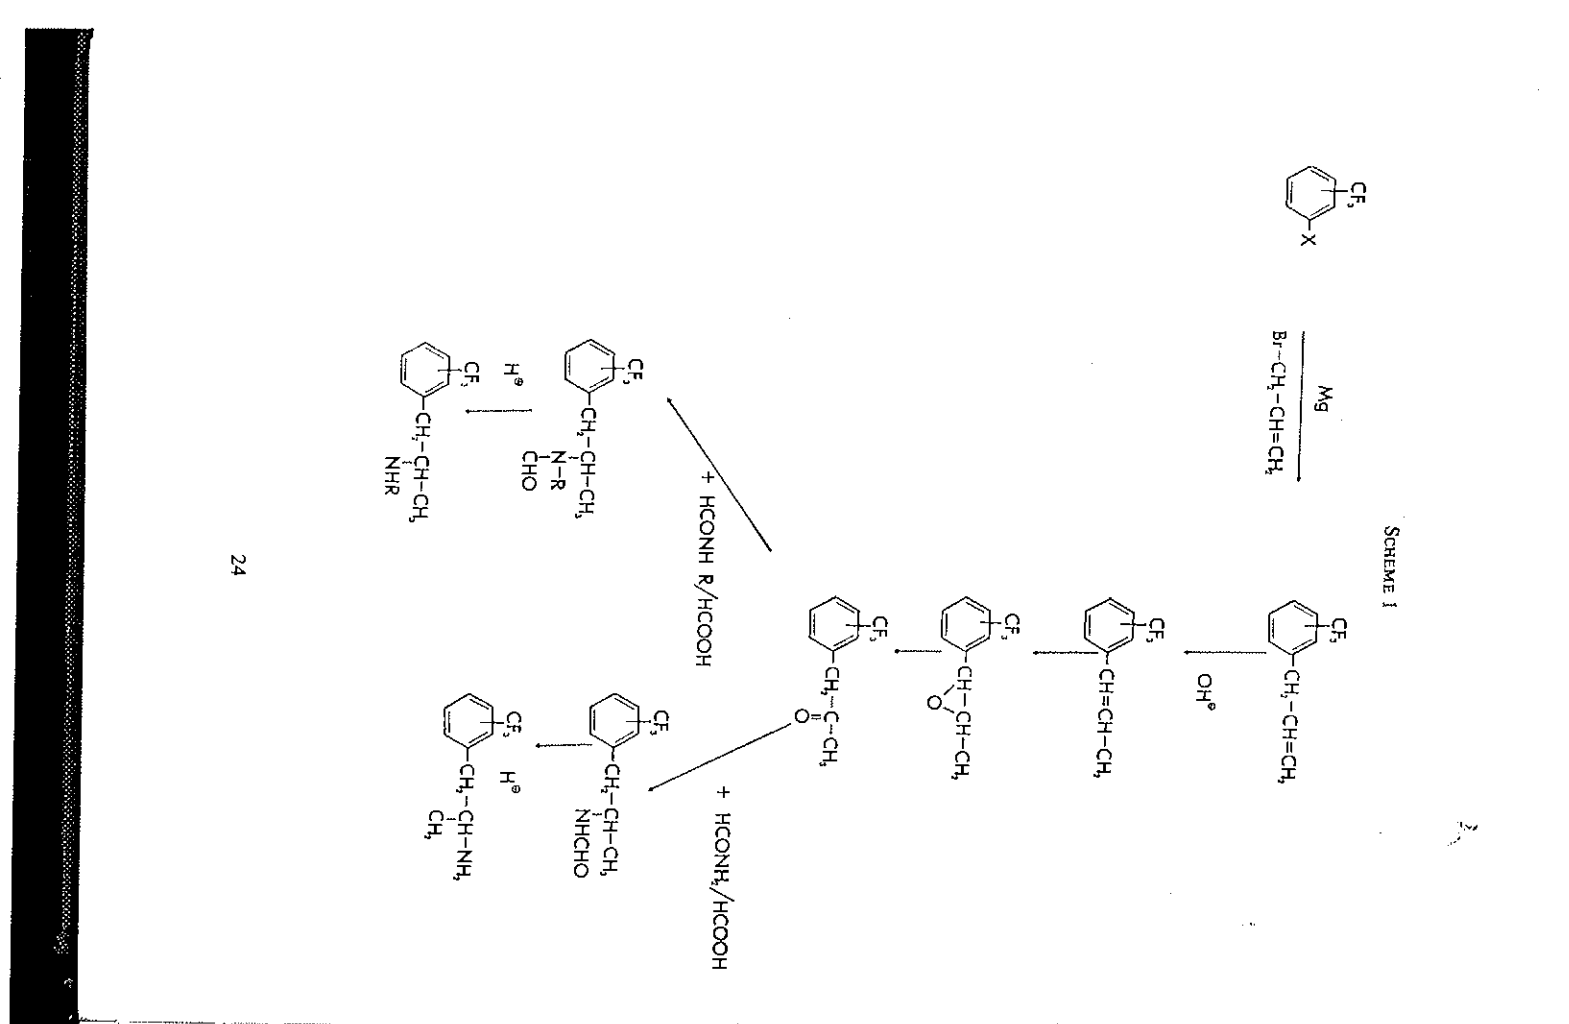
Typical methods used for the preparation of N-substituted derivatives are illustrated in Scheme 2.

FLUORO-AND TRIFLUOROMETHYL BETA-PHENYL ISOPROPYLAMINES

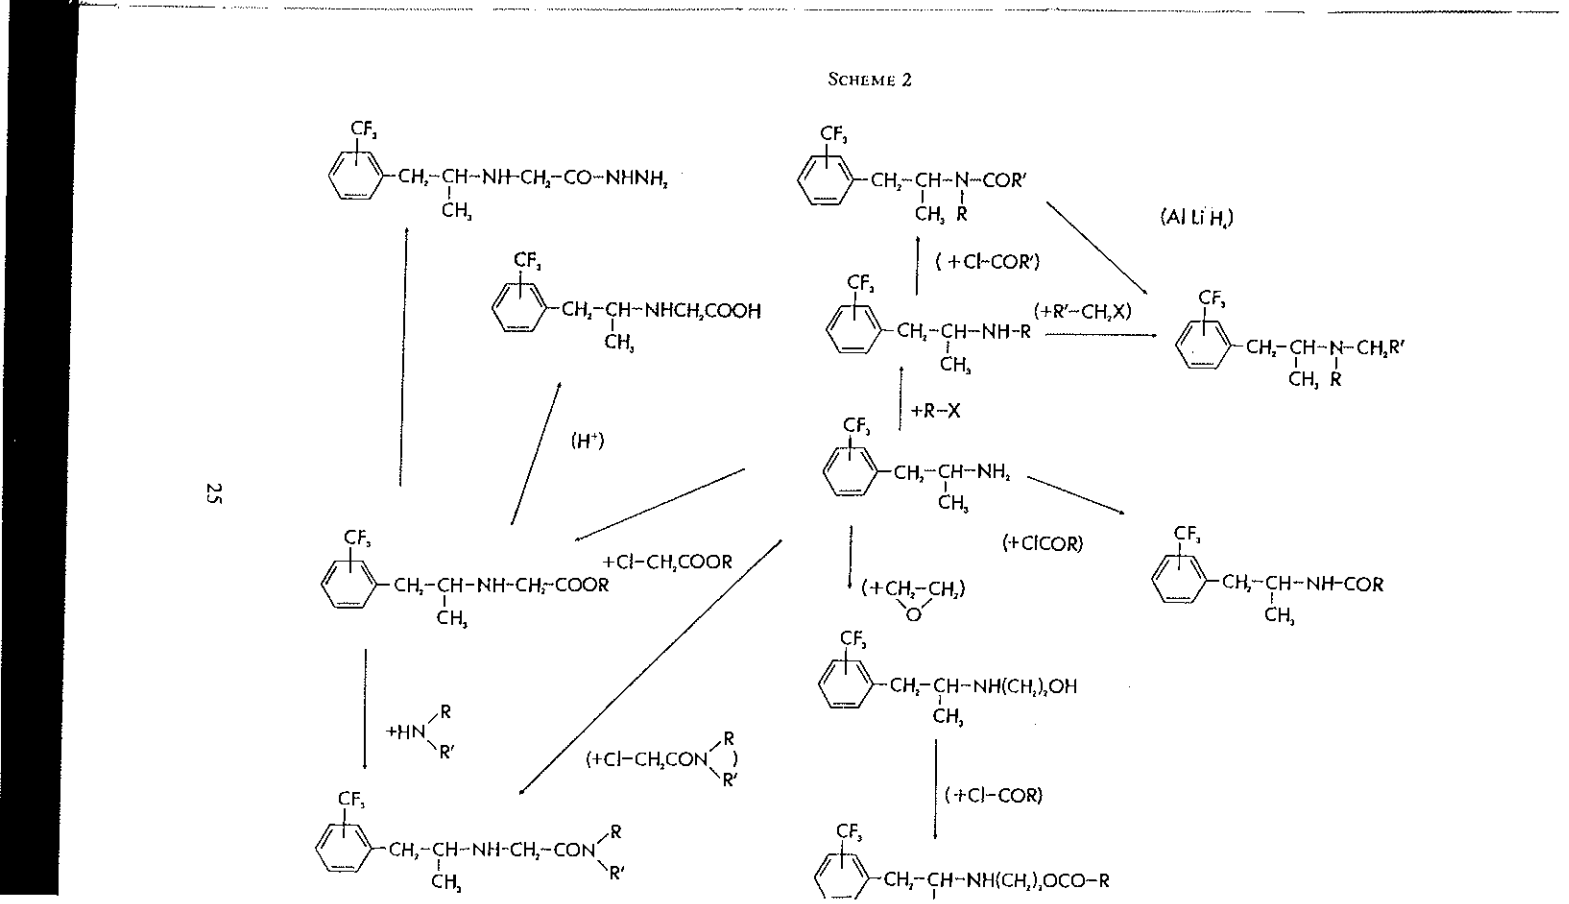
A systematic study of fluorinated and trifluoromethyl substituted beta-phenyl isopropylamines revealed to us that the whole spectrum of biological activity does not run parallel with amphetamine.

We have already shown (Le Douarec and Beregi, 1962), that the most striking finding was the reversal of the central stimulating action of amphetamine by means of CF_3 substitution, as judged by the index of locomotor activity and body temperature. It seemed clear, on the basis of these results, that the 3-CF_3 substitution was of particular interest. These findings were also substantiated by Holland *et al.* (1963).

A summary of other pharmacological activities is presented in Table I. It can be seen that compound 5 has a favorable vasopressive action in the dog, while in the rat there is no difference between amphetamine and this compound. The fluoro derivatives display a considerable amphetamine-like activity.



Scheme 1



Scheme 2

Explanation of Tables

Acute toxicity

Determined by intraperitoneal administration in mice, unless otherwise noted (NMRI strain, weight 20–22 g, in groups of 6). The experiments were carried out at a temperature of 21° ± 1° C.

Anorexia

Food intake in rats and dogs, as already published (Le Douarec, 1966). *Rat:* dose of the compound which inhibits food intake by 50% for 2 hours, when administered orally 1 hour previously. *Dog:* oral minimal dose delaying food ingestion for 2 hours.

Analgesia

Haffner's method in mice (in groups of 6): that dose which inhibits by 50% the reflex of biting the artery clip placed on the base of the mouse's tail. Intraperitoneal route of administration unless otherwise noted. We consider this test a tool for psychotropic activity, since many CNS active drugs inhibit the response, as recently showed by Weller (1968).

Anticonvulsant action

Experimental convulsions: electroshocks in mice (8 animals per dose). Bucco-occipital electrodes delivering electric shocks with the following characteristics: 7.5 to 30 volts lasting 1 second. Oral dose which protects by 50% against the tonic extension.

Vasopressive action

(a) *Blood pressure of the pithed rat.* The study of the intravenously administered derivative is based on the blood pressure of the rat prepared according to the procedure of Shipley and Tilden (1947). The results are expressed in terms of pressure variations in mm of mercury. At least 4 rats were used per dose studied.

(b) *Blood pressure in the anesthetized dog.* Dogs received chloralose anesthesia (120 mg/kg) intravenously. Blood pressure was recorded by mercury manometer at the femoral artery; we recorded the variations in pressure produced by intravenous injection of each of the compounds under study. The essential information concerning blood pressure has been recorded using the following symbols: (+) means an increase in mm Hg in the blood pressure; (−) means a decrease in mm Hg in the blood pressure.

Monoamine oxidase inhibition *in vitro*

This effect has been studied by Warburg's technique, using tyramine substrate. The incubation time was one hour, pH was 7.4, and temperature was 37° C. The percent inhibition is expressed as moles per liter concentration (M).

MODIFICATION OF THE SIDE CHAIN

In view of the promise shown by the CF_3 substitution in phenylisopropylamines, the optimum position (meta) constituted the basis for further investigations by alteration of the side chain.

Some of the compounds studied are listed in Table II. Noticeable decrease in activity was observed when the phenylisopropylamine structure was modified. The only allowable change was the methyl substitution of the beta carbon atom, as illustrated by the structure of compound 10.

N-MONOALKYLATED DERIVATIVES

Encouraged by these results, we undertook an extensive N-alkylation program in the beta-phenylisopropylamine series (Beregi *et al.*, 1960; 1964; 1965). A considerable number of pertinent analogs were prepared. Results with the more interesting of these derivatives are given in Table III.

N-Monoalkylation gives rise to high potency compounds. The major advantage which can be stressed is a dramatic decrease in the pressor effect, as compared with the primary amine. Moreover, some compounds, *e.g.*, 18 and 19, were almost completely devoid of pressor effect.

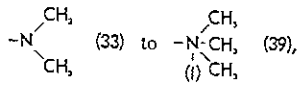
Considering both the toxicity and anorexic activity, the methyl (15), ethyl (16), chlorethyl (20), propenyl (22) and propargyl (26) derivatives were the most potent members. Generally, N-alkylation with larger groups resulted in considerable loss of activity.

From this table it is apparent that the most active anorexigenic substances also have significant analgesic potencies.

Compound 16, fenfluramine, stands out with a good balance between toxicity and other pharmacological properties, all of which have been studied rather extensively (Le Douarec, this volume).

N-DIALKYLATED DERIVATIVES

Data in Table IV show that disubstitution of the amine function results in decrease in anorexic and analgesic activities. There is a very marked increase in toxicity when going from



and a tenfold augmentation in pressor effect in the dog, while central actions are nearly abolished.

N-AMIDES

The acylation of the amine group led, as expected, to compounds with substantially diminished toxicity (Beregi *et al.*, 1967). Surprisingly, with the exception of the propionyl derivative (52), these amides exhibited a very low order of activity (Table V).

On the basis of results shown in the preceding tables, the structure-activity relationships appeared to be rather straightforward, and at this very point we could well have stopped our investigations. In spite of these findings, further, unobvious structural modifications were attempted in two main directions: (a) amino alcohols, esters and ethers; and (b) amino acids and their derivatives.

HYDROXYALKYL DERIVATIVES : ESTERS

The esterification of the hydroxyalkyl beta-phenylisopropylamine was found to be beneficial in most cases, as shown in Table VI.

The most active anorexic among the carbinols (62) indicates that in this series of compounds optimum activity is associated with a two-carbon chain between the nitrogen atom and the hydroxyl group. This structural feature was conserved in the esterification study.

Various observations can be made regarding correlations between toxicity and anorexic activity. It should first be noted that the aliphatic esters (65 to 69) led to a slight decrease in activity and no significant changes in toxicity.

In the aryl and aralkyl series, many compounds exhibit very high anorexic activity accompanied by a significant diminution in toxicity. Substitution of the phenyl ring can result in retention or diminution in activity, depending upon the type and position of the substituent group.

We chose compound 70 (S 992), which appeared to be the most effective orally, both in rats and in dogs, in order to compare its intensity and duration of action with fenfluramine (16). Interestingly, this compound displayed an unusual discrepancy between the intraperitoneal and oral toxicities. This observation might well lead us to conclude rather hastily that the compound had a low rate of absorption. In fact, in recent work on buccal absorption

studies (Brookes, 1968), only insignificant amounts of S 992 at all pH values could be recovered in spite of its low water solubility, thus evidencing a rapid absorption and a very important lipid solubility.

Whether S 992 is active *per se*, or its activity is a result of metabolic conversion by undergoing a rapid *in vivo* hydrolysis to liberate the parent hydroxyethyl compound, and whether the hypothesis of the re-arrangement of this drug could be accepted (Scheme 3), the active entity is clearly a potent anorexic.

SCHEME 3. *Possible re-arrangement of S 992 (Brookes, 1968).*

In any case, the particular interest of this drug lies in its extremely high therapeutic ratio and its lack of untoward effects (Beregi *et al.*, 1966).

Another substance (82) emerged from the study of these esters due to its anorexic and diuretic properties. In fact, this compound is a mild diuretic at a somewhat higher dosage than that needed for its anorexic effect.

HYDROXYALKYL DERIVATIVES : ETHERS

Table VII shows the effect of the introduction of the ether function. In comparison with the hydroxyethyl derivative (62), these compounds were more toxic and less active in rats.

AMINO ACID DERIVATIVES

The comparative activity of selected compounds is summarized in Table VIII. Again, in this series, the requirement for high anorexic activity is fairly specific. The essential structural system consists of one carbon atom between the nitrogen atom and the carboxy group. On this basis, a great number of acid derivatives were prepared and pharmacologically tested. These data indicate that the nature of the substituent has practically no influence on the anorexic activity, and it may be summarily stated that these amino acid derivatives represent one of the most potent structural types of non-stimulating anorexigens (Beregi *et al.*, 1969).

OPTICAL ISOMERS

The comparison of activity between the optical isomers and their racemic counterparts of the more interesting compounds is shown in Table IX. The general rule for the order of anorexic activity in the rat is: *dextro*-isomer > racemate > *levo*-isomer. However, a detailed analysis of results and a comparison of species turned up some anomalies. Thus, for the N-allyl compound (22), the order of anorexic activity in the dog is *dl* (22) > *d* (111) > *l* (112). The same is true in the case of the N-hydroxyethyl derivative (62) where *dl* (62) > *d* (113) > *l* (114).

If we consider now the isomers of S 992 we can see that the anomaly manifests itself in the rat (*dl* (70) > *d* (115) > *l* (116)), but not in the dog.

In the majority of cases, analgesic effectiveness is favorably influenced by resolution of isomers, the order of ranking by relative potency being: *dextro*-isomer > racemate > *levo*-isomer. Curiously enough, this rule does not seem to be followed by the two esters S 992 (70) and (82).

The vasopressive effect goes in accordance with the general order of activity for the N-ethyl compound (16), whereas all the other isomers studied are little active or inactive.

These discrepancies may be explained by differences in the rates of absorption and excretion, or by a preferential stereoselective elimination. The importance of species may be emphasized, and pharmacological interaction between isomers can also be an acceptable working hypothesis for further investigations in this field. However, if we consider an approximate therapeutic ratio, not computable here, it must be stressed that the enantiomers[1] have the best value.

POSITION ISOMERS

A. N-(2-benzoyloxyethyl)-beta-phenyl isopropylamine

Table X records the effect of different positions of the CF_3 group on the benzene nucleus in the very case of S 992 which appeared to have a high and sustained anorexic effect in animals. It seems apparent that a clear-cut relationship exists between anorexic activity and the position of substituents. As was evident with the CF_3 substituted beta-phenyl isopropylamines, and as is equally true in this series, high anorexic activity is always associated with the *meta*-position.

B. Phentermines

Our structure-activity relationship survey would not be complete without a comparative pharmacological investigation of relationships between the phenylisopropylamine and the corresponding phentermine derivatives.

First of all, the effect of CF_3 substitution was investigated in the latter series as compared with chlorphentermine (Table XI).

The optimum position for the CF_3 group was here again the *meta* position on the benzene nucleus, as was shown by the low activity of the other isomers. These findings do not seem to be in agreement with the results of Lorenz (1969). The compound (10) appeared to equal, in the rat, the anorexic potency of chlorphentermine, taken here as a model substance. Here again, the dog seems to be less sensitive to the compounds of this very structure.

COMPARISON BETWEEN PHENYLISOPROPYLAMINES AND PHENTERMINES

The study of trifluoromethylated phentermine analogs was further extended to groups on the nitrogen which conferred the highest activity in the phenylisopropylamines (Table XII). Between the direct analogs in the two series, only the N-ethyl derivative showed somewhat equivalent potency in the phentermines. All other changes attempted led only to loss of activity.

DISCUSSION

From the foregoing data on the influence of structure upon pharmacological activity, some broad generalizations can be made concerning structural features that led to a high anorexigenic effect.

In view of the chemical resemblance between the amphetamines and their trifluoromethylated analogs, it would be interesting to examine their similarities and differences.

Let us first consider the similarities. The requirement to satisfy our criterion for high anorexic activity follows surprisingly well the rules established by Van der Schoot *et al.* (1962) in their study on the relationship between structure and locomotor activity in mice in phenylethylamine derivatives. Those rules are: (1) The chain between the amino group and the ring is restricted to two-carbon units. (2) The binding of the amino group to a secondary carbon atom seems to be required. (In fact, compounds without this branching are devoid of anorexic activity in our series.) (3) Substitution in

the *ortho* position leads to a loss of activity. (As a general rule, in our series, *m*-CF_3 > *p*-CF_3 > *o*-CF_3.) (4) The introduction of substituents on the amino group is allowed. Large substituents result in a decrease or loss in activity.

The first and most striking difference is the absence of the stimulant effect regardless of the position of the CF_3 group on the ring. A further important consequence of the *meta*-CF_3 substitution in some secondary phenylisopropylamines is the reduction or even the suppression of the characteristic cardiovascular effects of amphetamine. Another essential feature of these compounds is a good balance between toxicity and anorexic activity, thus displaying significantly superior therapeutic indexes as compared to those of the amphetamine derivatives.

In fact, the various attempts made by several authors (Marsh *et al.*, 1950; Schmitt *et al.*, 1967; Beaton *et al.*, 1968; Owen, 1963) to alter the basic properties of amphetamine by the introduction of alkyl groups, chlorine or fluorine atoms on the phenyl ring resulted in the majority of cases only in the enhancement of toxicity with the appearance of hallucinogenic properties.

As we have shown in the course of this study by numerous examples of highly active anorexic substances, the *m*-trifluoromethylated phenylisopropylamine lends itself favorably to a mono-substitution on the amine group. In contrast, ring and N-substitution of the 1-phenyl-2-aminopropane lead only to a marked decrease in anorexic activity, as demonstrated in a fairly extensive study by R. Kopf *et al.* (1960).

A further difference can be observed by disubstitution on the amine group. While N-dialkyl, N-alkyl-alkylaryl, pyrrolidino and piperidino derivatives of CF_3 substituted phenylisopropylamine show only marginal activity, in the methamphetamine series the introduction of benzyl and furyl methyl groups bestows useful properties on these compounds by creating a balance between the CNS stimulant and anorexigenic activities (Veldkamp *et al.* 1964; Boissier *et al.*, 1966; 1967).

The hydroxyethyl substitution of the amine group seems to be beneficial. Some of its aryl and arylalkyl acid esters have outstanding pharmacological profiles. Maximal anorexigenic activity was obtained with a compound bearing a methylenecarboxy group on the nitrogen. Conversion of this amino acid into ester, amide, or hydrazide etc., increased the initial activity.

Finally, we established in the comparative study of some optical isomers with their racemates that there are no rules in these series to predict the higher activity.

A direct comparison between trifluoromethylated phentermine and beta-phenylisopropylamine derivatives demonstrated the higher level of activity of the latter.

It is clear from this survey that the introduction of a CF_3 group into the amphetaminic structure cannot be considered a simple, classical substitution, and it seems to us that the CF_3 substituted phenylisopropylamines can be

considered, without much exaggeration, as an independent class of compounds. This statement seems to be well supported by the results of comparative studies in different animal species with some of our more active compounds and their amphetaminic analogs. While trifluoromethylated derivatives have significant activities in mice, rats and dogs, it appears that their amphetaminic counterparts are species dependent. A similar discrepancy was pointed out by Boissier *et al.* (1966) in some benzylmethylamphetamine and furylmethylamphetamine derivatives.

We shall pass rapidly over the general inactivity of the compounds on monoamine oxidase *in vitro,* as well as the fact that we did not succeed in obtaining higher anti-convulsant activities than those seen in the few initial derivatives.

Finally, let us consider the intrinsic analgesic properties of these derivatives. There has been some question as to whether amphetamine is a true analgesic.

Evidence favoring this view was put forth by Goetz *et al.* (1944), Fellows and Ullyot (1951), Randall, Selitto and Valdes (1957), Moorman (1967) and Colville and Chaplin (1964), who insisted on the analgesic activity of sympathomimetic amines in laboratory animals. Cass *et al.* (1966) attribute the failure to find a clinically useful analgesic among the sympathomimetic amines to the difficulties in separating analgesic activity from CNS stimulatory and cardiovascular effects. The success in overcoming these sympathomimetic actions as well as the dramatic improvement of the narrow therapeutic ratio of the previously described amphetamine derivatives by the introduction of a CF_3 group on the phenyl ring cleared the way for a hopeful development of new analgesic compounds. Indeed, many members of the present series produced significant increases in pain threshold in the mouse, but generally analgesic and anorexigenic activities ran parallel.

One of the great difficulties encountered in the study of these analgesics remains in their clinical evaluation. Nevertheless, the analgesic activity found for several of these compounds in mice and rats has been substantiated in human beings.

Although our investigations in this field did not make a break-through, we have a deeper insight into the basic mechanism determining both analgesic and anorexigenic activities.

BREVET D'INVENTION

P.V. n° 101.584 N° 1.517.587
Classification internationale : C 07 c

Nouveaux dérivés du phényl-amino propane et leur procédé de préparation.

(Inventionî: Laszlo BEREGI, Pierre HUGON et Jean-Claude LE DOUAREC.)

SCIENCE UNION ET CIE, SOCIÉTÉ FRANÇAISE DE RECHERCHE MÉDICALE résidant en France (Hauts-de-Seine).

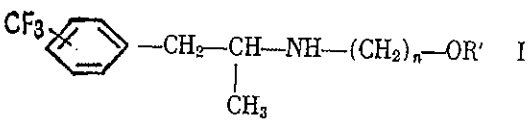
Demandé le 5 avril 1967, à 14h 56m, à Paris.

Délivré par arrêté du 5 février 1968.

(*Bulletin officiel de la Propriété industrielle*, n° 11 du 15 mars 1968.)

(*Demande de brevet déposée en Grande-Bretagne le 15 avril 1966, sous le n° 16.660/1966, au nom de la demanderesse.*)

La présente invention a pour objet les nouveaux dérivés trifluorométhylés du phényl-amino propane de formule générale I :



dans laquelle :

R représente un atome d'hydrogène ou un radical alcoyle inférieur jusqu'en 5 atomes de carbone;

n est un nombre entier égal à 2 ou 3; et

R' représente :

Un atome d'hydrogène; ou

Un groupe COR'' dans lequel R'' représente :

1° Un radical alcoyle inférieur renfermant de 1 à 6 atomes de carbone;

2° Un radical cycloalcoyle contenant de 3 à 7 atomes de carbone;

3° Un radical alcényle inférieur contenant de 2 à 6 atomes de carbone;

4° Un radical alcynyle inférieur contenant de 2 à 6 atomes de carbone; ou

5° Un radical aryle carbocyclique mono- ou bicyclique.

Le radical alcoyle inférieur 1° peut contenir un ou plusieurs substituants choisis parmi le groupe comprenant :

a. Des atomes d'halogène tels que, par exemple, chlore ou brome;

b. Des groupes oxygénés tels que, par exemple, les groupes hydroxyle, méthoxy, propyloxy ou carboxyle;

c. Des groupes aryles carbocycliques tels que, par exemple, phényle ou biphényle qui peuvent être substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, de groupes hydroxyle, alcoxy inférieurs jusqu'en C_4, alcoyle inférieurs jusqu'en C_4, méthylène-dioxy, nitro, amino et trifluorométhyle;

d. Des groupes aryloxy-carbocycliques tels que, par exemple, phénoxy ou naphtoxy, qui peuvent être substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, de groupes alcoxy inférieurs jusqu'en C_4 et de groupe nitro.

Comme radicaux cycloalcoyles 2 on peut citer, par exemple, les radicaux cyclopropyle, cyclopentyle ou cyclohexyle qui peuvent être eux-mêmes substitués par un ou plusieurs groupes aryle carbocycliques tels que, par exemple, le groupe phényle.

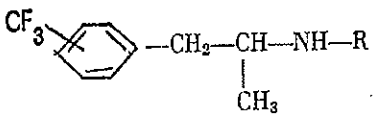
Parmi les radicaux alcényles inférieurs 3 on peut citer, par exemple, les radicaux éthényle, propényle-2, méthyle-2 propényle, butényle-2 et butényle-3. Ces radicaux alcényles inférieurs peuvent être substitués par un ou plusieurs groupes aryles carbocycliques tels que, par exemple, le groupement phényle qui peut être lui-même substitué par un ou plusieurs subsituants choisis parmi le groupe formé d'atomes d'halogènes, de radicaux hydroxyle, de groupes alcoxy inférieurs jusqu'en C_4, alcoyle inférieurs jusqu'en C_4 méthylène-dioxy, nitro, amino et trifluorométhyle.

Le radical alcynyle inférieur 4 peut être, par exemple, un radical propynyle ou méthyl propynyle et peut être lui-même substitué par un radical phényle.

Comme radicaux aryles carbocycliques 5 on peut citer, par exemple, les radicaux phényle,

naphtyle-1 et naphtyle-2. Ces radicaux peuvent être eux-mêmes substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, et de radicaux hydroxyle, alcoxy inférieurs jusqu'en C_4, alcoyle inférieurs jusqu'en C_4, méthylène-dioxy, nitro, amino, trifluorométhyle et phényle.

Les composés de formule générale I sont nouveaux et peuvent être préparés en faisant réagir une phényl isopropylamine substituée de formule II :



II

dans laquelle R prend la signification définie ci-dessus, avec un composé hydroxy-halogéné contenant 2 ou 3 atomes de carbone tel que, par exemple, le bromo-éthanol, ou avec un oxyde d'alcoylène tel que, par exemple, l'oxyde d'éthylène ou l'oxyde de triméthylène, en vue d'obtenir les composés pour lesquels R′ = H.

Les alcools ainsi obtenus sont estérifiés avec un halogénure d'acyle, un anhydride ou un acide approprié en présence de dicyclohexylcarbodiimide, afin d'obtenir les dérivés pour lesquels R′ = COR″, R″ ayant les significations précédemment définies, et, pour obtenir les dérivés pour lesquels R″ est un groupe substitué par un radical amino, il convient, de plus, d'effectuer la réduction par l'hydrogène des dérivés nitrés correspondants.

L'estérification peut être réalisée sur les amino-alcools racémique, dextrogyre ou levogyre. Le dédoublement peut être conduit soit sur la phényl-isopropylamine substituée, afin d'utiliser les isomères optiques comme produits de départ, soit sur les composés hydroxy-alcoylés eux-mêmes.

La séparation des isomères optiques peut se faire en traitant les dérivés racémiques par l'acide *d* (—) dibenzoyl tartrique, pour obtenir les isomères lévogyres et ensuite par l'acide *d* camphorique pour obtenir les isomères dextrogyres. L'invention comprend également la séparation des isomères optiques.

Les nouveaux composés de formule générale I forment des sels d'addition avec les acides minéraux et organiques et font, à ce titre, partie de l'invention. Comme acides utilisés pour la formation de ces sels d'addition, on peut citer, dans la série minérale : les acides chlorhydriques, bromhydrique, méthane sulfonique, sulfurique, phosphorique, sulfamique, et dans la série organique : les acides acétique, propionique, maléique, fumarique, tartrique, citrique, oxalique benzoïque, anthranilique, etc.

Les dérivés du phényl-amino propane, objet de l'invention, et leurs sels d'addition sont des produits industriels nouveaux, utilisables comme produits de base dans l'industrie chimique et pharmaceutique. Il est bien entendu que le présent brevet ne concerne pas leur utilisation comme médicament.

Les exemples suivants, donnés à titre non limitatif, illustrent l'invention. Toutes les parties sont en poids, à moins qu'elles ne soient autrement précisées et les points de fusion sont déterminés par la méthode de Kofler.

Exemple 1. — (m - trifluorométhylphényl) - 1 [(β-hydroxy - éthyl) - amino] - 2 propane.

Dans un autoclave de 1 litre, on ajoute, en maintenant la température à —20 °C, 305 parties de (m - trifluorométhylphényl) - 1 amino - 2 propane à 53 parties d'oxyde d'éthylène et 37,5 parties d'eau. On laisse ensuite le mélange se réchauffer jusqu'à la température ambiante, on maintient l'agitation pendant une heure, à température ambiante, puis le mélange réactionnel est chauffé jusqu'à 100-110 °C et maintenu à cette température pendant quatre heures.

La distillation du produit brut donne 154 parties de (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane, $Eb/_{0,4\ mm}$ = 109-111 °C, dont le fumarate acide fond à 133 °C (isopropanol).

Exemple 2. — 1 (m - trifluorométhylphényl) - 1 [β-hydroxy - éthyl) - amino] - 2 propane.

On ajoute 75 parties de *dl* (*m* - trifluorométhylphényl) - 1 [(β-hydroxy - éthyl) - amino] - 2 propane à une solution de 147 parties d'acide *d* (—) dibenzoyl tartrique dans 1 800 parties d'acétate d'éthyle, maintenu à reflux, sous agitation. Après refroidissement à la température ambiante, le sel est filtré, lavé à l'acétate d'éthyle et séché. On obtient 95 parties de sel A qui, recristallisé deux fois dans l'éthanol, donne 65 parties de sel pur (P.F. 154 °C).

La libération de la base à partir de ce sel A et d'une solution aqueuse d'hydroxyde de sodium, suivie d'une extraction à l'éther et d'un séchage sur $Mg\ SO_4$ donne 23,5 parties de *l* - (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane, $Eb/_{0,7\ mm}$ = 109 °C, $[\alpha]_D^{22}$ = —13,7° (C. 16; éthanol) dont le fumarate acide fond à 135 °C (isopropanol).

Exemple 3. — d (m - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane.

Le filtrat restant après la séparation du sel A de l'exemple 2 est concentré sous vide et la base est libérée. On obtient 24 parties de base, $Eb/_{1,05\text{-}1,1\ mm}$ = 111-115 °C, $[\alpha]_D^{22,5}$ = + 6,5 °C (C. 16; éthanol). 25 parties de cette base sont traitées par 22 parties d'acide *d*-camphorique dans 80 parties d'acétate d'éthyle. Lorsque la cristallisation est complète, le sel B ainsi formé est filtré et séché. On

obtient 18 parties de *d*-camphorate acide, P.F. 126 °,C, qui recristallisées dans 56 parties d'acétate d'éthyle donnent 16 parties de sel B pur, P.F. 127 °C.

La libération de la base, à partir de ce sel B avec une solution aqueuse d'hydroxyde de sodium donne le *d* (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane, $Eb/_{0,05\ mm} = 111$-112 °C, $[\alpha]_D^{22,5} = +13,6°$ (C. 16; éthanol dont le fumarate acide fond à 135 °C (isopropanol).

Exemple 4. — (m - trifluorométhylphényl) - 1 [(γ - hydroxy - propyl) - amino] - 2 propane.

Dans un autoclave, on ajoute, en maintenant la température à — 10 °C, 100 parties de (*m* - trifluorométhylphényl) - 1 amino - 2 propane, 17 parties d'oxyde de triméthylène et 12 parties d'eau. On laisse ensuite le mélange se réchauffer jusqu'à la température ambiante, on maintient l'agitation pendant une heure, à température ambiante puis le mélange réactionnel est chauffé à 150 °C et maintenu à cette température pendant douze heures.

La distillation du produit brut donne 41 parties de (*m* - trifluorométhylphényl) - 1 [(γ - hydroxy - propyl) - amino] - 2 propane, $Eb/_{0,5\ mm} = 115$ °C, dont le chlorhydrate recristallisé dans l'acétate d'éthyle fond à 95-96 °C.

Exemple 5. — Chlorhydrate de (m-trifluorométhylphényl) - 1[(β - acétyloxy - éthyl) - amino]- 2 propane.

A une solution de 14,2 parties de chlorhydrate de (*m*-trifluorométhylphényl) - 1 [*β* - hydroxy - éthyl) - amino] - 2 propane dans 70 parties d'acétate d'éthyle, on ajoute 5,1 parties d'anhydride acétique. Après deux heures de reflux la solution est refroidie et le produit est essoré et recristallisé dans 70 parties d'acétate d'éthyle. On obtient 8,8 parties de chlorhydrate de (*m*-trifluorométhylphényl) - 1 [(*β* - acétyloxy - éthyl) - amino] - 2 propane, qui fond à 136 °C.

En opérant de façon identique on a préparé :

a. *Le chlorhydrate de (m - trifluorométhylphényl) - 1[(β - propionyloxy - éthyl) - amino] - 2 propane*, P.F. 135 °C (isopropanol), à partir du (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane et d'anhydride propionique;

b. *Le chlorhydrate de (m - trifluorométhylphényl) - 1 [(β - succinyloxy - éthyl) - amino] - 2 propane*, P.F. 113 °C (acétate d'éthyle) à partir de (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane et d'anhydride succinique.

Exemple 6. — Chlorhydrate de (m - trifluorométhylphényl) - 1 [(β - salicyloyloxy - éthyl) - amino] - 2 propane.

A une solution de 24,7 parties de (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane dans 140 parties de benzène anhydre on ajoute, successivement, 15 parties d'éther chlorhydrique 4,7 N et une solution de 15,6 parties de chlorure de salicyloyle dans 24 parties de benzène anhydre. L'addition dure dix minutes, et le mélange réactionnel est ensuite chauffé à reflux pendant trois heures.

Le produit solide est filtré et recristallisé dans 180 parties d'acétate d'éthyle. On obtient 30,5 parties de chlorhydrate de (*m* - trifluorométhylphényl) - 1 [(*β* - salicyloyloxy - éthyl) - amino] - 2 propane qui fond à 144 °C.

Exemple 7. — (m - trifluorométhylphényl) - 1 [(β - benzoyloxy - éthyl) - amino] - 2 propane.

A une solution de 24,7 parties de (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane dans 140 parties de benzène anhydre on ajoute, successivement 15 parties d'éther chlorhydrique 4,7 N et une solution de 14 parties de chlorure de benzoyle dans 24 parties de benzène anhydre. L'addition dure dix minutes, et le mélange réactionnel est ensuite chauffé à reflux pendant huit heures.

Le produit solide est filtré et recristallisé dans 230 parties d'acétate d'éthyle. On obtient 15 parties de chlorhydrate de (*m* - trifluorométhylphényl) - 1 [(*β* - benzoyloxy - éthyl) - amino] - 2 propane, qui fond à 161 °C.

10 parties de ce chlorhydrate sont mises en suspension dans 100 parties d'eau. On ajoute 80 parties d'éther puis 10 parties d'une solution concentrée d'hydroxyde d'ammonium. Après quelques instants d'agitation durant lesquels le sel disparaît, la solution éthérée est décantée et séchée.

Après élimination de l'éther sous vide, on obtient 9 parties de (*m* - trifluorométhylphényl) - 1 [(*β* - benzoyloxy - éthyl) - amino] - 2 propane, à l'état de base, sous forme d'une huile incolore.

5,5 parties de cette base sont dissoutes dans 38 parties d'éthanol absolu et la solution ainsi obtenue est ajoutée à 2,2 parties d'acide fumarique dans 90 parties d'éthanol absolu. Le précipité formé est redissous à chaud. Après refroidissement, essorage et séchage, on obtient 5 parties de fumarate acide de (*m* - trifluorométhylphényl) - 1 [(*β* - benzoyloxy - éthyl) - amino] - 2 propane, qui fond à 161-162 °C.

En opérant de la même façon, on a préparé :

a. *Le chlorhydrate du d (m - trifluorométhylphényl) - 1 [(β - benzoloxy - éthyl) - amino] - 2 propane*, P.F. 156 °C (isopropanol), à partir du *d* (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane et du chlorure de benzoyle;

b. *Le chlorhydrate du l (m - trifluorométhylphényl) - 1 [(β - benzoyloxy - éthyl) - amino] - 2 propane*, P.F. 156-157 °C (isopropanol), à partir du *l* (*m* - trifluorométhylphényl) - 1 [(*β* - hydroxy - éthyl) - amino] - 2 propane et du chlorure de

benzoyle.

Exemples 8 à 34. — Par un procédé identique à celui décrit dans l'exemple 7, les dérivés suivants ont été préparés :

8. Le chlorhydrate du (*p* - trifluorométhylphényl) - [β - benzoyloxy - éthyl) - amino] - 2 propane, P.F. : 170-171 °C (acétate d'éthyle), à partir du (*p* - trifluorométhylphényl) - [β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de benzoyle.

9. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - chloroacétyloxy - éthyl) - amino] - 2 propane, P.F. : 128-130 °C (isopropanol/éther de pétrole), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide chloroacétique.

10. Le chlorhydrate du trans (*m* - trifluorométhylphényl - 1 [(β - cinnamoyloxy - éthyl) - amino) - 2 propane, P.F. : 159-160 °C (acétate d'éthyle), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du trans chlorure de cinnamoyle.

11. Le chlorhydrate du (*m* - trifluorométhylphényl - 1 [(β - *p* - chlorophénoxyacétyloxy - éthyl) - amino] - 2 propane, P.F. : 124-125 °C (xylène), à partir du (*m* - trifluorométhyl - phényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide *p* - chlorophénoxyacétique.

12. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - phénylpropionyloxy - éthyl) - amino] - 2 propane, P.F. : 93-94 °C (benzène/cyclohexane), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide phénylpropionique.

13. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - β' - β' - diméthylacryloyloxy-éthyl) - amino] - 2 propane, P.F. 153-154 °C (isopropanol), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl - amino] - 2 propane et du chlorure de l'acide β, β diméthylacrylique.

14. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - cyclopropylcarboxyloxy - éthyl) - amino] - 2 propane, P.F. : 136 °C (isopropanol), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide cyclopropylcarboxylique.

15. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [N - (β - salicyloyloxy - éthyl) N - éthyl amino] - 2 propane, P.F. : 136-138 °C (acétone/éther de pétrole), à partir du (*m* - trifluorométhylphényl) - 1 [N - (β - hydroxy - éthyl) N - éthyl - amino] - 2 propane et du chlorure de salicyloyle.

16. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *m* - trifluorométhyl α - méthyl cinnamoyloxy - éthyl) - amino] - 2 propane, P.F. : 105-108 °C (xylène/cyclohexane), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide *m* - trifluorométhyl α - méthyl cinnamique.

17. Le chlorhydrate du (*m* - trifluorométhylphényl - 1 [(β - phénylcyclopentane carboxyloxy - éthyl) - amino] - 2 propane, P.F. : 142 °C (acétate d'éthyle), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide phénylcyclopentane carboxylique.

18. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *o* - chlorobenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 147 °C (acétate d'éthyle), à partir du (*m* - trifluorométhyl - phényl) - 1 [(β - hydroxy - éthyl - amino] - 2 propane et du chlorure d'*o* - chlorobenzoyle.

19. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *m* - trifluorométhylbenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 137 °C (acétate d'éthyle, à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *m* - trifluorométhylbenzoyle.

20. Le chlorhydrate du (*m* - trifluorométhylphényl - 1[(β - phénylacétyloxy - éthyl) - amino] - 2 propane, P.F. : 102-104 °C (xylène), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide phénylacétique.

21. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *p* - chlorobenzoyloxy - éthyl) - amino]-2 propane, P. F. : 169 °C (acétone), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *p* - chlorobenzoyle.

22. Le chlorhydrate du (*m* - trifluorométhylphényl - 1 [(β - *p* - fluorobenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 160-162 °C (xylène), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *p* - fluorobenzoyle.

23. Le chlorhydrate du (*m* - trifluorométhylphényl - 1 [(β - *p* - phénylbenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 180 °C (éthanol/acétone), à partir du (*m* - trifluorométhylphényl - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *p* - phénylbenzoyle.

24. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *p* - méthylbenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 186-187 °C (éthanol), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *p* - méthylbenzoyle.

25. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - α' - phénylbutyryloxy - éthyl) - amino] - 2 propane, P.F. : 109-110 °C (acétate d'éthyl), à partir du (*m*-trifluorure méthylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2

propane et du chlorure de l'acide α - phénylbutyrique.

26. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - méthylène dioxy - 3',4' benzoyloxy - éthyl) - amino] - 2 propane, P.F. : 150-151 °C (acétate d'éthyle), à partir du (*m* - trifluorométhylphényl - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de méthylène dioxy - 3,4 benzoyle.

27. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - diméthyl - 3',4' benzoyloxy - éthyl) - amino] - 2 propane, P.F. : 172 °C (éthanol), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de diméthyl - 3,4 benzoyle.

28. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *p* - isobutyl phényl acétyloxy - éthyl) - amino] - 2 propane, P.F. : 123 °C (acétate d'éthyle), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide *p* - isobutyl phényl acétique.

29. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *p* - chlorophénylacétyloxy - éthyl) - amino] - 2 propane, P.F. : 115 °C (acétate d'éthyle), à partir du (*m* - trifluorométhylphényl - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de l'acide *p* - chlorophénylacétique.

30. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - α' - naphtoyloxy - éthyl) - amino] - 2 propane, P.F. : 171 °C (isopropanol), à partir du (*m* - trifluorométhylphényl - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure d'α - naphtoyle.

31. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - β' - naphtoyloxy - éthyl) - amino] - 2 propane, P.F. : 205-206 °C (éthanol), à partir du (*m* - trifluorométhylphényl - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de β - naphtoyle.

32. Le chlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *p* - nitrobenzoyloxy - éthyl) - amino] -2 propane, F.F. : 180-182 °C (éthanol), à partir du (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane et du chlorure de *p* - nitrobenzoyle.

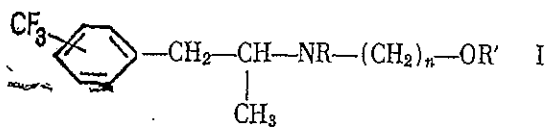
33. Le chlorhydrate du (*m* - trifluorométhylphényl - 1 [(β - *p* - aminobenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 166-168 °C (isopropanol), par hydrogénation, sous une pression de 6 kg/cm², en présence de platine comme catalyseur, du chlorhydrate de (*m* - trifluorométhylphényl) - 1 [(β - *p* - nitrobenzoyloxy - éthyl) - amino] - 2 propane mis en suspension dans l'éthanol absolu.

34. Le dichlorhydrate du (*m* - trifluorométhylphényl) - 1 [(β - *o* - aminobenzoyloxy - éthyl) - amino] - 2 propane, P.F. : 160-165 °C (éthanol/isopropanol), par hydrogénation du chlorhydrate de (*m* - trifluorométhylphényl) - 1 [(β - *o* - nitrobenzoyloxy - éthyl - amino] - 2 propane.

RÉSUMÉ

La présente invention concerne :

1° A titre de produits industriels nouveaux, les dérivés trifluorométhylés du phényl - amino propane de formule générale I :



dans laquelle :

R représente un atome d'hydrogène ou un radical alcoyle inférieur jusqu'à 5 atomes de carbone;

n est un nombre entier égal à 2 ou 3; et

R' représente :

Un atome d'hydrogène; ou

Un groupe COR'' dans lequel R'' représente :

a. Un radical alcoyle inférieur jusqu'à 6 atomes de carbone qui peut être substitué par un ou plusieurs substituants choisis parmi le groupe formé :

D'atomes d'halogène;

De radiacux oxygénés, tels que, par exemple, hydroxyle, méthoxy, propyloxy, carboxyle;

De groupes aryles carbocycliques, tels que, par exemple, phényle ou biphényle qui peuvent être substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, de groupes hydroxyle, alcoxy inférieur jusqu'en C_4, alcoyle inférieur jusqu'en C_4, méthylène-dioxy, nitro, amino et trifluorométhyle;

De groupes aryloxy carbocycliques tels que, par exemple, les groupes phénoxy ou naphtoxy, qui peuvent être substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, de groupe alcoxy inférieurs jusqu'en C_4 et de groupe nitro;

b. Un radical cycloalcoyle contenant de 3 à 7 atomes de carbone, tel que, par exemple, les radicaux cyclopropyle, cyclopentyle, cyclohexyle qui peuvent être substitués par un ou plusieurs groupes aryles carbocycliques tels que, par exemple, le radical phényle;

c. Un radical alcényle inférieur contenant de 2 à 6 atomes de carbone tels que, par exemple, les radicaux éthényle, propényle-2, méthyl-2 propényle, buténule-2, buténule-3, qui peuvent être substitués par un ou plusieurs groupes aryles carbocycliques tels que, par exemple, le groupement phényle qui peut être substitué par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogène, de radicaux hydroxyle, alcoxy inférieur jusqu'en C_4, alcoyle inférieur jusqu'en C_4, méthylène-dioxy, nitro, amino et trifluorométhyle;

d. Un radical alcynyle inférieur contenant de 2

à 6 atomes de carbone tel que, par exemple, les radicaux propynyle ou méthyl-propynyle qui peuvent être substitués par un radical phényle;

e. Un radical aryle carbocyclique, mono ou bicyclique tel que, par exemple, les radicaux phényle, naphtyle-1 et naphtyle-2 qui peuvent être substitués par un ou plusieurs substituants choisis parmi le groupe formé d'atomes d'halogènes, de radicaux hydroxyle, alcoxy inférieur jusqu'en C_4, alcoyle inférieur jusqu'en C_4, méthylène-dioxy, nitro, amino, trifluorométhyle et phényle, sous forme de racémiques et d'isomères optiques.

2° Le (*m* - trifluorométhylphényl) - 1 [(β - hydroxy - éthyl) - amino] - 2 propane, ainsi que ses isomères dextrogyre et lévogyre.

3° Le (*m* - trifluorométhylphényl) - 1 [(β - benzoyloxy - éthyl) - amino] - 2 propane, ainsi que ses isomères dextrogyre et lévogyre.

4° Le (*m* - trifluorométhylphényl) - 1 [(β - chloracétyloxy - éthyl) - amino] - 2 propane.

5° Le (*m* - trifluorométhylphényl) - 1 [(β - phénylpropionyloxy - éthyl) - amino] - 2 propane.

6° Le (*m* - trifluorométhylphényl) - 1 [(β - cyclopropylcarboxyloxy - éthyl) - amino] - 2 propane.

7° Le (*m* - trifluorométhylphényl) - 1 [(β - *m* - trifluorométhyl α - méthyl cinnamoyloxy - éthyl) - amino] - 2 propane.

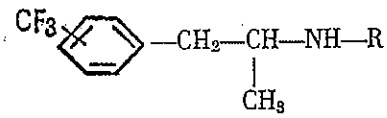
8° Le (*m* - trifluorométhylphényl) - 1 [(β - *o* - chlorobenzoyloxy - éthyl) - amino] - 2 propane.

9° Le (*m* - trifluorométhylphényl) - 1 [(β - *m* - trifluorométhylbenzoyloxy - éthyl) - amino] - 2 propane.

10° Le (*m* - trifluorométhylphényl) - 1 [(β - *p* - fluorobenzoyloxy - éthyl) - amino] - 2 propane.

11° Les sels d'addition physiologiquement tolérables des dérivés selon 1° à 10° avec les acides minéraux ou organiques.

12° Le procédé de préparation des dérivés selon 1° à 11°, caractérisé en ce que l'on fait réagir un trifluorométhylphényl isopropylamine de formule générale II :



II

dans laquelle R a les significations définies dans la revendication 1°.

Avec un composé hydroxy-halogéné contenant 2 ou 3 atomes de carbone, ou avec un oxyde d'alcoylène, l'on estérifie les composés ainsi obtenus avec un halogénure d'acyle, un anhydride ou un acide appropriés, et, l'on réduit, le cas échéant, par l'hydrogène sous pression et en présence d'un catalyseur, les dérivés nitrés en vue d'obtenir les dérivés aminés correspondants.

13° Le procédé de préparation des isomères optiques des dérivés selon la revendication 1°, caractérisé en ce que l'on dédouble les dérivés racémiques de formule générale I par l'acide *d* (—) dibenzoyl tartrique pour obtenir les isomères lévogyres, et par l'acide *d* camphorique, pour obtenir les dérivés dextrogyres.

A Monsieur Henri Schmitt, Maître de Conférences Agrégé, que nous remercions profondément des encouragements qu'il nous a prodigués et de l'attention qu'il a bien voulu accorder à notre travail.

En hommage reconnaissant.

A Monsieur le Docteur Jacques Servier,

A Madame le Docteur Jeanine Servier,

qui ont compris l'importance de la recherche pharmacologique et n'ont pas hésité à nous donner tous les moyens nécessaires à l'aboutissement de ce travail.

En hommage de notre reconnaissance et de notre respectueux dévouement.

A mes parents,

A ma femme,

A toute ma famille

En témoignage de ma profonde affection

A mes amis,

A mes collaborateurs,

JE DEDIE CE TRAVAIL.

INTRODUCTION

La découverte de l'action inhibitrice de l'amphétamine sur l'appétit a amené les thérapeutes à utiliser abondamment cette propriété particulière. Le traitement de base de l'obésité est la diminution de l'apport calorique au moyen de la restriction alimentaire. Aussi il est nécessaire d'aider le malade à supporter ce régime restrictif en lui administrant des drogues susceptibles de lui couper l'appétit.

Les mécanismes physiologiques de la faim et de l'appétit ont donné lieu à un grand nombre de travaux physiologiques, surtout depuis la dernière guerre mondiale. Ont été acquises ainsi des connaissances fondamentales sur la régulation psycho-physiologique de la faim.

Parallèlement le développement de nouveaux médicaments dits anorexigènes amena des tentatives pour élucider le mode d'action de ces corps sur la prise de nourriture chez l'homme et chez l'animal.

On ne trouve cependant pas un grand nombre d'études pharmacodynamiques de ces médicaments; il en va de même pour les méthodes d'étude qui n'ont guère été codifiées jusqu'à présent.

Il nous a semblé intéressant de tenter d'apporter une contribution à l'étude des substances agissant sur la faim et l'appétit.

Nous avons d'abord effectué l'étude critique des méthodes expérimentales, puis nous avons démontré la réalité de l'action pharmacodynamique de l'amphétamine et de 6 de ses dérivés chez l'animal. Nous avons ensuite envisagé les répercussions de l'anorexie médicamenteuse sur l'équilibre corporel. Finalement, nous avons étudié certains aspects du mode d'action de ces médicaments.

Chapitre III

RESULTATS

§ I - LES PROPRIÉTÉS ANOREXIGÈNES DES MÉDICAMENTS

Le premier objectif que nous avons poursuivi est la mesure chez trois espèces animales des variations de la prise de nourriture sous l'influence de médicaments utilisés en thérapeutique comme adjuvants du traitement de l'obésité. Les médicaments anorexigènes que nous avons étudiés sont d'introduction plus ou moins récente en France et nous avons limité notre choix aux plus importants.

1) Structure chimique des sept médicaments anorexigènes étudiés.

Ces produits sont chimiquement apparentés aux groupes des phenyl-ethyl amines.

CONCLUSIONS GENERALES

Un état de faim, mesuré par la quantité de régime consommé, peut être créé chez la Souris, le Rat et le Chien par des jeûnes réguliers ou intermittents. Cette faim est susceptible d'être inhibée par des médicaments anorexigènes proportionnellement à la dose administrée.

Des comparaisons quantitatives entre différents corps peuvent être établies dans des conditions définies de stabilité du comportement alimentaire. Une bonne corrélation existe entre ces résultats expérimentaux et ceux obtenus chez l'Homme.

La possibilité d'étudier l'anorexie médicamenteuse comme toute autre propriété pharmacodynamique, existe donc et l'étude comparative de séries de corps peut être envisagée.

La restriction alimentaire est la cause principale de l'amaigrissement chez le Rat, néanmoins il semble qu'une action propre sur les réserves lipidiques soit exercée par ces médicaments.

Dans l'étude du mode d'action de l'amphétamine et de ses dérivés sur la prise de nourriture chez le Rat, nous avons tenté d'intégrer certains faits expérimentaux aux grandes théories de la faim, de Mayer, de Brobeck et de Kennedy.

Les variations de la température rectale ne sont pas parallèles à celles du pouvoir anorexigène et, en fonction des produits administrés, se manifestent en sens opposé. Il est ainsi difficile chez le Rat de lier l'une à l'autre ces deux propriétés.

De nos résultats, il ressort que la différence de glycémie artério-veineuse (Δ glucose) varie dans le sens attendu, d'après la théorie de Mayer. L'amphétamine est en effet capable d'augmenter le Δ glucose dans ces conditions.

L'inhibition du transit gastro-intestinal a lieu à dose anorexigène. La présence plus longue des aliments dans le tractus gastro-intestinal

et l'inhibition déjà prouvée des contractions de l'estomac dues à la faim peuvent être des déterminants de l'action anorexigène de l'amphétamine et de ses dérivés.

L'exaltation de la secrétion gastrique entraînée par l'amphétamine cadre avec les travaux d'Ivy, Lin et Langberg (54). Ces auteurs ont montré que les relations entre la quantité de nourriture ingérée et la réponse secrétoire gastrique est représentée par une courbe sigmoïde. Dans la dernière portion de la courbe, il apparaît que la capacité de secrétion maxima est atteinte ou presque, c'est à ce moment que l'animal s'arrête de manger et que l'homme ressent la satiété. Si l'amphétamine est capable d'accélérer le taux de la secrétion gastrique en présence ou en l'absence d'aliments, elle peut troubler le déroulement normal de la digestion et le jeu des réflexes subséquents.

En somme, l'amphétamine et ses dérivés sont susceptibles de provoquer un ensemble de réactions concomitantes :

l'inhibition de la faim
l'augmentation du Δ glucose
le ralentissement du transit gastro-intestinal
la stimulation de la secrétion gastrique.

Dans nos expériences il est impossible de savoir si le déclenchement de ces effets est d'origine centrale ou périphérique.

Il est maintenant communément admis que l'anorexie amphétaminique est d'origine centrale, en fonction des actions de ce corps sur le système nerveux central. Nous pensons que les actions périphériques de l'amphétamine ne doivent pas être exclues de son mécanisme d'action sur la faim, certaines autres s'exerçant en l'absence de tout système nerveux central comme l'inhibition de la fibre lisse et l'hypertension.

Au cours de cette étude, nous avons montré que l'anorexie n'était pas le corollaire de la stimulation centrale et que différents états du système nerveux central pouvaient entraîner une anorexie avec ou sans modification visible du comportement de l'animal.

L'inhibition et même l'inversion de l'effet anorexigène de l'amphétamine par les sympathicolytiques et sa potentialisation par les inhibiteurs de la monoamine oxydase ont été démontrées chez le Rat. Quelle que soit l'origine de l'anorexie amphétaminique, centrale, périphérique ou mixte, il est probable qu'un mécanisme adrénergique y participe.

Nous admettrons pour conclure que l'anorexie amphétaminique peut être considérée comme une propriété sympathicomimétique, au même titre que celles déjà connues.

ARTICLES ORIGINAUX

Comparaison pharmacologique de sept médicaments anorexigènes (*)

Par J.-C. LE DOUAREC (**) et H. SCHMITT (***)

La thérapeutique de l'obésité utilise un certain nombre de substances destinées à limiter les apports caloriques en freinant l'appétit. On les a nommées anorexiantes ou anorexigènes. Dès 1937, les propriétés anorexiantes de l'amphétamine ont été découvertes chez l'homme [7, 17, 26] : elles furent étudiées ensuite chez l'animal par TAINTER [25]. L'emploi des dérivés de l'amphétamine comme adjuvants du traitement de l'obésité est une prescription aujourd'hui classique [8, 18, 19].

Toutefois, les effets secondaires des médicaments utilisés jusqu'à présent en limitent l'emploi. L'action excitante centrale et les actions hypertensives sont des propriétés indésirables de ces produits.

L'appétit et la faim sont des phénomènes subjectifs qui se prêtent mal à une analyse physiologique précise. Les connaissances sur ce sujet se sont accrues cette dernière décade, mais il ne nous appartient pas de les exposer ici ; citons seulement les importantes revues de MINER [16], de MAYER [15], de SOULAIRAC [22], de ANAND [1], de ANDERSSON et LARSSON [2].

On peut mesurer avec précision la prise de nourriture chez l'animal et étudier les facteurs qui conditionnent le comportement alimentaire de celui-ci. Nous avons étudié les propriétés anorexigènes

(*) Rapport présenté à la séance du 18 décembre 1963 de la *Société française de Thérapeutique et de Pharmacodynamie*.

de sept médicaments (*figure 1*) chimiquement proches, mais se différenciant par leur action secondaire sur le système nerveux central et la pression artérielle.

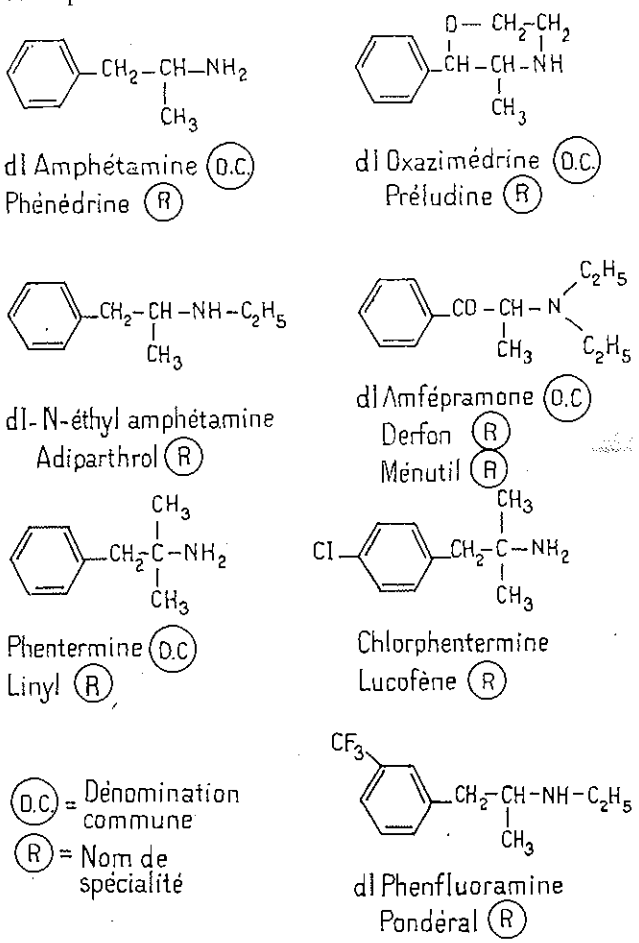

FIG. 1. — Formules chimiques des produits étudiés.

MÉTHODES

1) Toxicité aiguë.

La toxicité aiguë des corps étudiés a été déterminée par voie intrapéritonéale chez des souris blanches mâles de race Swiss, pesant de 18 à 22 g. Les expériences ont été effectuées à température constante (24° ± 1) dans des cages transparentes de 17 × 12 × 12 cm ; les animaux étaient isolés ou groupés par 10. Le nombre de morts

TABLEAU VI

Amphétamine	100
Oxazimédrine	12
N-éthylamphétamine	3,8
Amfépramone	0,8
Phentermine	14,1
Chlorphentermine	5
Phenfluoramine	3,5

Les chiffres du tableau VI montrent que les corps étudiés sont bien moins actifs que l'amphétamine sur la pression artérielle du Rat.

DISCUSSION

Les résultats obtenus dans cette étude permettent donc de chiffrer chez une même espèce animale le pouvoir anorexiant, l'action excitante centrale et l'activité tensionnelle de sept anorexiants utilisés en thérapeutique humaine.

Le chien semble l'animal le plus sensible aux effets anorexigènes de l'amphétamine et autant qu'on puisse en juger par les posologies utilisées il semble que chez l'homme les activités relatives des différents médicaments soient du même ordre.

Nos résultats obtenus avec l'amphétamine, l'oxazimédrine et l'amfépramone sont en bon accord avec ceux de SPENGLER et WASER [23]. De même, CAHEN [5] a obtenu des chiffres voisins des nôtres pour l'amphétamine et l'amfépramone. En ce qui concerne la phentermine et la chlorphentermine, nous confirmons les travaux respectivement de BECKER [4] et de HOLM [12].

Il nous paraît par ailleurs intéressant de comparer l'activité anorexiante aux autres effets.

L'action excitante centrale est encore très appréciable dans les dérivés tels que l'oxazimédrine, la N-éthylamphétamine, l'amfépramone et la phentermine. Par contre, elles est nulle pour la chlorphentermine et la phenfluoramine même à des doses bien supérieures aux doses anorexigènes.

Les activités tensionnelles des différents dérivés étudiés sont encore appréciables pour l'oxazimédrine, la phentermine et même la chlorphentermine. Elles sont, par contre, faibles pour l'amfépramone et la phenfluoramine.

Les recherches expérimentales effectuées ces dernières années sur les médicaments anorexigènes ont engendré des corps possédant un meilleur index thérapeutique que l'amphétamine puisque l'activité anorexigène est presque entièrement conservée alors que les propriétés secondaires sont considérablement diminuées.

A partir des chiffres obtenus au cours de cette étude nous avons établi la figure 2 où la partie supérieure représente l'effet principal

(anorexie) chiffré 100 pour l'amphétamine et la partie inférieure les effets secondaires chiffrés 100 chacun. Il apparaît clairement que des corps comme la chlorphentermine et la phenfluoramine possèdent chez le rat une balance plus favorable entre leur action principale et leurs actions secondaires.

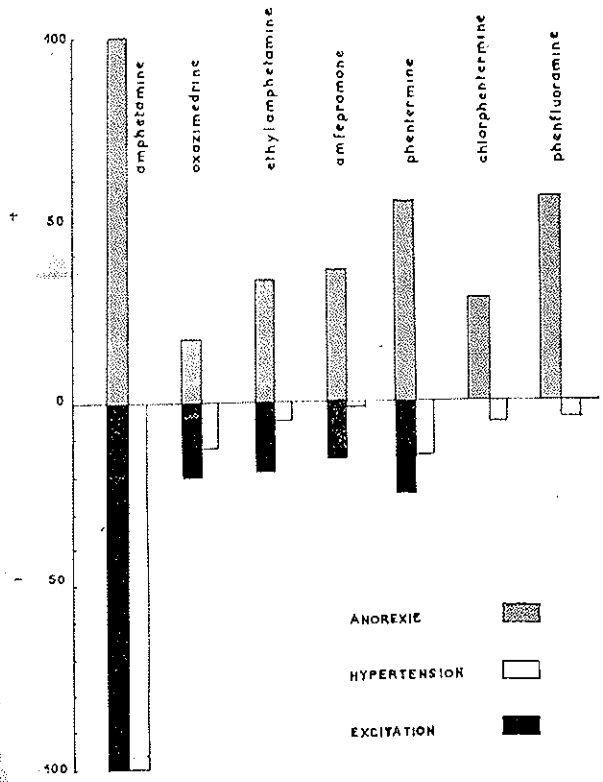

FIG. 2. — Comparaison des différents anorexiants.
En ordonnées : activité en p. 100 par rapport à l'amphétamine ; en haut (+) : effet anorexigène ; en bas (—) : activité excitante centrale et hypertensive.

The Effects of Chronic Fenfluramine Administration on Behaviour and Body Weight

M. Taylor, A. J. Goudie, and Amanda Williams

Department of Psychology, University College of North Wales, Bangor, Caernarvon, U.K.

Received January 22, 1973

Abstract. Two experiments were conducted on the effects of chronic administration of fenfluramine on behaviour and body weight in rats. In Experiment One the effects of 28 day chronic administration were studied. A dose related rapid weight loss was observed in treated subjects, with development of tolerance to the effects of the drug on body weight after 14 days administration. Observations of behaviour were made on days 1, 14 and 28 of chronic administration according to a "time sampling" procedure of behavioural categorisation. The incidence of some behavioural patterns varied significantly between observation days, although observations of control subjects were never significantly different. By the 28th day of administration tolerance to the behavioural effects of the drug had developed, no dose/response effects being noted in contrast to the results for prior observation days.

In Experiment Two confirmation of the development of behavioural tolerance was obtained. Abnormal, "stereotyped" behaviour induced by a very high dose of fenfluramine showed a much lower incidence in subjects that hadr eceived fenfluramine for 30 days than in saline controls. Attention is drawn to the difficulties inherent in describing psychotropic agents as either sedatives or stimulants. It is suggested that although fenfluramine is generally considered to be a sedative, stimulant effects may be observed after chronic administration of anorexic doses. Similarities between the effects of high doses of fenfluramine and amphetamine are described.

Key words: Fenfluramine — Anorexia — Activity Analysis — C.N.S. Stimulation — Stereotyped Behaviour.

Fenfluramine has often been described as an anorexic amphetamine derivative which lacks the stimulant and addictive properties of other phenylethylamines (Boissier *et al.*, 1965; Duhault, 1972; Elliot, 1970; Fink *et al.*, 1971; Hill and Turner, 1967; Sedgwick, 1972). However, a number of reports of human overdosage have demonstrated a marked stimulant effect (Campbell and Moore, 1969; Fleischer and Campbell, 1969; Gold *et al.*, 1969) and similarities to amphetamine psychosis (Brandon, 1969; Riley *et al.*, 1969). Similar observations have been made in animal studies (Yelnosky and Lawlor, 1970; Southgate *et al.*, 1971; Kun-

dig, 1971). At anorexic doses fenfluramine has been reported to act as a stimulant under certain conditions [Everitt and Hacket, 1972; Le Douarec *et al.*, 1966; Offermeir and Potgeiter, 1972; Ziance (personal communication)]. Lewis *et al.* (1971) and Johnson *et al.* (1971) have shown that administration of fenfluramine, to humans and cats respectively, causes suppression of paradoxical sleep time similar to that observed with *d*-amphetamine, with rebound phenomena on withdrawal, and bruxism (in humans) similar to that observed in amphetamine addicts (Ashcroft *et al.*, 1965).

All these reports indicate that the description of fenfluramine as a non-addictive sedative anorexiant may be an oversimplification of its pharmacological properties. It is true that a number of authors have reported reduction in spontaneous motor activity following acute fenfluramine administration (Le Douarec *et al.*, 1966; Ziance *et al.*, 1967; 1972) and a similar reduction in exploration (Boissier *et al.*, 1965; Valzelli, 1971). Inhibition of aggression in isolation reared mice has also been reported (Weischer and Opitz, 1972) as has protection from ECS (Ziance *et al.*, 1967). Clearly, in many "classical" psychopharmacological screening tests fenfluramine acts in a manner that is generally considered to reflect sedative properties.

A number of authors, however, have stressed that psychotropic drugs generally have multiple effects and that the terms "stimulant" and "sedative" are confusing unless the exact behavioural or neurophysiological effects observed are specified (Weiss and Laties, 1964; Dews, 1958; Schiørring, 1971). The use of the terms sedative and stimulant as mutually exclusive descriptive labels is to a large extent due to the fact that screening for C.N.S. active compounds frequently involves apparati such as photobeam cages, ultrasonic motion detectors and stabilimeters; all of which provide a gross measure of "general activity". The usefulness of such measures is questionable. For example, fenfluramine has been shown to reduce (Ziance *et al.*, 1972), to have no effect on (Van Rossum and Simmons, 1969; Offermeir and Potgeiter, 1972) and to increase (Le Douarec *et al.*, 1966; Everitt and Hacket, 1972) spontaneous motor activity as measured by such methods. Draper (1963) noted that such measures are "apparatus bound" and susceptible to large numbers of variables. As an alternative to these contradictory purely quantitative measures Bindra and Spinner (1958) proposed the use of a "time sampling" method of behavioural categorisation, using well defined, mutually exclusive, behavioural categories arranged in a hierarchy. This technique allows both quantitative and qualitative measurement of activity.

Taylor *et al.* (1971) used this technique, with categories modified after Winocour *et al.* (1969), to study the effects of acute fenfluramine on be-

haviour. Experiment one replicates this study and extends the analysis to 28 days chronic administration. Observations of possibile "stimulant" effects of fenfluramine, and definite behavioural and anorexic tolerance are reported. Tolerance to the behavioural effects of the drug was confirmed in Experiment Two, the results of which justify the proposal made above that "time sampling" activity analysis is superior to gross measures of activity, since significant differences in behavioural patterns, observed in tolerant and nontolerant subjects after injection of a very high dose of fenfluramine, were not reflected in simultaneous measurements of activity with an ultrasonic motion detector.

Experiment One

Method

Subjects were 24 male hooded rats, weighing between 200 and 250 g on arrival. They were randomly assigned to groups of threes, one group being placed in each of eight cages. From each cage one subject received saline control injections, whilst the other two subjects received 3 and 9 mg per kg of fenfluramine respectively. Subjects in any one cage were randomly assigned to dose conditions; they were injected daily, subcutaneously, with the relevant solution at a volume equivalent to 2 ml per kg of body weight. Drug solutions were made up in saline. On arrival, subjects were adapted to a 23 h deprivation schedule for three weeks, and were maintained on this schedule throughout the study. Saline injections were administered to all subjects for four days prior to drug administration in order to habituate them to the injection procedure; they were weighed and injected daily when $22^1/_2$ h food deprived, and fed half an hour after injection.

Behavioural Observations. These were made on days 1, 14 and 28 of the chronic study. On observation days subjects from each cage were injected in random order at five minute intervals, then placed in individual holding cages for half an hour prior to observation. Immediately after observation subjects were fed for one hour then returned to their home cages. Subjects were observed when 23 h food deprived, observations being made in a large plastic lined box with a perspex lid and with dimensions of 90 cm × 45 cm × 50 cm. The box was uniformly illuminated and placed in a soundproof room.

The following mutually exclusive behavioural categories were used, arranged in the hierarchical order as shown:

Rearing: Front limbs off floor with hind limbs extended
Walking: Movements involving all four limbs
Sniffing: Head movements with rear limbs immobile, twitching of vibrissae
Grooming: Scratching, biting or licking of coat
Immobile: Freezing, total inactivity
Miscellaneous: Eating faeces and other infrequent behaviours

This hierarchy follows that of Winocour *et al.* (1969), the justification for its use being that sniffing is frequently observed in conjunction with rearing or walking. A behavioural pattern may be categorised as rearing or walking even though the subject may be sniffing simultaneously. For each subject observations were made every $2^1/_2$ sec, for a total of 100 observations per subject. The experiment was run in a

double blind manner, observations always being made by the same individual who was well practised prior to day 1. Pilot studies indicated a high degree of concordance between observers. Statistical analysis was by the Mann Whitney *U* Test (one tailed) in all cases.

Results

(a) Weight Changes

Fig. 1 shows the cumulative sum of the daily differences between the mean body weights of the two treated groups and the mean body weight of the saline controls. Fluctuations in the baseline control body weights are small; however, the effects of such fluctuations are eliminated by presenting the data in the form shown, providing a reliable index of drug effects. There is a clear dose related initial rapid weight loss in treated subjects, followed by a consistent reduction in rate of weight loss, tolerance to the effects of the drug on body weight being apparent around day 14, for those subjects which received 9 mg per kg and around day 5 for those subjects which received 3 mg per kg. Once subjects had become tolerant to the drug effect they did not regain weight, indicating a permanent effect of fenfluramine.

(b) Behavioural Observations

Comparisons between controls observed on days 1, 14 and 28 were not significant for any behavioural category, so that repeated exposure to the chamber for the observation period of just over 4 min had no effects on behaviour on the spaced observation days. It is consequently possible to make comparisons between observations on different days for treated

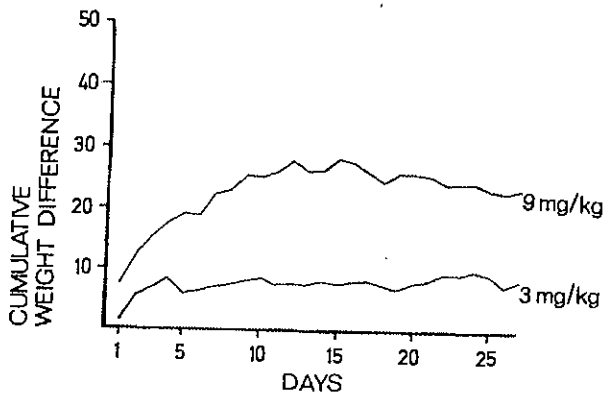

Fig. 1. Cumulative sum of the daily differences (gms) between mean weights of subjects receiving 3 and 9 mg per kgm of Fenfluramine, and saline controls

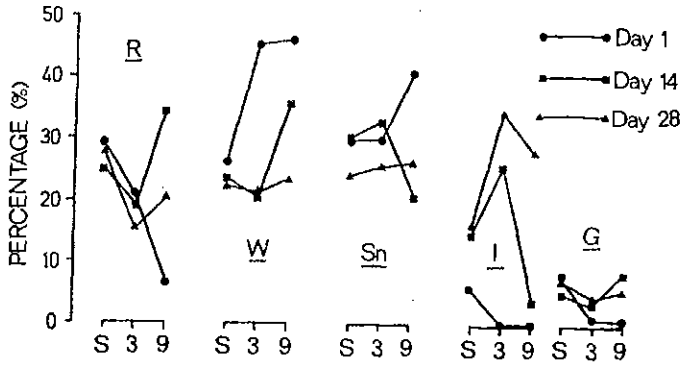

Fig. 2. Mean percentage incidence of Rearing (*R*), Walking (*W*), Sniffing (*Sn*), Grooming (*G*) and Immobility (*I*), after the 1st, 14th and 28th daily dose of Saline (*S*), 3 mg per kg (*3*) and 9 mg per kg (*9*) Fenfluramine

Table 1. Statistical comparisons between acute subjects (Observations on Day One) Mann Whitney *U* Test. NS = not significant

Behavioural category	Controls compared with subjects dosed with 3 mg per kg	Controls compared with subjects dosed with 9 mg per kg	Subjects dosed with 3 mg per kg compared with subjects dosed with 9 mg per kg
Rearing	$p < 0.05$	$p < 0.001$	$p < 0.005$
Walking	$p < 0.001$	$p < 0.005$	NS
Sniffing	NS	$p < 0.05$	$p < 0.005$
Grooming	$p < 0.05$	$p < 0.05$	NS
Immobile	NS	$p < 0.05$	NS

subjects. Fig. 2 shows the mean incidence of each behavioural category, for each of the three groups of subjects on the three observation days. Miscellaneous behaviour is omitted because very few instances of this category were recorded.

(i) *Acute Administration.* Table 1 shows the comparisons between control subjects and treated subjects, and the comparisons between the two dosed groups for each behavioural category. Acute administration leads to a dose related reduction in the incidence of rearing, a significant increase in walking, a significant increase in sniffing which is dose related and significant decreases in grooming and immobility. Acute fenfluramine administration has a profound effect on the "spectrum" of behaviour recorded.

Table 2. Statistical comparisons between subjects receiving 9 mg per gm Fenfluramine on Days 1 and 14. (Control comparisons are not significant)

Behavioural category	Coparisons between subjects dosed with 9 mg per kg on Days 1 and 14
Rearing	$p < 0.001$
Walking	$p < 0.05$
Sniffing	$p < 0.005$
Grooming	$p < 0.01$
Immobile	$p < 0.01$

(ii) *Chronic 14 Day Administration.* No *significant* effects were noted on any categories of behaviour when comparisons were made between 14 day treated subjects and controls except for a significant increase (at the $p < 0.05$ level) in the incidence of walking for the subjects receiving the high dose of drug. However, many of the effects approach significance and the patterns of results is very different to that observed following acute administration. For example, some of the drug effects after 14 days administration are in the opposite direction to that observed after acute administration (rearing and sniffing categories). Whilst comparisons with controls are not significant for all categories except walking, there are significant differences ($p < 0.05$ level) between subjects dosed with 3 and 9 mg per kg for rearing (significant increase at high dose), walking (increase), sniffing (decrease) and grooming (increase). The dose/response effect is in the opposite direction to that recorded for acute administration for the rearing and sniffing categories.

Comparisons between subjects receiving 9 mg per kg of fenfluramine on days 1 and 14 indicate a significant difference on all categories as shown in Table 2.

(iii) *Chronic 28 Day Administration.* No significant differences were noted between treated and control subjects for any behavioural category, nor were there any differences between subjects receiving 3 and 9 mg per kg of fenfluramine, in contrast to the dose/response effects reported for some categories on both days 1 and 14.

Discussion

(a) Weight Changes

The effect of fenfluramine on body weight with the development of "anorexic tolerance" is similar to that reported by many other authors. The development of anorexic tolerance would *not* appear to be related to that of behavioural tolerance, since subjects had ceased to lose weight by day 14 when the drug still had pronounced effects on behaviour. It is not

clear whether the permanent effect on body weight is due to the anorexic effects of fenfluramine or to its metabolic ("glycolyptic") effects (Butterfield *et al.*, 1971; Turtle *et al.*, 1971).

Similar results were obtained in a comparable study with Norfenfluramine (Taylor *et al.*, unpublished), the effects of Norfenfluramine being more pronounced at equal doses in accord with the suggestion of some authors that Norfenfluramine may be involved in the actions of fenfluramine (Campbell, 1971).

(b) Behavioural Observations

The acute data replicate those of Taylor *et al.* (1971), and differ significantly from observations made on day 14 in two ways. Firstly, the dose/response effect is in the opposite direction for the rearing and sniffing categories, and secondly, cross day comparisons indicate significant differences (at very high levels) for treated subjects but not for controls on *all* categories. Behavioural tolerance has developed by day 28 as shown by the absence of any dose/response effect on any category in contrast to the results from days 1 and 14. A very similar pattern of results was observed in a comparable study with Norfenfluramine (Taylor *et al.*, unpublished).

Due to the exhaustive nature of the behavioural categorisation system used in this study, the frequencies of the various categories are not independently variable. A drug induced change in the incidence of any one category will, by definition, be reflected in opposite changes in the incidence of one or more other categories. The effects of psychotropic agents can be considered as changing the "spectrum" of activities. However, it is clear that fenfluramine has pronounced effects on those categories at the head of the hierarchy (*i.e.* rearing and walking). The drug induces a significant increase in the incidence of rearing on day 14 even though it causes a reduction on acute administration, and it also increases the incidence of walking following both acute and chronic administration. These effects of fenfluramine on "active" exploratory behaviour may reflect genuine "stimulant" effects of the drug. Everitt and Hacket (1972) have shown that motor activity in a confined space which allows only rearing behaviour to occur is stimulated by acute administration of fenfluramine, an effect similar to that observed with *d*-amphetamine. This result may also reflect a stimulant effect of fenfluramine on active exploratory behaviour. The effects on sniffing behaviour may be secondary to those on categories higher in the hierarchy since, as noted by Winocour *et al.* (1969) sniffing is often observed concurrently with rearing and walking. The stimulation of sniffing observed after acute administration would not seem to be related to amphetamine induced "stereo-

typed" sniffing as described by Quinton and Halliwell (1963), Randup and Munkvad (1967) and Schiørring (1971) because in Experiment Two (described below) a very high dose of fenfluramine induced almost continuous vigorous sniffing, which differed in kind to that observed following acute and chronic administration of the lower doses.

A number of authors have suggested that rearing behaviour may provide an index of general "C.N.S. excitability" (Lat, 1963: Garg, 1969). However, Holland and Gupta (1967) have proposed that the incidence of rearing is related to two orthogonal factorial dimensions of "Activity" and of "Emotionality"; they have also shown that while amphetamine increases rearing frequency so does the depressant Sodium Amytal, the latter effect being attributed to an action on emotionality. Drugs may act on separate factorial dimensions to induce the same behavioural effect. Consequently the stimulation of rearing after 14 days chronic administration of fenfluramine reported in this study can not definitely be attributed to an effect on "C.N.S. excitability", nor can the results of Everitt and Hackett (1972), especially since fenfluramine *has* been reported to be an effective anxiolytic in clinical studies (Gaind, 1972), although this result is not unquestioned (Raich *et al.*, 1966).

The complexity of the interpretation of the results of fenfluramine on behaviour clearly illustrate the difficulties inherent in describing a psychotropic agent as either a stimulant or a sedative. Many previous studies of the effects of the drug on activity appear to have led to spuriously simplistic conclusions. However, the effects of fenfluramine on rearing and walking suggest that the drug may have stimulating properties, especially after chronic administration. In the light of these results it is probably necessary to draw a distinction between acute and chronic effects of fenfluramine, similar to that reported by Lewis *et al.* (1971) from sleep studies, and Costa *et al.* (1971) from studies of effects of fenfluramine on monoamine stores of rat tissues.

Experiment Two

Introduction

Yelnosky and Lawlor (1970) have shown that injection of 50 mg per kg of fenfluramine in rats induces stereotyped behaviour which is similar but not identical to that observed with high doses of amphetamine (Randrup and Munkvad, 1969). Southgate *et al.* (1971) showed that 5 or 32 mg per kg fenfluramine given in conjunction with a Monoamine Oxidase Inhibitor results in similar stereotyped behaviours in mice. The typical behavioural patterns reported by these authors included: excessive head movements, sniffing, backward locomotion and a very low incidence of normal behaviour such as those recorded in Experiment One.

As a result of the observation that behavioural tolerance to fenfluramine had developed by day 28 of chronic administration, it was hypothesised that tolerant subjects (*i.e.* those that had received fenfluramine for 28 days) would show a much lower incidence of stereotyped behaviours, and a higher incidence of normal behaviours than the saline treated subjects.

Method

Two groups of subjects were used from Experiment One; those which had received saline and 9 mg per kg of fenfluramine. There were eight subjects per group and they were maintained on the same schedule of injection and feeding times as in Experiment One. Chronic drug administration was continued for a total of 30 days, behavioural observations being made on day 31, after all subjects had received injections of 50 mg per kg of fenfluramine.

Behavioural Categorisation. As a result of the reports of steteotyped behaviours considered above and from the authors' own pilot studies, the following behavioural categories were introduced in addition to those already defined in Experiment One:

Backward locomotion: a behavioural pattern never observed in control subjects.
Head movements: characterised by being aimless and repeated
Circling: characterised by the back legs being dragged around the front legs as pivots

Subjects were observed for a 15 min period, 20 min after drug injection in a wooden box of dimensions 35 cm × 30 cm × 25 cm, with a perspex lid to which was attached an ultrasonic motion detector system. In contrast to the sampling procedure used in Experiment One categories were recorded only when a change of behavioural pattern occurred or when one pattern was prolonged for a period of greater than ten seconds (this was usually only true of the immobility category). The number of observations made per subject varies so that the data are presented in the form of the percentages of the total number of observations made per subject for each category. The subjects were run in a double blind manner, but the differences between the two groups of subjects was obvious to the observer.

Results

Fig. 3 presents the mean incidence of the various categories in the two groups. All the "normal" behavioural categories were observed at a higher level of incidence in the tolerant than in the non-tolerant subjects, the converse being true of the "stereotyped" categories. Table 3 shows the significant levels of the differences between the two groups (Mann Whitney *U* Test).

All subjects showed continuous vigorous sniffing of a type never observed in Experiment One; because of this the incidence of sniffing was ignored as it was not possible to quantitate it. No significant differences were observed between the two groups of subjects when activity was assessed by the ultrasonic motion recorder, although the form of activity was clearly different in the two groups.

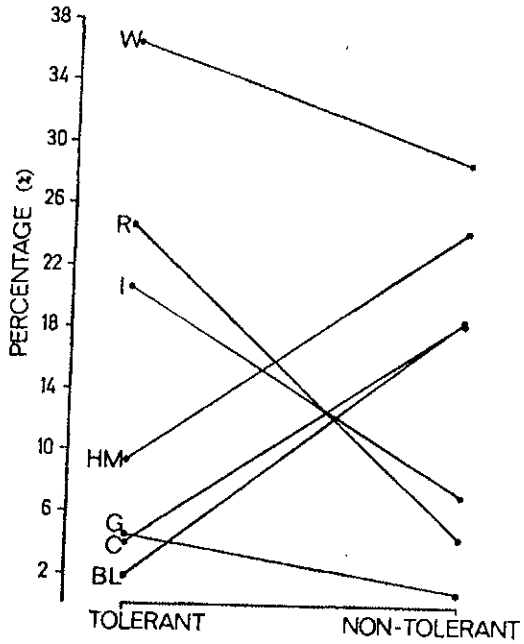

Fig. 3. The mean percentage incidence of behaviours after a 50 mg per kg dose of Fenfluramine to tolerant (30 days 9 mg per kg Fenfluramine) and nontolerant (30 days saline) groups. Walking (*W*), Rearing (*R*), Immobile (*I*), Head Movements (*HM*), Grooming (*G*), Circling (*C*) and Backward Locomotion (*BL*)

Table 3. Statistical comparisons between tolerant and nontolerant subjects in experiment two. (NS = not significant)

Behavioural category	Comparisons between tolerant and nontolerant subjects
Rearing	$p < 0.001$
Walking	NS
Grooming	$p < 0.05$
Immobile	$p < 0.001$
Head movements	$p < 0.001$
Circling	$p < 0.001$
Backward locomotion	$p < 0.001$

Discussion

The results confirm the development of behavioural tolerance after 30 days chronic administration of 9 mg per kg fenfluramine, in accord with those from Experiment One. Although tolerance to the behavioural

effects of fenfluramine had been convincingly demonstrated, informal observations of the treated subjects for a week after cessation of drug administration failed to indicate the presence of any withdrawal symptoms.

Randrup and Munkvad (1969) have shown that amphetamine induced stereotypy is due to stimulation of dopamine receptors in the corpus striatum, the characteristic pattern of stereotopy observed in rats involving vigorous sniffing, biting, gnawing and, occasionally, backward locomotion. The stereotopy observed after high doses of fenfluramine in rats appears similar in some ways to that induced by amphetamine, although there are differences between the two syndromes. Southgate *et al.* (1971) have shown that fenfluramine induced stereotopy in mice is at least partially due to direct activation of 5 HT receptors, fenfluramine in contrast to amphetamine being known to affect cerebral 5 HT metabolism (Costa *et al.*, 1971; Duhault and Verdavainne, 1967), so that the modes of action of fenfluramine and amphetamine in inducing stereotyped behaviour may differ in that the effects of fenfluramine may be mediated, at least partially, by 5 HT receptors. However, Costa *et al.* (1971) have shown that high doses of fenfluramine affect cerebral catecholamine metabolism in a manner similar to that observed with amphetamine. It is consequently possible that the induction of stereotyped behaviours by fenfluramine involves catecholamine receptors as well as 5 HT receptors and that the similarities between the behavioural syndromes of stereotopy may be paralleled by similarities in neurochemical modes of action. It is not clear however, to what extent such effects are related to behavioral effects observed with anorexic doses; they can hardly be termed "stimulatory effects" and may differ in kind from effects with therapeutic doses.

Taken together the possible stimulatory effects observed after 14 days chronic administration of fenfluramine in Experiment One and the similarities observed in the stereotopy syndromes reported in Experiment Two, suggest that the behavioural effects of fenfluramine and amphetamine may not be as different as have been suggested in the past.

Time Sampling of Rat Exploratory Behaviour: A Reliable Screening Test for the C.N.S. Effects of Anorexic Agents

A. J. Goudie and M. Taylor

Department of Psychology, University College of North Wales
Bangor, Caernarvonshire, North Wales

Received June 6, 1973

Abstract. A series of eight experiments were conducted on the acute effects of a number of anorexic agents on rat exploratory behaviour, as assessed by a "time sampling" procedure of behavioural categorisation. Compounds studied were of three types. Firstly, some well known anoroxiants (Amphetamine, Diethylpropion, Fenfluramine); secondly, a series of fenfluramine derivatives (Norfenfluramine, SE 780, SE 1513 and SKF 1-39728); and thirdly, an indole derivative (U 22-394A). All the compounds except the latter are based upon a phenylethylamine configuration. The results indicate that amphetamine and diethylpropion are stimulants whilst fenfluramine is a sedative, in accord with the clinical reports of the effects of acute administration of these compounds. All the other phenylethylamines and U 22-394A were found to be sedatives. The technique of activity analysis described here is a useful screening test for psychotropic agents which affect C.N.S. excitability in humans, which is probably superior to other measures of activity in its predictive value. However, it is noted that the effects of acute administration do not always provide a reliable index of chronic effects. The compounds SE 780 and SKF 1-39728 would seem to merit further study. It is suggested that all the fenfluramine derivatives, except SKF 1-39728, have a similar mode of anorexic action to U 22-394A.

Key words: Anorexiants — Activity Analysis — Time Sampling — Screening Tests — Phenylethylamines — Serotonin.

Introduction

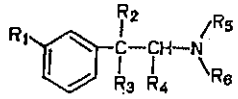
A very large number of anorexic agents such as phenmetrazine, phentermine, diethylpropion and all the amphetamines are derived from a phenylethylamine base and all have pronounced C.N.S. stimulant properties (Martindale, 1972). Fenfluramine is generally considered to be a sedative phenylethylamine; however, there are reports of stimulant effects in animals under some conditions (Everitt and Hacket, 1972; Le Douarec *et al.*, 1966; Taylor *et al.*, 1973; Kundig, 1971), and in humans at high doses (Campbell and Moore, 1969; Fleischer and Campbell, 1969; Gold *et al.*, 1969; Riley *et al.*, 1969; Brandon, 1969; Belvedere *et al.*, 1972). Furthermore, withdrawal mood depression has been reported after fenfluramine administration (Oswald *et al.*, 1971; Harding, T., 1971; Harding, T., 1972; Steel and Briggs, 1972). It is clear that even fenfluramine, which is

generally considered to be the anorexiant of choice, has adverse side effects.

The present paper reports on the effects of a series of anorexic agents on activity after acute administration; the technique used being a "time sampling" procedure of behavioural categorisation of rat exploratory behaviour. This screening test provides a reliable indication of the probable effects of psychotropic agents on the C.N.S. in humans; such effects being a very important aspect of the therapeutic validity of anorexiants.

Some of the compounds studied were well known and some were relatively unknown, their structures being as shown below:

a) Phenylethylamines



Drug	R_1	R_2	R_3	R_4	R_5	R_6
Amphetamine (+)	H	H	H	CH_3	H	$H \cdot SO_4$
Diethylpropion	H	O		CH_3	C_2H_5	$C_2H_5 \cdot HCl$
Fenfluramine	CF_3	H	H	CH_3	C_2H_5	$H \cdot HCl$
Norfenflur-amine	CF_3	H	H	CH_3	H	$H \cdot HCl$
SE 780[1]	CF_3	H	H	CH_3	H	SE 1513	CF_3	H	H	CH_3	H	SKF 1-39728	CF_3	H	CH_3O	H	H	
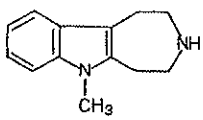
[1] This compound has also been referred to as "S 992".

b) U 22-394A



Methods

Methods were made as similar as possible throughout the series of eight experiments in order to facilitate inter-drug comparisons. However, procedural differences between experiments became necessary when it was found that some compounds were not active when injected S.C. but *were* active by the I.P. route

(SE 1513 and SE 780). In addition the injection vehicle had to be varied between experiments. The table below summarises the details of each experiment.

	Drug	Dose (mg per kg)	Injection route	Vehicle
Group one	*d*-Amphetamine	0.5, 1.0	S.C.	Saline
	Diethylpropion	2, 8	I.P.	Saline
	Fenfluramine	3, 9	S.C.	Saline
Group two	Norfenfluramine	3, 9	I.P.	Saline
	SE 1513	3, 9	I.P.	Sterile water
	SE 780	3, 9	I.P.	Tween 80 and sterile water
	SKF 1-39728	3, 9	I.P.	Saline
Group three	U 22-394A	0.5, 1.0	S.C.	Saline

The doses used were such that they were active anorexically; the effective doses for the novel compounds being determined by pilot studies in this laboratory. No attempt was made to administer equipotent doses of the compounds for two reasons. Firstly, because of the need to introduce procedural differences between experiments, as described above; and secondly, because any attempt to use equipotent doses is to some extent arbitrary, since a large number of variables (diets, times etc.) affect the measurement of the ED_{50} of any particular compound. Measurements of the ED_{50} of any drug are critically dependant upon procedures used, so that cross drug comparisons are only possible with identical procedures. The use of different procedures may well lead to different rankings of anorexic potency of a series of drugs. Weischer and Opitz (1972) attempted to administer equipotent doses of a range of anorexic agents by injecting a fixed percentage of the LD_{50}s. However, this procedure also fails to ensure that equipotent *anorexic* doses are administered since the therapeutic margins of the various compounds may vary considerably between drugs. For example, in this study that of SE 780 is approximately equal to seven times that of fenfluramine when determined acutely (unpublished Internal Report of Servier Laboratories).

Subjects were divided into eight experimental groups of male albino rats weighing between 200 and 300 g. In each experiment there were 24 subjects, eight per dose group and eight controls. Separate control groups were used in each experiment because it has been shown that exploratory behaviour is greatly influenced by handling habituation (Thompson and Lippman, 1972); and it was thought possible that control baselines might differ between experiments because of the influence of this variable, which is difficult to control for adequately when dealing with large numbers of subjects. Subjects were housed in threes and randomly allocated to dose conditions, being fed and watered ad lib prior to injection. Drugs were administered, in a volume equivalent to 2 ml per kg of body weight, 30 min prior to observation in a uniformly illuminated open field of dimensions $90 \times 45 \times 50$ cm. Activity was measured by a time sampling procedure of behavioural categorisation, with categories arranged hierarchically in the order, Rearing, Walking, Sniffing, Grooming, Immobile. Subjects were always observed blind by the same well trained observer, observations being made every $2^1/_2$ sec, 100 per subject. Further details of the procedure used and the rationale behind it, are described in Taylor *et al.* (1971); and in Taylor *et al.* (1973).

Results

A. Group One. Well Known Anorexiants: (Amphetamine, Diethylpropion and Fenfluramine). The behavioural effects of these compounds are shown in Table 1. Amphetamine induced a significant increase in the incidences of the active exploratory behaviours rearing and walking, with reductions in all other categories; some of the effects being dose related. No evidence of stereotyped behaviour was noted at the doses used. Diethylpropion induced a significant increase in the incidence of walking, which was dose related. Fenfluramine, in contrast to amphetamine reduces the incidence of rearing, also in a dose related manner. The significant increase in the incidence of sniffing observed with the high dose is considered to be an effect secondary to that on rearing (as described by Taylor *et al.*, 1973). It is not suggested that fenfluramine induces stereotyped sniffing at the dose used.

Discussion

A number of authors suggested that the incidence of rearing in a novel environment provides a reliable index of "C.N.S. Excitability" (Garg, M., 1969; Lat, J., 1963; Holland and Gupta, 1967), and it has been shown to be reduced by anxiolytics such as chlorodiazepoxide (Hughes, 1972; Iwahara and Sakama, 1972), and neuroleptics such as haloperidol and chlorpromazine (Janssen *et al.*, 1960; Brimblecombe, 1963). However, it is acknowledged that there are paradoxical effects of drugs on open field exploration; for example Bainbridge (1970) reported that low doses of amphetamine reduce ambulation. whilst Christmas and Maxwell (1970) reported that many benzodiazepines increase ambulation in a novel environment. These results may be interpreted in terms of the report of Holland and Gupta (1967) that exploration measures are influenced by two orthogonally related factorial dimensions, those of general activity and emotionality. The effect of a sedative or stimulant drug is dependant upon the state of the animal at the time of administration; for example, Christmas and Maxwell (1970) reported that benzodiazepines do *not* influence exploration when subjects are habituated to the open field. Paradoxical results can be obtained by drugs acting on *either* factorial dimension, the effect of any particular drug being dependant upon (i) the dose of drug administered, and (ii) the state of the subject at the time of administration. One way of minimising the complexity of interpretation of results of open field exploration is by using a range of doses of the drugs to be tested. Given the doses and "time sampling" technique of behaviour used in this study, *no* paradoxical effects were observed; this is

probably because two doses of each drug were used, both of which were comparatively high.

The increases in the incidences of rearing and walking observed after amphetamine injection reflect the well known stimulant properties of the drug. Diethylpropion would also seem to possess stimulant properties, in accord with the results of Offermeir and Potgeiter (1972). The effects of fenfluramine suggest that it has sedative properties after acute administration, as was reported with food deprived subjects by Taylor *et al.* (1971), and Taylor *et al.* (1973).

The results obtained from these well known compounds provide a baseline against which to assess the effects of less well known compounds, and provide striking parallels with reports of their effects in humans. Amphetamine is universally acknowledged to be a potent central stimulant in humans, and to be a potential drug of abuse; as is diethylpropion (Clein and Bernady, 1969), whilst fenfluramine has often been claimed to be a sedative in humans (Elliot, 1970; Gaind, 1972). It is consequently suggested that the technique of activity analysis described here provides a very useful screening test for C.N.S. active compounds, the results of which give a reliable indication of the probable effects of such compounds in humans. Comparisons between the acute and chronic effects of fenfluramine in humans and rats provide further evidence of the predictive validity of this technique. Chronic administration of fenfluramine to rats may result in stimulant effects, in contrast to the sedative effects observed following acute administration (Taylor *et al.*, 1973). These results closely parallel those of Oswald *et al.* (1971) and Steel and Briggs (1972) in humans. These authors described stimulant properties of fenfluramine and mood depression following withdrawal after chronic administration, in contrast to the sedative properties noted after acute administration.

The technique used here is considered to be superior to those involving gross measures of activity such as are obtained with running wheels, stabilimeters, photocell cages and ultrasonic motion recorders, since such measures have been shown to be susceptible to a large number of variables (Draper, 1963), to provide activity measures which are not related to drug induced behavioural changes (Krsiak *et al.*, 1970) and which are correlated at a very low level (Gross, 1968; Tapp *et al.*, 1968). Furthermore, for any one drug the results obtained with this method of activity analysis show a high degree of concordance between different observers after a suitable training period.

B. Group Two. Fenfluramine Derivatives: (Norfenfluramine, SE 1513, SE 780, SKF 1-39728. The behavioural effects of these compounds are shown in Table 2. All possess sedative properties after acute administration; however the data does not allow ranking of the four compounds

along a scale of sedative potency because of the procedural differences between experiments described above and the use of doses which are not equipotent anorexically.

Discussion

The sedative properties of these compounds are similar to those of their parent compound, fenfluramine, at least after acute administration. The presence of the m-trifluromethyl group on the benzene rings seems to confer sedative properties on the phenylethylamine series. A similar effect of direct halogenation of the benzene ring confering sedative properties on phenylethylamines has been suggested by Tang and Kirch (1971) and Weischer and Opitz (1972). The highly potent

sedative effects observed with norfenfluramine are in accord with suggestions that this compound may be an active metabolite involved in fenfluramine's actions (Le Douarec, 1971). At 9 mg per kg I.P. there was some evidence of stereotyped behaviour (Backward locomotion, Head movements and Circling) similar to that observed with high doses of fenfluramine (Taylor *et al.*, 1973; Yelnosky and Lawlor, 1970). SE 1513 and SE 780 were only active when injected I.P. and not when injected S.C. and it is suggested that they may be highly lipid soluble, in agreement with the findings of Galton and Wilson (1971). Chronic administration of SE 780 does not appear to result in the stimulant effects noted after chronic fenfluramine administration; the drug also seems to be active anorexically over longer periods of time than amphetamine and fenfluramine (Taylor and Goudie, 1973). Since it is active in humans (Pawan *et al.*, 1971) it would seem to merit further study. Groppetti *et al.* (1972) have reported that SKF 1-39728 reduces confinement motor activity in rats at anorexic doses, confirming the sedative properties of this compound, which also merits further investigation in chronic studies.

C. Group Three. The Indole Derivative: (U22-394A). The behavioural effects of this compound are shown in Table 3. The drug appeared to be a potent sedative which facilitated handling of the subjects. At the highest doses used abnormal head twitchings were noted in seven out of eight subjects, an effect absent in controls. Some indications of stereotyped behaviour similar to that observed after fenfluramine and norfenfluramine injections were also present.

Discussion

Acutely administered U 22-394A has been reported to have a slight sedative effect at high doses in monkeys, when activity is assessed by an ultrasonic motion recorder (Tang and Kirch, 1971). The

results reported here suggest that it is a potent sedative, although clinical trials of the compound as a potential neuroleptic in schizophrenics have failed to illustrate any therapeutic effects (Gallant *et al.*, 1971). The head twitching noted is similar to that reported by Tang *et al.* (1968) in mice. Such behaviour is thought to be due to stimulation of 5HT receptors since it is blocked by methysergide (Corne *et al.*, 1963, 1967). It is consequently likely that U 22-394A acts directly on 5HT receptors, an effect which is not surprising in that the drug is a tryptamine derivative (Hester *et al.*, 1968).

Southgate *et al.* (1971) have shown that fenfluramine induced stereotypy in mice is at least partially due to activation of serotonin receptors. The stereotypy syndrome reported here after injection of U 22-294A is similar to that reported after fenfluramine injection; this would seem to provide further evidence that U 22-394A acts on 5HT receptors. Since serotonin is known to be involved in the control of rat eating behaviour (Soulairac, 1969) and since there is some evidence that fenfluramine anorexia is mediated by 5HT receptors (Jespersen and Scheel-Kruger, 1970; Funderbunk *et al.*, 1971; Blundell *et al.*, 1973) it is possible that U 22-394A's *anorexic* mode of action also involves such receptors and is similar to that of fenfluramine, and maybe that of its derivatives SE 780 and SE 1513. In contrast, Gropetti *et al.* (1972) have reported that the anorexic action of SKF 1-39728 is dissociated from any actions on monoaminergic neurones so that this compound may differ qualitatively from the other anorexiants studied here.

Acknowledgements. The work reported here was supported by a research grant from Servier Laboratories Ltd., England, who also supplied the amphetamine, fenfluramine, norfenfluramine, SE 1513 and SE 780 used in this study. We are indebted to the Upjohn Company Ltd. for supplies of U-22-394A, and to Smith Kline and French Ltd. for supplies of SKF 1-39728.

After fenfluramine therapy 3 obese patients lost weight and showed increased peripheral glucose uptake. Peripheral oxygen consumption was also increased. In acute studies where fenfluramine was perfused intra-arterially into one arm, it appeared to have a direct effect in increasing glucose uptake.

SUMMARY

(1) Studies of metabolism in the human forearm (mainly muscle) tissues *in vivo* have shown that during an oral glucose tolerance test glucose uptake is high in lean nondiabetic and low in obese and diabetic subjects. There is, in fact, a close inverse correlation between skin fold thickness and glucose uptake. Exercise increases glucose uptake, as does weight reduction by diet in obese subjects.

(2) Small doses of fenfluramine (0.4 μg/min) infused intra-arterially into one arm increase the glucose uptake and blood flow, above that in the control arm.

(3) Following 2 weeks of fenfluramine therapy, 3 obese subjects lost weight and showed an increased glucose uptake and oxygen utilization in peripheral tissues.

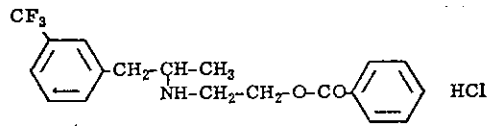
EFFECT OF A FENFLURAMINE DERIVATIVE (S 992) ON LIPID AND SUGAR METABOLISM

J. Duhault and C. Malen

Sciences Union et Associés, Groupe de Recherche des Laboratoires SERVIER, 14, rue du Val d'Or, 92 Suresnes, France

The availability of fenfluramine has made it possible to show that an anorexic activity (Le Douarec, Schmitt, and Laubie, 1966; Opitz, Kemper, and Loeser, 1965) may be obtained without the central stimulation exerted by amphetamine (Le Douarec, 1963). Fenfluramine retains the metabolic effects of amphetamine, such as the adipokinetic activity (Duhault and Boulanger, 1966; Herold, Kemper, and Opitz, 1965; Pawan, 1969), and in addition it increases the tolerance to carbohydrates (Butterfield and Whichelow, 1968). Continuing the screening of fenfluramine congeners (Beregi, Hugon, Le Douarec, Laubie, and Duhault, 1969), we have recently been interested in a derivative, namely (*meta*-trifluoromethyl-phenyl)-1-[β-(benzyloxy)ethyl] amino-2-propane (see formula), referred to here as S 992, which shows properties similar to those of fenfluramine, but 10 times less toxic. This study summarizes some findings concerning the effect of S 992 on lipid and carbohydrate metabolism.



Structure of S 992

METHODS

Male Sprague-Dawley (Charles River) rats averaging 200-250g were treated with single or repeated doses of S 992. In the acute experiments food was removed at 9 A.M. and the drug was given orally 1 hour later.

In the chronic study the administration of S 992 was given daily (suspended in tragacanth gum) at 4:30 P.M. The animals were sacrificed 16 hours after the last treatment. The schedule of treatment was kept constant because of the known daily rhythms in lipid metabolism (Muncker, 1959). Blood glucose was measured according to Hoffman (1937) with a Technicon autoanalyzer, plasma free fatty acids (FFA) according to Dole (1956), plasma glycerol according to Garland and Randle (1962), and plasma phospholipids according to Wachter and Zelger (1965). Liver glycogen was measured according to Weber, Kleine, and Wachter (1965). The gas chromatographic analysis of FFA was performed with a Perkin-Elmer instrument after esterification of FFA with methanol and H_2SO_4 in sealed vials at 90°C for 15 hours. The separation was carried out on a 2 m column filled with 5% DEGS on Aeropack under nitrogen and by using a flame ionization detector.

RESULTS

The *acute oral administration* of S 992 induced in fed rats an increase in plasma FFA which is proportional to the dose. Figure 1 shows the percent increase in FFA when animals were sacrificed one hour after the administration of S 992 or *dl*-amphetamine. A 50% increase was obtained with 3.4 mg/kg of amphetamine or 18 mg/kg of S 992. The increase in plasma FFA was accompanied by an increase in plasma glycerol and a marked decrease in

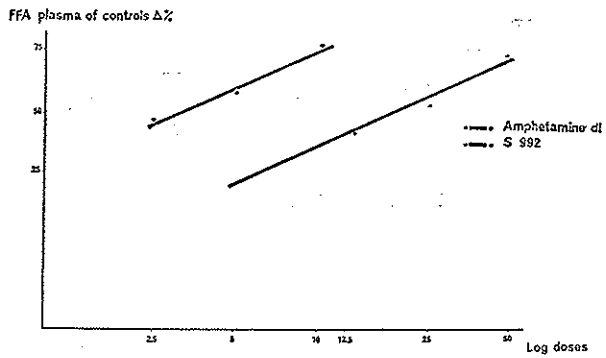


FIG. 1

plasma triglycerides (Table I). This metabolic effect did not occur if rats were fasted for 18 hours, even when the dose of S 992 was raised to 100 mg/kg orally.

TABLE I

The analysis of specific FFA did not reveal major changes under the influence of S 992 with the exception of a 30% decrease in linoleic acid. As far as carbohydrate metabolism is concerned, S 992 is similar to fenfluramine in increasing the levels of liver glycogen and blood glucose of rats submitted to a severe food restriction. Amphetamine was without effect on blood glucose, and it decreased the liver glycogen in similar experimental conditions (Table II). In other experiments, the administration of S 992 (2.5 mg/kg orally or 5 mg/kg i.v.) to dogs did not influence the tolerance curve after a glucose load.

The chronic administration of S 992 reduced food intake in normal rats for about 7 days. After that period the values tended to return to control values (Fig. 2). When the treatment was prolonged up to 20 days there was a decrease in body weight more pronounced in the animals treated with S 992 than in the rats kept under conditions of pair feeding (Fig. 3). Since the animals received the same amount of food, it is evident that the decrease in body weight induced by S 992 could not be due solely to its anorexic effect. The weight of the epididymal fat pads was also decreased in the group treated with S 992 with respect to the pair-fed animals. It is interesting to note that

the blood glucose or plasma FFA levels (measured after 20 days of treatment) were not different in the two experimental groups. However, significant changes were observed in the composition of FFA in plasma, white (epididymal) and brown (interscapular) adipose tissues. The changes, not reported here in detail, include for the S 992 an increase in C15 fatty acids (from 22 to 75%), C18:2 (from 15 to 63%), C18:3 (from 15 to 66%), and a decrease in C16:1 (from 14 to 40%) with respect to the pair fed group.

When S 992 was given to rats fed a high lipid diet the anorexic effect was not evident, but after 20 days of treatment there was a significant reduction

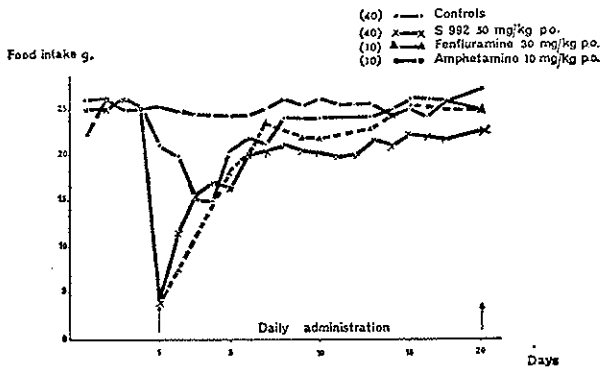

FIG. 2

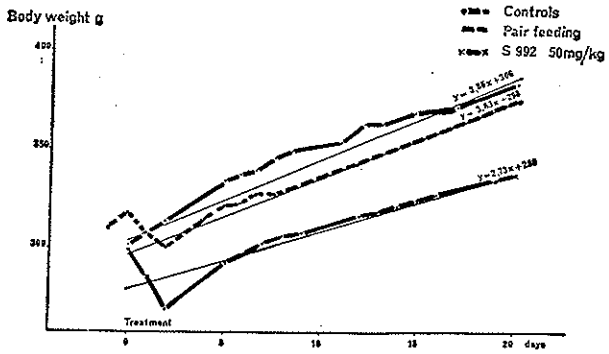

FIG. 3

in the epididymal adipose tissue without any change in body weight (Table III). The FFA of white and brown adipose tissues but not of plasma, as well as liver triglycerides, were reduced by S 992. Plasma glycerol and phospholipids, blood glucose, and liver glycogen were not affected (Table III). In this experimental condition the qualitative and quantitative composition of FFA in plasma and white and brown adipose tissue was not altered by S 992.

DISCUSSION AND CONCLUSIONS

We have established that in fed rats *dl*-amphetamine and S 992 produce an increase in the levels of plasma FFA and glycerol. These results are interpreted as evidence of an adipokinetic action taking place in the adipose tissue. The mechanism of this action is not elucidated, although it may be ascribed to a sympathomimetic effect. This increase in plasma FFA, which is proportional to the dose of S 992, is not accompanied by hyperglycemia or by a change in the glucose tolerance test. The effect of S 992 on plasma FFA was not evident during chronic treatment with S 992 when rats were submitted to a normal or a high lipid diet. The changes in the composition of FFA in plasma or adipose tissue were not related to the absolute level of FFA. In fact, after an acute treatment there was a decrease in linoleic acid, while after repeated administration of S 992 the pattern of FFA was changed, there being an increase in the unsaturated FFA. However, if the diet was rich in lipids, S 992 was unable to affect the composition of FFA. It is interesting to recall that previous unpublished data from this laboratory showed that

amphetamine was without effect in similar experimental conditions. Another metabolic difference between amphetamine and S 992 is represented by the capacity of the latter to increase blood glucose and liver glycogen in rats submitted to severe food restriction. This difference may not necessarily be related only to an intrinsic difference in activity between amphetamine and S 992, because some metabolic changes may be explained on the basis of the excitation and increased locomotor activity induced by amphetamine in contrast to the mild sedative action of S 992. The compound under study differs from amphetamine and even from fenfluramine because it does not increase water consumption during subacute treatment (Holm, Huus, Hopf, Nielsen, and Peterson, 1960; Shapiro and Freedman, 1957; Tormey and Lasagna, 1960). In this respect S 992 may serve as a useful tool to dissect and understand the multiple effects exerted by amphetamine. For instance, the effect of S 992 in decreasing body weight with respect to pair fed animals cannot be interpreted, as in the case of amphetamine, in relation to an increase in energy requirement because of the increased locomotor activity. It is suggested that S 992 may decrease body weight by changing the metabolic pattern, particularly with respect to lipids and carbohydrates. The available data do not permit us, however, to work out a precise hypothesis.

Acknowledgment. The authors wish to express their appreciation to Miss M. Boulanger, C. Verdavainne, and C. Voisin for their excellent technical assistance.

ADIPOKINETIC ACTION OF AMPHETAMINE—A STUDY IN THE BEAGLE DOG

Klaus Opitz

Pharmakologisches Institut der Universität Münster, Westfalen, Germany

Six years ago we published our observation that chlorphentermine-treated rats lost more weight than untreated control animals under equal nutritional conditions, that this weight loss was due to a depletion of fat stores, and that amphetamine, phentermine, and chlorphentermine cause an increase in plasma free fatty acid (FFA) concentration. We were not able to demonstrate a direct lipolytic action of amphetamines *in vitro* (Opitz and Loeser, 1963). Other authors confirmed that the administration of amphetamines is followed by an increase in circulating FFA in rat (Bizzi, Garattini and Veneroni, 1965; Fassina, 1964, 1966; Khan, Forney and Hughes, 1964), dog (Zsoter, Tom, Kraml and Dvornik, 1966), and man (Balasse and Thys, 1964; Pinter and Pattee, 1968). It is true that the concentration of FFA in blood plasma results from various factors, and increased plasma FFA concentrations do not necessarily indicate fat mobilization.

However, Pinter and Pattee (1968), with their kinetic studies in human volunteers, have recently produced strong evidence that amphetamine leads to an augmentation of the plasma FFA pool by increasing the rate of production of FFA, *i.e.*, by fat mobilization.

Several investigators studied the influence of amphetamine on isolated adipose tissue but they all found that amphetamines, unlike the catecholamines, are devoid of direct lipolytic activity (Fassina, 1966; Finger, Page and Feller, 1966; Finger and Feller, 1966; Mühlbachová, Wenke, Schusterová, Krčiková and Elisová, 1964). There is only one exception: Cucurachi, Strata, Zuliani, Castello and Cucurachi (1965) reported increased fatty acid release from fat pads incubated with amphetamine, but we were not able to reproduce their results.

Summing up, there is no doubt that amphetamines stimulate fat mobilization by some indirect mechanism, but this mechanism is not well understood. Do the amphetamines act by liberating norepinephrine from the

Department of Physiology,
Trinity College,
Dublin 2,
Eire.

Dr J. F. Munro,
Eastern General Hospital,
Seafield Road,
Edinburgh 6.

Professor J. Offermeier,
Department of Pharmacology,
University of Potchefstroom,
Western Transvaal,
South Africa.

Professor Dr K. Opitz,
Institut fur Pharmakologie,
Westring 12,
D-44 Munster,
Germany.

Dr Hans ørskov,
Second University Department of
Internal Medicine,
Aarhus Kommunehospital,
Aarhus C. 8000,
Denmark.

Dr I. Oswald,
University Department of Psychiatry,
Royal Edinburgh Hospital,
Morningside Park,
Edinburgh, EH 10 5HF.

Dr G. L. S. Pawan,
Metabolic Division,
Department of Medicine,
The Middlesex Hospital Medical School,
University of London,
London, W1P 7PN.

Dr F. J. Prime,
Institute of Diseases of the Chest,
Fulham Road,
London, SW3.

Dr H. B. Rainey,
Tasman Vaccine Laboratories,
Private Bag,
Upper Hutt,
New Zealand.

Dr P. H. W. Rayner,
The Children's Hospital,
Ladywood Middleway,
Birmingham, B16 8ET.

Dr P. Roscoe,
Western General Hospital,
Crewe Road,
Edinburgh 4.

Dr J.Runcie,
Department of Materia Medica,
Stobhill General Hospital,
Glasgow, N1.

Mr N. Santer,
Servier Laboratories Ltd,
Percival House,
Pinner Road,
Harrow, Middlesex, HA1 4HQ.

Professor N. Sapeika,
Department of Pharmacology,
Medical School,
Cape Town,
South Africa.

Dr J. P. Sedgwick,
Wheatley House,
12 Lucas Road,
High Wycombe, Bucks.

Dr J. T. Silverstone,
Department of Psychological Medicine,
St Bartholomew's Hospital,
London, EC1.

Dr F. O. Simpson,
Wellcome Medical Research Institute,
University of Otago Medical School,
P.O. Box 913,
Dunedin,
New Zealand.

Professor Tollak B. Sirnes,
Department of Pharmacology,
University of Bergen,
MFH-bygget,
Bergen,
Norway.

Dr B. C. Sproule,
4 Arthur Street,
Cabramatta 2166,
New South Wales,
Australia.

Professor J. A. Strong,
Department of Medicine,
Western General Hospital,
Crewe Road,
Edinburgh, EH4 2XU.

Dr V. K. Summers,
Director of Endocrine Unit,
University of Liverpool,
Liverpool 3.

Dr A. Svanborg,
Head of Clinic II,
University of Göteborg,
Göteborg,
Sweden.

Dr P. Turner,
Division of Clinical Pharmacology,
St Bartholomew's Hospital,
London, EC1.

Dr J. R. Turtle,
Department of Medicine,
University of Sydney,
New South Wales 2006,
Australia.

Dr C. H. Wakes-Miller,
St Michael's Close,
High Street,
Shefford,
Bedfordshire.

Miss M. J. Whichelow,
Department of Medicine,
Guy's Hospital Medical School,
London Bridge,
London, SE1.

Professor C. W. M. Wilson,
Department of Pharmacology,
University of Dublin,
Trinity College,
Dublin 2,
Eire.

Dr J. Womersley,
11 Park Circus Place,
Glasgow, C3.

Professor J. Yudkin,
Nutrition Department,
Queen Elizabeth College,
Campden Hill Park Road,
London, W8.

PROGRAMME

Monday 22 February

OPENING

MONSIEUR A. BOIS AND MR N. SANTER

SESSION I, PART 1

CHAIRMAN: PROFESSOR S. GARATTINI, MILAN

THE METABOLISM OF FENFLURAMINE IN MAN

Professor A. H. Beckett, London
The metabolism and distribution of fenfluramine and N-(2-benzoyloxyethyl)-norfenfluramine (J.P. 992) in man.

Mr D. B. Campbell, London
Absorption, distribution and metabolism of fenfluramine.

CENTRAL EFFECTS OF FENFLURAMINE IN MAN AND ANIMALS

Mr H. Kündig, Johannesburg
Studies in primates on the manifestations and treatment of fenfluramine intoxication.

Professor C. W. M. Wilson, Dublin
Effect of fenfluramine on alcohol consumption.

Professor Dr K. Opitz, Munster
Effect of p-chlorphenylalanine and fenfluramine on alcohol and saccharin consumption in rats.

Professor B. K. Anand, New Delhi
Effects of fenfluramine on the activity of feeding and satiety centres of hypothalamus.

Dr J. E. Blundell, Leeds
Hypothalamic model for investigating the central site of action of anorexic agents.

Dr P. Turner, London
Further studies on the human pharmacology of fenfluramine.

SESSION I, PART 2

CHAIRMAN: PROFESSOR C. W. M. WILSON, DUBLIN

COMPARISON OF SOME ANTI-OBESITY TREATMENTS IN ANIMALS

Professor S. Garattini, Milan
Pharmacological and metabolic studies on fenfluramine.

Professor J. Offermeier, Potchefstroom, South Africa
On the possible mechanisms of central stimulant actions of some phenylethylamine derivatives.

Dr G. L. S. Pawan, London
Comparative study of the effects of fenfluramine, S992, diethylpropion and phenformin on food intakes, body composition, blood lipids and oxygen uptake in mice.

COMPARISON OF SOME ANTI-OBESITY TREATMENTS IN MAN

Dr A. A. H. Lawson, Dunfermline and
Dr P. Roscoe, Edinburgh
Fenfluramine and metformin in the treatment of obesity.

Dr C. Wakes-Miller, Bedfordshire
Fifty patients treated with fenfluramine by a family doctor compared with fifty clients attending a 'beauty farm'.

Dr Hans ørskov, Dr Klaus Johansen and
Dr Johan Iversen, Aarhus
Effects of fenfluramine and other amphetamine derivatives on blood glucose, serum insulin, growth hormone and urinary insulin excretion.

Tuesday 23 February

SESSION II, PART 1

CHAIRMAN: DR P. TURNER, LONDON

SOME PERIPHERAL EFFECTS OF FENFLURAMINE IN ANIMALS

Dr Johan Iversen, Dr Hans ørskov and
Dr Klaus Johansen, Aarhus
Studies of the effect of fenfluramine on the secretion of immunoreactive insulin and glucagon from the isolated perfused canine pancreas.

Professor R. E. Moore, Dublin
The effect of fenfluramine on heat production in rats.

Professor N. Sapeika, Cape Town
The action of fenfluramine in reducing obesity: the inhibitory effect on certain enzymes.

Dr G. M. Kneebone, Adelaide
The non-anorectic aspects of fenfluramine hydrochloride at an experimental level.

SOME PERIPHERAL EFFECTS OF FENFLURAMINE IN MAN

Dr D. J. Galton, London
Effects of drugs on lipogenesis from glucose and palmitate in human adipose tissue.

Professor W. J. H. Butterfield and
Miss M. Whichelow, London
Peripheral metabolism in obesity: the effects of weight reduction by diet and fenfluramine.

Dr J. R. Turtle and
Dr J. A. Burgess, Sydney
The metabolic effects of fenfluramine:
1. Forearm perfusion and intravenous infusion in normal subjects.
2. Therapeutic value as a hypoglycaemic agent in diabetes mellitus.

Dr G. L. S. Pawan, London
Metabolic effects of S992 in man.

Annexe 1-12

SESSION II, PART 2

CHAIRMAN: PROFESSOR J. YUDKIN, LONDON

PERIPHERAL EFFECTS OF FENFLURAMINE IN THE CLINICAL SITUATION

Professor J. A. Strong, Edinburgh
Glucose tolerance and the metabolic response to exercise in obese patients treated with fenfluramine.

Dr V. K. Summers, Liverpool
Metabolic studies of fenfluramine with particular reference to fat-mobilizing substances.

Mr B. P. Bliss, London
The effect of fenfluramine on glucose tolerance, and lipid and lipoprotein levels in patients with peripheral arterial disease.

Dr P. H. W. Rayner, Birmingham
Fenfluramine in childhood obesity: clinical experience and effects of fenfluramine and weight loss on blood glucose, plasma insulin and plasma growth hormone response to oral glucose load.

Professor W. P. U. Jackson, Cape Town
Fenfluramine trials in a diabetes clinic.

Dr J. R. W. Dykes, Leeds
Effect of a low-calorie diet alone and with fenfluramine on the glucose tolerance and insulin secretion of maturity-onset diabetics and overweight non-diabetics.

Dr A. N. Chremos, Richmond, Va., USA
Body weight and blood lipid levels in obese subjects treated with fenfluramine.

Thursday 25 February

SESSION III, PART 1

CHAIRMAN: PROFESSOR J. A. STRONG, EDINBURGH

THE QUESTION OF DEPENDENCE

Dr H. S. Jones, Western Australia
Fenfluramine used as a substitute for methyl amphetamines and dexamphetamine in the treatment of dependence on these drugs.

Dr K. G. Götestam and
Professor L.-M. Gunne, Uppsala
Clinical evaluation of central stimulant effects of fenfluramine and AN. 448.

Dr S. A. Lewis, and Dr I. Oswald, Edinburgh
Fenfluramine: cerebral effects and dependence in chronic use.

SPECIAL PAPERS

Dr J. F. Munro, Edinburgh
Therapeutic starvation in obesity.

Dr J. W. Evans, Andover
Double-blind trial of fenfluramine as an aid to stop smoking.

Dr P. Ghalioungui, Kuwait
The respiratory quotient of patients on fenfluramine.

Dr C. M. Lewis, Cape Town
The acute effects of fenfluramine on coronary haemodynamics and myocardial energy metabolism in man.

SESSION III, PART 2

CHAIRMAN: PROFESSOR N. SAPEIKA, CAPE TOWN

WIDER APPLICATION IN CLINICAL MEDICINE

Dr R. Gaind, London
Psychological aspects in the aetiology and treatment of obesity.

Dr B. D. Hughes, Ashton-under-Lyne
Report on the use of Ponderax in mentally disturbed patients.

Dr F. J. Prime, London
An assessment of the value of anti-obesity treatment in a chest clinic.

Dr D. N. Golding, Harlow
Report on Ponderax trial to see if loss of weight relieves pain in arthritic weight-bearing joints.

Dr J. M. Court, London
A double-blind controlled trial of fenfluramine in children with obesity associated with reduced muscle activity.

Dr J. Lorber, Sheffield
The treatment of severe childhood obesity with fenfluramine: a controlled therapeutic trial.

Dr G. M. Kneebone, Adelaide
The non-anorectic effects of fenfluramine hydrochloride at a clinical level.

Friday 26 February

SESSION IV, PART 1

CHAIRMAN: PROFESSOR W. J. H. BUTTERFIELD, LONDON

WIDER APPLICATION IN CLINICAL MEDICINE

Dr J. V. G. Durnin and
Dr J. Womersley, Glasgow
The measurement of obesity and some comments on its treatment by fenfluramine with special reference to changes in metabolic rate and body composition.

Dr J. Runcie, Glasgow
A controlled trial of fenfluramine in obese patients following therapeutic starvation.

Dr F. J. Prime, London
Effects of fenfluramine on steroid induced obesity.

Dr J. P. Sedgwick, High Wycombe
A treatment for 'refractory obesity' in general practice.

Dr B. C. Sproule, Australia
Treatment of the grossly obese with a high dosage of fenfluramine.

Annexe 1-12

Professor F. O. Simpson, Dunedin
Use of fenfluramine in obese patients on antihypertensive therapy.

Professor J. Yudkin, and
Dr D. S. Miller, London
Dietary induced obesity and its treatment with fenfluramine and analogues.

SESSION IV, PART 2

CHAIRMAN: PROFESSOR A. H. BECKETT, LONDON

OPEN FORUM TO SUMMARIZE FINDINGS OF THE SEMINAR AND DISCUSS FUTURE RESEARCH

Dr J. V. G. A. Durnin, Glasgow
Definition of overweight and obesity.

Mr D. B. Campbell, Middlesex, Harrow
Signs and symptoms of fenfluramine overdosage and its treatment; the question of drug interaction.

Dr G. L. S. Pawan, London
The actions of fenfluramine on carbohydrate and lipid utilization—possible role of the drug in the treatment of diabetes.

Professor L.-M. Gunne and Dr A. Svanborg, Uppsala
Drug abuse: the problem of testing and control.

Dr J. C. Le Douarec, Neuilly-sur-Seine, France
The role of norfenfluramine in fenfluramine activity.

Professor B. K. Anand, New Delhi and
Dr J. E. Blundell, Leeds
An integrated theory involving the hypothalamus to explain the pharmacological effects of fenfluramine activity.

Professor S. Garattini, Milan
Absorption, distribution and metabolism of fenfluramine: species distribution.

Dr P. Turner, London
Intra- and inter-subject variations—the need for rationalization in experimental procedures.

Professor C. W. M. Wilson, Dublin
The relationship between *in vitro* and *in vivo* studies.

this institute. Three main points will be discussed as a continuation of studies already published:

1. Fenfluramine was measured by gas chromatographic procedure in the brain of normal and obese mice. The levels obtained are in agreement with the finding that fenfluramine exerts a more marked anorexic activity in obese than in normal mice. A metabolic interaction between amphetamine and fenfluramine was established and this may explain some pharmacological interactions observed between these two compounds.

2. Amphetamine and fenfluramine have been compared for their effect on the adrenergic system. Studies *in vitro* and *in vivo* have been carried out by stimulating chemically or electrically the sympathetic activity. The results are consistent with the hypothesis that the main difference between these two compounds is mostly quantitative, fenfluramine being much less stimulant than amphetamine.

Another aspect of the interaction of these drugs with the adrenergic system is their effect on the accumulation of homovanillic acid (HVA) in the striatum. While a resistance to the increase of HVA can be easily demonstated for amphetamine, it was not apparent for fenfluramine.

3. Amphetamine and fenfluramine show peculiar effects on lipid metabolism. They increase plasma glycerol and free fatty acids *in vivo* without showing a clear lipolytic effect on the adipose tissue. The two drugs decrease plasma and heart triglycerides without affecting liver triglycerides. The effect may be related to a decreased absorption of triglycerides present in the food because of the inhibition exerted by these drugs on gastric and intestinal motility.

DISCUSSION

Professor Offermeier: You were suggesting the possibilities of different side-effects of amphetamine and fenfluramine. Isn't it possible that the tolerance you get with amphetamine is the result of an enzyme-induction type of metabolism? It isn't necessarily a different type of action.
Garattini: Yes, we have the answer to that. We have measured the effect of amphetamine on the brain on two occasions and there was no difference in the brain function due to amphetamine. Furthermore, we tried to block the metabolism by using SKN-525 and even in a resistant animal—even by doubling the concentration of brain amphetamine—there was no effect.
Professor Moore: Three things, please. What was the environmental temperature of your tests? Room temperature?
Garattini: It was at room temperature. If you lower room temperature so that you don't get increase of body temperature from amphetamine, you still have the effect of the other tests.
Professor Moore: Did you do plasma glycerol levels in any of these?
Garattini: Yes.
Professor Moore: Does it match molecule to molecule?
Garattini: No, I would say that perhaps glycerol level is a little bit lower.
Dr Anderson: How chronic were your experiments?
Garattini: Eight days.
Dr Anderson: Do you know what happens after that?
Garattini: No, not yet. Because all of our experiments are not complete. Our experiments have been done only on rats and mice, in whom a long period of time is about 3 hours. We couldn't show any stimulation of lipolysis.
Dr Turtle: Have you incubated them for more than 90 minutes?
Garattini: Well, no. We have incubated them for 60 minutes.

Dr Svanborg: You have said that there may be a decrease in intestinal absorption of triglyceride. My question is: Do you think that this observation has some connection with the complication of diarrhoea and maybe the absorption of either compounds in the food?
Garattini: Well, I think your question is very interesting, because fenfluramine as well as amphetamine may react in different ways in the intestinal tract by decreasing the absorption of triglycerides, but one also has to consider, particularly with amphetamine, that there is an effect on the motility and an assimilatory effect. Furthermore, for fenfluramine there may be the complication of the release of serotonin which is very important in the intestines. The picture is quite complicated, and brings in several factors at the same time. I do not know which one is the most important.

ON THE POSSIBLE MECHANISMS OF CENTRAL STIMULANT ACTIONS OF SOME PHENYLETHYLAMINE DERIVATIVES

PROFESSOR J. OFFERMEIER AND B. POTGIETER, *Potchefstroom, South Africa*

The probable mechanisms involved in the central stimulant action (as measured by an increase in locomotor activity in mice and rats) were investigated for a number of phenylethylamine derivatives. Amphetamine, methylamphetamine, propylhexedrine, phentermine, mephentermine and p-choramphetamine probably produce their stimulant action by a release of catecholamines from neuronal extragranular pools since these compounds are inactive when the extragranular pools have been depleted by pre-treatment of the animals with a-methyl-p-tyrosine. The action of these compounds in pre-treated animals can be restored by treating the animals with the catecholamine precursor L-dopa 30 minutes before the experiment. The activity of the compounds mentioned is not decreased by pretreatment with reserpine, which is known to deplete the intraneuronal granular storage sites of catecholamines.

Chlorphentermine and diethylpropion are inactive after pretreatment with reserpine, but their activity is not affected by pretreatment with a-methyl-p-tyrosine. This indicates that chlorphentermine and diethylpropion probably produce an increase in locomotor activity by a release of catecholamines from neuronal granular pools.

Norfenfluramine, methylnorfenfluramine, fenfluramine, S992 and S1204 do not produce an increase in locomotor activity when given alone, but do increase locomotor activity in mice after pretreatment with an inhibitor of MAO. The increase in locomotor activity produced by S992 and S1204 only starts about 4 hours after administration, suggesting that neither S992 and S1204 is active as such, but that they are probably metabolized to active metabolites.

Norfenfluramine, methylnorfenfluramine and fenfluramine react the same way to a-methyl-p-tyrosine and reserpine pretreatment as amphetamine, suggesting that these fenfluramine derivatives produce an increase in locomotor activity (after inhibition of MAO) by liberating catecholamines from neuronal extragranular pools and not from neuronal granular pools.

Some evidence that some compounds presumably acting by releasing catecholamines from extragranular pools, may also release catecholamines from granular pools *in high doses*, was also presented.

A COMPARATIVE STUDY OF EFFECTS OF FENFLURAMINE, S992, DIETHYLPROPION AND PHENFORMIN ON FOOD INTAKE, BODY COMPOSITION, BLOOD LIPIDS AND OXYGEN UPTAKE IN MICE

DR. GASTON L. S. PAWAN, *London*

Several anorexigenic agents are known to produce weight loss in man and laboratory animals. This had been attributed to the reduction in food intake caused by these substances.

...ntly, it has been shown that amphetamine and some ... derivatives appear to have fat-mobilizing actions in ... conditions in addition to effects on food intake (Duhault ... Boulanger, 1966; Fassina, 1964; Santi and Fassina, 1964; ... and Pattee, 1968; Pawan, 1969). Moreover, it has been ...onstrated that fenfluramine-treated animals lose more ...weight and body fat than control animals on an identical ...e intake (Pawan, 1970).

...his paper reports some experiments on the effects of some ...ntly used 'anti-obesity' agents on food intake, blood ... oxygen consumption and body composition of mice. The ... used were fenfluramine, (S992) N-(2-benzoyloxyethyl)-...fluramine, diethylpropion and phenformin, administered ...intraperitoneal injection on alternative days, over a 42-day ..., to groups of adult male albino mice. The animals ...ved a normti well-balanced diet and water *ad libitum*. ...types of experiments were performed.

...*libitum* Feeding

...roups of mice (ten animals/group) were used. Each animal ...injected every other day with the following:
...trol group: 0·5 ml 0·9% aqueous sodium chloride
...fluramine group: 10 mg/kg.
... group: 40 mg/kg.
...ethylpropion group: 10 mg/kg.
...enformin group: 10 mg/kg.
...food consumption and body weight of each group of ...were measured daily. At the end of each week, each ...of animals was studied in the metabolic chamber ...Kekwick and Pawan, 1963) for 24-hour measure-...of oxygen uptake and respiratory quotient. At the end ...six-week period, the animals were killed by decapitation ...carcass composition and blood lipids analysed (Pawan, ...).

...*d Restriction*

...his experiment, the effects of intraperitoneal injection of ...ame doses of the drugs was studied in the same way, ...ept that the animals were given a restricted diet of well-...ed composition (60% of the normal daily food intake ...r group of 10 mice). Water was allowed *ad libitum*.

...ults

...*libitum* feeding, fenfluramine, S992, and diethylpro-...all produced a significant loss in body weight and a ...in food intake of the animals. Fenfluramine and ...ropion were the more effective. The rate of weight ...was lower during the first 3 weeks in the fenfluramine ...than in the diethylpropion group, but in the last 21 days ...was rapid in the former. The weight reducing effect of ...ropion tended to be absent in the last 3 weeks on the ...

...ramine, S992 and diethylpropion, all produced an ...in oxygen uptake and a fall in the RQ, which was ...nounced with fenfluramine. The effects of phenformin ...uptake were not significant.

...ty acids, free glycerol, and 'ketones' in the plasma ...ased by fenfluramine, S992, and by diethylpropion. ...formin effect on these parameters was very slight.

...analyses showed a significant reduction in body fat ...the animals which had received fenfluramine, S992 ...ylpropion.

...diet restricted to 60% of the normal daily intake of ...which all groups of mice readily consumed), the drugs ...greater losses in body weight than that of the control ...the same calorie intake. Fenfluramine was the most ...this respect, followed by diethylpropion. S992 ...more effective than phenformin.

...uptake of the control mice showed a typical and ...rgen response to the calorie restriction. The oxygen ...the fenfluramine and the diethylpropion groups ..., which in the case of the fenfluramine group ...throughout the 42 days, but in the diethylpropion ...to control values by the 28th day on the drug.

...alysis at the end of the experiment showed a ...body fat in the diethylpropion and fenfluramine ...the control group.

Conclusions

It would appear that the 'anti-obesity' agents used in the present experiments, exert effects on the metabolism of mice compatible with a fat-mobilizing and fat-catabolic action. These effects are not completely explained by a reduction in food intake of the animals.

DISCUSSION

Professor Garattini: Was food given throughout the day, or was it given only at a given period, and at which time was the drug given?

Pawan: The food was given daily at the same time, which was about 10.00 a.m., and the drug was injected in the afternoon, every other day.

Mr Miller: I understand Dr Pawan to say that in the first experiment at any rate, there was a change in food intake but an increase in oxygen consumption, which is very remarkable. Did you try and balance the calories?

Professor Moore: Can you tell us what was the temperature at which you measured the oxygen consumption, and did you measure them in groups of 10 altogether?

Pawan: 22°C.

Dr Svanborg: Do you think the figures could be explained only by a change in the food intake and maybe, as we heard earlier, triglyceride reabsorption? Do you really think that your figures indicate a direct catabolic effect, I mean, a direct effect on the lipolysis?

Pawan: Well, here we have a situation where the animals did consume all the diet. It was 60% of what they have normally, and we superimposed on this experimental set-up the various drugs, and we found these differences, so it implies that the drugs were producing something over and above the effects of calorie reduction.

Chairman: We have had three papers this afternoon dealing specifically with metabolism, and the effects of the drugs in the brain, and the interrelationships of the drugs. We could have a general question session on the effect of fenfluramine and other drugs on lipid and glucose metabolism. Professor Garattini, I am very interested in the effects of fenfluramine on triglyceride absorption.

Professor Butterfield: Is there any clinical evidence of an increased absorption of fats after fenfluramine?

Chairman: Following the first session, I think we all realized that a very great deal that has been done on the animals has considerable application to carbohydrate-fat metabolism, and the activity of the drug in human beings.

FENFLURAMINE AND METFORMIN IN THE TREATMENT OF OBESITY

DR A. A. H. LAWSON, *Dunfermline* AND DR P. ROSCOE, *Edinburgh*

A double-blind trial was conducted to compare the efficacy of fenfluramine (1-3-trifluoromethyl 2-ethyl aminopropane) and metformin (methylbiguanide HCl) at 2 dose levels in promoting weight reduction in a group of 34 women with simple polyphagic obesity. The effect of fenfluramine in a total daily dose of 80 mg was still evident even after 32 weeks on a reducing regimen and was free of important side-effects. Metformin in the dosage used was less effective and a total daily dose of 3·0 g produced unacceptable side-effects.

A further double-blind trial was conducted on 18 of these obese women after they had been on continuous dietary treatment for 48 weeks, to study the effect and suitability for long-term maintenance treatment of fenfluramine in a total daily

sulphonylurea alone, or a combination including biguanides in certain circumstances. The addition of a biguanide may achieve normoglycaemia in some patients who are inadequately controlled on diet and a sulphonylurea alone. Although they are frequently useful and satisfactory, the biguanides may cause nausea, anorexia and may contribute to the occasional appearance of lactic acidosis.

The present study has been undertaken to evaluate the effects of fenfluramine, a substituted amphetamine derivative, in the management of hyperglycaemia in diabetes mellitus. In short-term experiments, fenfluramine has been shown to increase glucose uptake by skeletal muscle and to accelerate the disappearance of glucose injected intravenously. There is no increase in blood lactate during fenfluramine administration and lactic acidosis has not been reported in patients who have been treated with fenfluramine for obesity. In view of the marked effect of fenfluramine on glucose uptake by muscle, the therapeutic efficacy of this drug has been assessed in maturity-onset diabetics who had been maintained with diet alone, or a combination of a diet plus sulphonylurea.

Patients and Methods

Nineteen patients were used in this study. All had maturity-onset diabetes mellitus on the basis of an abnormal oral glucose tolerance test using the criteria of the American Diabetes Association. Of the 19 patients, nine had been previously maintained on diet plus a sulphonylurea, but had achieved inadequate control of hyperglycaemia. Ten were maturity-onset diabetics presenting to the clinic for the first time. All patients were within 10% of the ideal weight for height and age. Patients outside this range were not included in the study. Four studies were undertaken:

1. One hundred gramme oral glucose tolerance tests were performed in 10 maturity-onset diabetics on presentation. In 9 patients, glucose tolerance tests were performed after three weeks on a supervised diet containing 25 - 30 cal/kg of ideal body-weight and 35 - 40% carbohydrate. These 9 patients were given fenfluramine 40 mg twice daily, 30 minutes before breakfast and the evening meal. After three months the glucose tolerance tests were repeated in 7 patients and also in 3 patients who had been maintained on diet alone.

2. Nine maturity-onset diabetics had been marginally controlled on diet and a sulphonylurea (tolbutamide 1 - 3 g daily or chlorpropamide 500 - 750 mg daily). An oral glucose tolerance test was performed whilst the stabilized dietary regime and former dose of tolbutamide were maintained. Subsequently, these patients were given fenfluramine 40 mg twice daily, 30 minutes before breakfast and the evening meal. After three months on fenfluramine, the oral glucose tolerance tests were repeated. During the period of fenfluramine therapy the dietary regime was not altered.

3. In 3 maturity-onset diabetics the acute effects of fenfluramine on glucose tolerance were evaluated. Two glucose tolerance tests were performed on each patient 24 hours apart. The second glucose tolerance test was preceded by an oral dose of 40 mg of fenfluramine 30 minutes before the test.

4. In 15 maturity-onset diabetics, 7 of whom had been maintained on sulphonylureas, blood glucose was estimated two hours after the patients had eaten their usual breakfast. This was then repeated on a different day when the same breakfast had been preceded by an oral dose of 40 mg of fenfluramine taken 30 minutes before the meal.

All oral glucose tolerance tests were performed with 100 g of glucose given as a 50% solution. Repeated blood samples were obtained from an indwelling venous cannula for the estimation of blood glucose and serum immunoreactive insulin. Glucose was measured by the alkaline ferricyanide method using an Auto-Analyzer and serum immunoreactive insulin was measured by a double antibody precipitation radioimmunoassay. Insulin secretion was expressed as the insulinogenic index, in which the area subtended by the insulin response curve was related to the corresponding glucose curve during a glucose tolerance test. Using this technique, an expression was obtained for the insulin response in terms of the glucose load.

DISCUSSION

Dr Galton: When you are measuring glucose uptake, into muscle using fenfluramine or insulin, or anything else, how do you make a correction for an increase of intercellular muscle space?

Professor Butterfield: I think the only way we can arrive at this is at the end of two and a half hours or so.

METABOLIC EFFECTS OF S992 IN MAN

DR GASTON L. S. PAWAN, *London*

The fenfluramine derivative, S992 (N-(2-benzoyloxy)-norfenfluramine), was shown by Duhault and Malen (1970) to produce an elevation in plasma free fatty acids and glycerol and a loss in body weight in rats. The LD50 of S992 in several animal species is higher than that of fenfluramine, and in addition, this substance has a greater lipid solubility than fenfluramine. For these reasons, it was considered worthwhile to investigate the effects of S992 in human subjects.

A preliminary trial was carried out on 5 subjects, 89 - 132% of ideal body weight while eating a normal diet, *ad libitum*. S992 was administered orally to each subject in the following daily dosage: week 1, 150 mg; week 2, 300 mg; week 3, 600 mg; week 4, 900 mg. At the end of the 4-week period on the drug, the subjects had lost a mean of more than 3 kg, but all five subjects reported increased sleepiness during the experiment with the higher doses.

A second study was made on the effects of oral S992 in 40 volunteers (aged 21 - 62 years, 10 men and 30 women, 88 - 157% ideal body weight) over a 6-week period. Attention was particularly focused on blood lipid changes, body weight, and side-effects. The experimental procedure was as follows: week 1, a control week; week 2, 150 mg/day; week 3, 300mg/day; week 4, 450 mg/day; week 5, 600 mg/day; and week 6, a final control week. During the experiment the subjects were weighed twice weekly, in the morning before breakfast, immediately after emptying the bladder. On the first and last days of each week, fasting blood samples were obtained in the morning after an overnight fast with the subjects at rest for analysis of blood plasma free fatty acids, free glycerol, triglycerides, ketones, cholesterol, total lipids, and glucose, by methods previously described (Pawan, 1969). Thirty of the volunteers completed the trial, 5 stopped the experiment for reasons unconnected with the drug, and 5 others discontinued the experiment as they felt unwell. In the group as a whole, the mean weight loss was 3·4 kg at the end of the experiment. Glucose, free fatty acids, glycerol, and triglycerides were not significantly altered, but ketones were elevated (mean 57%), and particularly with the 450 mg/day dose of S992, cholesterol levels were decreased. During the experiment the following subjective effects were reported by some of the volunteers (numbers in parentheses): dry mouth and thirst (2), depression (3), irritability (5), sleepiness (13), insomnia (1), reduction in cigarette consumption (7), reduction in alcohol consumption (5).

In 5 other subjects (2 normal and 3 obese) the effect of an intravenous infusion of S992 (150 mg over a 60-minute period) produced a slight increase in free fatty acids (+22%) and free glycerol (+18%) at 2 - 3 hours after the infusion in one normal and one obese subject, but induced no change in the other 3 subjects.

Further experiments are in progress to study the effects of different dose levels of S992, both orally and intravenously on metabolism of subjects on control diets and on constant diets, and a double-blind study is under way to evaluate the effects of the drug over several months, in a group of normal and a group of obese subjects.

DISCUSSION

Dr Silverstone: Did you attempt to assess the calorie intake at all during this study?

Pawan: Unfortunately, no. But with myself as subject, I

did attempt to eat roughly the same, but I certainly felt less hungry, so my calorie intake was reduced.

Professor Wilson: You proved a difference between female subjects and males, didn't you?

Pawan: It was not significant.

Professor Wilson: But wasn't there one female you talked about?

Pawan: Yes, bnt only one. In some other females, this did not happeh. I would rather not say anything definite about that yet.

Dr Oswald: May I ask about the side effects? Did the subjects that you were studying know that they were on increasing doses?

Pawan: They did know, yes.

Dr Oswald: What I am specially interested in is the timing of the course of subjective unpleasant effects, and not only while the drug is being given but before and after it has been withdrawn. Did you look for or receive reports of anything unpleasant in the week after the drug was stopped?

Pawan: I must say that we have no definite evidence that in the week after the drug was stopped there were any unpleasant effects.

GENERAL DISCUSSION

Chairman: I think we should discuss three things: The first is this word that Professor Jackson asked about—glycolyptic. Dr Silverstone raised the question of the anorectic action of fenfluramine, and I think we shall have to discuss this again, and finally there is the question of the base of this drug in the management of diabetics.

Professor Jackson: I think the question has been partially answered now. It appears that there is some sort of effect on glucose uptake, but maybe less effect if taken by mouth.

Chairman: Mr Santer, how did you first define the word glycolyptic. Do you feel that it needs perhaps some re-evaluation in the light of this?

Mr Santer: Well, I believe that the definition arose as we observed the effect of the glucose and lipid metabolisms. I still believe that we have a lot to learn on the subjects. I think that one of the interesting things that has been raised by a number of speakers is the time we spend in looking for these effects, and I believe that Dr Turtle's work demonstrated this, and I think some of the workers will possibly have to readjust their thinking on the methodology of the experimental work. Some of the data given this morning, and some that we shall see later in the week, will bear out that the definition is still valid, but it may require a little extension.

Chairman: The observation that weight loss did not occur or was not seen, does not of course mean that fenfluramine does not act in this way. It could mean that in fact when the patient does not respond by weight loss when on fenfluramine, then for some reason or other they do not show these metabolic effects. Professor Butterfield, what is your feeling on this?

Professor Butterfield: I must say that I am not quite sure what the word glycolyptic means, unless it means that when the drug has been given there are profound changes in lipid and glucose metabolism, which is what I suppose Neville meant by this term he has coined, but [illegible]. When we first started working, we knew that obese people were very badly taking up sugar in their peripheral tissues, and after they had lost weight that this improved, and this certainly improved after oral Ponderax. That is a change which is probably mediated through what I think Blundell called 'hoarding mechanism' on his rather nice model he put up yesterday morning. That is my view. I do not think there is any doubt that in fairly high doses in plasma water going into an isolated preparation, that something happens to sugar metabolism for a short time. I think that the $64 000 dollar question for me at this moment of time in this Congress is whether fenfluramine has this effect for a short time and norfenfluramine has the opposite action. It seems to me that that might explain the changes that Turtle shows with improved glucose assimilations soon after taking Ponderax by mouth and an impaired one later. So I think the necessary experimentations for me is perfusions of forearms with norfenfluramine to see whether that might account for Turtle's swingover, and perhaps even account for his fatty-acid release.

Dr Lawson: I was wondering whether your question was a semantic one, really. I wonder whether this is a word that we ought to use? It seems to me to have no sort of reasonable root in the Greek, and it seems to me that there is no point in adding medical jargon to what is already a very difficult subject by inventing a term that really has no exact meaning. I should want to refer to glycolysis and lypolysis.

Dr Anderson: I was just a bit worried about the term 'increased glucose utilization by muscle' I can conceive of a human being being loaded with calories and having to do something with these, but in the majority of us they are deposited as fat. Now, if a muscle is presented with more than its usual requirement of glucose, what does it do with it?

Professor Butterfield: At the end of a tolerance test in lean people, you will find that a lot of sugar has gone in and some lipid comes out. This has caused a certain amount of consternation amongst some of the lipid chemists, but we have repeatedly found in lean people with muscles at rest, an efflux of non-esterified fatty acids at the end of, or during, the glucose tolerance tests. Lipid efflux comes 15 minutes, or 15 - 30 minutes, after the peak glucose uptake. This may be what happens with the people who took fenfluramine, but I can't answer it.

Chairman: Professor Yudkin, we have not heard from you on this subject. Would you like to say anything on this?

Professor Yudkin: No, I don't think so. I find this extremely confusing. Like, I suppose, many of us here.

Dr Turtle: I am getting terribly worried about this situation. If David Galton's findings in adipose tissue and in the intestine and the liver, are correct we probably expect it to be so in muscles, so with glucose being taken up, it doesn't appear to be going to glycogen, and I just don't know where its going to. It can't just sit there. (Interjection from unknown: 'It could be burned'.) Well, is there any evidence that complete glucose oxydation of CO_2 is increased in the muscle?

Professor Butterfield: We do know in our preparations that O_2 consumption has gone up after weight reduction and whether or not it is associated with Ponderax.

Professor Moore: Some of Butterfield's points, of course, are difficult to interpret because of the lack of distinction between the deep and superficial sampling.

Miss Wichelow: I did not go into the details of our preparation, but our chemicals were always placed in deep veins and we were always satisfied throughout that any studies in which we were not quite satisfied, that we had, to the best of our knowledge, got the tip of our catheter right deep down in the muscle and were sampling dark venous blood.

Professor Butterfield: You obviously checked that the blood goes darker with 6 or 7 squeezes of the forearm.

Chairman: I think as pharmacologists we don't use therapeutic concentrations, and we have got to face that fact and we cannot, I think, go straight and extrapolate to therapeutic mechanisms of action from the concentrations that we use in our experiments. This does not mean to say that they are not important experiments. When we eventually learn how fenfluramine acts then we shall be able to explain its effects in pharmacological concentrations just as much as in therapeutic, and I think therefore that the effect on enzymes and fat cells are important experiments for us to do, but I don't think we should be particularly worried if we cannot, from those experiments, relate.

Dr Silverstone: There is a question of the appetite here. I was very interested when the original literature on fenfluramine was published, to note that it was, in its screening procedure, considered to be an appetite depressant drug in the same way as amphetamine. It has been quite clear that most workers when asked about it, or even upon hearing it, suggest that it has a direct appetite depressant effect. This to me is a most interesting comment. Now, Modell suggested not so long ago that all appetite depressants are appetite depressants entirely by virtue of their central stimulant activity. This is not so. I think fenfluramine could well prove the most useful tool in the unlocking of the appetite regulating mechanism in the hypothalamus, and I think that Dr Blundell has already begun to assess this work.

Chairman: Dr Sedgwick, I think, has some evidence that without dietary control, fenfluramine still produces a loss of weight.

Dr Sedgwick: One of the problems in general practice is getting people to stick to diets. I use a fairly high dosage of fenfluramine, with a step-by-step increase in the dose, and I see the patients regularly. In an effort to get them to reduce their weight, they were specifically asked not to diet (this is all in the paper I am reading on Friday). Now, this is not routine, but I have had, I think, 70 patients reporting and as they start to lose weight, which does take time, then one can start to encourage them to decrease their calorie intake.

Chairman: But do they decrease their calorie intake spontaneously as a result of this anorectic action, do you think?

Dr Sedgwick: I believe they do, although I only in fact take random checks, and call in at their houses at mealtimes uninvited and unexpected and see what they were eating. Certainly, most of them still seemed to eat plenty.

Dr Rainer: May I ask a very fundamental question. Do most of these patients overeat? I accept that the most generally accepted way to lose weight is to reduce one's calorie intake, but are we necessarily dealing with the same problem in obesity?

Professor Garattini: I think there is need to have more studies on balance of absorption and feeding and excretion because when we talk about food intake this may have no meaning if there is this absorption. Perhaps this is something which should be added to our material.

Dr Pawan: May I put in a plea for maintaining the metabolic aspects of fenfluramine. In our experience, at least in mice, given a 60% calorie diet, which the animals will eat well, fenfluramine-treated animals show a greater weight loss and fat loss than control animals eating an identical food intake, and this change cannot be explained as a result of decreased bowel absorption, so there must be some other effect.

Professor Yudkin: There is no experiment with any sort of drug in ordinary people that does not have some degree of absorption. Is there any evidence whatever that there is a diminished utilization, that is to say, a diminished faecal excretion?

Professor Garattini: Well, we just don't know.

Chairman: Well, this could be the first drug to show this. In other words, we ought to look for it.

Professor Jackson: Surely, it has been shown quite clearly that one of the effects of fenfluramine is to reduce the carbohydrate intake in the intestine.

Dr Blundell: I would just like to make one comment on the methodology so far, I have been absolutely amazed at the scarcity of those responsible for presenting this subject. I feel it is dangerous to draw conclusions from a single dosage.

Chairman: I think that this is very important. Now, I would like to pass on if we may to the question of the uses of fenfluramine in diabetes. Dr Turtle, you were suggesting that perhaps fenfluramine might be suitable as an alternative to diguanide.

Dr Turtle: Well, all we have done is to test a small group of untreated diabetics several hours after treating them with fenfluramine, and it does improve the K value once you have got lipolysis occurring.

Chairman: Professor Butterfield, would you like to comment on the use of fenfluramine in diabetes?

Professor Butterfield: Well, we don't have very much experience, but I suspect that it is going to be used more and more as time goes on, partly due to Chris Flint in America putting a great deal of propaganda about on the dangers of certain oral antidiabetics. The other part of that study which makes me think that fenfluramine will be used a lot is that most of the American diabetics in that study were very much overweight. Now when oral treatment for diabetes appeared on the scene, everybody, Derek Dunlop, Duncan, ourselves, every diabetologist, wrote two things: We must not use these drugs instead of losing weight and dieting, and we must wait 10 or 15 years to see if they influence the course of diabetic complications, and in the intervening 15 years, very, very few patients are really successfully and actively dieted when they are really overweight diabetics, and instead, after a period of a month or two, in general, people put them on one or other of the oral preparations. I would have thought that in the present state of knowledge, there would be a

strong case for people trying to get their diabetics to lose weight and if they fail on the diet then I think they will have their weight stripped off them using fenfluramine.

Mr Bliss: In answer to the question on K values in a small number, only about 15 cases, over six weeks of oral therapy, we have shown an increase in the K value.

Professor Wilson: We have been talking about this in relation to oral agents, and perhaps we should discuss this later, but I should like to enquire if from Dr Turtle's work whether there is any justification in using fenfluramine when the patients can be treated with insulin?

Dr Turtle: I suspect that we may have some hazards, particularly in patients who are prone to ketosis because if we put up their ketones any more, we may increase their instability.

Dr Dykes: I have got some evidence and experience on giving fenfluramine to diabetics, and I shall present some evidence this afternoon mainly involving one particular group of maturity-onset diabetics.

Dr Sedgwick: Going back to the anorectic activity, I wondered if other people have noticed if it is common in their patients that they have put on fenfluramine, in the first week or so, that they complain of increased appetite? In fact, this is not an uncommon complaint in the first week or ten days.

Dr Darey: Our experience is somewhat to the contrary. In about 10% of the patients we found that the appetite is increased in the first 2 or 3 days, but in the majority of them—about 50%—the appetite goes down, and by about the 5th or 6th day, their intake of food drops down to about 40%.

Professor Sapeika: In view of what Dr Turtle mentioned, that fenfluramine does not cause an increase in lactic release, I am just wondering whether fenfluramine might possibly be useful in the management of patients with lactic acidoses, including diabetics.

Chairman: We look forward to hearing about experiments with specific reference to the anorectic action of fenfluramine over long periods of time.

SESSION II PART 2

TUESDAY AFTERNOON

CHAIRMAN: PROFESSOR J. YUDKIN

GLUCOSE TOLERANCE AND THE METABOLIC RESPONSE TO EXERCISE IN OBESE PATIENTS TREATED WITH FENFLURAMINE

BARBARA K. BROCKIE, PATRICIA BROWN, NASR-EL-DIN AHMED, D. SHIRLING AND PROFESSOR J. A. STRONG, *Edinburgh*

The studies to be described were prompted by two sets of observations. The first of these by Pawan (1969) was concerned with the effect of fenfluramine on raising the circulating levels of NEFA. The other, by Butterfield and Whichelow (1968), indicated that fenfluramine could be shown to increase the uptake of glucose by muscle, and by inference, to divert glucose away from the fat depots. This would then serve to reverse the process occurring in obesity, where glucose is stored in excess as fat in these depots.

The data to be presented will be confined to 5 obese patients. They were aged between 21 and 36 years, and were overweight to an extent varying between 157% and 209%. Their thyroid function was normal, and their adrenocortical function, as judged by plasma 11-OHCS levels and cortisol secretion rates was normal.

On the day following admission to the metabolic ward, where the patients remained throughout the period of study, a glucose tolerance test (GTT) was carried out, with the intention of confirming that the patient's carbohydrate metabolism was normal. For the next two weeks the patient was maintained on a diet which provided 2 500 kcal *per diem*. Three of the patients were shown by energy balance studies to be expending as much as 4 400 kcal per diem. The diet was a conventional mixture of carbohydrate, protein and fat. Throughout the period of study, the patients were encouraged to take at least 2 hours' exercise walking daily.

At the end of 7 days a further GTT extended to 6 hours, was undertaken. On the following day, a 2 hours' walk was undertaken on a treadmill under close observation. After periods of walking for 20 minutes, they were allowed to rest for 5 minutes, during which time a sample of blood was taken, and a sample of expired air for alveolar acetone.

In the second week of the study, while the diet remained unchanged, fenfluramine was given in a dose of 40 mg 4 times daily.

At the end of the second week of the study, a further extended GTT and a similar exercise study were undertaken. For the third week, fenfluramine therapy continued at the same dose of 40 mg 4 times daily, and the diet was reduced to 800 kcal daily. At the end of this third week, the extended GTT and exercise study were repeated once more.

In those extended GTTs, after the administration of an oral dose of 50 g of glucose, blood was taken at intervals of 30 minutes for 3 hours, and thereafter hourly until 6 hours had elapsed. The mean blood level of glucose in 5 subjects was significantly raised at 1 hr, 2½ hr, and at 3 hr during the period when fenfluramine was being given. This effect did not appear to be influenced by the differences which might have arisen on account of the caloric content of the diet.

The plasma insulin concentrations found in the course of each of the GTTs did not differ significantly when the three regimens are compared with each other.

Likewise the values for plasma NEFA concentration showed no difference in the readings obtained throughout the extended GTTs, when the 3 regimens were compared.

The plasma glycerol readings obtained showed a very wide range of response with the GTTs, but the mean figures noted did not differ significantly between the 3 regimens.

As regards plasma HGH readings, the readings obtained were low throughout with each of the 3 regimens studied, and no significant differences were found.

In the exercise studies, after walking for 20 minutes on the treadmill at approximately 3 mph the patient rested for 5 minutes, during which a sample of blood was taken, as well as a sample of alveolar air for estimation of acetone. At the end of 6 periods of exercise of 20 minutes each, a rest was taken for 2 hours, and final samples were then taken. There was no significant change in the blood glucose concentrations throughout the period of study on each of the 3 regimens, nor in the concentration of plasma insulin throughout this period of the investigation.

Plasma NEFA concentrations were noted to rise consistently while the exercise continued, and fell again during the final period of rest. Concentrations of plasma glycerol were much more consistent during exercise than they had been during the glucose tolerance tests, but there was no statistical difference in the plasma concentrations of NEFA or glycerol within each of the 3 periods of study.

Plasma HGH concentrations, by contrast, showed striking increments with exercise, and the differences between the mean values found on the diet of 2 500 kcal, and the same diet when fenfluramine was added, were statistically significant at 1½, 2½, and 4½ hrs after the start of the period of exercise. It is striking that when the dietary intake was reduced, and with continuing treatment with fenfluramine, the values obtained reverted towards those noted initially.

In general, the observations on alveolar acetone concentrations indicated that the main differences were to be found between the full diet and the reducing diet, while there was

SESSION I PART 1

MONDAY MORNING

CHAIRMAN: PROFESSOR S. GARATTINI

THE METABOLISM AND DISTRIBUTION OF FENFLURAMINE AND N-(2-BENZOYLOXYETHYL) NORFENFLURAMINE (J.P.992) IN MAN

PROFESSOR A. H. BECKETT, *London*

Fenfluramine is de-ethylated to norfenfluramine in man; the drug and its metabolites are re-absorbed from urine in the kidney tubules under normal conditions and thus fluctuations in their rates of excretion occur as the pH of the urine fluctuates. Gas chromatographic techniques have facilitated the analysis of the drug and its metabolites in biological fluids.

When the urine is kept acidic at 4·8 - 5·0 pH by the administration of ammonium chloride, smooth curves of rate of excretion of the drug and its metabolites plotted against time are obtained, and under these conditions there is a direct relationship between plasma concentrations and rates of excretion. Also it is then possible to study the absorption, metabolism and excretion of fenfluramine, using a biological model.

Oxidation of J.P.992 N-(2-benzoyloxyethyl)norfenfluramine in urine by alkaline $KMnO_4$ to m-trifluorobenzoic acid has been used to give a quantitative assay of the drug and its main metabolites. The acid is extracted into ether and converted into its methyl ester with diazomethane which is then analysed by gas-liquid chromatography.

J.P.992 in man is metabolized into N-2-hydroxynorfenfluramine which is excreted as such and as the sulphate and glucuronide, and to norfenfluramine. A further water-soluble metabolite (metabolite A) which yields norfenfluramine upon treatment with zinc and hydrochloric acid is also present in the urine. Another metabolite (metabolite B) which accounts for approximately 20 - 30% of the drug can be extracted into ether from the urine.

No unchanged drug either with intact structure or the rearranged product which is produced in alkaline solution was recovered in the urine. The above bases were determined by gas-liquid chromatography.

Under conditions of acidic urine in man, metabolites with the intact m-trifluoromethylbenzyl moiety equivalent to 85 - 100% of the administered dose were excreted in the urine. Peak levels of these metabolites (total) were obtained 1 - 2 hours after the oral dose and then the rate of their excretion fell exponentially. The drug, as indicated by total m-trifluoromethylbenzyl moiety had a very short biological half-life (approx. 2 hours).

The metabolite of J.P.992, norfenfluramine, is extensively metabolized in man, as is the metabolite N-2-hydroxyethylnorfenfluramine.

The above results indicate that J.P.992 is absorbed quickly and completely from the gastro-intestinal tract and is then metabolized quickly and extensively to give products which are excreted quickly via the kidney.

The Effect of Mono N Substitution on the Metabolism and Excretion of Norfenfluramine

Methyl substitution has little effect on the excretion of the unchanged drug; only small amounts of norfenfluramine, the metabolites, are excreted. The introduction of the ethyl group reduces the amount of unchanged drug excreted but leads to much more norfenfluramine than in the case of methyl substitution. The introduction of a terminal OH group in the ethyl group leads to extensive metabolism of the compound so that a negligible amount of unchanged drug and norfenfluramine are excreted. Benzylation of the terminal OH group also leads to extensive metabolism of the drug so that no unchanged drug is excreted and only very small amounts of N-hydroxyethylnorfenfluramine and norfenfluramine.

DISCUSSION

Professor Wilson: Has anybody examined the effects of circadian rhythm on drug metabolism in the human body?

Beckett: No.

Professor Wilson: At what time of day was the drug administered?

Beckett: Always at 8.00 a.m. following an overnight fast.

Dr Turner: Some of the experimental points were not very close to the computer-calculated lines, and how did speaker actually assess the closeness of the fit of the points to the line?

Beckett: For fenfluramine this can be predicted very accurately from the computer but for norfenfluramine the excretion was volume-dependent.

Professor Offermeier: Is speaker aware of the problem of giving an isomer mixture?

Beckett: Yes, with ethylamphetamine there was a difference in the metabolism of the plus and minus isomers but this was not present with fenfluramine, presumably due to the transferral methyl substitution.

Professor Moore: Had the renal flow been examined, due to the great variation as a result of various factors such as meals and exercise?

Professor Butterfield: Does anybody know in which tissue or tissues does de-alkalation occur?

Professors Beckett and Garattini: Primarily in the liver.

Dr Turner: Had anybody investigated the protein binding of fenfluramine?

Mr Campbell: Yes, by equilibrium dialysis. For fenfluramine it was 32% and for norfenfluramine 16%, but as this was a loose binding it would not interfere with kinetics.

Mr Kündig: How did Professor Beckett control the urine pH and within what range?

Beckett: Normally with ammonium chloride, holding it at 4·8—5·0, but if the subjects experienced difficulty with ammonium chloride, methionine was added and if the urine flow was minimal a diuretic sometimes had to be added.

ABSORPTION, DISTRIBUTION AND METABOLISM OF FENFLURAMINE

MR D. B. CAMPBELL, *London*

This study of the blood and urine levels of fenfluramine and norfenfluramine show their similarity to other lipid-soluble drugs which are mainly eliminated from the body metabolically, as there appear to be subject variations in their rates of biotransformation. This becomes clinically important after a regular dosage regimen with differences in the rate of accumulation and magnitude of plateau plasma levels. Side-effects attributed to 'Ponderax', such as diarrhoea, headache, and drowsiness may be a result of elevated levels of fenfluramine or norfenfluramine, in a few subjects with a slow drug metabolism. The role of the metabolite norfenfluramine, in the therapeutic action of 'Ponderax' has not as yet been assessed and although it may not necessarily be the pharmacologically active substance it may contribute to the overall metabolic changes seen in patients treated with this drug. Certainly this work has demonstrated that the magnitude of the concentrations of norfenfluramine are comparable to those of fenfluramine at the steady-state level.

The ability to predict plateau drug levels in subjects from simple kinetic data has far-reaching possibilities and perhaps when further work has been conducted to correlate plasma fenfluramine and norfenfluramine concentrations with the degree of weight loss, dosage regimens can be tailor-made to suit the patients' drug metabolism and weight.

DISCUSSION

Dr Anderson: Did you test sufficient subjects to be able to decide a bimodal or trimodal response which would speak for a pharmacogenetic action here?
Campbell: No.
Professor Beckett: There are no examples of bimodal distribution for de-alkalation, but these are known for hydroxylation processes.
Dr Prime: Is there a correlation between subjective effects and high blood levels?
Campbell: In the few subjects examined, yes, it seemed to be so.
Dr Roscoe: Had he noticed any difference in the half-lives of patients who were young or old in cases of overdose?
Campbell: In the two children investigated the half-lives were shorter.

STUDIES IN PRIMATES ON THE MANIFESTATIONS AND TREATMENT OF FENFLURAMINE INTOXICATION

MR H. KÜNDIG, *Johannesburg, South Africa*

During the past few years a number of instances of fenfluramine poisoning in children and adults have been reported. These case reports stimulated the present study, the objective of which was to find an effective and safe treatment. Experiments were undertaken using mainly unanaesthetized and anaesthetized primates (vervet monkeys and baboons—Papio ursinus) to attempt to elucidate the possible mechanism(s) responsible for the manifestations described in the literature.

Fenfluramine was administered parenterally and only very large doses (50 mg/kg or more i.m. or s.c.) proved to be lethal. (This is 50 - 80 times the recommended therapeutic *oral* dose.) It was found that even after large doses (25 - 35 mg/kg) the animals recovered uneventfully within 24 - 48 hours, often exhibiting a residual tranquillization.

The animals appeared heavily sedated and in a drunken-like stupor during the acute intoxication phase. Convulsions were readily precipitated by excessive stimulation (noise, disturbance, etc.) A noteworthy phenomenon observed in all primates intoxicated with fenfluramine was the distinct 'taming' effect, i.e. the ease with which the animals could be handled, suggesting that the tranquillization was of the major type. Both central nervous system stimulant (as exhibited by tremor and clonic-tonic convulsion) and depressant (sedation and loss of righting reflexes) effects were observed. The central nervous system stimulation observed may, however, be due to inhibition of inhibitory mechanisms, as in the case of pentylenetetrazole. After lethal doses (more than 50 mg/kg s.c. or i.m.) the onset of intoxication and pattern of symptoms were little changed, except that the symptoms were more intense. Death occurred in these latter animals after 90 - 240 minutes (largely dependent on the dose) during repeated clonic-tonic convulsions with respiratory impairment.

The central nervous system effects were probably partially or entirely responsible for the effects observed on the cardiovascular system in anaesthetized animals, namely, the alteration of the P-R and Q-R-S complexes or severe ventricular arrhythmias after very large lethal doses. These arrhythmias were usually associated with a simultaneous respiratory arrest, and may

DISCUSSION

Professor Anand: Could the taming effect be ascribed to sedation?
Kündig: The small doses used were given to animals already anaesthetized.

THE EFFECT OF FENFLURAMINE ON ALCOHOL CONSUMPTION

PROFESSOR C. W. M. WILSON, *Dublin*

The fact that fenfluramine promotes the uptake and metabolism of glucose in cells and influences appetite suggested that it might also affect alcohol consumption and metabolism. An investigation has accordingly been carried out to investigate the effect of 2 doses of fenfluramine on the consumption of various concentrations of alcohol presented to rats with a simultaneous choice of water. Male rats were divided into 2 sets of 4 groups each of 5 animals. The rats were caged individually and the experiment was conducted over three successive time periods of 12 days each. Three of the groups in each set received water and 4, 6 or 8% alcohol and the fourth set received water in each vessel in the cages. During the first period all the rats received intraperitoneal saline daily. During the second period, the animals in the first set received 20 mg fenfluramine per kg daily, and those in the second set received 40 mg/kg fenfluramine daily, in place of the saline. During the third period all the rats received saline by intraperitoneal injection. Daily fluid consumption by each rat was recorded.

There was no significant difference in the water consumption by the control group, which received two containers of water in their cages, during the course of the experiment. The rats preferentially consumed 6% alcohol. Those receiving 4% alcohol drank the second largest volumes, and the rats to whom 8% alcohol was administered drank less of this mixture than the control rats to whom water alone was given. Both doses of fenfluramine caused a significant reduction in consumption of 4% alcohol from days 18 - 22 during the second period. Both doses of fenfluramine caused a significant reduction in consumption of 6% alcohol from days 18 - 24 during the second period. This effect continued during the first 4 days of the third period in those which had received 40 mg fenfluramine, but only for the first 2 days in the rats which had received 20 mg. Neither dose of fenfluramine had significant effects on the consumption of 8% alcohol.

It can be concluded that fenfluramine significantly reduces the consumption of alcohol in rats, but this effect is related to the concentration of alcohol which is being consumed, and to the dose of fenfluramine administered. In rats a dose of 20 mg/kg fenfluramine significantly reduces consumption of alcohol at the preferred concentration.

Experiments are being carried out to discover whether this is a metabolic or centrally mediated action of fenfluramine in rats. Initial results suggest that it is centrally mediated as has been shown to be the case with metronidazole.

EFFECT OF P-CHLOROPHENYLALANINE AND FENFLURAMINE ON ALCOHOL AND SACCHARIN CONSUMPTION IN RATS

PROFESSOR K. OPITZ, *Munster*

The observation of Myers and Veale (1968) that alcohol preference in the rat is greatly reduced by p-chlorophenylalanine (pCPA) led us to the finding that fenfluramine which also lowers

visable to give fenfluramine intermittently. Previous experiences have shown that in spite of millions of patient-doses, with apparent lack of serious side-effects, there still remains the possibility of ultimate long-term toxicity.

Mr Santer: Servier do most carefully keep records and obtain all available information as to the use of fenfluramine in all countries where it is marketed. In spite of thousands of tablets dispensed, there have been no reports of abuse or of dependence. Even amphetamine addicts who have taken fenfluramine because of its chemical similarity, have not become addicted to fenfluramine, nor have they experienced any of the amphetamine-induced sensations.

Professor Wilson: We will now have the opportunity of looking at S992 prospectively.

THE ROLE OF NORFENFLURAMINE IN FENFLURAMINE ACTIVITY

DR J. C. LE DOUAREC

We have had the privilege 10 years ago to be among the first few pharmacologists having carried out the initial investigations on trifluoromethyl substituted phenethylamines. We very soon became extremely interested in the unique properties of these new compounds.

In fact the CF^3 group induced a dissociation between the stimulant and anorectic properties of the amphetamines. In the first extensive pharmacological report presented in 1962, we emphasized the differences between the fluorine substitution which increased the stimulant effect and the CF^3 substitution which affected oppositely the basic CNS properties of amphetamines. The first compounds synthesized were primary amines substituted on the benzene ring with CF^3 in different positions o, m, n. Norfenfluramine was among them.

Norfenfluramine is more *toxic* than fenfluramine in the mouse, in standard conditions. Norfenfluramine is as an *anorectic* as active as amphetamines in the rat and twice less active in the dog. Fenfluramine in this respect is twice less active in the cat and 3 times in the dog. The *hypertensive* effect of norfenfluramine is comparatively less than those of amphetamines—one half in the rat, 10 times in the dog—but fenfluramine is still less potent on the blood pressure, between 1/5 and 1/10 in the rat and one half in the dog.

There are only quantitative differences between the two compounds, they only differ in their level of activity on different systems. Fenfluramine a number of times is less active than norfenfluramine. Norfenfluramine is certainly involved in the pharmacological effect of fenfluramine since we have evidence that it is its major active metabolite in animal and in man as well. May I add that norfenfluramine was discarded years ago from clinical trials in France because of prominent side-effects, namely nausea, vomiting, diarrhoea and dizziness. Thus norfenfluramine may be responsible for some side-effects of fenfluramine in man.

DISCUSSION

Professor Butterfield: Is there any conversion of norfenfluramine into fenfluramine, as there is conversion of fenfluramine to norfenfluramine?

Le Douarec: There is a difference in gut flora in different parts of the world due to national diets, and this can have an effect on the incidence of diarrhoea caused by norfenfluramine.

Mr Santer: It may be of interest to note that JP.992, the methyl-ethyl derivative of fenfluramine does not appear to produce norfenfluramine.

Dr Blythe: Is there any difference in the half-lives of norfenfluramine and fenfluramine?

Le Douarec: No.

Mr Kündig: How much fenfluramine is converted into norfenfluramine?

Le Douarec: There is a great variation, and under normal circumstances about one-third of the fenfluramine in the body exists in the form of norfenfluramine, but one cannot be more precise than that.

Dr Blundell: Is there a common metabolite of amphetamine and fenfluramine?

Le Douarec: No. There are no common metabolites, but there are common metabolic pathways for fenfluramine and amphetamine. The important point is that the CF^3 radical of fenfluramine is not split off with a resultant conversion to amphetamine or any of its metabolites.

Mr Santer: The results of work done in Prof. Beckett's laboratory proved that there were no alterations in fenfluramine-norfenfluramine ratio after repeated doses for six months.

Le Douarec: That is correct, and after prolonged use of fenfluramine the administration could be stopped and restarted without any change in the metabolic pathways.

Professor Opitz: Is there any effect on the pulmonary blood pressure in humans or animals?

Le Douarec: In animals there is evidence of pulmonary hypertension, but the clinical work stopped years ago, and we have no data.

Professor Garattini: In statistical terms we must realize that although in a clinical trial with about 1 000 patients only one or two withdrawal incidences may occur; this would mean that millions of users may eventually produce hundreds of thousands of cases of withdrawal symptoms. In other words, continued monitoring is essential.

AN INTEGRATED THEORY INVOLVING THE HYPOTHALAMUS TO EXPLAIN THE PHARMACOLOGICAL EFFECTS OF FENFLURAMINE

PROFESSOR B. K. ANAND AND DR J. E. BLUNDELL

In monkeys and cats we observed the following two types of electrophysiological and behavioural changes, depending upon the dosage of fenfluramine used: Smaller dosages of fenfluramine result in 'specific' changes restricted to the hypothalamic satiety and feeding centres. The activity of the satiety centre increases with a corresponding inhibition of the feeding centre, while no changes are observed in the rest of the hypothalamus and the adjoining areas of the brain. This is also accompanied by anorexia which appears to have some relation to increased level of glucose utilization.

When relatively larger dosages of fenfluramine are used, or when fenfluramine has been used continuously for a few days even in smaller dosages, there is a generalized inhibitory effect on the hypothalamic regions, which also spreads to the other adjoining areas of the brain. This is accompanied by drowsiness. It is not clear how fenfluramine produces its generalized inhibitory effects.

Drives from the Hypothalamus

In various presentations clinical observations have been made which may be due to influencing the 'drives' which result from the activities of certain specific areas in the hypothalamus.

Anorexia. This results from the 'specific' effects of the drug in increasing the excitability of the satiety centre and inhibiting the feeding centre, thus inhibiting the feeding (hunger) drive.

Thirst. In none of the presentations made at this conference has any mention been made concerning the effects of fen-

Chronic Anorexic and Behavioural Effects of the Fenfluramine Derivative SE 780* in Rats

M. Taylor and A. J. Goudie

Department of Psychology,
University College of North Wales, Bangor, Caernarvonshire,
North Wales

Received June 6, 1973

Abstract. The behavioural and anorexic effects of the fenfluramine derivative "SE 780" in rats were studied after chronic administration over 35 days. Behavioural effects of the compound were assessed by "time sampling" behavioural categorisation, on days 1, 14 and 28 of administration. An initial sedative effect observed after acute administration was absent on days 14 and 28 of observation, when the drug had no behavioural effects at all. The anorexic properties of the drug were investigated in two ways. Firstly, by measuring daily body weights; and secondly by measuring intake of food over a 2 h period on observation days. The drug appeared to be a highly potent anorexiant in that tolerance to its effects built up very slowly. It is suggested that SE 780 may be an anorexic agent which is superior to Fenfluramine in two ways; firstly, it lacks stimulant properties after chronic administration, and secondly it is active over longer periods of time; as such it merits further study in humans.

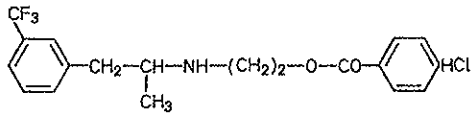
Key words: Anorexia — Time Sampling — Fenfluramine — SE 780.

Introduction

Most contemporary anorexiants are derived from a phenylethylamine base and possess two major therapeutic limitations. Firstly, they are usually C. N. S. stimulants and potentially addictive, and secondly tolerance to their anorexic effects is established very quickly. Fenfluramine is generally considered to be the anorexiant of choice, in that it has minimal amphetamine-like properties. Previous papers from this laboratory have reviewed the evidence for C. N. S. stimulant effects of fenfluramine (Taylor *et al.*, 1973; Goudie and Taylor, 1973). It is clear that Fenfluramine may possess C. N. S. stimulant properties, which differ from those of other phenylethylamines. The present paper reports on the pharmacologic properties of "SE 780", a novel fenfluramine derivative which is lacking in stimulant properties in rats, and which is an active anorexic agent for a longer period of time than other phenylethyl amines.

* This compound has also been referred to as "S 992".

The structure of SE 780 is as below:



Methods

Subjects were 24 male hooded rats weighing between 200 and 250 g at the start of the experiment. They were randomly divided into three groups: those receiving 3 and 9 mg/kg I. P. of SE 780 suspended in Tween 80 and sterile water, and those receiving injections of the control medium. They were adapted for a week to a 22 h food deprivation schedule and always injected 30 min prior to food access. Observations of exploration in an open field were made on days 1, 14 and 28 of chronic administration, 30 min post injection. A "time sampling" procedure of behavioural categorisation was used, with hierarchically arranged categories in the order Rearing, Walking, Sniffing, Grooming and Immobility. Each subject was observed every 2.5 sec for 100 observations. The procedure and rationale behind its use was essentially identical to that described in Taylor *et al.* (1971, 1973) and Goudie and Taylor (1973). In addition, food intake was measured for individual subjects on observation days.

Results

Fig. 1 A shows the cumulative sum of the daily differences between the mean body weights of the treated groups and that of controls. Tolerance to the effects of the drug on body weight appear around Days 20 and 30 of chronic administration for the low and high doses

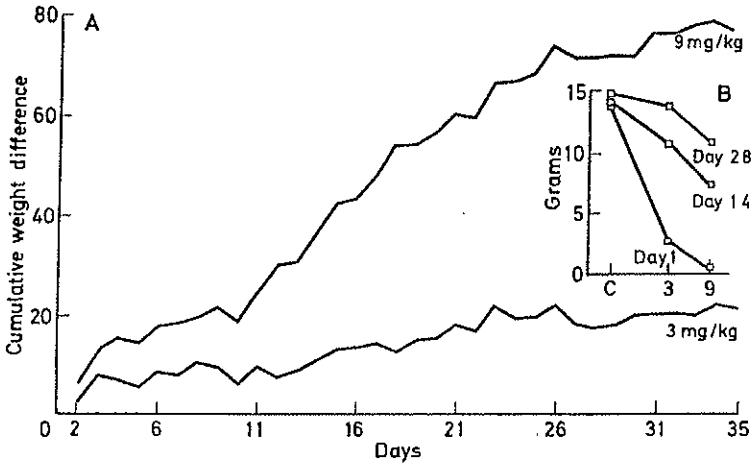


Fig. 1. (A) Cumulative sum of the daily differences, in g, between mean body weights of subjects receiving 3 and 9 mg per kg of SE 780, and that of controls. (B) Mean amounts of food eaten on days 1, 14 and 28 of chronic administration for controls (*C*), and subjects receiving 3 and 9 mg per kg of SE 780

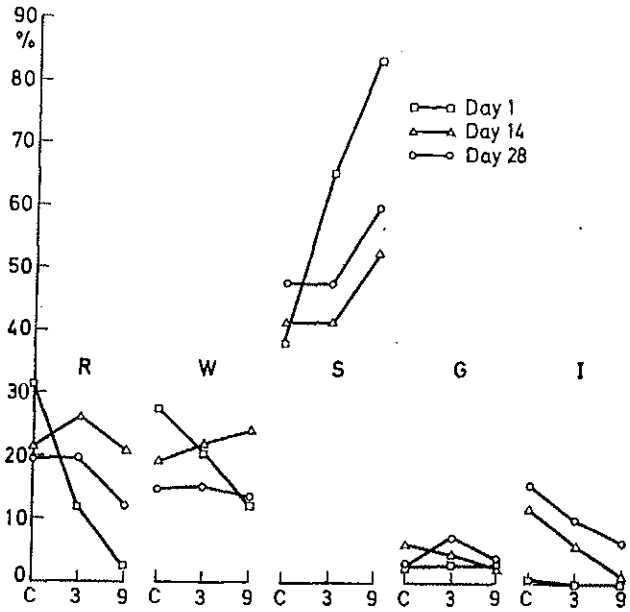

Fig. 2. Mean percentage incidence of Rearing (*R*), walking (*W*); Sniffing (*S*); Grooming (*G*) and Immobility (*I*) after the 1st, 14th and 28th day of chronic administration of control medium (*C*); 3 mg per kg (3) and 9 mg per kg (9) SE 780

respectively. Fig. 1 B shows the mean amounts eaten on observation days and shows that *even* on the 28th day of administration SE 780 still exerts a potent anorexic effect, at the 9 mg/kg dose. However, considered together the data presented in Fig. 1 A and 1 B demonstrate the gradual progressive development of tolerance.

Behavioural observations after acute administration indicated a significant sedative effect (Fig. 2) in that the incidences of rearing and walking were reduced at very high levels of significance (Table 1). The effects on sniffing behaviour are considered to be secondary to those on categories higher in the hierarchy, as described for fenfluramine by Taylor *et al.* (1973). Behavioural observations on Days 14 and 28 failed to show any significant effects of SE 780 on behaviour after chronic administration (Fig. 2).

Discussion

a) Weight Data. Comparable data for Fenfluramine (Taylor *et al.*, 1973) indicates a much more rapid development of tolerances; in this study the effects of SE 780 were so potent that administration was discontinued after 35 days because subjects receiving the high dose of the drug at the same doses became generally debilitated and suddenly be-

Table 1. Statistical comparisons between the three experimental groups (Mann Witney U Test) for all behavioural categories

	Controls vs 3 mg/kg	Controls vs 9 mg/kg	3 mg/kg vs 9 mg/kg
Rearing	$P < 0.001$ ↓	$P < 0.001$ ↓	$P < 0.01$ ↓
Walking	$P < 0.025$ ↓	$P < 0.002$ ↓	NS
Sniffing	$P < 0.001$ ↑	$P < 0.001$ ↑	$P < 0.005$ ↑
Grooming	NS	NS	NS
Immobile	NS	NS	NS

(↓ indicates reduction, ↑ indicates increase, NS = not significant).

gan to lose weight rapidly. (This effect is *not* thought to be due to toxicity of the drug, since the compound has been shown to have a high LD_{50} in chronic studies.) Pawan (1971a) has reported that in mice Fenfluramine causes greated *total* weight loss over a 42 day period than SE 780 when drugs are injected on alternate days. However, this procedure will delay development of tolerance to fenfluramine and so fails to illustrate the superiority of SE 780 as an anorexiant over fenfluramine.

Pankseep and Booth (1973) have suggested that tolerance to the anorexic effect of amphetamine is attributable at least partly to accruing deprivation rather than to the development of true pharmacological tolerance. If this result can be generalized to all phenylethylamine derivatives, (i. e. including SE 780 and Fenfluramine), then the comparison between the results reported here and those for fenfluramine in Taylor *et al.* (1973), becomes even more significant since the subjects in both studies were all between 200 and 250 g at the start of the experiments. The greater duration of action of SE 780 was definitely not due to subjects in *this* study being at a higher initial body weight. Rather, *in spite of* the effects of accruing deprivation, injected subjects continued to lose weight until many of them became greatly debilitated.

b) Behavioural Data. The marked acute sedative effects of SE 780 are in agreement with the findings of Weischer and Opitz (1972) that the drug reduces aggression in isolation reared mice. The sedative effects of acutely administered SE 780 (and its methanesulphonate salt SE 1513) have already been reported on in undeprived subjects (Goudie and Taylor, 1973), and were confirmed in unpublished studies with an ultrasonic motion recorder, in which significantly less gross motor activity was recorded in treated subjects than in controls over a 17 h period. The acute effects of SE 780 on behaviour in deprived subjects appear to be almost identical to those deseribed with fenfluramine (Taylor *et al.*, 1971, 1973).

However, the effects of chronic administration differ markedly in that no stimulant effects are noted. This indicates that tolerance to the *behavioural* effects of SE 780 has clearly developed rapidly.

In rats, SE 780 appears to be a potent anorexic agent to which tolerance is established slowly, and in which an important dissociation between the behavioural and anorexic effects of a phenylethylamine derivative is observed. Since acutely administered SE 780 has a therapeutic margin seven times that of fenfluramine (Unpublished Internal Report of Servier Laboratories) and since it has been shown to be active in humans when given orally (Pawan, 1971 b), it is suggested that further study of its anorexic properties in humans is merited.

Acknowledgements. The work reported here was supported by a research grant from Servier Laboratories Ltd., who also supplied SE 780.

Peripheral and metabolic effects of fenfluramine, 780SE, norfenfluramine and hydroxyethylnorfenfluramine—A review

SHEILA M. MACRAE

Research and Development Department, Servier Laboratories, Greenford, Middlesex UB6 7PW

Summary

In pharmacological aud clinical studies fenfluramine enhances glucose uptake by muscle and reduces plasma lipids and fat stores. 780SE, a fenfluramine analogue, appears to have similar effects in animals. Both compounds are weak indirect sympathomimetic agents when compared with amphetamine; the effects they elicit on responses to stimulation of sympathetic pathways differ from those evoked by amphetamine.

Introduction

Anorectic agents should ideally decrease body weight, have an effect on glucose and lipid metabolism, and possess minimal side effects.

Fenfluramine was derived from amphetamine by means of a trifluromethyl substitution of the third carbon atom of the phenyl ring of amphetamine by Beregi *et al.* (1970) at Les Laboratoires Servier. The effects of the parent compound which, though it was the drug of choice for the treatment of obesity in 1962, had a number of unacceptable side effects, were thus modified.

Fenfluramine, 780SE and the metabolites norfenfluramine and hydroxyethyl norfenfluramine are frequently classed as amphetamines since they contain a phenylisopropylamino group in their structure (Fig.). However, pharmacological and biochemical effects of the trifluoromethyl substituted compounds differ from those of amphetamine. This paper summarizes the recent findings with respect to the effects of amphetamine and the CF_3-substituted compounds on glucose and lipid metabolism, the cardiovascular system and the peripheral adrenergic system in animals and man.

Action on metabolism with particular reference to lipids and glucose

It is now universally accepted that obesity can be a complex metabolic disorder and that, with obesity, food ingested is selectively synthesized into lipids with a subsequent growth of adipose tissue. In addition, there is a decrease in glucose uptake by muscle and a decrease in fat mobilization.

Fenfluramine has been shown in pharmacological and clinical investigations to reduce fat stores, to alter fat metabolism by the release of catecholamines, to decrease the serum levels of triglyceride and to increase the uptake of glucose by muscle. Thus Bizzi, Veneroni and Garattini (1973) found that the rise in plasma and lymph triglycerides which is usually seen after an olive oil load was prevented in rats by pre-treatment with fenfluramine (20 mg/kg i.p.). The same dose of fenfluramine when administered to rats in a post-absorptive state produced a decrease in plasma and lymph triglyceride levels and a decrease in lymphatic flow. The authors therefore have postulated that fenfluramine inhibits the intestinal absorption of triglycerides. One explanation for the mode of action is that fenfluramine *in vivo* decreases the release of pancreatic lipase and *in vitro* (Dannenburg and Ward, 1971) and inhibits palmitoyl-CoA : mono-olein acyl transferase activity in the microsomal fraction of the intestinal walls of rats (Dannenburg, 1973; Dannenburg, Kardian and Norrell, 1973). In these studies fasting was found to reduce or eliminate the effects of fenfluramine. This finding has been confirmed by Bizzi *et al.* (1973). However, Evans *et al.* (1975) could find no evidence of a reduction in the absorption of fat in normal volunteers taking either fenfluramine or 780SE.

In clinical studies fenfluramine has been shown to lower serum triglyceride levels (Chremos, Dannenburg and Noble, 1971, Mace *et al.*, 1972) although Balasse (1973) could only demonstrate weight loss.

Wilson and Galton (1971) have shown that in man fenfluramine, 780SE and 1513 inhibit lipogenesis in adipose tissue *in vitro*. Only fenfluramine had an inhibitory effect on both the incorporation of T-palmitate and ^{14}C-glucose into neutral lipid. The same workers examined the effects of fenfluramine and 1513 on a broken cell preparation of human adipose tissue. Fenfluramine produced a significant inhibition of lipogenesis from glycerol phosphate and ^{14}C palmitate at a concentration of 1mM while

1513 was found to exert a significant inhibitory effect at a concentration of 0·4mM. A similar effect has been observed *in vivo* with fenfluramine (Pawan, 1969; Mace *et al.*, 1972). Duhault (1973) has suggested that lipid synthesis reduces the coenzyme $NADPH_2$ obtained in a reaction catalysed by glucose-6-phosphate dehydrogenase, and has shown that the activity of this enzyme is decreased in fat pads and in the liver of fenfluramine treated rats.

Marsh and Bizzi (1972) demonstrated *in vitro* that d-amphetamine, dl-fenfluramine and dl-norfenfluramine inhibit triglyceride release from rat liver slices. *In vivo*, the drugs increased liver triglyceride, decreased plasma triglyceride and inhibited net synthesis of triglyceride, but did not significantly affect very low density lipoprotein-triglyceride release. Brindley and Bowley (1975) have shown that fenfluramine, norfenfluramine, hydroxyethyl-norfenfluramine and 780SE inhibit *in vitro* triglyceride synthesis by rat liver homogenates. Bliss, Kirk and Newall (1972) found that fenfluramine treatment significantly reduced fasting cholesterol and β-lipoprotein levels in 60% of 25 patients, although no consistent effect on fasting non-esterified fatty acids, triglycerides or pre-beta lipoprotein was seen.

In fasting rats fenfluramine has been shown to prevent glycogen depletion of the liver (Duhault, 1973). A comparison of the effects of an acute oral dose of fenfluramine, 780SE and amphetamine on blood glucose and liver glycogen in rats fasted for 18 hr is shown in the Table. No significant differenee was demonstrated between the pair fed control animals and those treated with amphetamine.

The first step in the formation of glycogen from glucose-6-phosphate is catalysed reversibly by phosphoglucomutase, an enzyme which Zwarenstein and Sapeika (1970) found to be inhibited by fenfluramine in *in vitro* studies with mouse heart and muscle; it is possible that fenfluramine could reduce glycogen formation *in vivo* by inhibiting this enzyme. Duhault and Boulanger (1965) reported that in dogs, an intravenous injection of fenfluramine (2·5 mg/kg) produced an increase in the peripheral uptake of glucose, as determined by measuring the Conard coefficient of carbohydrate utilization. The same authors found

TABLE. Effect of acute oral dose of 780SE, fenfluramine, and amphetamine on blood glucose and liver glycogen levels in rats fasted for eighteen hours. From Duhault and Malen (1969)

Treatment (number of animals)	Food consumption g/24 hr	Liver glycogen content wet tissue mg/g (mean ± S.E.)	Blood glucose mg/100ml (mean ± S.E.)
Controls (18)	24	39·3 ±2·7	78 ± 1·4
Pair-fed controls (17)	4	3·08 ± 1·13	48 ± 1·6
780SE 50 mg/kg (19)	4	*11·6 ±1·79	*74 ± 4·7

dl-amphetamine 10 mg/kg (12)	4	*** 0·69 ± 0·23	53 ± 1·4

* $P < 0·001$ ** $P < 0·01$ *** $P < 0·10$ compared with pair-fed controls.

that neither 780SE (5 mg/kg p.o.) nor amphetamine produces this effect.

Kirby and Turner (1974) found that in the presence of insulin (100 μu/ml) fenfluramine and norfenfluramine produced a significant increase of glucose uptake by the isolated rat diaphragm. In the absence of insulin, the mean glucose uptake by the diaphragm did not change significantly. The authors have suggested that fenfluramine and norfenfluramine in therapeutic concentrations influence peripheral glucose uptake in rats.

Turtle and Burgess (1973) reported that fenfluramine had a biphasic effect on glucose removal by skeletal muscle during forearm perfusion. The initial early increase in glucose uptake by skeletal muscle which lasts 90–120 minutes disappeared with the release of free fatty acids. There was no increase in lactate release suggesting that there is complete oxidation of glucose by skeletal muscle. The same workers assessed the effects of fenfluramine on plasma glucose levels in maturity onset and insulin requiring diabetics and concluded that the drug was most effective as a hypoglycemic agent when taken before a meal. Fenfluramine consistently lowered plasma glucose levels for a minimum of 2 hr in maturity onset diabetics, and in insulin-requiring diabetics had similar but less marked effects. The authors also found that fenfluramine lowered plasma glucose levels in diabetics maintained on diet alone, or diet plus tolbutamide without risk of lactic acidosis and without a direct effect on insulin secretion.

Dykes (1973) studied glucose tolerance and insulin secretion in twenty-three maturity onset diabetics on a low calorie diet with and without fenfluramine. There was a significant improvement in glucose tolerance only, after the patients had been on the diet for 10 weeks. Those patients who continued with diet alone maintained the improvement in glucose tolerance; patients who received fenfluramine on the diet not only maintained the improvement in glucose tolerance but also, in the case of the high insulin secretors, showed a significant decrease in insulin secretion.

Bliss *et al.* (1972) investigated the effects of fenfluramine on glucose tolerance, insulin, fasting lipid, and lipoprotein levels in 25 patients with peripheral arterial disease. They found that fenfluramine significantly improved glucose tolerance though this was not as a result of an increase in insulin production.

It is possible to conclude from the results obtained in the four studies just described that fenfluramine does have an effect on glucose metabolism in man and in animals and may be useful in the treatment of maturity onset diabetes.

Action on the cardiovascular system

In 1966 Le Douarec, Schmitt and Laubie demonstrated that fenfluramine produced a slight fall in blood pressure in rats, cats, dogs and rabbits. This was followed by a rise in blood pressure in all animals except the rabbits. Berry, Poyser and Robertson (1971) confirmed this effect in anaesthetized cats at doses of 0·3 to 3·0 mg/kg i.v.

At doses of 1–10 mg/kg i.v. Sipes, Ziance and Buckley (1971) produced a biphasic blood pressure response in rats, cats and dogs, characterized by an initial depressor response followed by a prolonged pressor response. Administration of fenfluramine did not significantly affect the blood pressure response to 30 sec carotid occlusion or 1 μg/kg noradrenaline, adrenaline or isoprenaline. They also found that the pressor components of the blood pressure response to fenfluramine could be eliminated by administration of cocaine 10 min before, reserpine 24 hr before or phenoxybenzamine just before the start of the experiment. Sipes *et al.* (1971) therefore concluded that fenfluramine produces its effects by an indirect sympathomimetic action, and that this hypertensive effect is consistent with stimulation of alpha-adrenergic receptors. The same investigators found that the initial transient depressor response was enhanced by treatment with reserpine 24 hr prior to the experiment, and since the same treatment abolishes the response to intraventricular fenfluramine they concluded that the response is a direct effect of the compound.

Berry *et al.* (1971) reported that the depressor

responses to (+) amphetamine (0·01–0·3 mg/kg) were reduced by fenfluramine and subsequently higher doses of (+) amphetamine produced a prolonged and dose related fall in blood pressure. No explanation has yet been found for this reversal of the (+) amphetamine effect on blood pressure. These workers also found that in cats prior administration of amphetamine reduces the pressor response to fenfluramine and also that the tyramine pressor response was unaltered or potentiated by fenfluramine. However, Bocknik and Kulkarni (1973) found that in dogs fenfluramine at doses of 1·0–4·0 mg/kg has a pressor effect on the blood pressure. In addition, they found that fenfluramine potentiates the tyramine pressor response and that it also potentiates the depressor response produced by acetylcholine. Intravenous injection of 780SE in propylene glycol/saline (in the rat, cat and dog) produced no effect on the heart rate. In all 3 species 780SE in doses exceeding 30 mg/kg caused a transient fall in B.P., but unlike fenfluramine produced no pressor response. Intravenous injection of 1513, at doses of 5 mg/kg in the dog produced a slight fall in blood pressure.

It is possible therefore to suggest that fenfluramine, and 780SE, like amphetamine exert their effects on the cardiovascular system by acting as indirect sympathomimetic agents, but that their activity is less marked than that of amphetamine.

Action on the peripheral autonomic nervous system

The effects of fenfluramine hydrochloride on the peripheral autonomic system have been studied by Sipes *et al.* (1971). Intravenous fenfluramine (1, 2, 5 and 10 mg/kg) produced a dose related contraction of the nictitating membrane of the anaesthetized cat. Pre-treatment of cats with reserpine (24 hr prior to the experiment) or phenoxybenzamine (10 min before the administration) eliminated the 2 mg/kg i.v induced contraction. Ganglionic blockade, with chlorisondamine or removal of the superior cervical ganglion did not significantly alter the contraction. As the membrane responses to stimulation of pre- and post-ganglion fibres were not altered; fenfluramine was not affecting ganglionic transmission under these conditions. Fenfluramine has a direct effect on the membrane, whilst 780SE, at i.v. doses between 100 μg and 30 mg/kg, did not cause the membrane to contract. However 780SE is similar to fenfluramine, in that it does not affect ganglionic transmission.

Initial studies by Duhault and Verdavainne (1967) suggested that fenfluramine did not affect catecholamine stores, but subsequent work including that of Sipes *et al.* (1971) has shown that high doses of fenfluramine deplete peripheral and central stores. The latter workers found that fenfluramine reduced the noradrenaline content of both the rat myocardium and the perfused cat spleen, inhibited the uptake of noradrenaline by isolated guinea pig atria and accumulated in noradrenaline storage sites. This accumulation was not inhibited by cocaine. On the basis of this work, Sipes *et al.* (1971) concluded that fenfluramine acts initially as an indirect sympathomimetic agent, and that unoccupied α receptors and noradrenaline are prerequisites for the activity of fenfluramine. They have also suggested that fenfluramine releases noradrenaline from adrenergic nerve endings and that it exerts its effects intraneuronally.

Babulova *et al.* (1972) compared the effects of dl-fenfluramine and d-amphetamine on the adrenergic system using a number of *in vitro* and *in vivo* preparations. Amphetamine potentiated the duration of contraction of the inferior eyelid at a dose ten times lower than that needed with fenfluramine. Blocking of adrenergic transmission by guanethidine was completely reversed by amphetamine at a dose of 30 μmol/kg while fenfluramine only partially reduced the blockade at a dose of 40 μmol/kg. Amphetamine weakly potentiated the increase in blood pressure produced when the posterior hypothalamus was stimulated electrically; this effect was inhibited by 30% in 5 minutes after intravenous fenfluramine. They found that fenfluramine was 50 times less effective than amphetamine in increasing the rate of spontaneously beating isolated atria of the rat, while forty times the dose of amphetamine was required before fenfluramine would induce a contraction of the isolated tail artery of the rat. They also found that fenfluramine was less effective than amphetamine in inducing a contraction of the isolated vas deferens of rats and potentiation of the contraction of the guinea pig vas deferens elicited by electrical stimulation of the hypogastric nerve.

Jespersen and Bonaccorsi (1969) found that both 780SE and fenfluramine blocked the vasoconstrictor effects of amphetamine on the isolated tail artery of the rat and that the drugs did not produce a contraction when added alone or in the presence of tetrabenazine.

In human saphenous vein Coupar (1970) showed that fenfluramine produced contractions, which could not be blocked by phenoxybenzamine or thymoxamine, but which could be blocked with methysergide (Kirby and Turner, 1971). In isolated human uterine tissue fenfluramine also produced responses dependent on the concentration of calcium present and the hormonal status of the tissue (Kirby and Turner, 1971).

In conclusion, fenfluramine has sympathomimetic properties, but its activity is much less than that of amphetamine. The effects of fenfluramine on the responses elicited by stimulation of the sympathetic

pathway seem to differ from those evoked by amphetamine. This may be due to a difference in the modes of action. 780SE is a weaker sympathomimetic agent than fenfluramine.

A review of the CNS effects of fenfluramine, 780SE and norfenfluramine on animals and man

CELIA J. REUTER

Servier Research Institute, Greenford, Middlesex UB6 7PW

Summary

The changes in body functions arising from alterations produced by fenfluramine derivatives in metabolism, storage and release of brain monoamines are reviewed. These include feeding, drinking, behaviour, sleep, body temperature regulation, pain perception, neuroendocrine effects and mood.

Central drug interactions with fenfluramine, which may have an important bearing on clinical usage are summarized.

Introduction

The family of substituted phenylethylamines included in this review are fenfluramine, its benzoyloxyethyl derivative 780SE (992) and a metabolite common to both, norfenfluramine. Their structural relationships are shown in the Figure.

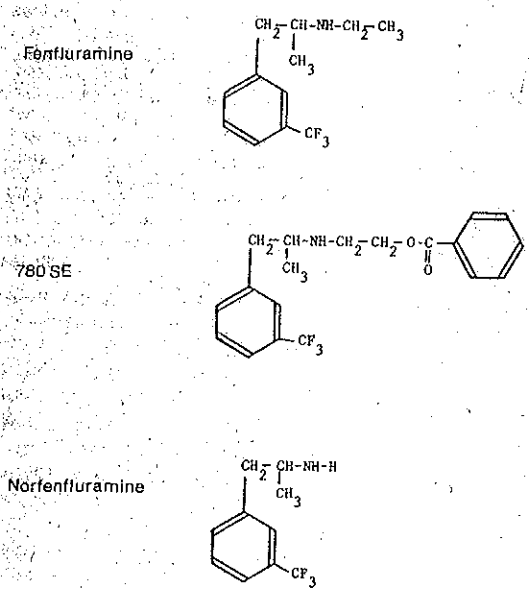

FIG. Chemical relationship.

Effects on brain monoamines

1. Serotonin (5HT)

Table 1 summarizes the studies which have been carried out in several animal species on the alterations in brain 5HT and 5-hydroxyindole acetic acid (5HIAA). The results are in good agreement and show that all three derivatives produce a dose related depletion of brain 5HT following acute administration, characterised by a rapid onset (within 1 hr), a 60–70% depletion lasting up to 48 hr, and the effect being selectively confined to the teldiencephalon in the rat.

For fenfluramine, radioactive studies to estimate turnover show this to be increased (Costa, Groppetti and Revuelta, 1971; Garattini, 1972), whereas brain 5HIAA has been reported to be both increased (Tagliamonte and Tagliamonte, 1970) and decreased (Duhault and Verdavainne, 1967; Garattini; 1972). Brain tryptophane is increased (Tagliamonte *et al.*, 1970; Garattini, 1972). Norfenfluramine has been found to increase 5HT turn over in teldiencephalon and brain stem and 5HIAA levels are raised up to 1 hr, but thereafter return to normal (Costa and Revuelta, 1972); 5HT depletion is comparable to that with fenfluramine, but is of longer duration (Costa *et al.*, 1971, 1972).

Sensitivity to 5HT depletion varies with the animal species. Rat and cat are more sensitive than the mouse, which in turn is more sensitive than the rabbit, whose 5HT appears to be almost unaffected by fenfluramine (Funderburk *et al.*, 1971a). Slight stereospecific differences in the 5HT depleting potency have been reported; the dextro (d) isomer has been found to be slightly more potent than the racemic (dl) or laevo (l) (Duhault and Verdavainne, 1967), but other workers have found no statistically significant differences (Garattini, 1972; Ghezzi *et al.*, 1973). To assign a precise neuropharmacological action for these derivatives on serotonergic pathways has been difficult in the absence of inhibition *in vitro* and *in vivo* on tryptophane hydroxylase or 5HTP-decarboxylase (Duhault and Verdavainne, 1967). It has been suggested that fenfluramine inhibits 5HT uptake at nerve terminals (Garattini, 1972).

fenfluramine (Garattini, 1972) and to antagonize anorexia (Ghezzi *et al.*, 1973; Jesperson and Scheel-Kruger, 1973).

Table 10 details the interactions which have been reported with amphetamine. These interactions are complex and unpredictable in animals; in some instances amphetamine induced activity is antagonized, whilst in others potentiation is found.

Conclusion

Fenfluramine and 780SE appear to share qualitatively similar effects on the brain amines, anorexia, behaviour and sleep. Norfenfluramine, however, differs quantitively with a more pronounced and prolonged effect on central catecholamine pathways. In man, its sympathomimetic potency has been reported to be responsible for the mydriatic effect of fenfluramine (Kramer, Rubicek and Turner, 1973). Norfenfluramine has a greater thermogenic potency and is more toxic.

Stereospecificity with fenfluramine and norfenfluramine appear to be parallel, the d-isomers being more potent on anorexia, and possibly slightly on 5HT depletion, mydriasis, hyperthermia and toxicity, whereas the l-isomers are more active on central catecholamine turn over and analgesia. The activities of the racemic mixture, the marketed form, are intermediate between the d and l.

The drug interaction studies in animals suggest that the anorectic activity of these compounds may be impaired, especially with some tricyclic antidepressants and that careful dosage titration may be necessary in combination with other sedatives and narcotic analgesics.

SESSION II

Chairman: PROFESSOR S. GARATTINI

Comparisons between the behavioural and anorexic effects of 780SE and other phenylethylamines in the rat

M. TAYLOR A. J. GOUDIE

Department of Psychology, University College of North Wales, Bangor

Summary

The behavioural and anorexic effects of fenfluramine, norfenfluramine, and 780SE have been studied in the rat. Behavioural Activity analysis of these compounds indicates that acutely after intraperitoneal administration they all possess sedative properties but that 780SE and the related compound 1513 are much less active when administered subcutaneously. Chronically, fenfluramine and norfenfluramine possess possible stimulant properties, the latter being more potent; in contrast 780SE has been found to be totally devoid of stimulant properties.

Anorexic effects of these compounds were assessed by body weight recording in chronic studies. All were found to have a pronounced permanent dose related effect on body weight. 780SE was found to be a highly potent anorexiant in rats in that tolerance to its effects on body weight built up slowly in comparison to equivalent studies of fenfluramine and norfenfluramine. All three compounds have been found to induce abnormal behaviour at high doses, the characteristic behavioural pattern elicited being that of Backward Walking. 780SE was found to be much less potent in eliciting such behaviour than fenfluramine and norfenfluramine. The behaviour elicited by all three compounds differs from that characteristically induced by amphetamine at high doses which is commonly referred to as stereotypy. Both fenfluramine and 780SE were found to antagonize d-amphetamine induced excitation. However, fenfluramine was found to potentiate amphetamine toxicity whilst 780SE did not at the doses used. The results show that 780SE possesses a number of properties which make it a potentially attractive anorexic agent. Firstly, it appears to be devoid of any possible stimulant properties; secondly it is active anorexically over long periods of time; thirdly much larger doses are required to elicit abnormal behaviour than fenfluramine and norfenfluramine. Further study of 780SE seems merited.

Introduction

Most anorexic agents such as phenmetrazine, phentermine, diethylpropion and the amphetamines possess two major therapeutic limitations. Firstly, they have pronounced stimulant effects and are potentially addictive. Secondly, tolerance to their anorexic effects is established rapidly, thus considerably reducing their usefulness in the treatment of obesity. In evaluating any anorexic agent, the two major dimensions to be considered would consequently seem to be those of duration of action, and drug-induced C.N.S. changes which are reflected in behavioural stimulation. The present paper reports on the anorexic and behavioural effects of a number of phenylethylamines with reference to these dimensions. Emphasis is placed on comparisons between fenfluramine, norfenfluramine and 780SE.

A wide variety of methods exist for the assessment of drug effects on activity (e.g. Boissier's hole board, jiggle cages, photocell cages, Y mazes, open fields, sensory contingent bar pressing, activity meters). Measures obtained from these techniques have frequently been shown to be correlated at very low levels (Tapp *et al.*, 1968; Gross, 1968). The use of the mutually exclusive labels 'sedative' and 'stimulant' with respect to psychotropic agents may be misleading unless the exact behavioural or neurophysiological variables involved are specified. Furthermore, if the terms sedative and stimulant are to be meaningful any one particular method of assessing drug effects on activity needs to be validated by the use of drugs which are universally accepted to be sedatives or stimulants themselves within the specific experimental situation under consideration.

The present paper reports on a number of studies, both acute and chronic, in which activity analysis involved time sampling behavioural categorization (Bindra and Spinner, 1958); an advantage of this system over other techniques is that it allows both

Anorexic effect

Figures 10, 11 and 12 present the effects of chronic fenfluramine, norfenfluramine and 780SE on body weight, and in addition in the case of 780SE, amounts of food eaten. It is clear that in the case of all three compounds, there is a sustained and maintained weight loss, which was greatest for 780SE. An effect on amounts of food eaten after 28 days is also apparent, suggesting that 780SE is anorexically active for long periods of time.

Conclusions

The above results suggest that 780SE, in comparison with fenfluramine and other phenylethylamines, is a potent anorexic agent with a number of important properties. It appears to be devoid of either acute or chronic stimulant properties; it is active over long periods of time; and it requires much larger doses than either fenfluramine or norfenfluramine to elicit abnormal behaviour. It demonstrates an important dissociation between behavioural and anorexic effects. Since acutely administered 780SE has a therapeutic margin seven times that of fenfluramine (Unpublished internal report of Servier

Laboratories), and since it has been shown to be active in humans when given orally (Pawan, 1971) it is suggested that further study of its anorexic properties in humans is merited.

The mechanism of action of fenfluramine

S. GARATTINI W. BUCZKO

A. JORI R. SAMANIN

Istituto di Ricerche Farmacologiche 'Mario Negri', Via Eritrea 62–20157 Milano, Italy

Summary

Fenfluramine and amphetamine exert different actions on central biogenic amines. Neither drug alters the concentration of dopamine (DA) in the rat striatum but both drugs increase striatal homovanillic acid levels with opposite stereoisomeric specificity and by different mechanisms. The evidence presented suggests that fenfluramine blocks the DA receptors, whereas amphetamine acts indirectly presynaptically to stimulate the release of DA from dopaminergic terminals. Thus a similar biochemical effect is achieved by completely opposite mechanisms.

Neither fenfluramine nor amphetamine change the concentration of acetylcholine in whole brain. Fenfluramine and norfenfluramine though not amphetamine lower brain 5-hydroxytryptamine(5HT) and 5-hydroxyindole acetic acid. The results with fenfluramine on release and uptake of ^{14}C 5HT in platelets suggest that this drug acts on 5HT stores by 2 different mechanisms, these being a release of 5HT and inhibition of 5HT uptake.

The results of brain amine manipulations on the anorectic actions of fenfluramine and amphetamine suggest that these two drugs induce anorexia in animals by different mechanisms. An intact serotonergic system appears to be necessary to permit fenfluramine

Summary

The effects of fenfluramine, norfenfluramine and N-(2-benzoyloxyethyl) norfenfluramine (780 SE, 1513) have been studied on ^{3}H-dopamine(DA), ^{3}H-noradrenaline-(NA) and ^{3}H-5-hydroxytryptamine (5HT) uptake and release *in vitro*, on 5-HT receptor activity in the spinal cord, on behaviour and on food intake.

Fenfluramine was found to be a powerful granular releaser of ^{3}H-5-HT in cerebral cortex, but much less active on ^{3}H-NA and ^{3}H-DA release in the hypothalamus and the neostriatum respectively. Fenfluramine also caused a marked blockade of ^{3}H-5-HT uptake in the cortex cerebri. This effect cannot be secondary to its 5-HT releasing action, since the 5-HT depleting action of fenfluramine is blocked by pretreatment with chlorimipramine, a 5-HT membrane pump blocker. Thus fenfluramine probably utilized the membrane pump to enter the 5-HT neurons.

In agreement with the demonstrated 5-HT releasing action, fenfluramine enhanced the 5-HT depletion caused by a tryptophan hydroxylase inhibitor.

The functional studies on the spinal cord also produced evidence that fenfluramine is a releaser of granular 5-HT stores and a blocker of the 5-HT membrane pump. Thus, fenfluramine increased spinal 5-HT receptor activity and this action was increased by nialamide and reduced by reserpine, tryptophan hydroxylase inhibition and chlorimipramine. Studies on 5-HT denervated spinal cord obtained by intraventricular 5,7-DHT injections revealed that the activity of fenfluramine was paradoxically increased, probably due to the development of 5-HT receptor supersensitivity. Thus, fenfluramine can release 5-HT from the few remaining 5-HT nerve terminals to reach the supersensitive 5-HT receptors. It is important to stress that monoamine oxidase was inhibited in these experiments. This result makes it easier to explain the finding that the lever pressing for food reward was more reduced when fenfluramine was given to rats with 5,7-DHT induced lesions of the 5-HT ascending pathways than to intact rats. When studying the effects of fenfluramine on the food intake in rats on a food deprivation schedule, however, the anorectic effects of fenfluramine were reduced in the rats with a 5,7-DHT induced degeneration of the ascending 5-HT pathways.

These results are difficult to interpret but the speculative hypothesis is advanced that motivational control of food intake mainly involves the limbic system whereas the basal control of food intake mainly involves the hypothalamus. Norfenfluramine and its derivatives were less potent than fenfluramine on uptake and release of 5-HT but had similar weak actions like fenfluramine on ^{3}H-NA and ^{3}H-DA release in the hypothalamus and neostriatum respectively. The cortical NA nerve terminals however appear to be more sensitive to the releasing action of norfenfluramine and

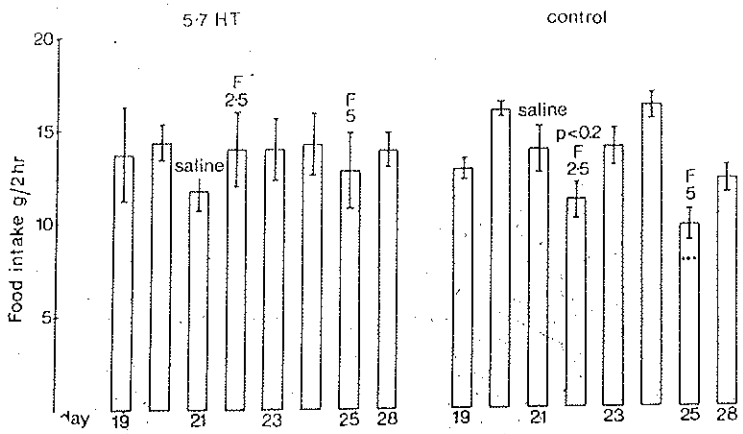

FIG. 6. *Effect of fenfluramine (F) on food intake in animals which had received 5,7-HT in the median raphe* (4 µg/4 µl) 3 *weeks earlier.* Control group received the solvent of 5,7-HT into the raphe. The animals were on a food deprivation schedule receiving food between 1 and 3 p.m. every day. The experiment started 19 days after the operation. Food intake was measured in g/2 hr. Means ± s.e.m. out of 5 rats in each group. Statistical significance according to Student's t-test. *** = $P < 0.001$.

operation, and when the scores are summed for both days there was a significant decrease of both the ambulation and rearing scores ($P < 0.1$ two sample rank test).

This difference could not be seen 14 days after the operation and seems to be time dependent.

Effects of fenfluramine on the rate of lever pressing in sham-operated and 5-HT lesioned animals (Table 7). Neither the sham-operated or 5,7-DHT lesioned animals showed any decrease in response rate on the FR-30 schedule after the operation. Furthermore, there was no significant difference between the two groups and their response rate after saline which ranged between 300 and 500 responses per 5 min.

Injection of fenfluramine (5 mg/kg i.p.) completely inhibited the lever pressings for food in both sham-operated and 5,7-DHT lesioned animals. Lower doses (2·5 and 1·25 mg/kg i.p.) partially blocked the response-rate of the sham-operated animals but strongly inhibited the response-rate of the 5,7-DHT lesioned animals.

The experiment was repeated the next day. There was a marked tolerance to fenfluramine in both sham-operated and 5,7-DHT lesioned animals.

There were no signs of overt sedation with the doses of fenfluramine used. The body temperature showed a slight drop of 0·5°C in some animals in both groups after fenfluramine.

Although the animals received a constant amount of food there was a significant lowering of the body weight after fenfluramine (Table 8), suggesting also the importance of metabolic effects of fenfluramine (Le Douarec and Neveu, 1970).

Discussion

The 5-HT neurons have been postulated as playing an important role in the mediation of the pharmacological actions of fenfluramine and its derivatives. The results from the present investigation further support this view.

Fenfluramine and norfenfluramine have been found *in vitro* to cause a marked release of stored 5-HT in cerebral cortex slices. Also there is a marked inhibition of 5-HT uptake.

However, since fenfluramine and norfenfluramine were very active on 5-HT release, it is difficult to know if the reduction of 5-HT uptake occurs secondary to a reduced 5-HT accumulation.

On the other hand, the biochemical studies *in vivo* and the functional experiments on the extensor reflex suggest that fenfluramine and norfenfluramine can act both on the 5-HT granules to cause release and at the nerve cell membrane to reduce 5-HT uptake. Thus, *in vivo* fenfluramine causes a 5-HT depletion as found in this and previous studies (Duhault and Verdavainne, 1967; Opitz, 1967), and it also enhances the depletion caused by H 22/54. These findings can be explained from the *in vitro* findings which showed a releasing action on the 5-HT granules. The mechanism for the 5-HT release is probably a displacement by fenfluramine and norfenfluramine of the 5-HT, since the functional

TABLE 8. Effect of fenfluramine on the body weight of sham-operated and 5,7-dihydroxytryptamine lesioned animals. Each figure represents the mean and S.E.M. of 5 animals

Treatment	Average body weight (g) before fenfluramine (7 days after operation)	P	Average body weight (g) after fenfluramine (14 days after operation)
Saline	266·0±2·9	<0·001	237·0±3·0
5,7-dihydroxytryptamine	277·0±4·6	<0·001	241·0±1·9

experiments suggest increased 5-HT receptor activity after fenfluramine, making a reserpine-like action unlikely. An action at the 5-HT nerve cell membrane is indicated by the fact that chlorimipramine, a potent 5-HT uptake blocking agent (Carlsson *et al.*, 1969), can block the fenfluramine and norfenfluramine induced increase in spinal 5-HT receptor activity. Also chlorimipramine antagonizes the 5-HT depletion caused by fenfluramine (Garattini *et al.*, 1975), and the anorexic action of fenfluramine (Jespersen and Scheel-Krüger, 1973). It thus seems that fenfluramine and norfenfluramine utilize the 5-HT membrane pump in order to get into the 5-HT neuron and displace the 5-HT stores. The studies on the extensor reflex further underlined the importance of the presynaptic actions of fenfluramine, since the increase in 5-HT receptor activity caused by fenfluramine was blocked by pretreatment with reserpine and H 22/54 and potentiated by nialamide, a monoamine oxidase inhibitor. The potentiation by nialamide can be due to several mechanisms, one being that under normal conditions the 5-HT released from the granules by fenfluramine will be attacked by intraneuronal monoamine oxidase, and therefore large amounts may be broken down before 5-HT can diffuse out of the cell and reach the 5-HT receptors. It has in fact been shown by Ziance and Rutledge (1972) that the NA released by fenfluramine has increased access to monoamine oxidase.

It may be pointed out that the fenfluramine derivatives, 780SE and 1513 were much less potent than fenfluramine and norfenfluramine on 5-HT release and uptake. These results were in agreement with the functional experiments on the spinal cord which suggested only weak increases of 5-HT receptor activity with high doses.

The studies on DA and NA uptake and release *in vitro* showed that fenfluramine and norfenfluramine had relatively weak effects on NA and especially on DA terminals. The cortical NA terminals appeared to be more sensitive to norfenfluramine and its derivatives (data not shown) than the hypothalamic NA terminals. Thus, it may be that the NA and DA granules are less sensitive to the releasing action of fenfluramine and/or it is not taken up as efficiently in these terminals as in the 5-HT terminals. In agreement with this view, the histochemical findings revealed no changes in DA and NA stores following fenfluramine and norfenfluramine treatment in a dose of 10 mg/kg. The histochemical findings further suggested that the cortical NA terminals were more sensitive to fenfluramine and norfenfluramine than the hypothalamic NA nerve terminals since the H 44/68 induced NA disappearance was enhanced in the cortex cerebri but not in the hypothalamus. Also the studies on the turning behaviour in experimental animals indicated that fenfluramine and norfenfluramine were only weak DA releasing agents and are thus in agreement with the biochemical and histochemical findings. It should be noted that 780SE had about the same potency as fenfluramine and norfenfluramine on NA release in hypothalamus in contrast to the findings with 5-HT release in the cortex cerebri. It is also of interest that the methane sulphonate of 780SE but not the hydrochloride, caused a significant reduction of 5-HT uptake and a significant release of 5-HT at concentrations as low as 10^{-7}M. It can be speculated that even if the experiments are performed *in vitro* 780SE and 1513 could partly act by being a precursor to hydroxyethylnorfenfluramine. Thus, it is possible that esterases in the slices could remove the benzoyloxy part of the molecule.

In view of the available evidence that fenfluramine acts by releasing granular stores of 5-HT (see above) it may seem paradoxical that the action of fenfluramine in the spinal cord was potentiated by treatment with 5,7-DHT which results in disappearance of the majority of the spinal cord 5-HT nerve terminals. However, it has been shown that the 5-HT receptors rapidly become supersensitive following degeneration of the 5-HT terminals (Fuxe *et al.*, 1974; Daly *et al.*, 1974; Nygren *et al.*, 1974), and recent findings suggest (Nygren *et al.*, 1974) that 5-HT can leak out from the remaining 5-HT nerve terminals to reach the supersensitive 5-HT receptors. It should also be pointed out that monoamine oxidase was inhibited in the present experiment which will protect the diffused 5-HT from being broken down before it reaches the 5-HT receptors. This explanation is also supported by the fact that when a complete 5-HT denervation is obtained, there are no signs of supersensitivity following nialamide-chlorimipramine treatment (Nygren *et al.*, 1974). It is

therefore assumed that the enhancement of the fenfluramine induced inhibition of food reward observed in the present experiment after 5,7-DHT induced lesion of the subcortical 5-HT pathway is best explained in a similar way, although no monoamine oxidase inhibitor was used. However, it may seem difficult to reconcile this hypothesis with the fact that inhibition of food intake in a free-feeding situation by fenfluramine was significantly reduced by the same type of lesion, which has been previously reported (Samanin *et al.*, 1972; Clineschmidt, 1973). It must be remembered that this lesion causes a 70% loss of 5-HT nerve terminals in the hypothalamus and a 30—50% loss of 5-HT terminals in the cortex cerebri (Fuxe and Jonsson, 1974; Everitt, Fuxe, Jonsson and Hökfelt, unpublished data). The CA neurons are relatively unaffected. Therefore, since extrahypothalamic influences mainly from the limbic cortex probably also play a role in the control of food intake (Grossman, 1973), it is possible to propose the following speculative explanation of the present results. The limbic and other cortical 5-HT terminals may mainly control the *motivational* aspects of food intake. Therefore, since the majority of these terminals still remained, 5-HT released by fenfluramine may easily reach the supersensitive limbic 5-HT receptors, and an enhancement of inhibition of food drive is obtained.

This mechanism also explains the rapid development of tolerance found, since the 5-HT stores even if only little depleted may not reach the supersensitive 5-HT receptors in sufficient quantities after fenfluramine. The hypothalamic 5-HT terminals, on the other hand, could be involved in the *basic* control of food intake regulated *e.g.* by glucostatic mechanisms. Therefore, since most of the hypothalamic 5-HT nerve terminals have degenerated, the fenfluramine induced inhibition of food intake in deprived animals is lost. This is in contrast to the case in the studies on the spinal 5-HT receptors where monoamine oxidase inhibition was performed. Had this been done in the study on food intake, an opposite result might have been expected according to the present hypothesis which must be tested by further experiments. Finally, it should be pointed out that lesions of the sub-cortical 5-HT pathway did not result in hyperphagia although this has recently been reported to occur following lesions of the ventral NA pathway to the hypothalamus and other subcortical structures (Ahlskog and Hoebel, 1972). This lesion was found by these workers to counteract amphetamine-induced anorexia.

The subcortical 5-HT pathway may also be involved in control of exploratory behaviour. Thus, rearing and ambulation may be reduced during the first 2–4 days following the operation.

Acknowledgments

The mechanism of action of fenfluramine

S. GARATTINI W. BUCZKO

A. JORI R. SAMANIN

Istituto di Ricerche Farmacologiche 'Mario Negri', Via Eritrea 62–20157 Milano, Italy

Summary

Fenfluramine and amphetamine exert different actions on central biogenic amines. Neither drug alters the concentration of dopamine (DA) in the rat striatum but both drugs increase striatal homovanillic acid levels with opposite stereoisomeric specificity and by different mechanisms. The evidence presented suggests that fenfluramine blocks the DA receptors, whereas amphetamine acts indirectly presynaptically to stimulate the release of DA from dopaminergic terminals. Thus a similar biochemical effect is achieved by completely opposite mechanisms.

Neither fenfluramine nor amphetamine change the concentration of acetylcholine in whole brain. Fenfluramine and norfenfluramine though not amphetamine lower brain 5-hydroxytryptamine(5HT) and 5-hydroxyindole acetic acid. The results with fenfluramine on release and uptake of ^{14}C 5HT in platelets suggest that this drug acts on 5HT stores by 2 different mechanisms, these being a release of 5HT and inhibition of 5HT uptake.

The results of brain amine manipulations on the anorectic actions of fenfluramine and amphetamine suggest that these two drugs induce anorexia in animals by different mechanisms. An intact serotonergic system appears to be necessary to permit fenfluramine

anorexia by a release of 5HT, whilst the catecholaminergic pathways appear to be involved in amphetamine anorexia.

Introduction

Fenfluramine is an anorectic drug which, being different from amphetamine at the biochemical, pharmacological and behavioural levels, has represented a useful research tool for unmasking the complex mechanisms involved in the regulation of food intake.

Previous work from these laboratories has shown several effects of fenfluramine at the central as well as the peripheral level (Bizzi *et al.*, 1970; Garattini *et al.*, 1974a). This review is devoted to summarizing the present knowledge of the action of fenfluramine on brain monoamines with particular reference to dopamine (DA) and serotonin (5HT).

Table 1 shows that fenfluramine and amphetamine exert different effects on central biogenic amines. While neither drug affects the concentration of DA in the striatum or of acetylcholine in the whole brain, an opposite effect can be seen on noradrenaline (NA) and 5HT levels. In fact, amphetamine, but not fenfluramine, lowers brain NA, while fenfluramine but not amphetamine decreases brain 5HT.

Studies on striatum dopamine

The fact that the concentration of a given biogenic amine is not affected by a given drug does not necessarily mean a lack of activity. Both amphetamine and fenfluramine (Jori and Bernardi, 1969, 1972) have been shown to increase the concentration of the major metabolite of DA in the striatum, namely homovanillic acid (HVA). However, the actions of the two drugs do not appear comparable according to a number of observations, which may be summarized as follows:

(a) In the case of fenfluramine, the effect on striatum HVA is higher for the l- than for the d-isomer, whereas the opposite is true for amphetamine (Jori *et al.*, 1973). These differences in action do not appear to be related to major differences in the availability of the two drugs to the dopaminergic structures in the striatum. In this respect it should also be mentioned that fenfluramine does not appear to act on striatum HVA through the formation of its major metabolite, norfenfluramine, because norfenfluramine appears to be less active at equal concentrations (Jori *et al.*, 1973).

(b) Repeated treatments with d-amphetamine induce a tolerance to the increase of striatum HVA (Jori and Bernardi, 1969), whereas fenfluramine is still able to elicit a rise of striatum HVA, suggesting that it may act at a different site (Jori and Bernardi, 1972). Conversely, rats pretreated with l- or dl-fenfluramine are still able to respond to d-amphetamine as far as HVA in the striatum is concerned. These findings are summarized in Table 2.

(c) Previous studies from these laboratories have indicated that C3H mice are relatively insensitive to the stimulant action of amphetamine (Dolfini, Garattini and Valzelli, 1969; Dolfinini *et al.*, 1970) although these mice react to this drug with a decrease of food intake (Jori and Garattini, 1973). Amphetamine does not show in this strain of mice any effect on striatum HVA at doses effective in the CD_1 strain (Caccia *et al.*, 1973). As shown in Table 3, fenfluramine however increases the level of striatum HVA in both strains of mice. Other drugs, such as chlorpromazine and haloperidol which increase the levels of striatum HVA by inhibiting dopaminergic receptors and, therefore, eliciting an increased turnover of DA by a feedback mechanism (Da Prada and Pletscher, 1966), are also effective in both strains of mice.

(d) The difference in the mechanism by which fenfluramine or amphetamine raise striatum HVA can also be studied by the interaction with dopaminergic stimulant drugs. It is known that apomorphine (Ernst, 1967; Andén *et al.*, 1967) and piribedil (Corrodi, Fuxe and Ungerstedt, 1971; Jori *et al.*,

TABLE 1. Effect of amphetamine and fenfluramine on rat brain monoamines

HVA was measured according to Korf *et al.* (1971).

1974a; Garattini *et al.*, 1974b) by stimulating dopamine receptors reduce, by a feedback mechanism, the synthesis of DA and therefore the level of striatum HVA. Table 4 summarizes the results obtained by combining apomorphine or piribedil with either amphetamine or fenfluramine. While the increase of HVA induced by fenfluramine is antagonized by dopaminergic agents, the effect of amphetamine remains unchanged (Jori *et al.*, 1974b). These studies suggest that only fenfluramine may interact with DA receptors while amphetamine is acting only indirectly through its well-known capacity to release DA from presynaptic dopaminergic terminals.

(e) More direct proof that fenfluramine may interact with dopaminergic receptors is offered by studies showing that this drug antagonizes the stereotyped behaviour induced by agents currently believed to induce this behaviour through stimulating DA receptors directly (Ernst, 1967; Andén *et al.*, 1967) as well as indirectly (Glowinski, 1970) by releasing DA at the presynaptic level. Table 5 shows that fenfluramine inhibits the stereotypy induced by apomorphine, piribedil and amphetamine at a dose similar to the one effective in increasing striatum HVA. Due to the variety of chemical structures involved, it is unlikely that the interaction observed is occurring unspecifically. It should also be remembered that, if anything, fenfluramine is known to increase the brain levels of amphetamine (Jonsson, 1972; Jonsson and Gunne, 1972). These and other data available in the literature permit a tentative interpretation of the action of amphetamine and fenfluramine on the striatum. According to the scheme suggested in Fig. 1, amphetamine increases the levels of HVA by releasing DA and therefore inducing a compensatory increase in synthesis of DA in the striatum. Thus amphetamine is considered to be a stimulant of the dopaminergic system (Glowinski, 1970). Fenfluramine however acts by a mechanism common to the neuroleptic drugs (Jori *et al.*, 1974b), because the increase of striatum HVA would be the consequence of the blockade of dopaminergic receptors which elicits, by a feedback action, an increase of dopamine synthesis. Fenfluramine should, therefore, be considered as an inhibitor of the dopaminergic system (Jori *et al.*, 1974b). It is of interest to observe how compounds with a similar chemical structure eliciting a similar biochemical effect (increase of striatum HVA) may eventually act in a completely opposite manner.

Studies on brain serotonin

It is well known that fenfluramine lowers the level of brain 5HT (Duhault and Verdavainne, 1967; Opitz, 1967; Costa, Groppetti and Revuelta, 1971) by a mechanism which is not yet fully elucidated and, in any case, it appears to be different from the action exerted by other drugs. In fact, fenfluramine decreases not only brain 5HT but also the major metabolite of 5HT, namely 5-hydroxyindoleacetic acid (5HIAA) (Garattini, 1973). Chase and Shoulson (1975) have also observed that fenfluramine

TABLE 3. Effect of various drugs affecting the HVA concentration in the striatum of CD_1 and C3H mice

reduces by about 50% the levels of 5HIAA in the cerebrospinal fluid of neurological patients. The effect on brain 5HT and 5HIAA is dose-dependent in rats (Garattini, 1973) and occurs in all the parts of the brain (Ghezzi *et al.*, 1973) although quantitative regional differences have been reported (Costa *et al.*, 1971). No major difference exists between the d- and the l-isomers of fenfluramine in lowering brain indoleamines (Garattini *et al.*, 1974). Also the metabolite of fenfluramine, norfenfluramine, has the capacity to decrease brain 5HT (Morgan, Löfstrandh and Costa, 1972; Garattini *et al.*, 1974) and it may contribute to the long-lasting effect of fenfluramine. However, fenfluramine acts *per se*, shown by the fact that equal lowering of brain 5HT may be obtained when the N-deethylation of fenfluramine is blocked by a previous treatment with SKF525A, a known inhibitor of liver microsomal enzymes (Axelrod, Reichentral and Brodie, 1954; Stitzel, Anders and Mannering, 1966) (Table 6).

As previously mentioned, the mechanism of action of fenfluramine on brain 5HT remains unknown since there is no simple mechanism to explain its action. The only compounds known to lower simultaneously 5HT and 5HIAA in the brain are the inhibitors of 5HT synthesis, such as p-chloroamphetamine (Sanders-Bush and Sulser, 1970a, b) and p-chlorophenylalanine (Koe and Weissman, 1966). However, there is no proof that fenfluramine inhibits 5HT synthesis. On the other hand it has been shown that although the levels of 5HT are lowered, the turnover of 5HT is increased (Costa *et al.*, 1971). Consistent with this finding is the observation that fenfluramine does not block tryptophan hydroxylase (Morgan *et al.*, 1972), while it does increase the brain levels of tryptophan (Tagliamonte *et al.*, 1971; Morgan *et al.*, 1972) which are believed to be rate limiting for 5HT synthesis.

Work on isolated platelets, as a possible model for nerve-endings with respect to their serotonin uptake system (Pletscher, 1968; Todrick and Tait, 1969) has shown that fenfluramine rapidly inhibits the uptake of ^{14}C–5HT. Fig. 2 shows that d-fenfluramine, particularly in the first few minutes, is a strong inhibitor, although the concentrations required are considerably higher than for chlorimipramine, a well-known inhibitor of 5HT uptake (Carlsson *et al.*, 1969; Todrick and Tait, 1969; Lidbrink, Jonsson and Fuxe, 1971). In addition, Tables 7 and 8 show that the effect of fenfluramine is dose-dependent and that fenfluramine is more effective than its metabolite, norfenfluramine. The inhibition of the 5HT uptake may explain why fenfluramine lowers brain 5HIAA since it is currently believed that most of the oxidative deamination of 5HT occurs intraneuronally (Blaschko and Levine, 1966).

However, other experiments indicate that, unlike chlorimipramine, fenfluramine is able to release 5HT from platelets which have previously been incubated with ^{14}C–5HT. These results, summarized in Table 9, taken together with the inhibition of 5HT uptake,

TABLE 5. Effect of dl-fenfluramine and chlorpromazine (CPZ) on the stereotypy induced by amphetamine, apomorphine and piribedil in rats

Treatment (mg/kg i.p.)		Stereotypy (mean score±SEM) induced by Amphetamine	Apomorphine	Piribedil
Saline		3·3±0·2	3·7±0·1	2·2±0·2
dl-fenfluramine	10	0·5±0·2**	0·8±0·2**	1·0±0·001*
CPZ	5	1·6±0·5**	1·0±0·3**	1·2±0·2*

Each figure is the mean score±SEM of 4–6 animals.
dl-Fenfluramine and CPZ were injected 30 min before d-amphetamine

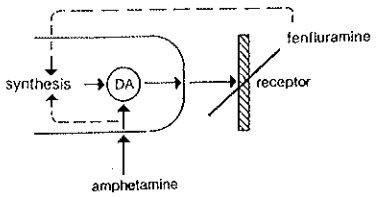

FIG. 1. Proposed mechanism of action of fenfluramine or amphetamine on the dopaminergic system. Amphetamine releases dopamine from nerve terminals by acting directly at the presynaptic level, whereas fenfluramine would produce an increase of dopamine synthesis through a feed-back mechanism due to the blockade of postsynaptic dopamine receptors.

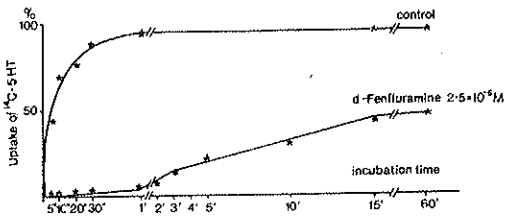

FIG. 2. Influence of d-fenfluramine ($2{\cdot}5 \times 10^{-5}$M) on the uptake of ^{14}C-serotonin (0·5 μg) by rat blood platelets.

suggest that fenfluramine decreases the stores of 5HT by two different mechanisms, i.e. release of 5HT and inhibition of 5HT uptake. Similar data have been obtained by Fuxe *et al.*, (1975) working with brain slices of rats. The following further data may help to elucidate the action of fenfluramine. It was observed that chlorimipramine prevents the effect of fenfluramine on the brain 5HT stores (Ghezzi *et al.*, 1973). The fact that this interaction may be related to the capacity of chlorimipramine to block 5HT uptake is suggested by the following findings:

(a) Chlorimipramine does not induce major changes in the levels of fenfluramine or norfenfluramine in the brain (Ghezzi *et al.*, 1973).

(b) Chlorimipramine does not inhibit the increase of striatum HVA induced by fenfluramine (Garattini, 1973).

(c) Other tricyclic antidepressant agents (imipramine and desipramine) which are more effective inhibitors of NA than 5HT uptake do not prevent the action of fenfluramine on brain 5HT (Ghezzi *et al.*, 1973).

It is, therefore, suggested that chlorimipramine may prevent the access of fenfluramine to the serotonergic terminals, inhibiting in this way the depletion of brain 5HT.

Significance of the effect on serotonin to explain the anorexic effect of fenfluramine

Several data indicate that by manipulating brain monoamines it may be possible to affect the anorectic action exerted by amphetamine or fenfluramine.

Table 10 reports three experimental conditions which are able to affect selectively the various monoaminergic pathways. The lesion of the midbrain raphe (MR) induces degeneration of the serotonergic projections (Andén *et al.*, 1965) to the forebrain (Kostowski *et al.*, 1968). This effect is consistent with the marked lowering of forebrain 5HT occurring without any change of brain NA or DA (Samanin *et al.*, 1972). The intraventricular administration of 6-OH-dopamine (6-OH-DA), on the other hand, induces a degeneration of the noradrenergic terminals and a partial degeneration of the dopaminergic ones (Samanin *et al.*, 1972), leaving the levels of brain 5HT unaltered. When the treatment with 6-OH-DA is preceded by the administration of the monoamine oxidase inhibitor, pargyline, there is a destruction of both noradrenergic and dopaminergic terminals (Breese and Taylor, 1971) without any effect on 5HT.

Table 11 shows that fenfluramine-induced anorexia does not occur in rats with MR lesions, while it is fully present in the other two experimental conditions where the noradrenergic and/or dopaminergic systems were degenerated. On the contrary, amphetamine partially loses its capacity to decrease food intake in animals treated with pargyline and

6-OH-DA while it is still effective in animals with MR lesions or following the intraventricular administration of 6-OH-DA. These data again show that amphetamine and fenfluramine induce anorexia by different mechanisms suggesting that fenfluramine may act via a release of 5HT.

In Table 12 it is shown that the anorectic effect of fenfluramine is also inhibited by chlorimipramine and by methergoline, a blocker of serotonergic receptors (Ferrini and Glässer, 1965). While chlorimipramine inhibits the lowering effect of fenfluramine on brain 5HT, methergoline, as expected, does not show any action on this biochemical effect (Table 13). These last results are in agreement with a number of data reported in the literature. In fact, several 5HT antagonists inhibit the anorectic effect of fenfluramine (Funderburk *et al.*, 1971; Jespersen and Scheel-Krüger, 1973), but do not affect the action of amphetamine (Jesperson and Scheel-Krüger, 1973). Furthermore, another agent known to destroy the serotonergic central terminals, 5,6-dihydroxytryptamine (Baumgarten and Lachenmayer, 1972), has been reported to abolish the anorectic effect of fenfluramine (Clineschmidt, 1973).

All these findings strongly suggest, although they do not conclusively prove, that fenfluramine induces in animals a reduction of food intake by a mechanism which is different from the one currently ascribed to amphetamine. It is possible that 5HT is somewhat involved in the action of fenfluramine and that, in any case, an intact serotonergic system is necessary to permit the anorectic effect of this drug. If this hypothesis should be confirmed by future studies, it will become apparent that the regulation of food intake is under the control of several systems not necessarily involving only the ventromedial nucleus and the lateral hypothalamus (Rabin, 1972) or the

TABLE 10. Forebrain levels of noradrenaline (NA), dopamine (DA) and serotonin (5HT) in midbrain raphe (MR)-lesioned, 6-hydroxydopamine (6-OH-DA) treated or pargyline + 6-OH-DA treated rats

	Brain amines (μg/g ± S.E.)

TABLE 11. Effect of fenfluramine or amphetamine on food intake of midbrain raphe (MR)-lesioned, 6-hydroxydopamine(6-OH-DA)-treated or pargyline + 6-OH-DA-treated rats

Treatment	mg/kg i.p.	Control	Experimental
MR Lesion

the effect of fenfluramine derivatives was not simply due to liver damage.

It is therefore concluded that fenfluramine derivatives significantly diminish the output of triglycerides by the liver, or from the splanchnic region, of the rabbit as measured by the plasma triglyceride response to protamine sulphate injection in the fed animal. This raises the possibility that the fenfluramine induced lowering of plasma triglycerides in man may be due to an effect on secretion by the liver. Unlike triton WR 1339, protamine sulphate, which is used therapeutically as an anti-heparin agent, may be administered to humans. Work is in progress to study the protamine response in humans in relation to hypertriglyceridaemia.

Pharmacological effects of 780SE (992) on hyperlipidaemic and obese rats

J. DUHAULT M. BOULANGER

L. BEREGI

Institut de Recherches Servier, 14 rue du val d'or, 92150, Suresnes, France

Summary

The effect of 10 days oral administration of 780SE, a fenfluramine analogue, was evaluated in four rat models of hyperlipidaemia. The models used were rats fed high lipid diet and high carbohydrate diets for three weeks, rats with alloxan induced diabetes for three weeks and 16-week-old genetically obese rats.

In both types of dietary induced hyperlipidaemia (neither of which were associated with obesity) the rats were markedly hypertriglyceridaemic, especially the high lipid diet animals. 780SE, in oral doses of 25 and 50 mg/kg significantly lowered triglyceride levels and free fatty acids, the effects being more pronounced at the higher dose level. Drug treated rats showed a slower weight gain.

In the alloxan diabetic rats, 780SE (25 mg/kg) lowered the raised serum triglycerides, free fatty acids and blood glucose.

In the genetically obese rats, 780SE (25 and 100 mg/kg) significantly reduced plasma triglycerides, and total lipids, especially at the higher dose. Cholesterol levels did not change significantly and plasma free fatty acids increased.

780SE orally administered for 10 days was thus associated with a reduction in plasma triglycerides to near control concentrations in each of the four experimental models. The effects on serum cholesterol were slight. The hyperlipidaemic action of 780SE does not appear to depend upon the amount of exogenous fat. Whether the mechanism of action is a decrease in lipid synthesis and/or an increase in lipid utilization requires further elucidation.

Introduction

Disorders of lipid metabolism are now well established as playing a role in the pathogenesis of

many forms of cardiovascular disease, although only one of many factors. From a pharmacological aspect, it is however the one which is most easy to study. In a previous paper (Duhault and Malen, 1969), we have shown that a new compound, 780SE, is able to lower plasma triglyceride levels in normal rats and to modify the composition of plasma free fatty acids. Because of this, the effect of 780SE on blood lipids has been further studied in four animal models of hyperlipidaemia using high lipid diets, high carbohydrate diets, rats with experimental diabetes and genetically obese rats.

An increase in the carbohydrate content of the diet of normal humans and rats produces a progressive rise in the serum triglycerides, possibly due to an increase in hepatic lipogenesis. Since hyperlipidaemia frequently accompanies diabetes mellitus, the diabetic rat model, which has been shown to have endogenous and exogenous types of hyperlipidaemia was used (Schnatz, Formaniak and Chlouverakis, 1972; Duhault *et al.*, 1972b). The raised free fatty acids and triglycerides in the diabetic rat are probably of endogenous origin and represent an indispensable substrate for the formation of triglyceride and cholesterol in the liver (Feigelson *et al.*, 1961).

Rats homozygous for the mutant gene (fa) have genetically determined metabolic disorders such as obesity, hyperlipidaemia and hypercholesterolaemia (Zucker and Zucker, 1961), It has been reported that 'fatties' have a lipid distribution like that in human hyperlipidaemia (Zucker, 1965). Obesity and hyperlipidaemia seen in the fatty rat may more closely parallel certain types of human obesity in which adiposity is related to increased cell numbers and cell size, than does experimental obesity produced by hypothalamic lesions. Thus these rats also seem to be a suitable model for the investigation of anti-obesity and hypolipidaemic drugs.

Materials and methods

Male Sprague-Dawley rats delivered by caesarian section and weighing 175–200 g were fed *ad libitum* for three weeks either with a standard diet, a high lipid diet or a high sucrose diet (Table 1).

Male Sprague-Dawley rats weighing 150 g were made diabetic by subcutaneous injection of alloxan monohydrate as previously described (Duhault and Lebon, 1972a). Daily insulin injection was adjusted for glycosuria ++ or +++ (Tes-tape) and stopped eighteen hours before sacrifice. The diabetic animals were killed three weeks after the alloxan injection. All the rats had free access to food. In the drug treated animals, oral 780SE was given in doses of 25 and 50 mg/kg daily at 4.30 p.m. for ten days and the animals killed at 10.00 a.m., one hour after an additional dose.

Genetically obese male and female rats ('fatties') (Zucker and Zucker, 1961) were also studied. The 'fatties', sixteen weeks old, were trained to eat their food in a seven hour diurnal period. In order to eliminate the anorectic effect, 780SE was given orally after feeding in doses of 25 and 100 mg/kg for 10 days. Tap water was allowed *ad libitum*.

Chemical analyses were performed on individual blood samples obtained by decapitation of all the unanaesthetized animals. Blood glucose (Hoffman, 1937) and free fatty acids (FFA) (Dole, 1957) were measured using a Technicon auto-analyser. After removal of phospholipds with 'zeolith' (hydrated alkali-aluminium silicate), serum triglycerides were measured according to Van Handel and Zilversmit (1965) and serum cholesterol by the procedures of Lieberman-Burchard, modified by Huang *et al.* (1961) and adapted for the Technicon autoanalyser by Levine, Morgendtern and Ulastelica (1967). Total blood lipids were determined by a precipitation method using dextran sulphate on the Technicon auto-analyser. Serum insulin was assayed by a radio-immunoassay technique (Wide and Porath, 1966).

Epididymal fat pads were excised and weighed. In some experiments, the diameter of fat cells from perirenal adipose tissue (or the proximal part of the epididymal fat pads) was measured according to the

histological method of Sjörnström, Björntorp and Vrana (1971).

Results

1. *Dietary induced hyperlipidaemia* (*Table* 2)

Control rats fed the high lipid diet or the carbohydrate diet had somewhat smaller fat-pad weight than normal controls fed the standard diet. The difference was not statistically significant, but could be related to a somewhat slower weight gain shown by these rats. This may be a consequence of an unbalanced diet as the rats on these diets were consuming less protein than rats on control diets. The rats fed the high fat diet were markedly hypertriglyceridaemic with a mean serum triglyceride level of 255 mg/100 ml compared with 73 mg/100 ml for normal controls. Free fatty acids (FFA), always much higher in the fat fed group than in the control group, were probably of alimentary origin. Total blood lipid was also markedly increased but serum cholesterol levels were not changed. Plasma insulin showed a small but non-significant increase.

780SE (Table 3) significantly reduced the triglycerides and FFA, especially at 50 mg/kg. Plasma cholesterol levels were slightly reduced in the high carbohydrate fed group. 780SE treated rats had significantly smaller fat-pad weight and showed a slower weight gain compared with the controls.

2. *Alloxan diabetic rats*

As shown in Table 4, long-term diabetic rats showed a significant increase in plasma glucose, FFA and triglycerides, when compared with normal non diabetic controls. The diabetic rats grew more slowly than the normal group. Oral administration of 780SE (25 mg/kg) for 10 days significantly lowered plasma glucose triglycerides and cholesterol.

*** $P < 0{\cdot}001$.

3. *Genetically obese rats* (*Table 5*)

Female 'fatties' were relatively much fatter than male 'fatties'. In the fed state, serum lipids were above normal but triglycerides and total lipids levels were higher in females (respectively 283 ± 69 and 877 ± 222 mg/100 ml), than in males (respectively 247 ± 50 and 535 ± 76 mg/100 ml). This difference was not seen in fasted animals. Plasma insulin was twice as high in the 'fatties' compared with the controls. However, because of the abnormal feeding schedule, the weight gain in the 'fatties' was less than that obtained by free access to food in 24 hr periods.

The degree of obesity is shown by the weight of the abdominal and epididymal fat tissue. As the growth of the fat depots in the non-obese Zucker rat is quite similar to that reported for the Sprague-Dawley animals (Hirsch and Han, 1969), these latter were used as controls because of lack of lean heterozygote (fa-) rats. Perirenal fat cells were significantly larger than those of normal rats.

'Fatties' had a very low sensitivity to the anorectic effects of 780SE. The data presented in Table 6 shows the effect of a 10 day oral 780SE administration (25 and 100 mg/kg) when compared with control fatty animals of both sexes. Plasma FFA were significantly increased in male and female 'fatties', whereas plasma triglycerides and total lipid were decreased. The epididymal fat pads and body weight gain were markedly reduced by 780SE, all these effects being more evident after the higher dose.

Discussion

The data presented in this paper show that after a ten day administration of 780SE, plasma triglyceride levels were reduced to near control concentrations in the four experimental models. It is interesting to note that in genetically obese rats, females were more responsive to the drug than males. The effect of 780SE on serum cholesterol was slight. While a decrease in cholesterol concentration was observed on the high carbohydrate diet and in alloxan diabetic rats, a slight increase was noted in high lipid diet animals and in 'fatties'.

The effects of 780SE on serum lipids suggest that the influence of the drug does not depend only on the amount of exogenous fat. Recent evidence by Garattini and ourselves (unpublished results) suggests that 780SE decreases the absorption of endogenous fat. This effect could be mediated by pancreatic lipase inhibition as described *in vitro* (Bernier, personal communication). Such a mode of action cannot

explain the simultaneous decrease in FFA and triglyceride noted in diabetic rats, genetically obese rats and in rats on a carbohydrate diet. These data suggest an increase of lipid utilization and/or a decrease of the endogenous lipid synthesis, possibly by inhibition of phosphatidate phosphohydrolase, (Brindley and Bowley, 1974) or by inhibition of liver triglyceride production (Kaye, Galton and Tomlin, 1974). Since FFA represent an indispensable substrate for the formation of triglycerides and cholesterol in the liver, it is important to underline that a ten day administration of 780SE does not induce triglyceride deposition in the liver (Duhault and Malen, 1969). Removal of plasma triglyceride by adipose tissue with high lipoprotein lipase activity might be suggested, but this hypothesis would need an increase of lipid turn-over with subsequent utilization since administration of 780SE reduces fat stores. In this regard, diabetic rats which had low adipose tissue and high lipoprotein lipase activity did not present additional lost weight under treatment. On the other hand a decrease of plasma insulin albeit not statistically significant was noted in 'fatties'. As blood lipids are known to induce insulin resistance (Randle, Garland and Hales, 1966), it seems to us that the decrease in plasma insulin was due to the important blood lipid lowering effect of 780SE.

The hypoglycaemic effect of 780SE, observed in alloxan diabetic rats is however not readily explicable [illegible] not induce insulin secretion as do mechanism of action of 780SE as a hypolipidaemic drug and as a glucose lowering agent needs further elucidation.

Discussion

Chairman: MR D. B. CAMPBELL

Sessional Secretaries: MISS S. MACRAE, MR. C. H. L. PARKER

DR ASMAL (Natal) said that insulin is known to play a most important role in carbohydrate induced hypertriglyceridaemia, and he wondered therefore if DR BRINDLEY knew whether insulin exerts any influence on the enzyme phosphohydrolase. He suggested that fenfluramine and its analogue 780SE exert their effects by suppressing insulin secretion.

DR BRINDLEY said that we know little about these enzymes, but it is possible that insulin may reduce the synthesis of the phosphohydrolase although there is no direct evidence to support this.

DR BRINDLEY wondered to what extent fatty acid synthesis is governed by the activity of the synthetase and the acetyl-CoA-carboxylase, and to what extent fluctuations of, for example, the levels of citrate and other metabolites might influence the activity of carboxylase.

PROFESSOR LOWENSTEIN (Waltham) said that the enzymes involved in fatty acid synthesis do not respond rapidly in terms of changes of level. The enzymes involved in cholesterol synthesis, in particular HMG-Co-A reductase, show a very rapid response. There is a 50% loss in the total amount of reductase within approximately 4 hr. It is possible therefore that changes in enzyme level play a part in the control of cholesterol synthesis. He said his work with metabolite levels was incomplete and he could not give a definite answer.

DR BALASSE (Brussels) wondered whether Dr Duhault

DR BALASSE said that he had carried out studies which confirmed the results which Dr Duhault had presented and that he was convinced that fenfluramine, 780SE and amphetamine can decrease the absorption of triglyceride from the intestine, though he had been unable to demonstrate a similar effect on the absorption of cholesterol. He believed that there was a small decrease in plasma cholesterol levels when fenfluramine and 780SE are given to both animals and patients.

PROF. GARATTINI (Milan) said that he had seen a decrease in the absorption of triglycerides from the gut and that fenfluramine may inhibit the enzyme pancreatic lipase and the enzyme which re-esterifies the fatty acid with monoglyceride in the intestine.

MR MILLER (London) said that when comparing normal animals with obese, the total metabolic activity would be very different.

PROF. LOWENSTEIN agreed that the obese have a much higher rate of fatty acid production, largely due to their bigger livers.

DR BEREGI (Paris) said he wished to comment on the important difference between obese and normal animals with respect to drug kinetics as in the obese animal there is 50% more fenfluramine in plasma, liver and brain than in the normal animals given the same dose of fenfluramine in mg/kg body weight.

LES LABORATOIRES SERVIER

Neuilly, le 14 Novembre 1977

Monsieur Jean WEBER
Directeur de la Pharmacie et des Médicaments
9 Avenue de Lowendal
75007 - P A R I S -

Objet : Inscription du BENFLUOREX (MEDIATOR) au tableau A des substances vénéneuses. (Arrêté du 1/9/77 publié au Journal Officiel du 29/9/77).

Monsieur le Directeur,

Nous avons pris connaissance avec un certain étonnement de l'Arrêté sous référence qui modifie l'inscription de notre spécialité pharmaceutique "MEDIATOR" au tableau des substances vénéneuses.

Le MEDIATOR dont l'autorisation de mise sur le marché sous les numéros : 317 553.3 - 317 555.6 - 317 556.2 - 317 557.9 - 317 558.5 - 317 559.1 a été accordée le 16 Juillet 1974, est inscrit depuis cette date au tableau C.

Les indications thérapeutiques de notre spécialité étayées par le dossier pharmacologique et clinique soumis lors de notre demande d'A.M.M. et approuvées par le Ministère de la Santé et de la Sécurité Sociale comme l'atteste l'A.M.M. ci-joint (annexe 1) sont les suivantes :

- Troubles métaboliques glucido-lipidiques athérogènes
- Troubles du métabolisme des lipides
- Troubles du métabolisme des glucides.

.../...

Annexe 1-15

Or, nous constatons que le Benzoate de{[méthyl-1 (trifluorométhyl-3 phényl) -2 éthyl] amino} -2 éthyle, chlorhydrate ou BENFLUOREX, Principe Actif de notre spécialité est, d'après l'Arrêté du 1/7/77, classé au tableau A.
N'ayant pas été consultés avant cette prise de position à nos yeux injustifiée, nous nous devons de rappeler à votre haute attention les qualités profondément originales du MEDIATOR qui constituent une véritable découverte sur le plan thérapeutique.

Par la tripolarité de son action

- hypolipémiante
- antihyperglicémiante
- hypouricémiante

dont le mécanisme est brièvement rappelé ci-contre (annexe 2), le MEDIATOR se présente comme la médication de choix d'une pathologie métabolique complexe et sévère.

A cet égard, le MEDIATOR permet de supprimer le recours aux associations thérapeutiques toujours susceptibles d'entraîner des interactions médicamenteuses indésirables et par là même, répond aux soucis bien actuels de pharmacovigilance et d'économie de traitement.

Malgré la parenté relative de sa structure chimique avec celle de la FENFLURAMINE le BENFLUOREX est une molécule originale douée de propriétés métaboliques et cliniques fondamentalement distinctes de cette substance et, par voie de conséquence, dénuée des actions anorexigènes et amphétaminomimétiques reprochées aux autres produits visés par l'Arrêté du 1/9/77.

En tout état de cause, il a été prouvé que les deux substances donnent naissance à des produits de dégradation essentiellement différents.
La FENFLURAMINE est métabolisée par déséthylation en une amine primaire oxydée secondairement en acide métatrifluorométhylhippurique, tandis que le BENFLUOREX est hydrolysé dans cette fonction ester en libérant un alcool primaire ultérieurement oxydé en acide métatrifluorométhylisopropylaminoacétique (annexe 3).

En outre, les analyses spécifiques de nos chercheurs n'ont, à aucun moment du processus de métabolisme du BENFLUOREX, mis en évidence de traces de FENFLURAMINE.

.../...

Annexe 1-15

A la lumière de ces informations, nous vous prions de bien vouloir accepter notre demande de recours par laquelle nous sollicitons l'abrogation du Paragraphe VII de l'Article 1 de l'Arrêté du 1/9/77 et la réinscription de notre spécialité MEDIATOR au tableau C des substances vénéneuses.

Nous restons à votre entière disposition pour vous fournir tout élément complémentaire de justification, et vous prions de croire,
Monsieur le Directeur, à l'expression de notre haute considération.

SERVIER

LES LABORATOIRES SERVIER

RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

Le 3 décembre 2010

Cher Confrère,

Au nom des collaborateurs des Laboratoires Servier, je souhaiterais vous dire à quel point nous partageons votre émotion et celle de vos malades, devant le déferlement d'une campagne médiatique sans précédent qui vise notre spécialité Mediator® (benfluorex) alors qu'elle n'est plus commercialisée depuis fin novembre 2009. Au-delà des multiples contre-vérités qui ont pu être avancées par certains médias, nous sommes particulièrement sensibles à l'inquiétude ressentie par les malades et leurs familles. Ce d'autant que les atteintes valvulaires sont fréquentes dans la population générale, d'origine dégénérative le plus souvent, et que leur prévalence augmente avec l'âge et le diabète.

Mediator® est un antidiabétique oral mis à la disposition du corps médical depuis 1976. De nombreuses études ont démontré son efficacité : diminution de la glycémie à jeun et baisse d'environ 1 point de l'hémoglobine glyquée HbA1c, associées à un effet favorable sur le profil lipidique (baisse des triglycérides, du cholestérol total et LDLc).

Ces dernières années trois nouvelles études internationales multicentriques randomisées et contrôlées en double aveugle ont permis de confirmer cette efficacité selon les standards internationaux les plus récents et les plus rigoureux chez plus de 1500 patients.

Dans la première étude (1), l'efficacité antidiabétique et la tolérance de Mediator® ont été comparées, à double insu, à celles du placebo et de la metformine chez des diabétiques de type 2 mal équilibrés par le régime seul. Dans une deuxième étude (2), elles ont été évaluées contre placebo, chez des diabétiques insuffisamment contrôlés par des sulfamides hypoglycémiants. Ces deux études ont montré que Mediator® abaissait de 0,8 à 1 point l'HbA1c, diminuait la glycémie à jeun, par rapport au placebo, avec une amélioration du profil lipidique, et une bonne acceptabilité clinique. En particulier, il n'y a pas eu d'hypoglycémie, pas d'acidose lactique, pas d'impact sur la fonction hépatique ou rénale, pas de variation cliniquement signifiante du poids, et pas d'effet indésirable émergent autre que des effets classiquement connus (essentiellement des troubles digestifs).

A la suite des résultats de ces deux études, et dans le but de préciser la place de Mediator® dans la stratégie thérapeutique, en 2005, une troisième étude a été mise en place, REGULATE (3), comparant l'efficacité antidiabétique de Mediator® à celle de la pioglitazone, chez des diabétiques de type 2 insuffisamment contrôlés par des sulfamides hypoglycémiants. Dans le cadre de cette étude, 847 malades ont été recrutés et traités pendant un an. Comme dans tout essai, une surveillance approfondie des événements indésirables a été réalisée, avec notamment un suivi cardiologique comprenant des échocardiographies qui ont été analysées de façon centralisée et en aveugle des traitements.

Cette étude confirme l'efficacité à un an du benfluorex en association aux sulfamides sur le contrôle glycémique, avec une meilleure efficacité de la pioglitazone sur l'équilibre glycémique mais une efficacité supérieure du benfluorex sur le profil lipidique (triglycérides, cholestérol LDL) et sans prise de poids.

Les résultats échocardiographiques de l'étude REGULATE, disponibles lors de l'été 2009, ont montré pour leur part :

- que 51 % des patients diabétiques présentaient à l'inclusion, et donc avant la mise en route du traitement par benfluorex ou pioglitazone, des altérations morphologiques valvulaires sans retentissement clinique hémodynamique, et que 84 % présentaient déjà des anomalies valvulaires fonctionnelles (régurgitations de grade 1 dans la majorité des cas) ;

- une incidence des modifications valvulaires fonctionnelles (de grade 1, non symptomatiques), plus importante sous benfluorex que sous pioglitazone (26 % vs 10 %, p<0,0001), essentiellement chez des malades ayant des anomalies pré-existantes. Des régurgitations incidentes de grade >1 ont été détectées chez 2 malades sous benfluorex (0,7 %) et 3 malades sous pioglitazone (1 %). Quant aux altérations morphologiques nouvellement observées, elles ont concerné 8 malades du groupe benfluorex et 4 du groupe pioglitazone.

Ces résultats disponibles et validés par les experts de l'étude (en septembre 2009), ont été communiqués à l'AFSSAPS (à la Commission Nationale de Pharmacovigilance), dans le cadre de la réévaluation du rapport bénéfice/risque du benfluorex. Parallèlement sont apparus les résultats d'études rétrospectives de type pharmaco-épidémiologique, notamment celle de la CNAM (4), aboutissant, sur la base d'hypothèses d'imputations et d'extrapolations, à partir de données des années 2006 à 2008, au calcul d'un risque relatif de valvulopathie de 2,9 chez les malades diabétiques traités par benfluorex.

Bien que les principes actifs de Mediator® et d'Isomeride® soient différents, tant en termes de structures chimiques que d'effets biologiques (en pharmacologie et en clinique) ou en termes de métabolisme, l'existence d'un métabolite commun entre la fenfluramine et le benfluorex avait conduit sur décision de l'AFSSAPS, dès 1998, à rechercher la possible émergence d'hypertensions artérielles pulmonaires et de valvulopathies. Cette surveillance n'a pas objectivé de risque d'hypertension artérielle pulmonaire lié au benfluorex, comme le confirment, depuis cette date, différents rapports de la Commission Nationale de Pharmacovigilance et les conclusions de l'AFSSAPS. Et toujours selon les Autorités compétentes « il n'y a pas eu de signal d'alerte significatif de valvulopathies avant fin 2008-début 2009 » (5).

Dans ce nouveau et récent contexte de signal avéré, la réévaluation du ratio bénéfice/risque a conduit l'AFSSAPS à suspendre en novembre 2009 l'AMM des spécialités contenant du benfluorex (Mediator® ainsi que 2 génériques mis sur le marché en octobre 2009). Nous avons pris acte de cette décision.

Depuis quelques jours, apparaissent dans les médias des chiffres issus, d'une part d'un complément d'études de la CNAM reposant toujours sur des hypothèses concernant les causes de décès, l'imputation, le calcul du nombre de malades exposés à Mediator® à partir de données recueillies entre 2006 et juillet 2010, et d'autre part sur des extrapolations, aboutissant à un nombre de 500 décès « attribuables au benfluorex » en conséquence de valvulopathies, entre 1976 et 2009. A ce jour nous ne disposons toujours pas des rapports des études pharmaco-épidémiologiques ni des précisions nécessaires pour expliquer les calculs réalisés, en l'absence de tout chiffre comparable disponible à ce jour dans les bases de données de pharmacovigilance.

Annexe 1-17

Pour ce qui est de la conduite à tenir aujourd'hui, chez les patients qui ont été traités par Mediator®, elle a été définie dès 2009 par l'AFSSAPS, et précisée ultérieurement par la Société Française de Cardiologie : il est recommandé aux patients de consulter leur médecin traitant pour rechercher une éventuelle symptomatologie fonctionnelle compatible avec une valvulopathie, ou un souffle à l'auscultation. Et si le médecin constate des éléments cliniques évocateurs d'une valvulopathie, il lui appartient d'adresser son patient à un cardiologue qui jugera de l'utilité de pratiquer une échocardiographie.

Pour plus de précisions, nous vous suggérons de vous rendre sur les sites internet (6) de l'AFSSAPS et/ou de la Société Française de Cardiologie, où vous pourrez trouver des éléments complémentaires d'information, utiles dans le cadre de la conduite à tenir face aux malades qui pourraient s'adresser à vous.

Notre Département de l'Information Scientifique et Médicale (Tél. 01 55 72 60 00) se tient à votre disposition pour vous fournir les informations complémentaires, ou la bibliographie, et toute l'aide dont vous auriez besoin.

En espérant vous avoir apporté des précisions utiles, nous vous prions de croire, Cher Confrère, à l'assurance de nos sentiments respectueusement dévoués.

Dr Denys SCHUTZ

visable to give fenfluramine intermittently. Previous experiences have shown that in spite of millions of patient-doses, with apparent lack of serious side-effects, there still remains the possibility of ultimate long-term toxicity.

Mr Santer: Servier do most carefully keep records and obtain all available information as to the use of fenfluramine in all countries where it is marketed. In spite of thousands of tablets dispensed, there have been no reports of abuse or of dependence. Even amphetamine addicts who have taken fenfluramine because of its chemical similarity, have not become addicted to fenfluramine, nor have they experienced any of the amphetamine-induced sensations.

Professor Wilson: We will now have the opportunity of looking at S992 prospectively.

THE ROLE OF NORFENFLURAMINE IN FENFLURAMINE ACTIVITY

DR J. C. LE DOUAREC

We have had the privilege 10 years ago to be among the first few pharmacologists having carried out the initial investigations on trifluoromethyl substituted phenethylamines. We very soon became extremely interested in the unique properties of these new compounds.

In fact the CF^3 group induced a dissociation between the stimulant and anorectic properties of the amphetamines. In the first extensive pharmacological report presented in 1962, we emphasized the differences between the fluorine substitution which increased the stimulant effect and the CF^3 substitution which affected oppositely the basic CNS properties of amphetamines. The first compounds synthesized were primary amines substituted on the benzene ring with CF^3 in different positions o, m, n. Norfenfluramine was among them.

Norfenfluramine is more *toxic* than fenfluramine in the mouse, in standard conditions. Norfenfluramine is as an *anorectic* as active as amphetamines in the rat and twice less active in the dog. Fenfluramine in this respect is twice less active in the cat and 3 times in the dog. The *hypertensive* effect of norfenfluramine is comparatively less than those of amphetamines—one half in the rat, 10 times in the dog—but fenfluramine is still less potent on the blood pressure, between 1/5 and 1/10 in the rat and one half in the dog.

There are only quantitative differences between the two compounds, they only differ in their level of activity on different systems. Fenfluramine a number of times is less active than norfenfluramine. Norfenfluramine is certainly involved in the pharmocological effect of fenfluramine since we have evidence that it is its major active metabolite in animal and in man as well. May I add that norfenfluramine was discarded years ago from clinical trials in France because of prominent side-effects, namely nausea, vomiting, diarrhoea and dizziness. Thus norfenfluramine may be responsible for some side-effects of fenfluramine in man.

DISCUSSION

Professor Butterfield: Is there any conversion of norfenfluramine into fenfluramine, as there is conversion of fenfluramine to norfenfluramine?

Le Douarec: There is a difference in gut flora in different parts of the world due to national diets, and this can have an effect on the incidence of diarrhoea caused by norfenfluramine.

Mr Santer: It may be of interest to note that JP.992, the methyl-ethyl derivative of fenfluramine does not appear to produce norfenfluramine.

Dr Prime: Is there any difference in the half-lives of norfenfluramine and fenfluramine?

Le Douarec: No.

Mr Kündig: How much fenfluramine is converted into norfenfluramine?

Le Douarec: There is a great variation, and under normal circumstances about one-third of the fenfluramine in the body exists in the form of norfenfluramine, but one cannot be more precise than that.

Dr Blundell: Is there a common metabolite of amphetamine and fenfluramine?

Le Douarec: No. There are no common metabolites, but there are common metabolic pathways for fenfluramine and amphetamine. The important point is that the CF^3 radical of fenfluramine is not split off with a resultant conversion to amphetamine or any of its metabolites.

Mr Santer: The results of work done in Prof. Beckett's laboratory proved that there were no alterations in fenfluramine-norfenfluramine ratio after repeated doses for six months.

Le Douarec: That is correct, and after prolonged use of fenfluramine the administration could be stopped and restarted without any change in the metabolic pathways.

Professor Opitz: Is there any effect on the pulmonary blood pressure in humans or animals?

Le Douarec: In animals there is evidence of pulmonary hypertension, but the clinical work stopped years ago, and we have no data.

Professor Garattini: In statistical terms we must realize that although in a clinical trial with about 1 000 patients only one or two withdrawal incidences may occur; this would mean that millions of users may eventually produce hundreds of thousands of cases of withdrawal symptoms. In other words, continued monitoring is essential.

AN INTEGRATED THEORY INVOLVING THE HYPOTHALAMUS TO EXPLAIN THE PHARMACOLOGICAL EFFECTS OF FENFLURAMINE

PROFESSOR B. K. ANAND AND DR J. E. BLUNDELL

In monkeys and cats we observed the following two types of electrophysiological and behavioural changes, depending upon the dosage of fenfluramine used: Smaller dosages of fenfluramine result in 'specific' changes restricted to the hypothalamic satiety and feeding centres. The activity of the satiety centre increases with a corresponding inhibition of the feeding centre, while no changes are observed in the rest of the hypothalamus and the adjoining areas of the brain. This is also accompanied by anorexia which appears to have some relation to increased level of glucose utilization.

When relatively larger dosages of fenfluramine are used, or when fenfluramine has been used continuously for a few days even in smaller dosages, there is a generalized inhibitory effect on the hypothalamic regions, which also spreads to the other adjoining areas of the brain. This is accompanied by drowsiness. It is not clear how fenfluramine produces its generalized inhibitory effects.

Drives from the Hypothalamus

In various presentations clinical observations have been made which may be due to influencing the 'drives' which result from the activities of certain specific areas in the hypothalamus.

Anorexia. This results from the 'specific' effects of the drug in increasing the excitability of the satiety centre and inhibiting the feeding centre, thus inhibiting the feeding (hunger) drive.

Thirst. In none of the presentations made at this conference has any mention been made concerning the effects of fen-

The absorption, metabolism and elimination of (±)-*N*-(2-benzoyloxyethyl)norfenfluramine (JP992) in man

A. H. BECKETT, E. V. B. SHENOY AND L. G. BROOKES*

Department of Pharmacy, Chelsea College (University of London), Manresa Road, London, S.W.3, U.K.

The urinary excretion of *N*-(2-benzoyloxyethyl)norfenfluramine (JP 992) was examined in man with normal and acidic urine after oral administration of the drug; 86–100% of the dose was excreted in 48 h as metabolites of the drug having *m*-trifluoromethylbenzyl and benzoyl moieties, but no unchanged drug was detected. Norfenfluramine, *N*-2-hydroxyethylnorfenfluramine, and a metabolite, which on treatment with zinc and hydrochloric acid gave norfenfluramine, were excreted in urine. *N*-2-Hydroxyethylnorfenfluramine and a second unidentified metabolite were also excreted as both sulphate and glucuronide conjugates.

N-(2-Benzoyloxyethyl)norfenfluramine (Id, JP 992) is as potent an anorectic but ten times less toxic in animals as fenfluramine (compound Ib) (Beregi, Hugon & others, 1970). In man with acid urine only 7–10% of the dose of Id was excreted in urine as *N*-2-hydroxyethylnorfenfluramine (Ic) and norfenfluramine (Ia), but no unchanged drug was detected (Brookes, 1968). Pronounced renal tubular reabsorption of Id is probable because it was almost completely absorbed between pH 4 and 9 in the buccal absorption test; its extensive metabolism is also likely.

We have determined by the oxidation method of Beckett, Shenoy & Brookes (1971) the metabolites of Id containing *m*-trifluoromethylbenzyl and -benzoyl moieties excreted in the urine in order to investigate the absorption, distribution and elimination of Id in man, and to determine quantitatively the excretion of various metabolites of the drug.

MATERIALS AND METHODS

Urinary excretion trials

Three normal healthy males took 60 or 100 mg doses of compound Id hydrochloride (equivalent to 54·31 or 90·52 mg of the base respectively) by mouth in water (the drug was dissolved in 1 ml absolute ethanol and then diluted to 50 or 100 ml

* Present address: Upjohn International, Crawley, Sussex.

with water). The urinary pH was kept acid by ingestion of ammonium chloride (Beckett & Brookes, 1967). One subject was also given 2 × 150 mg tablets of compound Id (equivalent to 271·56 mg of the base) and the pH of the urine was not controlled.

In another experiment, two subjects with induced acid urine were given 180 mg base equivalent of Id in solution orally, or on other occasions 8 mg base of Id equivalent (as methane sulphonate) in 2 ml aqueous solution intravenously or 20 mg base equivalent of Ic orally in aqueous solution.

Urine samples were collected at every ½ h or 1 h for the first 4 h, hourly for the next 10 to 12 h and then at longer intervals up to 48 h. In all cases the exact time of urine collection was noted, the pH of the urine and volume was determined shortly after collection, and the urine was stored at 4° until analysis. A "blank" urine sample was collected at the time of drug administration.

Materials

Compounds Ia, b, c, d and e hydrochlorides were obtained from Servier Laboratories Ltd., U.K., as the racemic forms.

Analysis

Total *m*-trifluoromethylbenzyl and -benzoyl metabolites and compounds Ia and Ic were measured (Beckett & others, 1971). After large doses, aliquots of urine high in drug concentration were diluted to contain >50 μg/ml of drug with the subjects "blank" urine before analysis.

Investigations for other metabolites

The urine samples (5 ml) were made alkaline (pH 12) for the extraction of Ia and Ic. They were then made acidic with 6N HCl and zinc powder (about 0·05 g) added. After ½ h, the solution was made alkaline with 20% NaOH, the internal standard (1 ml, 10 μg/ml aletamine hydrochloride in water) added and the solution extracted with freshly distilled ether (3 × 2·5 ml) and analysed for compound Ia by gas liquid chromatography (g.l.c.).

Investigations for conjugated metabolites

(a) With β-glucuronidase (Ketodase, Warner–Chilcott). The following samples were placed on a water bath at 37·5° with constant shaking for 24 h: 1. A "blank" urine (5 ml) adjusted to pH 4·5 with acetic acid, acetate buffer, B.P. 1963 (1 ml) and containing Ketodase (0·5 ml). 2. Aliquots of urine (5 ml) from subjects given oral doses of JP 992; these were adjusted to pH 4·5 with acetic acid and acetate buffer (1 ml) and Ketodase added to some.

(b) With sulphatase (Clarase 300; Takamine). The above experiments were repeated at pH 5·5 using sulphatase (20 mg) instead of β-glucuronidase. After incubation, the samples were analysed by g.l.c. for bases as described.

Thin-layer chromatography

Glass plates (20 × 20 cm) coated with a layer (0·5 mm) of silica gel G (Merck) and activated at 105° for 1 h were stored in a desiccator over silica gel. The reference samples of compounds Ia, Ic, Id and Ie and ethereal extracts of the bases from urine were spotted on plates and the chromatograms developed with the following solvent systems: (a) methanol–acetone (1:1), (b) methanol–chloroform (20:80), (c) methanol–chloroform–ammonia 25% (90:10, 5 drops), and (d) methanol–

chloroform (1:1). Dragendorff's reagent (Stahl, 1962) and a solution of bromothymol blue in ethanol were used to visualize the spots.

Buccal absorption test

The general procedure of Beckett & Triggs (1967) was adopted. Drug solution (0·5 ml) equivalent to 1 mg base of compounds Ia, Ib, Ic and Id was diluted with appropriate buffer solution to 25 ml (pH range 4–9·18) and examined by the test. The expelled solutions were combined, the volume adjusted to 250 ml with distilled water and an aliquot (5 ml) analysed by g.l.c. as for the bases described and the findings were related to calibration graphs prepared from diluted saliva solutions. All curves were plotted as a percentage of the base absorbed against the mean pH of the buffer solution before and after the test.

RESULTS AND DISCUSSION

Total m-*trifluoromethylbenzyl and -benzoyl-containing metabolites*

The drug Id was excreted almost completely after an oral dose under conditions of acidic and uncontrolled urinary pH as *m*-trifluoromethylbenzyl and -benzoyl metabolites (Table 1); unchanged drug was not detected in the urine. These meta-

bolites were excreted rapidly during the first 12 h with a peak at about 2 h (Fig. 1), but small amounts continued to be excreted up to 48 h; smooth rate of excretion: time curves were obtained in subjects with acid urine (Fig. 1) but not when urine pH was uncontrolled. The semi log plots after the maxima showed an exponential decrease and were parallel (Fig. 2); the "apparent" half life of the total drug moieties was about 2 h. Thus, the drug is rapidly and completely absorbed from the gastro-

intestinal tract and is eliminated rapidly and almost completely via the urine; the predominant metabolites must therefore be highly water soluble compounds and their solubility must be independent of pH since they were recovered from acid and alkaline urine in similar amounts (Table 1). Because virtually quantitative amounts of *m*-trifluoromethylbenzoic acid equivalent to the drug given were obtained after oxidation of total urinary metabolite, a negligible amount of *p*-hydroxylation could have been involved since *p*-hydroxylated metabolites would not give the above acid on oxidation.

Basic metabolites

N-2-Hydroxyethylnorfenfluramine Ic and its dealkylated product norfenfluramine Ia were shown to be present in urine by g.l.c. (see Beckett & others, 1971) and t.l.c. (Table 2); less than 4% of Ic and only about 5% of Ia were recovered after an oral dose of Id under conditions of acid urine (Table 1). By comparison with the oral route, the amount recovered of Ic was doubled (6·7–8·7%) and Ia halved (1–1·7%) when

(Similar results were obtained with Subject 5.)

a small amount (8 mg base) of Id was administered intravenously to the same subject this was probably a result of a partial bypass of the liver.

The recovery of Ia and Ic in the urine after doses of 180 mg base of Id and 20 mg base of Ic orally were respectively 1·5–3·5 and 1·2–3·7% (5 subjects) and their profiles (Fig. 3) were similar, indicating rapid *in vivo* hydrolysis of Id to Ic; Fig. 4 shows that hydrolysis is virtually complete within 2 h since the semi log rate of excretion:

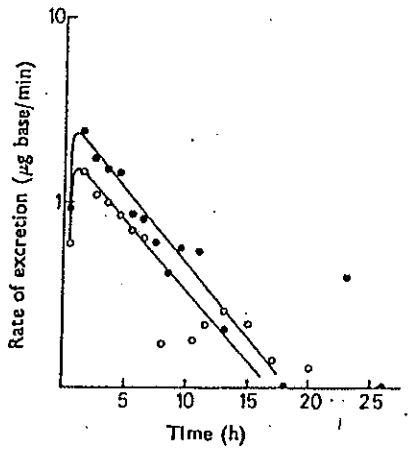

FIG. 4. Comparison of the urinary excretion of compound Ic after the oral administration of 100 mg of compound Id HCl ●—● and 20 mg base of compound Ic ○—○ under acidic urine conditions to Subject 6. (Similar results were obtained with Subject 5.)

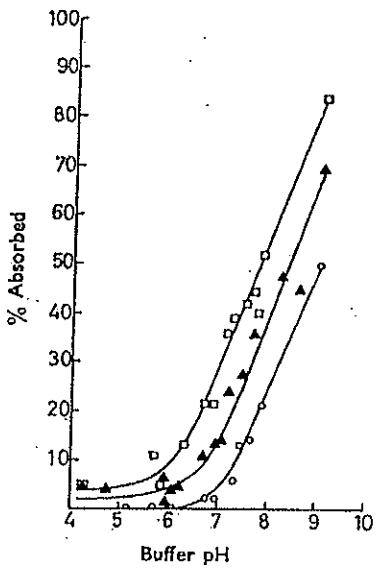

FIG. 5. Buccal absorption of norfenfluramine (Ia) ▲—▲, fenfluramine (Ib) □—□ and *N*-2-hydroxyethylnorfenfluramine (Ic) ○—○.

time plots of Ic from Id and Ic after that time are parallel. The peak excretion rate of Ia occurs later than that of Ic and the urine concentrations remain high for longer (Fig. 3), although Ia is only slightly more lipophilic than Ic in the buccal absorption test (see Fig. 5) at pH 5 and only a slight difference in the kidney tubular reabsorption would then be expected at this urinary pH. The results in Fig. 3 indicate that Ia is produced by metabolism of Ic which itself is formed rapidly *in vivo* from Id.

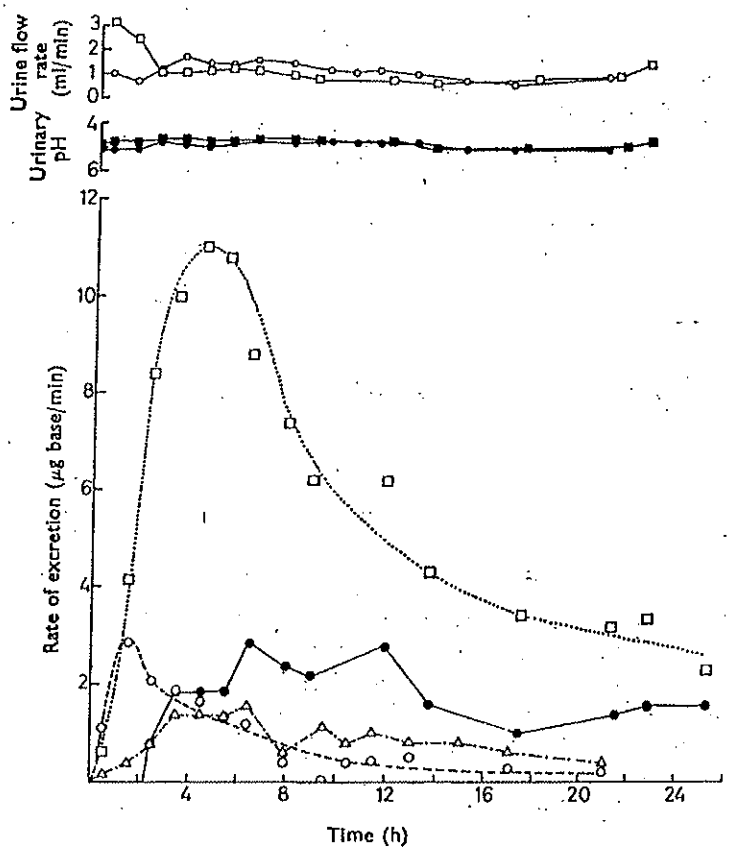

FIG. 6. Comparison of the urinary excretion of (a) unchanged drug □—□ and metabolite compound Ia ●—● after the oral administration of 20 mg of compound Ib HCl and (b) unchanged drug ○- - - ○ and compound Ia △-·-△ after the oral administration of 20 mg of compound Ic under acidic urine conditions to Subject 6.

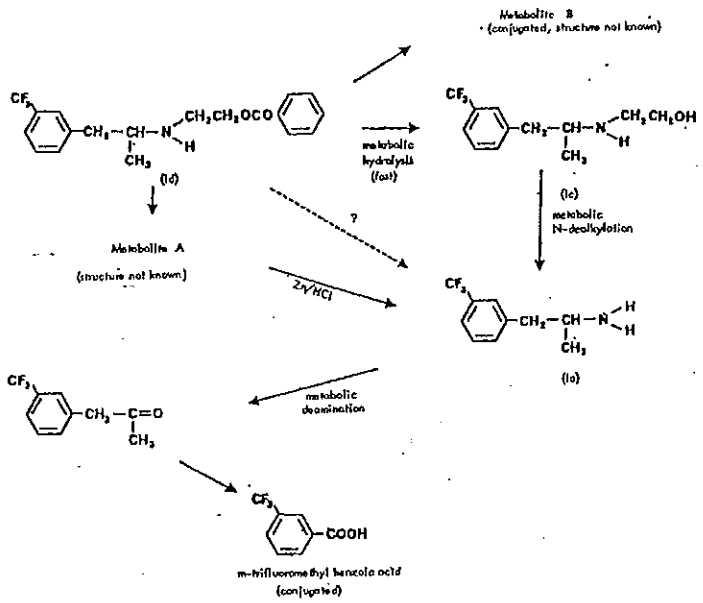
Under acidic urine conditions, about 25% (19–32·5%, 5 subjects) of an oral dose of compound Ia (20 mg base) was recovered from urine unchanged and about 13% (9·7–19·1%, 5 subjects) of Ia was recovered after an oral dose of Ib (20 mg base), thus indicating about 50% *in vivo* conversion of Ib to Ia. However, only about 3% (1·2–3%, 2 subjects) of Ia was recovered in urine after an oral dose of Ic (20 mg base), indicating about 10% metabolism of Ic by this route; the introduction of the hydrophilic OH group into fenfluramine (Ib) to give *N*-2-hydroxyethylnorfenfluramine (Ic) has thus led to a significant reduction in *N*-dealkylation. Elimination of Ic as

conjugates cannot account for the difference since only about 15–20% of Ic is excreted as combined glucuronide and sulphate conjugates (Table 1). The introduction of the hydroxyl group into the *N*-ethyl group facilitates metabolism of *N*-2-hydroxyethylnorfenfluramine other than by dealkylation since less of this compound as well as of norfenfluramine is excreted when this change is made (see Fig. 6).



Neither compound Id nor its rearranged form Ie (see Beckett & others, 1971) were detected in urine. Two unknown metabolites were excreted. Metabolite A in urine on treatment with zinc and hydrochloric acid give Ia and had an excretion profile similar to that of Ia excreted as free base (Fig. 1). Metabolite B with a g.l.c. retention time of 23 min on Column A (see Beckett & others, 1971) was excreted as glucuronide and sulphate conjugates. Neither the ketone nor the oxime, free or conjugated were excreted in the urine, but conjugated *m*-trifluoromethylbenzoic acid was excreted.

Chronic Anorexic and Behavioural Effects of the Fenfluramine Metabolite, Norfenfluramine: An Evaluation of Its Role in the Actions of Fenfluramine

A. J. Goudie*, M. Taylor, and T. J. Wheeler

Department of Psychology, University College of North Wales, Bangor, Caernarvonshire, UK

Received December 10, 1973; Final Version March 22, 1974

Abstract. The anorexic and behavioural effects of Norfenfluramine were studied in rats. Two separate experiments were conducted involving administration by intra-peritoneal and sub-cutaneous routes respectively. Behavioural effects were assessed by time sampling categorisation on Days 1 and 14 of a 20 day chronic study and anorexic effects by daily weighing. Norfenfluramine was found to be a potent anorexiant, to which tolerance is established fairly quickly. It was also found to possess sedative properties after acute administration, but marked stimulant properties after 14 days chronic administration. These results are similar to those previously reported in a study of Fenfluramine, although the behavioural effects of Norfenfluramine are more marked. The results implicate Norfenfluramine in the anorexic and behavioural effects of Fenfluramine, and provide indirect confirmation of the suggestion made in an earlier paper that Fenfluramine may have chronic stimulant properties.

Key words: Fenfluramine — Norfenfluramine — Anorexia — Activity Analysis.

Introduction

Fenfluramine is known to be metabolized rapidly both in man and in animals, and one of its major metabolites has been shown to be the de-ethylated derivative, Norfenfluramine (Opitz and Weischer, 1966; Beckett and Brookes, 1967; Bruce and Maynard, 1968; Belvedere *et al.*, 1972; Morgan *et al.*, 1972). Campbell (1973) has recently reviewed the literature on the metabolism, absorption and distribution of Fenfluramine; it is clear that whilst Fenfluramine is extensively metabolized to Norfenfluramine, both compounds are eliminated slowly from the body, and only then after being further metabolized. During chronic administration of Fenfluramine blood plasma levels of both compounds plateau for a sustained period. Le Douarec (1971) claimed that "Norfenfluramine is certainly involved in the pharmacological effects of Fenfluramine." However, it is difficult to establish the *precise* role played by Norfenfluramine, (partic

* The work reported here forms part of an M.Sc. thesis to be submitted to the Department of Psychology, U. C. N. W. Bangor.

cularly after chronic administration), because of the simultaneous presence of Fenfluramine, Norfenfluramine *and* other possible metabolites in the body, any of which may have unique pharmacological effects. The situation is made more complex in the study of *chronic* effects by the development of tolerance to these drugs. Taylor *et al.* (1973) have described a possible stimulant effect of Fenfluramine after 14 days chronic administration, in contrast to an acute sedative effect. The present paper reports on the behavioural and anorexic effects of Norfenfluramine with an identical experimental procedure in an attempt to elucidate, at least partially, the role played by Norfenfluramine in the anorexic and behavioural effects of Fenfluramine. The results indicate that Norfenfluramine is a potent anorexiant which acts acutely as a sedative but has a definite chronic stimulant effect. It is concluded that part, at least, of the anorexic effect of Fenfluramine is mediated by Norfenfluramine, and that the stimulant effect noted after chronic administration of Fenfluramine is due either to the build up of high body levels of Norfenfluramine *itself*, or of metabolites of Norfenfluramine.

Methods

The methods used were essentially identical to those described by Taylor *et al.* (1973). In both of the experiments reported here there were 16 male hooded rats weighing between 200 and 250 g at the start of the experiment, which were housed randomly in groups of four. In Experiment One, 8 of the 16 subjects received 3 mg per kg of Norfenfluramine sub-cutaneously, whilst the other eight subjects received saline control injections. In Experiment 2 the drugged subjects received 3 mg per kg of Norfenfluramine by the intra-peritoneal route. Drugs were made up in saline and injected daily for the twenty day chronic studies, all subjects receiving the relevant solution at a volume equivalent to 2 ml per kg body weight. Subjects were adapted to a 22 h deprivation schedule prior to both experiments and fed for two hours daily throughout the studies. Drug injections preceded this feeding period by 30 min. The anorexic effects of Norfenfluramine were assessed by daily weighing, and the behavioural effects by time sampling categorisation 30 min post injection on Days 1 and 14 of the chronic study, according to the procedure described in detail by Taylor *et al.* (1973) and Goudie and Taylor (1974). All behavioural observations were made blind, by a well trained observer. The two experiments were run successively.

Results

a) Weight Changes. Fig. 1 shows the cumulative sum of the daily differences between the mean body weights of the two treated groups and the mean body weights of the saline control groups. Norfenfluramine has a clear permanent effect on body weight, the magnitude of which is proportional to the route of injection, the I. P. route having the greater effect.

b) Behavioural Observations. The behavioural effects observed in the two experiments are shown in Table 1. Acutely, Norfenfluramine pro-

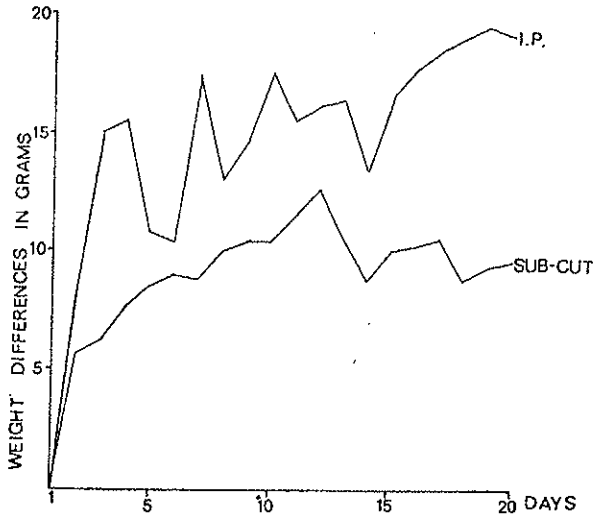

Fig. 1. Cumulative sum of the daily differences between the mean body weights of the sub-cutaneous and I.P. injected groups and the mean body weights of the saline controls

Table 1. Statistical comparisons between controls and drugged subjects on days 1 and 14 of the chronic study for each behavioural category. (Mann Witney U Test)

	Experiment 1		Experiment 2	
	Controls day 1 compared with drugged subjects day 1	Controls day 14 compared with drugged subjects day 14	Controls day 1 compared with drugged subjects day 1	Controls day 14 compared with drugged subjects day 14
Rearing	$P < 0.001$ ↓	NS	$P < 0.001$ ↓	$P < 0.05$ ↑
Walking	NS	$P < 0.05$ ↑	$P < 0.05$ ↓	$P < 0.001$ ↑
Sniffing	$P < 0.05$ ↑	NS	$P < 0.001$ ↑	NS
Grooming	$P < 0.05$ ↓	NS	NS	$P < 0.05$ ↓
Immobile	NS	$P < 0.01$ ↓	NS	$P < 0.01$ ↓

NS = Not Significant ↓ Indicates reduction ↑ increase

duces a significant reduction in the incidence of Rearing and an increase in the incidence of Sniffing when given sub-cutaneously. When given I. P. significant reductions in the incidences of Rearing and Walking and an increase in Sniffing occur. The effects are more pronounced when the same dose is given by the I. P. route than sub-cutaneously. After 14 day chronic administration sub-cutaneous injection causes an increase in the incidence of Walking with a reduction in the incidence of Im-

mobility; I. P. injection again has more marked effect in that the incidence of Walking *and* Rearing are significantly increased whilst the incidences of Grooming and Immobility are decreased. It is clear that the behavioural effects of Norfenfluramine are reversed following chronic administration in both experiments.

Discussion

a) Weight Changes. Norfenfluramine *per se* is a potent anorexic agent to which tolerance is established fairly rapidly in a manner similar to that reported for Fenfluramine (Taylor *et al.*, 1973) but which is not a general feature of the effects of all phenylethylamine derivatives (Taylor and Goudie, 1974). Norfenfluramine, like Fenfluramine (Taylor *et al.*, 1973) exerts a permanent effect on body weight. Magour *et al.* (1974), have shown that Amphetamine exerts a similar permanent effect on body weight in rats, despite the development of tolerance to its effects on food intake, and suggest that "the persistance of body weight loss is probably due to the increased hyperactivity of rats during the experiment". An alternative explanation for the permanent effects of Fenfluramine, Norfenfluramine and Amphetamine on body weight lies in their well known fat mobilising effects (Garratini, 1973). It is difficult to see how the permanent effect of Fenfluramine, in particular, can be attributed to increased locomotor activity since Taylor *et al.* (1973) have presented evidence for such an effect *despite* the development of behavioural tolerance to the drug after sustained chronic administration.

Since Norfenfluramine is an active anorexic agent and is known to be one of the major metabolites of Fenfluramine, it seems clear that at least part of the anorexic effects of Fenfluramine are mediated by Norfenfluramine or its metabolites, as suggested by Le Douarec (1971).

b) Behavioural Observations. The acute behavioral changes induced by Norfenfluramine indicate that it has sedative properties, whilst the chronic behavioural effects are indicative of possible stimulant properties of the compound. Taylor *et al.* (1973) emphasised the difficulties inherent in describing psychotropic agents as either sedatives or stimulants without reference to the behavioural or neurophysiological variables involved. The most obvious example of this problem has been derived from studies on the effects of amphetamine on operant behaviour, which led McKearney (1972) to suggest that "Amphetamine tends to increase responding that normally occurs at relatively low rates . . . at the same doses at which it decreases responding that normally occurs at high rates". The most adequate method of validating a screening test for C.N.S. stimulants or depressants is by studying the effects of drugs which are themselves generally defined as stimulants or sedatives, within the specific expermental situation of the test. Goudie and Taylor (1974) have reviewed the

evidence for the effects of neuroleptics, anxiolytics and stimulants on exploratory behaviours such as those considered here; and concluded that reductions in the incidences of rearing and ambulation are generally indicative of sedative properties of a drug, whilst increases in the incidence of these "active" behaviours are indicative of stimulant properties Norton (1973) has presented evidence that amphetamine at doses of 0.5 and 1.0 mg per kg increases the incidence of rearing and walking in a novel environment, whilst reducing those of sniffing and grooming, in agreement with suggestions made above. As suggested by Taylor *et al.* (1973) and Goudie and Taylor (1974) an increase in the incidence of sniffing observed after acute administration of a phenylethylamine derivative does not necessarily reflect the induction of stereotyped behaviour. Due to the hierarchical, exhaustive nature of the behavioural categorisation system used in these studies a reduction in the incidences of rearing and walking, following administration of a sedative drug, will by definition be accompanied by an increase in the incidences of behaviours lower down the hierarchy. The sniffing observed after injection of 3 mg per kg Norfenfluramine differs in kind from that observed following injection of high doses of Amphetamine. The observed increase in the incidence of sniffing following acute administration of Norfenfluramine is consequently not due to the induction of sterotyped behaviour.

The behavioural effects of Norfenfluramine are similar to those described for Fenfluramine except that they are much more marked; in particular, the chronic "stimulant" effect (reported by Taylor *et al.*, 1973, with 9 mg per kg Fenfluramine sub-cutaneously) is much more marked with Norfenfluramine even at a lower dose. Since Fenfluramine is extensively metabolized to Norfenfluramine in rats and since the latter is known to be metabolized prior to excretion it is suggested that the effects noted after chronic administration of both Fenfluramine and Norfenfluramine are due *either* to the build up of brain concentrations of Norfenfluramine or of its metabolites. Bruce and Maynard (1968) suggested that Norfenfluramine is converted to m-trifluormethylhippuric acid, although this has been questioned by Campbell (1973); any possible active metabolites consequently remain unknown. The marked stimulant effects noted after chronic administration of Norfenfluramine, provide indirect confirmation that under certain conditions Fenfluramine itself has a stimulant effect in accord with reports of such effects in animals (Everitt and Hackett, 1972; Le Douarec *et al.*, 1966; Taylor *et al.*, 1973) and in humans (Oswald *et al.*, 1971; Belvedere *et al.*, 1972). At high doses (between 15 and 30 mg per kg) Norfenfluramine induces abnormal behaviour of a type similar to that induced by Fenfluramine; and it is more potent in this respect than Fenfluramine. The behavioural syndrome induced by both compounds differs from that induced by amphetamine in that,

over a range of doses, it is characterised by a predominance of the behaviour patterns of backward locomotion and circling, whilst the amphetamine induced syndrome is characterised by a predominance of repeated head movement, compulsive gnawing and sniffing (Taylor *et al.*, 1974). Fenfluramine and Norfenfluramine consequently have similar behavioural effects at high doses, just as they do at low doses. The two compounds also have similar neurochemical effects (which differ from those of amphetamine) and which have been shown to be closely linked to their psychopharmacological actions. Both drugs are known to lower brain serotonin concentrations (Duhault and Verdavainne, 1967; Costa *et al.*, 1971; Costa and Revuelta, 1972; Ghezzi *et al.*, 1973); and 5HT has been implicated in the behavioural (Jespersen and Scheel-Krüger, 1970; Southgate *et al.*, 1971) and anorexic (Funderbunk *et al.*, 1971; Samanin *et al.*, 1972; Jespersen and Scheel-Krüger, 1973; Blundell *et al.*, 1973; Clineschmidt, 1973) effects of Fenfluramine. Morgan *et al.* (1972), Costa and Revuelta (1972) and Ghezzi *et al.* (1973) have all suggested that the 5HT depletion observed following Fenfluramine administration may be mediated by Norfenfluramine, and not by the parent compound. Since 5HT has been strongly implicated in the actions of Fenfluramine it is clear that Norfenfluramine and its metabolites may play an important role in the anorexie and behavioural effects of Fenfluramine. Whether or not Norfenfluramine is best characterised as the major compound involved in Fenfluramine's effects remains uncertain. The data reported in this paper provide evidence which implicates Norfenfluramine as a mediator of the actions of Fenfluramine.

Does fenfluramine act via norfenfluramine?

Goudie, Taylor & Wheeler (1974) recently demonstrated that behavioural and appetite depressant effects of norfenfluramine were strikingly similar to those of fenfluramine. In several species fenfluramine is de-alkylated to norfenfluramine (Bruce & Maynard, 1968; Beckett & Brookes, 1967; Morgan, Cattabeni & Costa, 1972). These findings suggest that the anorectic properties of fenfluramine could be due to its metabolite norfenfluramine.

Samanin, Ghezzi & others (1972) and Clineschmidt (1973) demonstrated that lesions which specifically affect the serotonergic systems in the brain antagonized the anorectic properties of fenfluramine. We have investigated the possible central action of fenfluramine and its metabolite norfenfluramine by injections of small amounts directly into the brain of rats.

For the local injections, the area of the nucleus interstitialis of the stria terminalis was chosen because its involvement in the regulation of food intake is indicated by experiments on the elicitation of feeding behaviour by α-adrenoceptor stimulating drugs (Booth, 1967; Davis & Keesey, 1971; Broekkamp & van Rossum, 1972), and the neostriatum was chosen because it contains the highest synthesizing capacity for 5-hydroxytryptamine and therefore seems to be highly innervated by serotonergic nerves (Mandell, Knapp & Hsu, 1974).

Bilateral implantation of two cannulae was made stereotaxically in male Wistar rats of 200-250 g. In two groups the cannulae were aimed at the nucleus interstitialis of the stria terminalis and in two groups the cannulae were placed into the neostriatum. Post mortem examination of the brains confirmed that the injection sites were in the area A 7·3 ± 0·35, L 2·4 ± 0·7 and D 0·9 ± 0·4 within the neostriatum and A 6·65 ± 0·4, L 0·9 ± 0·4 and D −1·0 ± 0·5 within the nucleus interstitialis of the stria terminalis with reference to the atlas of König & Klippel (1963).

The drugs were dissolved in saline and injected in a volume of 0·5 μl into each hemisphere.

The anorectic effect was measured on the intake of cold cooked white rice in a 30 min period. The injections were made 15 min before the test period began. The animals were housed and tested individually and had laboratory chow and tap water freely available. The rats were made accustomed to the diet and the injection procedure in the week preceding the injections. Injections were made every other day in ascending dosage until an anorectic effect was evident or the dose became unreasonably high. The sequence of doses was concluded with a second saline injection.

Table 1. *Amount of rice eaten in a half hour period following injections of saline, norfenfluramine and fenfluramine.*

Treatment (μg)	Neostriatum		Nucleus interstitialis of the stria terminalis	
	Fenflur. n=7	Norfenflur. n=6	Fenflur. n=6	Norfenflur. n=6
saline	4·7±1	5·1±1·3	5·5±0·8	5·7±1
2 × 2·5	4·6±0·9	6·9±1·2	5·1±1·2	5·6±0·6
2 × 5	4·2±0·8	7·3±1·6	5·9±0·6	5·8±1·3
2 × 10	3·2±0·3	0·7±0·3*	6·2±0·9	2·1±0·9*
2 × 20	3·6±0·4		5·9±0·7	
2 × 40	4·3±0·9		4·9±1·3	
saline	5·0±0·7	4·9±1·3	6·1±1·2	5·1±0·6

The amounts eaten are given in grams ± the standard error of the mean; * = $P<0·05$; two-tailed Mann-Whitney U-Test. Drugs were: (±)-fenfluramine HCl and norfenfluramine HCl.

As shown in Table 1, even high dosages of fenfluramine are inactive when administered via the intracerebral route. Under identical conditions norfenfluramine is active in moderate doses. There was a significant difference in the amount of rice eaten by the rats with nucleus interstitialis cannulae and those with neostriatal cannulae after norfenfluramine administration (Mann-Whitney U-test; two-tailed; $P<0{\cdot}05$).

It is unlikely that fenfluramine is inactive because of a more rapid removal from the brain since Morgan & others (1972) have shown that both fenfluramine and norfenfluramine persist in the brain for up to 24 h after a systemic injection. Our results are comparable to the results of Kramer, Rubicek & Turner (1973) who demonstrated that after topical application only norfenfluramine is effective in inducing mydriasis whereas after systemic injections both drugs are active. Together these findings add substance to the suggestion that the central anorectic properties of fenfluramine are mediated mainly by norfenfluramine.

A further screening of other brain sites with norfenfluramine is necessary before it can be concluded that the neostriatum is the main site of action after systemic administration.

The authors thank Dr. R. Vroom and The Servier Company for the generous gift of fenfluramine HCl and norfenfluramine HCl.

Discriminative Stimulus Properties of Fenfluramine in an Operant Task: An Analysis of its Cue Function

A. J. GOUDIE

Department of Psychology, University of Liverpool, P.O. Box 147, Liverpool L69 3BX, England

Abstract. Fenfluramine at a dose of 3.0 mg/kg was found to possess discriminative stimulus properties controlling lever selection by rats in a two-lever operant task. Subjects trained to discriminate the 'Fenfluramine cue' failed to generalize to amphetamine in extinction tests at doses between 0.25 and 1.0 mg/kg. Subjects did, however, generalize to the fenfluramine metabolite, norfenfluramine, at a dose of 2.0 mg/kg. These data provide further evidence for a pharmacological difference between fenfluramine and amphetamine, and support the hypothesis that norfenfluramine is an active metabolite of fenfluramine. The relevance of these findings to theoretical and methodological aspects of drug discrimination studies is considered.

Key words: Fenfluramine – Norfenfluramine – Amphetamine – Drug discrimination – Stimulus properties of drugs – Fixed ratio responding

Fenfluramine is a phenylethylamine derivative whose pharmacological effects reportedly differ from those of amphetamine (for reviews see Garratini et al., 1975; Pinder et al., 1975). Despite evidence for a distinction between these two chemically related compounds, however, there have been reports of amphetaminelike effects of fenfluramine in animals (Everitt and Hacket, 1972; Taylor et al., 1973; Zolovick et al., 1973; Clineschmidt et al., 1975) and in humans at very high doses (e.g., Riley et al., 1969). Moreover, in a recent study from this laboratory we reported that the aversive effects of amphetamine in the conditioned taste aversion paradigm were markedly attenuated by prior drug experience with either fenfluramine or amphetamine (Goudie and Thornton, 1975). While the interpretation of the effects of drug pretreatment on drug-induced taste aversions remains a subject of controversy (Cappell and Le Blanc, 1976), one possible explanation of our finding is that amphetamine and fenfluramine have common stimulus properties in rats. In conjunction with earlier reports of possible amphetaminelike effects of fenfluramine, this result led us to examine both the ability of fenfluramine to act as a discriminative stimulus and the relationship between any such stimulus properties and those of amphetamine. In addition, in an attempt to clarify the role of norfenfluramine in the actions of fenfluramine (Goudie et al., 1974; Broekkamp et al., 1975), we examined the relationship between the stimulus properties of the metabolite and those of its parent compound.

The results reported demonstrate the potential value of studying the discriminative stimulus properties of drugs as one method of predicting the abuse potential of novel derivatives of drugs of abuse. They also provide further information about the pharmacological identity of fenfluramine.

METHODS

Seven female albino rats (230–280 g) were individually housed and run in 30 min operant sessions 5 days a week. One hour after each session subjects received access to food and water for 1 h, but at all other times they were deprived of food and water. On weekends the subjects received access to food and water for 1 h. This deprivation regime allowed subjects to maintain their body weight at approximately 75% of ad lib. body weight.

Standard two-lever operant chambers were used in the study. Reinforcement consisted of 0.02 ml of 20% (v/v) condensed milk presented via a dipper situated between the levers. Secondary reinforcement was available in the form of a light onset in the food chamber during dipper operation. Standard electromechanical programming and cumulative recorders were used to record and control behaviour.

(i) Acquisition of Fixed-Ratio Lever Pressing. Following preliminary shaping subjects were trained for seven sessions during which reinforcement was available on a CRF schedule on both levers. From the eighth session onwards only one lever was operative throughout any one session on an FR 10 schedule of reinforcement. Subjects were run for a further 22 sessions in this phase of the study. Between

sessions the operative lever was varied pseudorandomly with the constraint that the same lever was never operative on more than three consecutive sessions. During these sessions all subjects developed the stable response pattern characteristic of FR schedules of reinforcement.

(ii) Acquisition of a Saline-Fenfluramine Discrimination. The procedure adopted in this study was derived from that described by Colpaert et al. (1975a). Subjects were reinforced for responses on the drug (right) lever on days on which they received injections of fenfluramine and for responses on the saline (left) lever on days on which they received saline injections. After four sessions of alternating saline and drug injections the operative lever was varied according to the two weekly pseudorandom sequence shown:

Week 1: Drug – Saline – Saline – Drug – Drug

Week 2: Saline – Drug – Drug – Saline – Saline.

Injections were administered 30 min before each session. *d,l*-Fenfluramine hydrochloride was administered at a dose of 3.0 mg/kg. All injections were made i.p. at a volume equal to 2 ml/kg body weight of rat.

Each subject was trained to a criterion of ten consecutive sessions of 'correct lever selection.' 'Correct lever selection' was defined as taking place in a session in which the first reinforcement (on an FR 10 schedule) was obtained within the first 12 responses, regardless of which lever was selected (subjects were consequently allowed no more than two responses on the inoperative lever).

(iii) Stimulus Control Test with Fenfluramine. After all the rats could discriminate between saline and fenfluramine, the degree of discriminative control exerted by the training dose of fenfluramine was assessed in a 5 min extinction session in which neither primary *nor* secondary reinforcement was available. This stimulus control test took place (as did subsequent generalization tests) on the last day of the two weekly alternating sequence described above. On this day the saline session was omitted and subjects received a 5 min extinction session only. The test day was consequently preceded by a day on which subjects received saline injections; this procedure was adopted in order to minimise on testing days any residual drug effects that might have influenced the results of the stimulus control test (and subsequent generalization tests).

Two measures of discriminative control and generalization were recorded. The first measure was the total number of responses made (irrespective of which lever they were made on) before ten had accumulated on the drug lever. This measure is subsequently referred to as the CRD 10 index (cumulative responses before ten made on the drug lever), and gives an index of lever selection by subjects. A CRD 10 value of between 10 and 12 was considered to indicate 'perfect' generalization to the training drug, values between 13 and 19 to indicate 'imperfect' generalization, and values greater than 19 to indicate progressively greater discrimination between the drug administered and the training dose of fenfluramine. The second measure recorded was the percentage of total responses made on the drug lever during the extinction session. This index is subsequently referred to as 'Percentage Drug Responding.'

(iv) Generalization Tests with Amphetamine and Norfenfluramine. Following the stimulus control test subjects were tested for generalization to *d*-amphetamine sulphate and *d,l*-norfenfluramine hydrochloride. Generalization tests involved the methods and procedures described above. Generalization to amphetamine was tested at doses of 0.25, 0.5 and 1.0 mg/kg, and to norfenfluramine at doses of 1.0 and 2.0 mg/kg.

(v) Rationale behind Experimental Design and Data Analysis. Overton (1974) has considered in some detail the methodology of cross-drug generalization studies, noting that conventional procedures that employ measures of percentage responding on the training drug lever raise the problem that it is virtually impossible to interpret meaningfully the commonly encountered partial transfer effects (i.e., 50% responding as under training drug). Since it is possible to assess such transfer against either the saline or the training drug baseline, it may seem possible to derive statistically significant results that can be considered indicative of either generalization or discrimination, but in fact they merely reflect random responses. Because it is invalid to assess partial transfer effects against an arbitrarily chosen baseline, it appears that percentage training drug responding scores in cross-drug generalization tests are subject to difficulties of interpretation. If a saline baseline is used, such scores may result in the labelling of drugs as similar when they do in fact differ – a phenomenon termed 'over-inclusiveness' (Overton, 1974). In order to show that two drugs are equivalent, it is necessary to show that 'the test drug causes drug choices just *as frequently* as does the training drug' (Overton, 1974). In this study the fenfluramine stimulus control test consequently provides a baseline for the assessment of the possible stimulus equivalence of other drugs. It should be noted, however, that the statistical techniques required to fulfill the criterion outlined are those that involve acceptance of the null hypothesis; the sophisticated techniques required for such an analysis have not been previously used in this field, nor are they commonly encountered in psychological and pharmacological literature.

Due to the problems of interpretation and analysis of percentage drug responding scores, those reported in this study are interpreted with considerable caution. Such scores are only used to support conclusions drawn from lever selection data (CRD 10 index) and to make tentative inferences when equivocal lever selection data is obtained.

The methodological problems raised by the percentage drug responding scores can be largely resolved by using a procedure that forces the subject to make a binomial choice between the drug and the nondrug responses. A response selection index, such as that used in this and related studies (Colpaert et al., 1975a, b, c, d), consequently provides a more viable measure of the discriminative properties of drugs than the more conventional percentage drug response measure.

RESULTS

(a) Acquisition and Maintenance of Saline-Fenfluramine Discrimination. All subjects were run for 98 operant sessions with six intervening extinction sessions. Table 1 presents data relevant to the acquisition and successful maintenance of discrimination.

After subjects had been trained to criterion, a few "errors" in lever selection were recorded (Table 1), but these occurred in only a very small proportion of sessions postcriterion. Figure 1 shows a typical cumulative record for a session in which an "error" in selection occurred. The cumulative record illustrates how a subject that initially selected the inoperative lever rapidly switched to the operative lever and continued responding on that lever with only rare alternations between levers. In the session shown, 96.7% of the total responses were made on the correct (operative) lever.

(b) Stimulus Control Test with Fenfluramine. Table 2 shows the results of the stimulus control test with fenfluramine (generalization test in extinction).

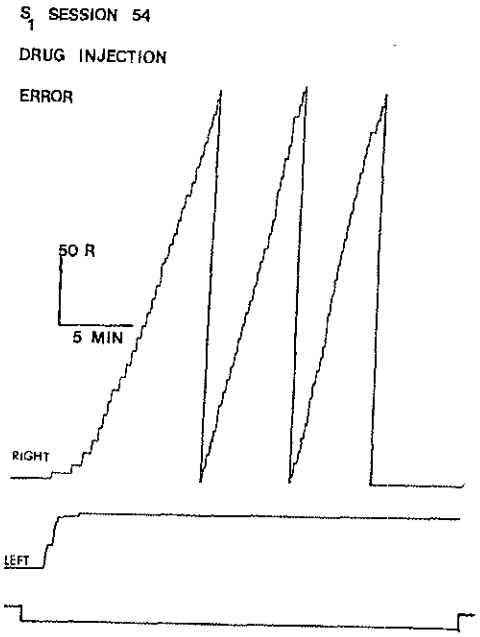

Fig. 1. Sample cumulative records for a session in which an 'error' selection was recorded. Only the right (drug) lever was operative. Cumulative records of responding on both right and left levers are shown

[a] Last trial in sequence of ten successive 'correct lever selection' sessions

[b] Sessions in which the first reinforcement was obtained after > 12 but < 20 responses

[c] Sessions in which the first reinforcement was obtained after ≥ 20 responses

All subjects selected the drug lever (CRD 10 index). This effect was highly significant ($P < 0.01$, Binomial Test). However, the degree of stimulus control exerted by the drug was variable. Some subjects persisted in responding on the drug lever in extinction (S_6), while others showed a much weaker degree of stimulus control (S_7).

[a] Two subjects failed to respond in the 5 min extinction session at the 2.0 mg/kg dose

tion when this measure was used. However, at this dose the subjects showed significantly less Percentage Drug Responding in extinction than under fenfluramine (Randomisation Test for Matched Pairs, $P < 0.05$). Although subjects did not readily discriminate the fenfluramine cue from the amphetamine cue in lever selection, fenfluramine clearly exerted a greater degree of stimulus control than did amphetamine (Percentage Drug Responding index), suggesting that at higher doses the drugs might be discriminated.

At the higher doses of amphetamine (0.5 and 1.0 mg/kg), no subject initially selected the drug lever (the CRD 10 values were all greater than 19). This effect was statistically significant ($P < 0.01$ at both doses, Binomial Test). The CRD 10 values were greater under both higher doses of amphetamine than under fenfluramine ($P < 0.02$ at both doses, Randomization Test for Matched Pairs). Furthermore, subjects made significantly fewer responses on the drug lever (as a percentage of the total number of responses) under amphetamine than under fenfluramine ($P < 0.02$ at both doses, Randomisation Test for Matched Pairs).

The results show that in cross-drug generalization tests rats are able to discriminate the fenfluramine cue from the amphetamine cue.

(d) Generalization Test with Norfenfluramine. Table 4 shows the results of the generalization test with norfenfluramine.

At the lowest dose (1.0 mg/kg), 2 of the 7 subjects selected the drug lever, so that the results obtained from the lever selection (CRD 10) measure were again somewhat equivocal since no clear pattern emerged. However, there was *no* significant difference in the Percentage Drug Responding scores obtained with norfenfluramine at this dose and with fenfluramine at the training dose (Randomisation Test for Matched Pairs). This result contrasts with the findings with amphetamine, since with the latter drug subjects made significantly fewer responses on the drug lever at all doses, suggesting that subjects *might* generalize from fenfluramine to norfenfluramine at higher doses. This conclusion was substantiated by the results of the cross-drug generalization test with the higher dose (2.0 mg/kg), at which all subjects who responded selected the drug lever ($P < 0.05$, Binomial Test). Furthermore, the Percentage Drug Responding, scores were not significantly different from those generated by fenfluramine (Randomisation Test for Matched Pairs). The results consequently demonstrate that subjects generalized to norfenfluramine, in contrast to the discrimination noted with amphetamine.

A comment is appropriate on the fact that at the 2.0 mg/kg dose two subjects failed to respond at all in extinction. In fact, all subjects emitted very few responses in the extinction test at this dose. This effect may reflect the potent anoretic and behavioural effects of norfenfluramine, which is more active dose for dose than fenfluramine (Goudie and Taylor, 1974).

DISCUSSION

It is clear that relatively low doses of fenfluramine possess discriminative stimulus properties that can be used by rats as a cue for lever selection in an operant task. Overton (1973) has emphasised that drugs with high abuse potential are characterised by potent stimulus properties in state-dependent and discriminative learning tasks. However, the ability to act as a discriminative stimulus is not in itself an indication of the abuse potential of a particular drug. There have been extremely few reports of abuse of fenfluramine in man (Pinder et al., 1975). The data reported here suggest that the mere ability of a drug to induce a discriminative cue may be a necessary but not a sufficient characteristic to consider the drug liable to abuse. Colpaert et al. (1975b) have suggested that *one* further necessary condition for a drug to be a drug of abuse is that it should induce cue properties at doses lower than those that have marked aversive effects. This hypothesis seems to be in accord with the finding that fenfluramine (generally considered a non-abused drug) possesses discriminative stimulus properties as well as aversive properties in humans (Stunkard et al., 1973; Griffith et al., 1975) and in rats (Goudie and Thornton, 1975).

In a study of the discriminative properties of fenantyl, Colpaert et al. (1975a) have claimed that

for sessions in which reinforcement was available "the (high) percentage of responding on the reinforced lever evidences the extreme and virtually perfect accuracy with which lever selection is executed." This conclusion is potentially misleading since it is clear (Fig. 1) that the percentage of responding on the reinforced lever can reach a very high level despite the fact that an 'error' in lever selection occurs. In two-lever drug discrimination tasks in which only one lever is operative during acquisition and maintenance of the discrimination, the percentage responding on the operative lever in reinforced sessions is a poor measure of the discriminative stimulus properties of drugs since it may provide a spuriously high index of discriminative control. That this is the case was indicated by the results of the stimulus control tests in extinction with fenfluramine, from which it was clear that the stimulus control exerted by the drug was relatively weak (in some subjects lever selection degenerated to chance levels). This effect, in conjunction with the finding that in sessions in which the inoperative lever was selected the subjects switched rapidly to the correct lever, suggested that in this study subjects effectively learned a 'win-stay, lose-shift' discrimination (Weiskrantz, 1968) upon which the discriminative stimulus properties of drugs were superimposed in any specific session. Thus the information provided by the stimulus properties of the drug is in effect redundant once the subjects have emitted ten responses. This analysis of the behavioural strategies adopted in this study again suggests that the initial lever selection index used in this and related studies (Colpaert et al., 1975a; b; c; d) provides a more reliable and more readily interpretable index of the discriminative stimulus properties of drugs than the more conventional measure of percentage responding on the drug lever in extinction. A further advantage of this index is that it is not confounded by possible drug effects on motor output. It has been suggested that one of the major features of the behavioural effects of amphetamine is to cause perseveration of responding (Lyon and Robbins, 1975); such an effect will confound percentage drug responding indices of drug generalization. Although no quantitative data relevant to this point were collected in this study, examination of the cumulative records obtained in the amphetamine generalization tests indicated that at all doses some subjects showed perseverative responding on both levers with few alternations between levers. Any such effect of the test drug on motor output limits the extent to which a subject's behaviour reflects the discriminative properties of the test drug when such properties are assessed over long response sequences. However, such an effect becomes irrelevant when one considers very short response sequences, as in the lever selection (CRD 10) index. Thus there are a number of theoretical and statistical reasons for suggesting that a response selection index is at present the index of choice in studies of the discriminative properties of drugs. In this study the conclusions drawn from the Percentage Responding index are essentially the same as those derived from the lever selection index, although it is clear that the results obtained from the latter index are much less equivocal. However, it is perhaps relevant to note that although a selection index as used here provides statistical and methodological clarity, it suffers from a major limitation in that it does not allow for the possibility that drugs may vary along a variety of stimulus dimensions. Since one drug may be similar to another on some dimensions and not on others, it is to be expected that 'true' partial transfer may occur between drugs. It does not appear that contemporary techniques for the study of the stimulus properties of drugs can address themselves to this problem at the present.

The finding that subjects generalized in extinction to norfenfluramine supports the hypothesis that norfenfluramine is an important active metabolite of fenfluramine (Goudie et al., 1974; Broekkamp et al., 1975; Duhault et al., 1975) since the pharmacological effects of norfenfluramine presumably constitute a major part of the discriminative stimulus complex mediating the cue properties of the parent drug. This hypothesis is supported by the finding that subjects injected with norfenfluramine emitted fewer responses in the extinction test with norfenfluramine at the 2.0 mg/kg dose than in the extinction test with fenfluramine at a higher dose (3.0 mg/kg) due to the more potent anorectic and sedative effects of the metabolite.

The discrimination between amphetamine and fenfluramine noted in this study provides further evidence of a fundamental pharmacological difference between these two related compounds and clearly does not support suggestions that fenfluramine has amphetaminelike effects. At no dose studied was there *any* indication of generalization to amphetamine. These findings are in accord with studies of the subjective effects of the two drugs in humans (Gotestam and Gunne, 1972; Griffith et al., 1975), which indicate that addict volunteers can discriminate the two drugs. The results consequently illustrate the predictive value of cross-drug generalization in tests in animals for assessing the abuse potential in humans of novel derivatives of drugs of abuse and in the classification of psychoactive agents (Barry, 1974).

Anorectic effect of fenfluramine isomers and metabolites: Relationship between brain levels and in vitro potencies on serotonergic mechanisms

Tiziana Mennini, Silvio Garattini, and Silvio Caccia

Istituto di Ricerche Farmacologiche „Mario Negri", Via Eritrea 62, I-20157 Milano, Italy

Abstract. A study of the possible molecular mechanisms of action by which the isomers and metabolites of fenfluramine increase serotonin transmission, leading to anorectic activity, is presented. The actual brain levels of fenfluramine and norfenfluramine isomers after administration of equi-anorectic doses to rats are compared with their potencies in affecting serotonergic mechanisms in vitro. Isomers and metabolites of fenfluramine can have the same pharmacological action by influencing serotonin uptake, release and binding in a quantitatively different manner.

Key words: Fenfluramine – Anorectic effect – Serotonin uptake – Serotonin release – $5HT_1$ binding sites – $5HT_2$ binding sites

There is ample evidence that fenfluramine exerts its anorectic activity by selectively enhancing serotonergic mechanisms in the brain (Garattini et al. 1978, 1979), although its precise mechanism of action is at present unknown. Fenfluramine (F) is a racemic compound, and the *d*- and *l*-isomers are metabolized to form the respective norfenfluramine (NF) isomers (Caccia et al. 1979, 1981); all four different compounds display anorectic activity in rats (Garattini et al. 1979). In this study we compare the brain concentrations of fenfluramine and norfenfluramine isomers after administration of equi-active anorectic doses of the compounds, with their potencies in affecting serotonergic mechanisms in vitro. We selected three main sites at which drugs can increase serotonin (5HT) transmission: (a) inhibiting reuptake of the released 5HT, (b) increasing 5HT release from nerve endings, (c) mimicking 5HT action on post-synaptic receptors.

Materials and methods

CD-COBS (Charles River, Italy) male rats weighing 180–200 g were used. The animals were housed in plastic cages at constant room temperature (21 ± 1° C) and relative humidity (60%).

In vitro studies

^{3}H-5HT (specific radioactivity 28 Ci/mmol) and ^{3}H-spiroperiodol (specific radioactivity 29 Ci/mmol) were purchased from NEN. Uptake of ^{3}H-5HT (0.1 μM) was studied in 0.6-ml aliquots of purified synaptosomes in Krebs-Henseleit buffer, incubated for 5 min at 30° C or 0° C (to determine passive transport) as previously described (Mennini et al. 1978). Release experiments were performed as described by Mennini et al. (1981a), using synaptosomes purified from brains of normal male rats and of males treated 24 h before with 10 mg/kg reserpine IP. Briefly, 0.6-ml aliquots of synaptosome suspension, preloaded with 0.1 μM ^{3}H-5HT, were filtered and put on the bottom of superfusion chambers, at 37° C. Drugs, dissolved in Krebs-Henseleit buffer, were superfused for 20 min at 0.5 ml/min; the effluent was collected every 5 min and counted for radioactivity content. Crude membrane preparations from rat cortex were used for binding assays, using a semiautomatic filtration technique as reported in a previous paper (Mennini et al. 1981b). ^{3}H-5HT, for measuring $5HT_1$ binding sites, and ^{3}H-spiroperidol, for detecting $5HT_2$ binding sites, were used at concentrations of 2 nM and 0.7 nM, respectively. For both ^{3}H ligands, non-specific binding was determined in the presence of 1 μM dLSD.

In vivo studies

a) Food intake. Each ED_{50} (dose inducing 50% reduction of food intake) was calculated in separate experiments (Garattini et al. 1979) on at least five dose levels with six animals for each dose, measuring the 1-h food intake beginning 30 min after drug administration, as described before (Samanin et al. 1979).

b) Drug measurement. Rats, injected IP with drugs at doses corresponding to the determined ED_{50}, were killed by decapitation 30 or 90 min after dosing. Their brains were quickly removed, frozen on dry ice, and stored at −20° C until assay.

Fenfluramine isomers and metabolites were determined by gas-liquid chromatography, as described by Caccia and Jori (1977).

Drugs

Fenfluramine isomers and metabolites were a kind gift from Servier Labs, Neully/Seine, France; reserpine (Serpasil) from Ciba-Geigy, Origgio, Italy; LSD from Sandoz, Basel, Switzerland.

Results

Table 1 shows the concentrations of fenfluramine and norfenfluramine isomers in rat brain after intraperitoneal

Data are means ± SE of four replications
IC_{50} are the drug concentrations producing 50% inhibition of ^{3}H-5HT uptake or binding, and are calculated from the log dose-effect plot of the data, using three-four drug concentrations. SC_{25} are the drug concentrations stimulating ^{3}H-5HT release by 25%, calculated from the log dose-effect plot of the data using three drug concentrations
% release stimulation = (% release with drugs/% release of controls × 100)−100

administration of the dosages found to induce 50% reduction in food intake. The *d*-forms of fenfluramine and norfenfluramine were both more active than the *l*-forms: the injected dosages and the brain concentrations necessary to elicit anorectic effects in the rat were lower than those of the *l*-forms. In fact, fenfluramine concentrations of about 9 nmoles/g (2 μg/g) were measured in rat brain 30 min after administration of *d*-fenfluramine, while after *l*-fenfluramine injection the brain concentrations were higher (about 15 nmole/g or 3.5 μg/g). At this interval *d*-norfenfluramine amounted to only 40% of the parent concentrations, while the *l*-metabolite reached brain concentrations slightly higher than *l*-fenfluramine.

Table 2 shows the in vitro activities of fenfluramine and norfenfluramine isomers on serotonergic mechanisms. Preliminary data were reported in a previous paper (Garattini et al. 1979). For uptake inhibition results were the same, but for $5HT_1$ binding assay and release studies slight modifications in the method used and calculations of results (Mennini et al. 1981a, b) resulted in disparities between data reported previously and data presented here. The present experimental data in Table 2 are more homogeneous and thus give a better indication of relative drug potencies than earlier findings. The *d*-isomers of fenfluramine and norfenfluramine were both more active than the *l*-forms in inhibiting 5HT accumulation, *d*F being the most active (similar to chlorimipramine and LM 5008). Further experiments in our laboratories using synaptosomes from reserpinized animals have shown that while *d*F is a true inhibitor of 5HT uptake, the reduced 5HT accumulation is due to the releasing ability of *d*NF (Borroni et al. 1983).

The *d* and *l* metabolites were slightly more active than the parent compounds in releasing ^{3}H-5HT from normal

Table 3. Ratios of brain concentrations to in vitro activities of the optical isomers of fenfluramine and norfenfluramine

Treatment	Time	Compounds in the brain	Uptake	Release		Binding	
				Normal	Reserpine	$5HT_1$	$5HT_2$
*d*F	30	*d*F	17.0	1.8	–	1.3	–
		*d*NF	2.6	3.6	18.0	0.9	1.6
	90	*d*F	8.9	0.9	–	0.7	–
		*d*NF	4.1	5.7	28.5	1.4	2.6
*d*NF	30	*d*NF	5.3	7.4	36.9	1.8	3.4
	90	*d*NF	5.2	7.2	36.2	1.7	3.3
*l*F	30	*l*F	1.7	5.0	15.1	5.6	3.3
		*l*NF	1.1	7.9	7.9	7.9	5.3
	90	*l*F	0.6	1.8	5.5	2.0	1.2
		*l*NF	1.6	11.2	11.2	10.1	7.4
*l*NF	30	*l*NF	1.7	11.7	11.7	10.7	7.8
	90	*l*NF	1.6	11.7	11.7	10.7	7.8

Ratios were calculated from the data in Table 1 and 2 as follows: Brain concentrations (nmoles/g)/in vitro activities (nmoles/ml)

synaptosomes in superfusion. However, in synaptosomes of reserpine-treated rats the effect of *d*-fenfluramine was virtually abolished, indicating that most of 5HT released by *d*F in normal synaptosomes originates from a reserpine-sensitive pool. In contrast, the effect of *d*NF was enhanced in synaptosomes of reserpine-treated animals, indicating that *d*NF is able to release 5HT from an extra-granular compartment. This is supported by pharmacological data showing that reserpine treatment potentiates the anorectic effect of *d*NF in rats (Borsini et al. 1982).

The pattern of effects of the *l*-isomers of fenfluramine and norfenfluramine was different from that of the *d*-isomers, *l*-fenfluramine's effect being increased by reserpine whereas that of *l*-norfenfluramine was not affected.

The *l*-forms were slightly more potent than the *d*-forms at $5HT_1$ binding sites; *d*NF was the most active compound at $5HT_2$ binding sites, although their IC_{50}-values were considerably higher than those obtained for known 5HT receptor agonists and antagonists (Table 2). *d*F was the least active compound both at $5HT_1$ and $5HT_2$ binding sites.

Table 3 reports the ratios between the brain levels of drugs and metabolites and their relative in vitro activities on serotonergic mechanisms (see Discussion).

Discussion

In the present investigation of the possible molecular mechanism of action by which the isomers and metabolites of fenfluramine increase serotonin transmission leading to anorectic activity, we compared the actual brain levels of fenfluramine and norfenfluramine isomers after administration of equi-active doses to rats, with their in vitro potencies on serotonergic synaptic mechanisms. Since fenfluramine distribution is the same in different brain regions (Garattini et al. 1979) and the compound has not been shown to accumulate selectively in serotonergic terminals (Mennini et al. 1980), we assumed that under these experimental conditions, its brain level distribution was uniform, representing the drug concentration available in vivo at target molecules to produce 50% of its maximal effect.

Then we took the in vitro activities (concentrations producing half-maximal effects or 25% in the cases of release) of fenfluramine isomers and metabolites as an index of their affinities for the three possible "targets" leading to increased serotonergic transmission. The ratios presented in Table 3 are therefore directly proportional to the expected activities of the four compounds on serotonergic mechanisms, taking into account the actual presence of the parent compound and metabolites in the rat brain.

It is important to underline that we do not know the exact extent to which uptake inhibition, release and receptor stimulation contribute to the final effect: no direct quantitative comparison of the different mechanisms is at present possible.

d-Norfenfluramine was the most active compound in terms of doses and brain concentrations necessary to elicit anorectic effect in the rat. Its action may be principally due to serotonin release from a reserpine-insensitive pool (Mennini et al. 1981a), followed by its ability to bind to postsynaptic serotonin binding sites. That the postsynaptic activity of *d*NF results in stimulation of receptors rather than blockade is supported by the fact that metergoline significantly reduced the depletion of brain serotonin caused by *d*NF in the rat (Invernizzi et al. 1982).

*d*F was the compound with pharmacological activity nearest to that of *d*NF (1.4 times in term of dosage), but its potency cannot be predicted simply from in vitro experiments because of its rapid metabolism to *d*NF in the rat. At the beginning (30 min) the parent compound induces a powerful inhibition of 5HT uptake, but this effect is probably not sufficient per se to reduce food intake in rats (Samanin et al. 1980). Its activity as a 5HT releaser from a reserpine-sensitive pool (Mennini et al. 1981a) and as a direct agonist on post-synaptic receptors, although not marked, could play a role in the anorectic effect. However the presence in the brain of *d*F-treated rats of *d*NF, which

represents only 40% of the parent compound levels at 30 min but which on account of its longer half life reaches 123% at 90 min, probably also contributes to the anorectic effect of fenfluramine, with the enhancement of 5HT release that can be obtained in such conditions. It is important to consider that *d*F and *d*NF release 5HT through two different mechanisms (Mennini et al. 1981a), the former being active on a reserpine-sensitive pool, the latter on a reserpine-insensitive pool. Thus the final effect of the administered *d*F on 5HT release may be the result of potentiation between the parent compound and its metabolite simultaneously present at the synapse (see Table 3).

The mechanism of action of *l*NF seems balanced between a direct stimulation of 5HT postsynaptic receptor sites and the increase of 5HT release from the reserpine-insensitive pool; uptake inhibition does not seem to be important for the activity of the *l*-isomers (Table 3). When rats were treated with *l*F, the levels of *l*F and *l*NF were roughly the same at 30 min, while *l*F present at the end of experiment amounted to only 25% of its metabolite.

This is in accordance with previous reports of a faster N-demethylation of the *l*- than the *d*-form after administration of the isomers to rats (Caccia et al. 1981; Jori et al. 1978), and suggests that, even if in vitro the mechanism of action of *l*F and *l*NF on serotonergic neurons seems to be similar, the anorectic effect obtained after *l*F treatment might well derive from the presence of high concentrations of *l*NF in the brain.

In conclusion, the present study demonstrates that the isomers and metabolites of fenfluramine can have the same pharmacological action (anorexic effect) by influencing basic mechanisms (uptake, release, and receptor binding) of stimulation of serotoninergic neurons in a quantitatively different manner.

Received July 16, 1990/Accepted January 17, 1991

Summary. The present study compares the anorectic activity of *d*-fenfluramine and its metabolite *d*-norfenfluramine in three animal species. *d*-Fenfluramine and *d*-norfenfluramine show anorectic activity at increasing doses (ED_{50}) in rats, guinea pigs, and mice, *d*-norfenfluramine being more active than *d*-fenfluramine in all three species. Equiactive anorectic activities are reached with different brain levels of *d*-fenfluramine and *d*-norfenfluramine, guinea pigs being the most sensitive species, followed by rats then mice. The metabolite most probably plays a major role in the anorectic effect of *d*-fenfluramine in guinea pigs, contributes to the anorectic activity in rats, but adds little to the action of the parent drug in mice. The different sensitivity to *d*-fenfluramine and *d*-norfenfluramine in these three species does not appear to be explained by a number of biochemical parameters, including serotonin uptake or release, receptor subtypes, or ^{3}H-*d*-fenfluramine binding and uptake.

Key words: *d*-Fenfluramine – Anorectics – Rats – Mice – Guinea pigs – Serotonin – Serotonin receptors – Serotonin uptake – Serotonin release

Introduction

Fenfluramine has long been considered an anorectic agent which acts through serotonergic system (Duhault and Verdavainne 1967; Garattini et al. 1975), although at higher doses fenfluramine also affects catecholamines in the brain (Invernizzi et al. 1986). The two isomers of fenfluramine have different biochemical and functional effects, with the *d*-isomer showing more potency and specificity in its effects on the serotoninergic system and food intake (Garattini et al. 1987).

d-Fenfluramine is an anorectic agent that differs from *d*-amphetamine in that it has no stimulating or stereotypic effects (Le Douarec and Neveu 1970). In some experimental conditions *d*-fenfluramine shows a clear anti-amphetamine activity (Berger et al. 1973; Garattini et al. 1975; Bendotti et al. 1980). Unlike *d*-amphetamine, *d*-fenfluramine does not significantly affect the catecholamine metabolism (Garattini et al. 1986; Invernizzi et al. 1986) but it enhances serotonin transmission (Garattini et al. 1987). The anorectic effect of fenfluramine is not reduced by antidopaminergic or antinoradrenergic drugs (Garattini and Samanin 1976) but is specifically blocked by antiserotoninergic drugs such as metergoline (Samanin and Garattini 1990).

The biochemical basis for the enhancement of the serotonergic system lies in the capacity of *d*-fenfluramine to block serotonin uptake (Borroni et al. 1983) and to release serotonin from nerve terminals (Mennini et al. 1981). In order to understand the mechanism of action of *d*-fenfluramine it is essential to know that this compound is rapidly transformed by the liver into an *N*-de-ethylated metabolite, *d*-norfenfluramine (Caccia et al. 1982). Also *d*-norfenfluramine is an anorectic agent (Garattini et al. 1979), inhibits serotonin uptake (Borroni et al. 1983) and enhances its release (Mennini et al. 1981). However, *d*-norfenfluramine differs from *d*-fenfluramine in that it also releases serotonin in reserpinized animals (Mennini et al. 1981).

The effect of *d*-fenfluramine on the serotoninergic system may be mediated by the high-affinity binding sites for ^{3}H-*d*-fenfluramine (Mennini et al. 1988; Gobbi et al. 1989) and by the fact that ^{3}H-*d*-fenfluramine is taken up by synaptosomes through a serotonin carrier mechanism (Garattini et al. 1989). Previous investigations have characterized the binding and uptake of ^{3}H-*d*-fenfluramine, showing that the two mechanisms can be differentiated using suitable inhibitors (Garattini et al. 1989). Most of the data concerning the described mechanism of action of *d*-fenfluramine have been obtained in the rat, and information on the effect of *d*-fenfluramine in other species is scanty and fragmentary. This investigation therefore compared the effect of *d*-fenfluramine and its metabolite *d*-norfenfluramine in three animal species:

Send offprint requests to T. Mennini at the above address

rats, mice, and guinea pigs. This paper summarizes the observations concerning (a) the anorectic activity, (b) the brain levels of *d*-fenfluramine and *d*-norfenfluramine at an equal anorectic effect, (c) the effect of *d*-fenfluramine on receptor binding, and uptake and release of serotonin, and (d) the presence of high-affinity binding sites and uptake for ^{3}H-*d*-fenfluramine in the three selected species.

Materials and methods

Animals. Male CD1 albino mice (20–25 g), male CD-COBS rats (175–200 g), and male albino guinea pigs (250–300 g) (Charles River, Italy) were used. The animals were housed at constant temperatures and relative humidity with fixed 12-h light/dark cycles. All the animals, with the exception of those used for evaluation of food intake, had free access to food and water.

In vivo studies. All experiments were performed between 9 a.m. and 12 a.m. *d*-fenfluramine hydrochloride and *d*-norfenfluramine hydrochloride (Servier, Neuilly-sur-Seine, France) were injected i.p. dissolved in saline. Animals concerning food intake evaluation were trained to eat their daily ration in 4 h (10 a.m.–2 p.m.). On the day of the experiment *d*-fenfluramine or *d*-norfenfluramine was administered i.p. and after 5 min (mice) or 30 min (rats and guinea pigs) food was made available. The amount of food eaten during the first hour was then measured and calculated as percentage of the amount eaten by controls.

The ED_{50} (reduction of 50% of food eaten by controls) was calculated at five dose levels with five rats and four guinea pigs per group or with three groups of four mice for each dose, according to the method of De Lean et al. (1978), adapted for use with a Macintosh computer (V. Guardabasso, personal communication). Statistical differences were assessed according to the F-test of the extra mean of squares (De Lean et al. 1978). Data concerning the ED_{50} in rats have already been published elsewhere (Mennini et al. 1985).

In a second experiment *d*-fenfluramine and *d*-norfenfluramine were given at doses corresponding to their anorectic ED_{50} and animals were killed by decapitation 5 and 60 min (mice) and 30 and 90 min (rats, guinea pigs) thereafter for determination of the parent drug and metabolite brain concentrations. *d*-Fenfluramine and *d*-norfenfluramine were extracted with benzene from aliquots (0.1–1 ml) of the brain homogenates (1 g/10 ml) after the addition of an internal standard and analyzed by electron capture gas liquid chromatography (Spinelli et al. 1988). Standard curves were prepared by spiking tissues daily with known concentrations of *d*-fenfluramine and *d*-norfenfluramine (calculated as free bases). Because of the wide range found for the drug and its metabolite in brain tissue in different animal species and in different experimental conditions, calibration graphs in the concentration range 0.05–1 µg/g were generally used. The slopes of these curves, determined by linear regression analysis, were used to calculate compound concentrations in unknown samples. The coefficient of variation for identical samples containing 0.1 µg was 10% or less and the recovery was approximately 90%.

In vitro studies. The brain regions were dissected as described by Glowinski and Iversen (1966).

^{3}H-d-fenfluramine binding. Frozen rat total brains were homogenized (Ultra-Turrax TP 1810, 2 × 20 s) in 50 vol Na^+/K^+ phosphate buffer, 50 mmol/l, pH 7.4. The homogenate was incubated at 37°C for 10 min and centrifuged at 50000 *g* for 10 min. The pellet was resuspended in 125 vol Na^+/K^+ phosphate buffer, 50 mmol/l, pH 7.4, and kept on ice until use. For the binding assay (Mennini et al. 1988) 0.50 ml of this preparation was incubated for 90 min at 37°C with 0.50 ml of the same buffer containing ^{3}H-*d*-fenfluramine [Commissariat a l'Energie Atomique (CEA, France), specific activity 15 Ci/mmol] at a final concentration of 10 nmol/l.

^{3}H-paroxetine, ^{3}H-ketanserin, ^{3}H-serotonin, ^{3}H-8OH-DPAT, ^{3}H-mesulergine binding. Crude membrane preparations were obtained from frozen brain areas [hippocampus for 2 (*N,N*-di[2,3 (*n*)-3H-propylamino)-8-hydroxy-1,2,3,4-tetrahydronephthalene (^{3}H-8OH-DPAT), cerebral cortex for ^{3}H-ketanserin, ^{3}H-paroxetine and ^{3}H-mesulergine, striatum for ^{3}H-5HT].

Binding assays, using the ligand ^{3}H-paroxetine, were performed according to Habert et al. (1985): ^{3}H-paroxetine (NEN, Du Pont, Germany, specific activity 23 Ci/mmol, final concentration 0.12 nmol/l) and crude membrane preparation from cerebral cortex (1000 vol) were incubated for 60 min at 22°C in 50 mmol/l Tris-HCl buffer, pH 7.4, containing 120 mmol/l NaCl and 5 mmol/l KCl in a final volume of 2 ml.

^{3}H-ketanserin ($5HT_2$) binding assay were performed according to the method of Leysen et al. (1982). In brief, ^{3}H-ketanserin (NEN, specific activity 62 Ci/mmol, final concentration 0.8 nmol/l) and tissue suspension (100 vol final dilution, cerebral cortex) were incubated at 37°C for 15 min in 50 mmol/l Tris-HCl buffer, pH 7.7, final volume 1 ml.

^{3}H-serotonin ($5HT_{1B}$ and $5HT_{1D}$) binding was assayed in a final incubation volume of 1 ml, consisting of membrane suspension 100 vol final dilution (mouse and rat striatum for $5HT_{1B}$ and guinea pig striatum for $5HT_{1D}$), ^{3}H-serotonin (NEN, specific activity 30 Ci/mmol, final concentration 2 nmol/l) and displacing agents or buffer. The samples were incubated at 25°C for 30 min (Peroutka 1986) in 50 mmol/l Tris-HCl buffer, pH 7.7, containing 10 µmol/l pargyline, 4 mmol/l $CaCl_2$, and 0.1% ascorbic acid.

^{3}H-8OH-DPAT ($5HT_{1A}$) binding was assayed in a final incubation volume of 0.5 ml, consisting of membrane suspension (100 vol final dilution, rat, mouse, or guinea pig hippocampus), ^{3}H-8OH-DPAT (NEN, specific activity 223 Ci/mmol, final concentration 1 nmol/l) and displacing agents or buffer (0.01 ml). The samples were incubated at 25°C for 30 min (Peroutka 1986) in 50 mmol/l Tris-HCl buffer, pH 7.7, containing 10 µmol pargyline, 4 mmol/l $CaCl_2$ and 0.1% ascorbic acid.

^{3}H-mesulergine binding to $5HT_{1C}$ receptors was studied in the presence of 0.1 µmol/l spiperone using cerebral cortex (Mengod et al. 1990) in a final incubation volume of 1.0 ml, with ^{3}H-mesulergine (NEN, specific activity 85 Ci/mmol, final concentration 1 nmol/l), membrane preparation (50 vol) and displacing agents or buffer (0.02 ml). The mixture was incubated for 30 min at 37°C in 50 mmol/l Tris-HCl buffer, pH 7.7, containing 10 µmol/l pargyline, 4 mmol/l $CaCl_2$ and 0.1% ascorbic acid.

After incubation, the samples for ^{3}H-paroxetine, ^{3}H-ketanserin, ^{3}H-*d*-fenfluramine, ^{3}H-serotonin, ^{3}H-8OH-DPAT, and ^{3}H-mesulergine binding were rapidly filtered (using a Brandel M-48RP model) under vacuum through Whatman GF/B glass fiber filters (GF/C for ^{3}H-paroxetine binding) and washed three times with 4 ml ice-cold buffer. The radioactivity trapped on the filters was counted in 8 ml Filter Count (Packard) in a Beckman LS 7500 liquid scintillation spectrometer with a counting efficiency of 45%. Inhibition curves were calculated using the "Allfit" program (De Lean et al. 1978) running on an IBM-AT personal computer.

^{3}H-serotonin and ^{3}H-d-fenfluramine uptake. Crude mitochondrial pellets (P2) were obtained from fresh brain regions (hypothalamus for ^{3}H-serotonin and total brain minus cerebellum for ^{3}H-*d*-fenfluramine) as previously described (Mennini et al. 1981). The final pellet was diluted (100 vol initial weight for ^{3}H-serotonin, 67 vol for ^{3}H-*d*-fenfluramine) with Krebs-Henseleit buffer having the following composition (mmol/l): NaCl (116); $NaHCO_3$ (25); NaH_2PO_4 (1); KCl (6); $MgSo_4$ (1); $CaCl_2$ (2); glucose (10); pargyline (10); EDTA (0.07); ascorbic acid (0.3); pH 7.2–7.4. Samples of 0.6 ml (for ^{3}H-serotonin) and 1.5 ml (for ^{3}H-*d*-fenfluramine) with final protein concentrations of 0.5–1.0 mg/ml (Peterson 1977) were incubated at 4°C or 30°C in a water bath. Drugs in a concentration range 10 pmol–100 µmol were added during 5-min preincubation at 30°C. Uptake was started by the

Table 1. Anorectic activity of *d*-fenfluramine (*d*-F) and *d*-norfenfluramine (*d*-NF) expressed as ED_{50} (mg/kg, i.p.) and brain concentrations after administration of these doses to mice, rats, and guinea pigs

addition of 50 nmol/l ^{3}H-serotonin or ^{3}H-*d*-fenfluramine. The reaction was stopped 5 min later by adding 1 ml ice-chilled Krebs-Henseleit buffer and rapid filtration under vacuum on cellulose nitrate filters (0.65 µm pore size, Società Italiana Microfiltrazione), which were washed twice with 2 ml Krebs-Henseleit buffer. The radioactivity trapped on the filters was counted in 8 ml Filter Count (Packard) in a Beckman LS 7500 liquid scintillation spectrometer with a counting efficiency of 45%. Inhibition curves were calculated using the Allfit program (De Lean et al. 1978) running on an IBM-AT personal computer.

^{3}H-serotonin release. Crude synaptosomal pellets (P2; Mennini et al. 1981) were obtained from fresh rat and guinea pig hypothalamus or mouse whole brain. The synaptosomes were then resuspended in 5 ml (about 50 vol) Krebs-Henseleit buffer having the following composition (mmol/l): NaCl (125); KCl (3); $CaCl_2$ (1.2); $MgSO_4$ (1.2); Na_2PO_4 (1); $NaHCO_3$ (22); glucose (10) (aeration with 95% O_2 and 5% CO_2); pH 7.2–7.4. The suspension was then added to an equal volume of the same buffer containing ^{3}H-serotonin (Amersham, England, 27.8 Ci/mmol), final concentration 60 nmol/l. After incubation for 15 min at 37°C, the solution was diluted to 80 ml with fresh buffer and 5-ml aliquots were then distributed on 0.65 µm cellulose nitrate filters in a 16-chamber superfusion apparatus (Raiteri et al. 1974) thermostatically maintained at 37°C. The synaptosomes were stratified on the filters through aspiration from the bottom under moderate vacuum. Superfusion was started (t = 0) at a rate of 0.6 ml/min; after 42 min, to equilibrate the system, fractions were collected every 2 min. At t = 47 min the medium in the chambers was replaced with a new one containing the drugs (3–4 chambers each) which was left for 3 min. At t = 51 min the medium was replaced again with the standard one and the superfusion and fraction collection continued until t = 60 min. The filters were then put in the scintillation vials and counted for radioactivity, as the fractions, in 8 ml Atom-Light (Packard).

Percentage of serotonin release was calculated as the amount of radioactivity released into each 2-min fraction over the total radioactivity present on the filter at the start of the fraction considered; after 40-min superfusion the baseline was stabilized at about 2%. Serotonin overflow was the difference between the radioactivity released in the presence and absence (baseline) of the drugs. Concentration–effect curves were calculated using the Allfit program (De Lean et al. 1978) running on an IBM-AT personal computer.

Results

In vivo studies

Table 1 summarizes the anorectic properties of i.p. *d*-fenfluramine in the rat, mouse, and guinea pig. The ED_{50} calculated on giving different doses of *d*-fenfluramine or *d*-norfenfluramine to overnight-starved rats used to taking their daily food ration during a period of 4 h and by increasing food consumption within the first hour show that the efficacy of *d*-fenfluramine was as follows; rat > guinea pigs > mouse. The activity ranking was the same for *d*-norfenfluramine, although in all three species *d*-norfenfluramine was more active than *d*-fenfluramine in terms of dosage. However, the differences reached statistical significance only in mice.

In mice the interval between treatment and the first measurement of food intake was kept shorter (5 min) than in rats and guinea pigs, because pilot experiments had shown that the anorectic effect of *d*-fenfluramine in mice was particularly short-lasting. In an experiment comparing these treatments, the ED_{50} of *d*-fenfluramine given 5 min before food intake was 16.3 mg/kg while, when *d*-fenfluramine was given 30 min before, the ED_{50} was 26.5 mg/kg (P = 0.07).

To assess whether the difference in anorectic activity was due to different kinetics of *d*-fenfluramine or *d*-norfenfluramine in the three animal species, brain concentration of *d*-fenfluramine and *d*-norfenfluramine after administration of the respective ED_{50} were measured (Table 1) at two times, corresponding to the beginning and the end of the period considered for food intake measurements. The brain concentrations necessary to obtain an anorectic ED_{50} after either drug were quite different in the three species. Much higher brain concentrations of *d*-fenfluramine were needed in mice than in guinea pigs and rats to obtain the same anorectic effect. Thus the

relative potency of *d*-fenfluramine established on the basis of *d*-fenfluramine brain concentrations does not parallel that obtained on the basis of the doses. It was clear that the shorter lasting effect of *d*-fenfluramine in mice than in rats and guinea pigs was not due to kinetic reasons since brain concentrations of *d*-fenfluramine in mice increased during the first 30 min of food intake and then remained relatively constant until the end of the observation period.

The potency ranking in the three species was similar for *d*-norfenfluramine. However the presence of the metabolite *d*-norfenfluramine in relation to the parent compound after administration of *d*-fenfluramine was quite different; brain *d*-norfenfluramine concentrations were comparable to or exceeded those of *d*-fenfluramine in guinea pigs and rats but were markedly lower than the parent drug brain concentrations in mice.

In vitro serotoninergic effects

In order to clarify the differences in anorectic potency of *d*-fenfluramine and *d*-norfenfluramine in the three species several experiments were done in vitro to establish the sensitivity of serotoninergic parameters such as serotonin receptors, uptake, and release. In addition the binding and uptake of ^{3}H-*d*-fenfluramine were studied in the whole brain of mice, rats, and guinea pigs.

Effect on serotonin receptor subtypes

The kinetic parameters of serotonin receptor subtypes in the three animal species are summarized in Table 2. The affinities of the various ligands were not different in the three species, thus making it simple to compare the data obtained with inhibitors. The maximum number of bindings sites for $5HT_{1A}$, $5HT_{1B}$, and $5HT_2$ was lower in the mouse than in the rat and guinea pig.

The effects of *d*-fenfluramine and *d*-norfenfluramine on various serotonin subtypes are summarized in Table 3; affinity was always in the µmol range with the exception of $5HT_{1C}$ receptors, for which *d*-norfenfluramine shows a relatively high affinity, ranging from 0.17 and 0.28 µmol/l in mouse and rats to 0.55 µmol/l in guinea pigs. *d*-Fenfluramine was slightly more active than *d*-norfenfluramine on $5HT_{1A}$ receptors but there was no marked difference in the three species. $5HT_{1B}$ receptors were present only in mice and rats (Heuring et al. 1986) but their sensitivity to *d*-fenfluramine or *d*-norfenfluramine was slight. Guinea pigs had $5HT_{1D}$ receptors (Waeber et al. 1989) but in this case too *d*-fenfluramine and *d*-norfenfluramine had a relatively high IC_{50}, i.e. 13.5 and 5.13 µmol/l respectively. $5HT_{1D}$ receptor binding is not relevant for mice and rats.

$5HT_2$ receptors are more sensitive to *d*-fenfluramine in mouse cortex than in the same brain area in rats and guinea pigs; *d*-norfenfluramine is about five times more effective in mice and rats than in guinea pigs.

Effect on ^{3}H-5HT uptake and ^{3}H-paroxetine binding

The kinetic parameters for ^{3}H-5HT uptake and ^{3}H-paroxetine binding were similar in the three animal species (Table 2). *d*-Fenfluramine and *d*-norfenfluramine were quite effective in blocking the uptake of ^{3}H-5HT from hypothalamus in vitro (Table 3). *d*-Fenfluramine shows about the same potency in guinea pigs (IC_{50} = 0.08 µmol/l), rats (IC_{50} = 0.07 µmol/l), and mice (IC_{50} = 0.10 µmol/l). The same is true for *d*-norfenfluramine, although its effect on mouse hypothalamus tends to be two to three times higher than for the same brain area of guinea pigs or rats. In contrast to the high nanomolar inhibition exerted by *d*-fenfluramine and *d*-norfenfluramine on serotonin uptake, activity on ^{3}H-paroxetine binding, a putative site for serotonin carrier-mediated

Table 3. In vitro effects of *d*-fenfluramine and *d*-norfenfluramine on 5HT receptor subtypes and transport mechanisms

Receptor type	Ligand	Area	IC_{50} (μmol/l)

$5HT_{1B}$	^{3}H-5-HT	Striatum	16.30 (3.55)	61.00 (13.00)	–
$5HT_{1C}$	^{3}H-mesulergine + spiperone	Cerebral cortex	4.43 (0.17)	6.80 (0.28)	12.60 (0.55)
$5HT_{1D}$	^{3}H-5HT	Striatum	–	–	13.50 (5.13)
$5HT_2$	^{3}H-ketanserin	Cerebral cortex	7.25 (2.09)	30 (2.20)	37.70 (10.6)
5HT uptake site	^{3}H-paroxetine	Cerebral cortex	26.30 (25.0)	10.25 (21.9)	28.40 (68.5)
d-F	^{3}H-*d*-F	Whole brain	0.25 (3.1)	0.04 (0.5)	0.27 (3.3)
3H-5HT uptake		Hypothalamus	0.10 (0.08)	0.07 (0.17)	0.08 (0.24)
3H-*d*-F uptake		Whole brain	0.37 (0.60)	0.26 (1.03)	0.25 (0.67)
3H-5HT release (EC_{50} μmol/l)		Hypothalamus	1.25 (1.98)[a]	1.78 (1.10)	1.30 (1.60)

IC_{50} or EC_{50} refers to *d*-fenfluramine (*d*-F) and (in parentheses) to *d*-norfenfluramine (*d*-NF). Statistical comparison between parameters was done by Student's *t*-test, and was as follows: ^{3}H-*d*-fenfluramine receptor binding: *d*-F and *d*-NF rat different from mouse and guinea pigs, $P < 0.01$; *d*-NF different from *d*-F in all species, $P < 0.01$; ^{3}H-*d*-F uptake: *d*-F mouse different from rat and guinea pigs, $P < 0.05$; *d*-NF rat different from mouse and guinea pigs, $P < 0.05$; *d*-NF different from *d*-F in all species, $P < 0.05$; ^{3}H-5HT release: *d*-NF rat different from mouse and guinea pigs, $P < 0.05$. [a] whole brain

transport, was much less marked (IC_{50} ranging from 10.2 to 68.5 μmol/l; Table 3).

Effect on ^{3}H-5HT release

Concentrations of *d*-fenfluramine that affect serotonin uptake do not influence the spontaneous release of ^{3}H-serotonin in superfused synaptosomes from rat and guinea pig hypothalamus or mouse whole brain. In fact the concentrations that raise serotonin release are at least one order of magnitude higher than those affecting serotonin uptake in the three animal species. *d*-Norfenfluramine shows a trend (not statistically significant) to be more active than *d*-fenfluramine in rats in stimulating ^{3}H-serotonin release, but *d*-fenfluramine and *d*-norfenfluramine were equipotent in mice and guinea pigs. *d*-Norfenfluramine was more active in stimulating serotonin release in the rat than in mice and guinea pigs. The ratio between enhancement of serotonin release and inhibition of serotonin uptake by *d*-fenfluramine was higher for rats (about 25) and guinea pigs (about 16) than for mice (about 12.5), while for *d*-norfenfluramine it was higher in mice (about 25) than in rats or guinea pigs (about 6).

The EC_{50} reported in Table 3 are somewhat different than the SC_{25} (concentration stimulating release by 25%) previously reported for *d*-fenfluramine and *d*-norfenfluramine in rats (Mennini et al. 1985). The reason is that in earlier studies drugs were added at the beginning of superfusion, and the effect was calculated on 10-min cumulative release as the difference between samples with or without drugs. In the present experiments (see Materials and methods) drugs were added after 47 min of superfusion when basal efflux was stabilized at about 2%, and the effect was calculated as net overflow induced during 3-min drug superfusion. EC_{50} are drug concentrations producing half-maximal effect, which was 20–25% for rats and mice and 15% for guinea pigs.

Table 4. In vitro ^{3}H-*d*-fenfluramine binding and ^{3}H-*d*-fenfluramine uptake by whole brain of mice, rats, and guinea pigs

Animal species	^{3}H-*d*-F binding		^{3}H-*d*-F uptake	
	K_d (nmol/l)	B_{max} (pmol/min/mg protein)	K_m (nmol/l)	V_{max} (pmol/min/mg protein)
Mouse	122 ± 15	1.34 ± 0.148[b]	359 ± 57[c]	2.02 ± 0.30[d]
Rat	32 ± 3[a]	0.90 ± 0.054[b]	242 ± 34	1.37 ± 0.18[d]
Guinea pig	325 ± 62	3.52 ± 0.672[b]	183 ± 55	0.66 ± 0.16[d]

The two parameters (K_d and B_{max} or K_m and V_{max}) ± coefficient of variation were obtained using the "Ligand" program (Munson and Roadbard 1984). Statistical comparison between parameters was done by Student's *t*-test and was as follows: ^{3}H-*d*-fenfluramine binding: [a] $P < 0.01$ different from mouse and guinea pigs, [b] $P < 0.01$ different in all animal species; ^{3}H-*d*-fenfluramine uptake: [c] $P < 0.05$ different from rat and guinea pigs; [d] $P < 0.05$ different in all animal species

^{3}H-d-fenfluramine uptake in brain synaptosomes

^{3}H-*d*-fenfluramine is actively taken up, presumably with a 5HT-like carrier, by rat brain synaptosomes (Garattini et al. 1989). It was therefore of interest to investigate whether a similar mechanism existed in the guinea pig and mouse synaptosomes. As shown in Table 4, the V_{max} for ^{3}H-*d*-fenfluramine uptake was higher for mouse brain synaptosomes than for rats and guinea pigs, while K_m followed the opposite order in terms of affinity. Table 3 reports the IC_{50} for *d*-norfenfluramine, which was less active than *d*-fenfluramine in all animal species. *d*-Norfenfluramine was also less active in rat than in mouse and guinea pig.

^{3}H-d-fenfluramine binding in brain

^{3}H-*d*-Fenfluramine is bound to brain structures of rats both in vitro and in vivo (Mennini et al. 1988; Gobbi et

al. 1989). It was therefore of interest to investigate whether there was a high-affinity binding site in brain of mice and guinea pigs. As shown in Table 4, the B_{max} was higher in guinea pigs than in mice and rats; the affinity (K_d) of *d*-fenfluramine was considerably higher in rats; in fact in this species it was respectively about four and ten times higher than in mice and guinea pigs. *d*-Norfenfluramine inhibited the binding of ^{3}H-*d*-fenfluramine with an IC_{50} about ten times higher than for *d*-fenfluramine in all three animal species (Table 3), and similarly to *d*-fenfluramine, was more active in rat than in mouse and guinea pig.

Discussion

The possible mechanisms of the anorectic activity of *d*-fenfluramine have been summarized by several authors (Blundell and Hill 1988; Samanin and Garattini 1990; Garattini et al. 1979, 1986, 1987, 1988, 1989; Garattini 1987). There is a general consensus that *d*-fenfluramine should be considered as belonging to a different class from the classic prototype of anorectic agents, *d*-amphetamine. *d*-Amphetamine requires an intact catecholaminergic system to inhibit food intake (Samanin and Garattini 1982), whereas an intact serotoninergic system is necessary for the effect of fenfluramine (Samanin and Garattini 1990). Whereas *d*-amphetamine releases brain dopamine and noradrenaline (Garattini et al. 1978), *d*-fenfluramine lowers brain serotonin and 5-hydroxyindolacetic acid (5HIAA; Garattini et al. 1986), an effect which persists over time (Garattini et al. 1986; Zaczek et al. 1990). The mechanism by which *d*-fenfluramine depletes the stores of brain serotonin is not fully understood. Brain concentrations of *d*-fenfluramine and its active metabolite *d*-norfenfluramine found after an anorectic ED_{50} in rats are compatible with concentrations of *d*-fenfluramine and *d*-norfenfluramine which in vitro block serotonin uptake and enhance its release (Mennini et al. 1985). This has led to the suggestion that *d*-fenfluramine increases the transmission of serotonin in the brain, as indirectly confirmed by the increase of brain extracellular serotonin (Carboni and Di Chiara 1989; Schwartz et al. 1989) and 5HIAA (De Simoni et al. 1988).

That an involvement of serotonin is important in the anorectic activity of *d*-fenfluramine (and *d*-norfenfluramine) is sustained by the fact that serotonin antagonists prevent the anorectic effects of *d*-fenfluramine and *d*-norfenfluramine (Samanin and Garattini 1990). Furthermore indirect serotonin agonists such as fluoxetine (Yen et al. 1987), sertraline (Lucki et al. 1988), paroxetine (Bizzi, personal communication), zimelidine (Angel et al. 1988) and direct serotonin agonists such as m-chlorophenyl-piperazine (Samanin et al. 1979), quipazine (Samanin et al. 1977), RU24969 (Bendotti and Samanin 1987), and DOI (Schechter and Simansky 1988) show anorectic activity.

However almost all the studies that have helped elucidate the mechanism of action of *d*-fenfluramine have been done in rats, and scant data are available in other animal species; hence the interest of comparative studies to find out whether there is any difference when mice, rats, and guinea pigs are utilized, as in the present report.

It was found that *d*-fenfluramine reduces food intake in the three animal species investigated at doses which do not have gross behavioral effects that might indirectly interfere with food intake. The ED_{50} expressed in mg/kg indicated that rats are more sensitive than guinea pigs or mice, in terms of dosage. For *d*-fenfluramine the ED_{50} for rats was 3.7 and 12.5 times lower than for guinea pigs and mice respectively; for *d*-norfenfluramine the ED_{50} for rats was 3.7 and 8.5 times lower than for guinea pigs and mice. In all three species *d*-norfenfluramine was slightly more active than *d*-fenfluramine, 2.4 times more active in mice, and 1.6 times in rats and guinea pigs.

It was logical to investigate whether kinetic reasons could explain these quantitative differenees in the anorectic activity of *d*-fenfluramine. After administration of equiactive anorectic doses (ED_{50}) the brain concentrations of *d*-fenfluramine and *d*-norfenfluramine varied widely and were not dose-related; mice appeared to be the species least sensitive to *d*-fenfluramine, followed by rats and guinea pigs. *d*-Norfenfluramine administered as such was present in the brain approximately in the same order as *d*-fenfluramine, i.e. higher in mice than in rats than in guinea pigs. However, brain *d*-norfenfluramine concentrations after *d*-fenfluramine were comparable to or exceed those of the parent drug in guinea pigs and rats but were less than 20% of *d*-fenfluramine in mice. Comparing the brain concentrations of *d*-norfenfluramine after equiactive doses of *d*-fenfluramine or *d*-norfenfluramine, it thus appears that the active metabolite (Borroni et al. 1983; Garattini et al. 1979) most probably plays a major role in the parent drug's anorectic activity in guinea pigs, contributes to the effect in rats, but adds only a minor component to the pharmacological action in mice. The findings concerning the metabolism of *d*-fenfluramine to *d*-norfenfluramine in mice and guinea pigs are consistent with previously reported data (Caccia et al. 1982; Steranka and Sanders-Bush 1979; Fuller et al. 1988).

In an effort to understand the reason for these differences in sensitivity to *d*-fenfluramine and *d*-norfenfluramine, in vitro studies were made of parameters indicative of serotonin function, i.e. uptake, release, and affinity for receptor subtypes. Uptake and release of serotonin should be considered together, because inhibition of uptake and enhancement of release contribute in a synergistic manner to increase serotoninergic transmission by making more serotonin available at receptor sites. Unfortunately it is difficult, at least quantitatively, to reconcile the different anorectic sensitivities of the three species with these serotonin biochemical parameters. Comparing the brain levels of *d*-fenfluramine or *d*-norfenfluramine at equal anorectic doses with the concentrations of *d*-fenfluramine or *d*-norfenfluramine affecting serotonin uptake and/or release, the most sensitive species should be the mouse, but this was clearly not the case. Measurement of serotonin uptake sites by determining ^{3}H-paroxetine binding was not very helpful because *d*-fenfluramine and *d*-norfenfluramine have low

affinity for these sites, as previously reported for ^{3}H-imipramine binding (Gobbi et al. 1988).

The study of the affinity of *d*-fenfluramine and *d*-norfenfluramine for various serotonin receptor subtypes also led to no firm conclusion; as in rats (Mennini et al. 1985), in mice and guinea pigs the affinity of *d*-fenfluramine and *d*-norfenfluramine for or $5HT_1$ $5HT_2$ receptors is relatively low. $5HT_{1B}$ receptors, suggested to be the sites responsible for the anorectic activity of *d*-fenfluramine and *d*-norfenfluramine (Garattini et al. 1986), are more sensitive to *d*-fenfluramine in mice than in rats. $5HT_{1D}$ receptors are probably the equivalent of $5HT_{1B}$ receptors for guinea pigs (Waeber et al. 1989) but they did not show specially high affinity for *d*-fenfluramine or *d*-norfenfluramine (the IC_{50} was more than twice the brain concentration of *d*-norfenfluramine after an ED_{50} of *d*-fenfluramine or *d*-norfenfluramine.) $5HT_{1C}$ receptors are also probably involved in food intake (Garattini et al. 1989). It is of interest that *d*-norfenfluramine shows a fairly good affinity for $5HT_{1C}$ receptors in the three animal species, with IC_{50} compatible with the brain concentrations.

Activation of $5HT_{1A}$ receptors is presumably related to an increase of food intake (Garattini et al. 1988; Bendotti and Samanin 1987; Mennini and Garattini 1988) and in this light it is difficult to interpret the results with *d*-fenfluramine and *d*-norfenfluramine in the three animal species.

The studies on serotonin uptake were carried out in the mouse, rat, and guinea pig hypothalamus, while the receptor binding assay was done in whole brain or in brain areas (hippocampus, striatum, cortex) particularly suitable for the measurement of serotonin receptor subtypes. It thus cannot be excluded that receptors located in certain nuclei of the hypothalamus in the three species may have different sensitivity to *d*-fenfluramine or *d*-norfenfluramine. Studies are in progress on this point.

Finally, binding and uptake of ^{3}H-*d*-fenfluramine in brain were determined in vitro. Previous studies in rats have shown that various brain areas in vitro and in vivo bind ^{3}H-*d*-fenfluramine with high affinity and stereospecificity (Mennini et al. 1988; Gobbi et al. 1989). ^{3}H-*d*-Fenfluramine binding could be reduced either by lesioning the serotoninergic terminals with 5,7-DHT (Garattini et al. 1988) or by inhibition with several agents showing affinity for presynaptic serotonin carriers (Mennini et al. 1988).

The density of ^{3}H-*d*-fenfluramine binding was highest in guinea pigs, followed by mice and rats. The affinity of *d*-fenfluramine and *d*-norfenfluramine was higher in rats than in mice or guinea pigs, and *d*-norfenfluramine had about ten times less potency in all these species.

^{3}H-*d*-fenfluramine not only binds to brain structures but it is also taken up with a temperature- and ouabaine-sensitive mechanism presumably connected with the carrier of serotonin transport (Garattini et al. 1988). The V_{max} of ^{3}H-*d*-fenfluramine uptake is not directly related to the anorectic activity of *d*-fenfluramine or *d*-norfenfluramine since it was highest in mice, followed by rats and guinea pigs. The affinity for *d*-fenfluramine and *d*-norfenfluramine was substantially the same in the three species. Again it is possible that these measurements in the whole brain may not be representative of brain areas responsible for the anorectic effect of *d*-fenfluramine and *d*-norfenfluramine.

It is difficult at the moment to relate any particular effect of *d*-fenfluramine or *d*-norfenfluramine on single serotonin biochemical parameters to the anorectic sensitivity of the three animal species; a weighed combination of various serotonin parameters in selected crucial brain sites might yield more satisfactory results.

In conclusion we have shown that: 1. The anorectic activity of *d*-fenfluramine and *d*-norfenfluramine requires progressively higher doses in rats, guinea pigs, and mice. 2. *d*-Norfenfluramine is slightly more active than *d*-fenfluramine in all three species. 3. Equiactive anorectic activities are reached with different brain levels of *d*-fenfluramine and *d*-norfenfluramine, guinea pigs being the most sensitive species, followed by rats then mice. 4. *d*-Norfenfluramine may have great importance for the anorectic effect of *d*-fenfluramine in guinea pigs, contributes in rats, but has no significance in mice. 5. A number of biochemical parameters, including serotonin uptake, release and affinity for receptor subtypes as well as ^{3}H-*d*-fenfluramine binding and uptake, apparently could not explain the different sensitivity to *d*-fenfluramine and *d*-norfenfluramine in the three species considered.

In vitro studies on the mechanism by which (+)-norfenfluramine induces serotonin and dopamine release from the vesicular storage pool

Received: 6 April 1998 / Accepted: 9 June 1998

Abstract (+)-Norfenfluramine is the main metabolite of the serotoninergic anorectic agent (+)-fenfluramine. Both compounds inhibit 5-HT reuptake and stimulate its release, although they induce release from different pools, with (+)-norfenfluramine acting primarily on the cytoplasmic pool. Moreover, (+)-norfenfluramine was more potent than the parent drug in inducing dopamine release.
In order to investigate whether (+)-norfenfluramine induces a Ca^{2+}-dependent vesicular release, like some amphetamine derivatives, in the present study we preloaded synaptosomes with the [^{3}H]neurotransmitter ([^{3}H]5-HT or [^{3}H]dopamine), superfused (washed) them for 47 min in the absence of pargyline and then exposed them to the releasing stimulus. With this protocol, the cytoplasmic pool should be absent and the [^{3}H]neurotransmitter should mainly be stored in synaptic vesicles, where (+)-norfenfluramine should act to induce release. This was confirmed by a significant *decrease* of (+)-norfenfluramine-induced [^{3}H]5-HT and [^{3}H]dopamine release after reserpine pretreatment. The dose-response curves of (+)-norfenfluramine-induced [^{3}H]5-HT release were superimposable in hippocampus and hypothalamus, and also superimposable on the curve for (+)-fenfluramine-induced [^{3}H]5-HT release; the dopamine releasing potency of (+)-norfenfluramine in the striatum was more than ten times lower. The [^{3}H]5-HT release induced by (+)-norfenfluramine was partly (about 50%) but significantly Ca^{2+}-dependent, and it was also markedly (68%) inhibited by Cd^{2+}, a non-specific blocker of voltage-dependent Ca^{2+} channels, suggesting that the Ca^{2+}-dependent release is mediated by entry of Ca^{2+} into the synaptosomes through these channels. The [^{3}H]dopamine release induced by 5 μM (+)-norfenfluramine was completely Ca^{2+}-independent whereas at higher concentrations (10 and 20 μM) it was only slightly (20%) Ca^{2+}-dependent. We have no clear explanation why (+)-norfenfluramine has these different effects on serotoninergic and dopaminergic synaptosomes.

Introduction

(+)-Norfenfluramine [(+)-NF] is the main metabolite of the serotoninergic anorectic agent (+)-fenfluramine [(+)-Fen], and has even greater anorectic effect than the parent drug (Mennini et al. 1991). This metabolite contributes to, but does not explain, the anorectic effect of (+)-Fen in rats and other animal species, except for guinea pigs where (+)-Fen seems to be a prodrug of (+)-NF (Mennini et al. 1991; Caccia et al. 1993a). In vitro, both compounds inhibit 5-HT reuptake and stimulate its release from brain synaptosomes of different animal species (Mennini et al. 1991, 1996a). Moreover, (+)-NF is more potent than the parent drug in inducing dopamine (DA) release (Mennini et al. 1996b) and binds to 5-HT_{2C} receptors with appreciable affinity (Mennini et al. 1991, 1996a), suggesting it might also act as a direct 5-HT_{2C} agonist (Gibson et al. 1993; Oluyomi et al. 1994; Curzon et al. 1997).

The mechanism by which (+)-NF induces 5-HT release is different from the mechanism underlying (+)-Fen-induced release since, in a release superfusion model in which the cytoplasmic neurotransmitter pool was artificially enhanced (i.e., by using unwashed synaptosomes in the presence of pargyline), reserpine pretreatment abolished the effect of (+)-Fen but it did not affect – or even increased – the [^{3}H]5-HT releasing properties of (+)-NF (Mennini et al. 1981).

Recently we described a carrier-dependent and calcium-dependent [^{3}H]5-HT and/or [^{3}H]DA release from the vesicular pool shared by amphetamine derivatives [including (+)-Fen, *p*-chloroamphetamine (pCA), 3,4-methylenedioxymethamphetamine (MDMA), and (+)-amphetamine] (Crespi et al. 1997). The aim of the present study was to verify, in experimental conditions where the cytoplasmic pool is absent, whether (+)-NF also induced exocytotic-like [^{3}H]5-HT and/or [^{3}H]DA release from synaptic vesicles.

We used a completely different superfusion system: the synaptosomes were superfused in the absence of pargyline for 47 min before adding the releasing agent, in order to deplete the cytoplasmic compartment. Under these conditions the [^{3}H]neurotransmitter is only stored in the synaptic vesicles, so presumably we are measuring release only from this pool. The effect of (+)-NF on this release mechanism could cast useful light on the pharmacological and toxicological (Gobbi et al. 1996a) effects of this compound.

Materials and methods

Preparation of the synaptosomal fraction. Male CRL:CD(SD)BR rats (Charles River, Italy) weighing about 150 g were used. Procedures involving animals and their care were conducted in conformity with the institutional guidelines that are in compliance with national (D.L. n. 116, G.U., suppl. 40, Feb. 18, 1992, Circolare No. 8, G.U., July 14, 1994) and international laws and policies (EEC Council Directive 86/609, OJ L 358, 1, Dec.12, 1987; Guide for the Care and Use of Laboratory Animals, U.S. National Research Council, 1996). When used, reserpine (Ciba-Geigy, Switzerland) was given at a dose of 10 mg/kg, i.p., 24 h before killing. The rats were killed by decapitation and their hippocampi, hypothalami and striata were rapidly dissected and homogenized in 40 volumes of ice-chilled 0.32 M sucrose, pH 7.4, in a glass homogenizer with a Teflon pestle. The homogenates were centrifuged at 1000 *g* for 5 min and the supernatants centrifuged again at 12000 *g* for 20 min to yield the crude synaptosomal pellet (P_2; Gray and Whittaker 1962).

Release studies. The P_2 pellets were resuspended in about 20 volumes of Krebs-Henseleit buffer with the following composition (mM): NaCl (125); KCl (3); $CaCl_2$ (1.2); $MgSO_4$ (1.2); NaH_2PO_4 (1); $NaHCO_3$ (22); glucose (10); gassed with 95% O_2 and 5% CO_2, pH 7.2–7.4. The suspension was then added to an equal volume of the same buffer containing [^{3}H]5-HT (NEN, Germany; specific activity 30 Ci/mmol) or [^{3}H]DA (Amersham, UK; specific activity 7 Ci/mmol), both at a final concentration of 0.06 μM. After 15-min incubation at 37°C, the suspension was diluted with fresh buffer, and 5-ml samples (about 5 mg initial tissue) were distributed onto cellulose mixed-esters filters (0.65 μM pore size; Millipore, Italy) in a 20-chamber superfusion apparatus held thermostatically at 37°C (Raiteri et al. 1974). The synaptosomes were layered onto the filters by aspiration from the bottom under moderate vacuum.

Superfusion was started (t=0 min) at a rate of 0.5 ml/min with standard medium; after 44-min equilibration, fractions were collected every 2 min until t=60 min. The filters were put into scintillation vials and counted for radioactivity, as were the fractions, in 4 ml of Ultima Gold MV (Packard, The Netherlands). (+)-NF (Servier, France) was present in the superfusion medium for 3 min from t=47 to t=50 min. When used, 1 μM indalpine (Rhone-Poulenc, France) or 3 μM nomifensine (RBI, USA) were added from t=40 to t=60 min for [^{3}H]5-HT release or [^{3}H]DA release, respectively. In some experiments, synaptosomes were superfused from t=40 to t=60 min with a Ca^{2+}-free medium containing 3 mM EGTA for [^{3}H]5-HT release or 0.03 mM EGTA for [^{3}H]DA release (under these conditions there was no effect on basal release, whereas the depolarization-induced release was completely blocked). When used, $CdCl_2$ (100 μM) was added to the superfusion medium from t=40 to t=60.

The fractional release rate (FRR) was calculated as 100 times the amount of radioactivity released into each 2-min fraction over the total radioactivity present on the filter at the start of that fraction. The FRR before the releasing stimulus (t=44–46), expressed as a percentage in 2 min, was reported as basal outflow. The overflow (%) was calculated as the difference between the stimulated (t=48–56) and the non-stimulated FRR (mean t=44–48 and t=56–60; see for example Fig. 2). The effect of the drugs added at t=47 was only detectable 1 min later, since the fluid takes about 1.5 min to flow from the filters to the collecting vials.

The content of unmetabolized [^{3}H]5-HT and [^{3}H]DA in the superfusate was determined as previously described (Goldstein et al. 1981; Gobbi et al. 1992).

Statistical analysis. Data are generally reported as means ±SD from n replications obtained in different experiments, as specified. The data were analyzed by one-way analysis of variance (ANOVA) followed by post hoc comparison (Tukey's test).

Results

[^{3}H]5-HT and [^{3}H]DA releasing effect of (+)-NF

Figure 1 shows the concentration-response curves for the tritium releasing effect of (+)-NF from superfused synaptosomes preloaded with [^{3}H]5-HT (hippocampal and hypothalamic synaptosomes) and from rat striatal synaptosomes preloaded with [^{3}H]DA. For comparison, Fig. 1 also shows the release induced by (+)-Fen (Crespi et al. 1997). The overflows were calculated as described in Materials and methods from data similar to that shown, as examples, in Figs. 2A and 3A. The tritium overflow induced by (+)-NF and (+)-Fen was mainly (>80%) unmetabolized [^{3}H]neurotransmitter (Mennini et al. 1996b; Crespi et al. 1997 and unpublished data), and is referred to hereafter as [^{3}H]5-HT or [^{3}H]DA release.

Both (+)-NF and its parent compound were more potent in inducing [^{3}H]5-HT than [^{3}H]DA release (more than ten times); (+)-NF was equipotent with the parent compound in inducing [^{3}H]5-HT release in both brain regions but more potent as a [^{3}H]DA releaser.

We have previously demonstrated that, under our preloading conditions, [^{3}H]5-HT is only taken up by serotoninergic synaptosomes (Gobbi et al. 1996b). Similarly, it is also very likely that [^{3}H]DA is only taken up by dopaminergic synaptosomes: in fact, confirming previous data (Andersen 1989), we measured that the uptake of 60

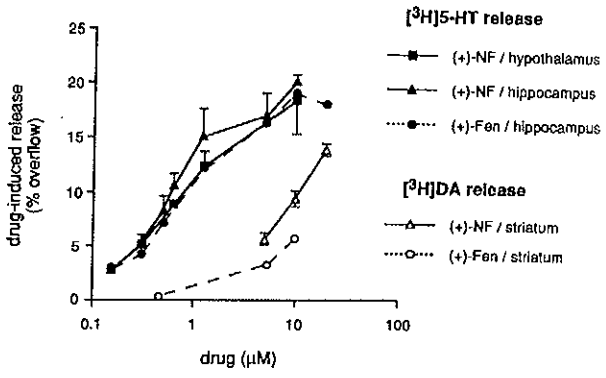

Fig. 1 Concentration-effect curves for (+)-norfenfluramine [(+)-NF]-induced [^{3}H]5-HT release from rat hippocampal synaptosomes (*filled symbols*) and [^{3}H]DA release from rat striatal synaptosomes (*empty symbols*). For the sake of comparison, the releasing effects of (+)-fenfluramine [(+)-Fen] are also shown (Crespi et al. 1997). Superfused synaptosomes were exposed to the drug for 3 min. Each overflow is the mean ±SD of 3–5 results from 1–5 experiments

nM [^{3}H]DA in striatal synaptosomes is completely inhibited by GBR-12909 at a concentration (100 µM) which selectively blocks DA transporter without interacting with the noradrenaline transporter (Andersen 1989).

Effect of reserpine

Pretreatment of the rats 24 h before with 10 mg/kg of reserpine significantly reduced the accumulation of [^{3}H]5-HT in hippocampal and [^{3}H]DA in striatal synaptosomes (by about 80%), whereas FRR significantly increased (from 1.7±0.2 to 3.4±0.2 for [^{3}H]5-HT release, $P<0.01$, and from 1.18±0.17 to 1.62±0.14 for [^{3}H]DA release, $P<0.01$). The [^{3}H]5-HT overflow induced by maximal (10 µM) (+)-NF was decreased by reserpine from 22.3±0.4 to 9.8±0.2 ($P<0.01$ Student's *t*-test, means ± SD of three rats per group); the [^{3}H]DA overflow induced by maximal (20 µM) (+)-NF was reduced by reserpine from 17.88±2.53 to 0.45±0.36 ($P<0.01$, Student's *t*-test, mean ± SD of three rats per group).

Carrier dependency

[^{3}H]5-HT release induced by 1.25 µM (+)-NF was completely inhibited by 1 µM indalpine, a 5-HT transporter blocker, which has no releasing activity per se (Fig. 2A). The [^{3}H]DA release induced by 10 µM (+)-NF was largely, although not completely, inhibited by 3 µM nomifensine, a DA transporter blocker (64 and 75% in two different experiments; Fig. 3A); this concentration of nomifensine should be sufficient to completely inhibit the DA transporter, since we measured that its IC_{50} on synaptosomal [^{3}H]DA uptake is 234 nM (data not shown), similar to the value reported in the literature (134 nM; Andersen 1989). Moreover, we previously described that 3 µM nomifensine completely inhibited the [^{3}H]DA release induced by (+)-amphetamine, MDMA and pCA under identical experimental conditions (Crespi et al. 1997).

Ca^{2+} dependency

Removal of Ca^{2+} ions from the superfusion buffer partially but significantly reduced [^{3}H]5-HT release induced by (+)-NF (Fig. 2). [^{3}H]5-HT overflow induced by 0.5, 1.25 and 5 μM (+)-NF was reduced by 48%, 46% and 41%, respectively (Fig. 2B). The [^{3}H]5-HT release induced by 1.25 μM (+)-NF was also reduced by 68% in the presence of 100 μM $CdCl_2$, a non-specific blocker of voltage-dependent Ca^{2+} channels (from 11.56±0.56 to 3.64±0.38, mean ± SD, n=5, P<0.01, Student's t-test).

Removal of Ca^{2+} ions from the superfusion buffer slightly reduced the [^{3}H]DA release induced by 10 and 20 μM (+)-NF (by 22 and 12%, respectively, P<0.05), whereas it had no significant effect on the release induced by 5 μM (+)-NF (Fig. 3).

Discussion

This study set out to verify the effect of (+)-NF on 5-HT and DA release in experimental conditions where the cytoplasmic pool (for which (+)-NF has preferential activity) is abolished. Thus, with the experimental protocol used [preloaded synaptosomes superfused (washed) for 47 min in the absence of pargyline and then exposed to the releasing stimulus], [^{3}H]5-HT is presumably mainly stored in the synaptic vesicles and (+)-NF should act on this pool to induce its release. This was confirmed by the significant (56%) *decrease* of (+)-NF-induced [^{3}H]5-HT release after reserpine pretreatment, resembling the data obtained with (+)-Fen (60% decrease by reserpine; Gobbi et al. 1992). The (+)-NF-induced [^{3}H]DA release was also strongly (98%) reduced by reserpine.

With the superfusion apparatus employed, the neurotransmitter released by the drug is immediately removed and cannot interact with presynaptic receptors or be taken up again. This is particularly important when comparing the effects of compounds that act both as releasers and reuptake inhibitors.

[^{3}H]5-HT release

Under these experimental conditions, (+)-NF induced [^{3}H]5-HT release in a concentration-dependent manner, with similar potency in the hypothalamus and hippocampus. We thus confirmed that in vitro (+)-NF has the same potency as, or is even slightly more potent than, the parent compound (+)-Fen, as previously shown in different animal species (Mennini et al. 1991; Caccia et al. 1993b; Mennini et al. 1996a). The IC_{50}s of (+)-NF and (+)-Fen as [^{3}H]5-HT uptake inhibitors are 0.6 and 0.4 μM, respectively (Garattini et al. 1992). Recent in vivo studies showed that (+)-Fen (2.5 mg/kg, i.p.) but not (+)-NF (1.5 mg/kg, i.p.) increased medial hypothalamic dialysate 5-HT, thus suggesting a significant difference in the releasing properties of the two compounds in vivo (Oluyomi et al. 1994). These findings are hard to explain, since the brain concentrations of the two compounds after these acute treatments should not differ significantly (Mennini et al. 1991), and in view of our in vitro results. However, there are other in vivo data obtained either by microdialysis (Puig de Parada et al. 1995; Paez and Hernandez 1996) and by voltammetry (De Simoni et al. 1988) suggesting that (+)-NF is equally potent, or even more so than the parent compound in releasing 5-HT.

The [^{3}H]5-HT release induced by (+)-NF was partly but significantly Ca^{2+}-dependent, thus confirming with (+)-NF a finding previously shown with (+)-Fen (Gobbi et al. 1992, 1993), pCA and MDMA (Crespi et al. 1997). The Ca^{2+}-dependent release was about 50% of the total (+)-NF-induced release at all concentrations used (0.5, 1.25 and 5 μM); these values are similar to those for MDMA and pCA (Crespi et al. 1997), whereas (+)-Fen-induced 5-HT release was 82% Ca^{2+}-dependent with 0.5 μM (+)-Fen, and 30% Ca^{2+}-dependent with 10 μM (+)-Fen (Gobbi et al. 1992). It is unlikely that the Ca^{2+} dependency of the releasing effect is due to an effect on the transporter protein since in our experimental conditions [^{3}H]5-HT uptake was not modified by removing Ca^{2+} ions from the buffer (Gobbi et al. 1993; Crespi et al. 1997).

The 5-HT release induced by (+)-NF was also markedly (68%) inhibited by Cd^{2+}, a non-specific blocker of voltage-dependent Ca^{2+} channels, thus suggesting that the Ca^{2+}-dependent release is mediated by Ca^{2+} entering the synaptosomes through these channels. This agrees with previous findings that release induced by 0.5 μM (+)-Fen, MDMA and pCA was significantly inhibited by ω-agatoxin-IVA (Frittoli et al. 1994; Crespi et al. 1997), a specific blocker of P/Q type voltage-operated Ca^{2+} channels (Mintz et al. 1992). The mechanism by which amphetamine derivatives induce Ca^{2+} influx, and the subsequent exocytotic release, is not yet understood. However, we previously reported that this mechanism can be antagonized by nanomolar concentrations of methiotepine not acting on 5-HT extracellular receptors or Ca^{2+} channels (Crespi et al. 1997). It is thus very interesting that methiotepine also inhibited the (+)-NF-induced [^{3}H]5-HT release (Mennini et al. 1996b), suggesting a common mechanism for the Ca^{2+}-dependent [^{3}H]5-HT release induced by (+)-Fen and (+)-NF.

In conclusion, (+)-NF, like the other amphetamine derivatives tested so far [(+)-Fen, pCA and MDMA], induces Ca^{2+}-dependent 5-HT release, which may be due to drug-induced Ca^{2+} influx into the nerve endings. Ad hoc studies are required to clarify whether these mechanisms apply in vivo, and whether they are relevant to the pharmacological and/or toxicological effects of these drugs.

[^{3}H]DA release

In the present study we confirmed that (+)-NF was a more potent DA releaser than (+)-Fen, possibly because of higher affinity for the DA transporter (the IC_{50}s of (+)-NF and (+)-Fen as [^{3}H]DA uptake inhibitors in rat striatal synaptosomes are 4.2 and 16.3 μM, respectively; Garattini et al. 1992). The concentrations of (+)-NF required to induce

[^{3}H]DA release from rat striatal synaptosomes are, however, ten times those required to induce [^{3}H]5-HT release, and this is also likely due to higher affinity of (+)-NF for the 5-HT transporter (see above). Similarly, we previously described that MDMA and pCA induce [^{3}H]DA release at concentrations higher than those required to induce [^{3}H]5-HT release, and this was associated to their higher affinity for the 5-HT- than the DA-transporter (Crespi et al. 1997); however, the [^{3}H]DA release induced by 5 μM MDMA and pCA was similar to the [^{3}H]5-HT release induced by 0.5 μM MDMA and pCA in that both of them were decreased by about 50% using a Ca^{2+}-free buffer (Crespi et al. 1997). On the contrary, the [^{3}H]DA release induced by 5 μM (+)-NF was completely Ca^{2+}-independent, whereas at higher concentrations (10 and 20 μM) it was only slightly (20%) Ca^{2+}-dependent. This would agree with previous data showing that methiotepine (which antagonized only the Ca^{2+}-dependent component of amphetamine-induced [^{3}H]DA release; Crespi et al. 1997) had no effect on (+)-NF-induced [^{3}H]DA release (Mennini et al. 1996b).

Conclusions

The present study, using an experimental protocol in which the releasing effect of (+)-NF from the vesicular neurotransmitter pool can be studied, indicated that (+)-NF shares with other amphetamine derivatives [(+)-Fen, pCA and MDMA] the ability to induce a Ca^{2+}-dependent [^{3}H]5-HT release. However, the same amphetamine derivatives also induced a relevant Ca^{2+}-dependent [^{3}H]DA release, but this was not found with (+)-NF.

We have no clear explanation why (+)-NF has these different effects on serotoninergic and dopaminergic synaptosomes.

The use of common stems in the selection of International Nonproprietary Names (INN) for pharmaceutical substances

2002

Programme on International Nonproprietary Names (INN)
Quality Assurance and Safety: Medicines
Essential Drugs and Medicines Policy
World Health Organization
Geneva

Preface

WHO'S INN PROGRAMME

WHO has a constitutional responsibility to "develop, establish and promote international standards with respect to biological, pharmaceutical and similar products". This is the basis for many activities within WHO, such as International Nonproprietary Names (INN), WHO Good Manufacturing Practices, the International Pharmacopoeia, the WHO Certification Scheme and many others. The section of the WHO specifically dealing with selection of International Nonproprietary Names for pharmaceutical substances falls under the Department of Essential Drugs and other Medicines.

INN SELECTION PROCEDURE AND CRITERIA

A request for an INN is usually submitted on a form to the World Health Organization. In certain countries, where national nomenclature commissions exist, this is done through the corresponding national nomenclature authority.

Precise information on the chemistry, pharmacological action and use, as well as suggested nonproprietary names, name and address of the manufacturer are to be provided on the form. Each name proposed by the originator of such a request is then examined and a name selected.

All members of the WHO Expert Panel on the International Pharmacopoeia and Pharmaceutical Preparations designated to select nonproprietary names have to agree to the name which is then first published as a proposed INN. During a four-month period, any person can forward comments, or lodge a formal objection to a name, e.g. on grounds of similarity with a trade-name. If no objection is raised the name will be published a second time as recommended INN.

The primary principles for selection are that an INN should be

- distinctive in sound and spelling,

- not too long,

- not liable to confusion with other names in common use.

INNs for substances belonging to a particular group of pharmacologically related substances show their relationship by the use of common stems, which are listed and defined in this document.

In addition to the above rules, certain rules have been established to allow the use of INNs internationally, i.e. in various languages. For example, the letters "h" and "k" should be avoided; "c" should be used instead of "ae" and "oe", "i" instead of "y" and "t", "f" instead ot "th" and "ph".

Further information on the selection procedure and general principles in devising INNs may be found in Annex 2 and 3.

THIS DOCUMENT

This document lists common stems for which chemical and/or pharmacological categories have been established. These stems and their definitions have been selected by the INN experts and are for use when selecting new international nonproprietary names for pharmaceutical substances that belong to an established series of related compounds.

The list is not exhaustive in that it might not include all stems used by the INN Committee. It is the nature of the nomenclature process that new, potential stems are constantly being created and that definitions of older stems may need to be modified as new information becomes available.

Examples of nonproprietary names have been selected from Lists 1 - 84 of Proposed International Nonproprietary Names. They were compared with:

Stems listed in article 9 of the "General Principles for Guidance in Devising International Nonproprietary Names for Pharmaceutical Substances", Annex to List 81 of proposed INN and some well-established old or new stems not included in article 9 of the general principles. Details on stems are indicated as follows:

(x) stems that are included in article 9 of the general principles

(d) stems deleted from article 9 of the general principles

The reference to TRS 581* indicates that the stem is listed in Annex 3 of the 20th Report of the WHO Expert Committee on Nonproprietary Names for Pharmaceutical Substances.

References to syllables in the British Approved Names (BAN) dictionary and the USP Dictionary of USAN and International Drug Names have also been made wherever applicable. Whenever the BAN or USAN definitions are not identical to the INN definition they are given in brackets under the INN definition.

For each stem, the names have been classified as:

(a) names in which the preferred stem has been used in accordance with its definition;

(b) names in which the preferred stem has been used but not in accordance with its definition;

(c) names which belong to the same group of pharmaceutical substances and in which no preferred stem has been used. (This part of the list is not always complete).

The codes given on the left-hand side under each stem refer to the WHO pharmacological classification used in the WHO Drug Evaluation and Monitoring Programme.

Note for trade-mark officers:

In line with the WHO World Health Assembly resolution (*WHA46.19***) it would be appreciated if trade-marks were not derived from INNs and if INN stems were not used in trade-marks. This practice endangers the principle that INNs are public property; it can frustrate the rational selection of further INNs for related substances, and it will ultimately compromise the safety of patients by promoting confusion in drug nomenclature.

LES LABORATOIRES SERVIER

RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

Neuilly, le 30 Août 1973

Monsieur le Directeur
du Service Central de la Pharmacie
et des Médicaments
Ministère de la Santé Publique
et de la Sécurité Sociale
9, avenue de Lowendal
75 007 PARIS

A l'attention de M. LALANNE

Bureau PH 4

Demande de changement de dénomination commune

Monsieur le Directeur,

Nous avons l'honneur de solliciter le changement de dénomination commune de l'un de nos principes actifs, le

benzoate de {[méthyl-I (trifluorométhyl-3 phényl)-2 éthyl] amino}-2 éthyle.

En effet, lorsqu'en Juin I970 nous avons demandé une dénomination commune internationale pour ce composé chimique, nous pensions que la principale indication thérapeutique serait l'obésité.

C'est ainsi que la dénomination commune BENFLUOREX a été retenue et publiée par la Commission de la Pharmacopée Française (Additif n° I3 à la Pharmacopée I965 et à son premier supplément paru au J.O. du 28 Juillet I97I) et par l'O.M.S. (liste des D.C.I. proposées n° 25[2] parue dans la chronique O.M.S., volume 25, n° 3 de Mars I97I).

Or, à la lumière des nombreux travaux d'expertises cliniques, l'activité anorexiante alors revendiquée s'est avérée en réalité très faible et tout à fait accessoire par rapport aux propriétés métaboliques de ce produit.

.../...

Annexe 1-29 2

LES LABORATOIRES SERVIER

Les indications désormais retenues sont les suivantes :

- troubles métaboliques athérogènes
- troubles du métabolisme des lipides
- troubles du métabolisme des glucides
- troubles nutritionnels.

Le suffixe -OREX étant, selon les directives générales pour la formation des D.C.I., réservé aux agents anorexigènes, nous pensons donc nécessaire que la dénomination commune soit changée afin qu'elle ne soit pas en opposition avec les activités cliniques de notre produit.

Par ailleurs, nous vous signalons que la dénomination commune BENFLUOREX a été frappée d'antériorité par une marque autrichienne et, de ce fait, ne pourra jamais être recommandée par l'O.M.S.

Nous nous permettons de vous suggérer de nouvelles dénominations :

. BENZAFLUMINE

. BENFLURATE

Nous vous prions de croire, Monsieur le Directeur, à l'assurance de notre considération distinguée.

R.J.C. DENIS
Vice-Président Expansion

SERVICE CENTRAL DE LA PHARMACIE
ET DES MEDICAMENTS

Bureau PH.4

29 NOV. 1973

PH.4-73-D/ 29.11/1145

OBJET : Demande de changement de dénomination commune.

NOTE pour M. SAUNIE

J'ai l'honneur de vous communiquer la lettre, dont vous trouverez ci-joint photocopie, que les laboratoires SERVIER nous ont adressée pour solliciter un changement de dénomination pour le produit : BENFLUOREX (dénomination commune française et internationale).

La Commission de Nomenclature, saisie de ce problème, s'est étonnée de l'expression : "les indications désormais retenues..." employée dans la lettre précitée ; la Commission considère que les nouvelles propriétés thérapeutiques et indications cliniques n'ont pas annulé le risque d'utilisation de ce médicament par les toxicomanes.

Cependant, l'Organisation Mondiale de la Santé ayant attribué à un produit voisin la dénomination FENFLURAMINE, la Commission souhaite avoir l'avis des Experts de cet organisme et propose FENFLURAMATE par analogie.

Avant d'exposer ce problème à GENEVE, je souhaiterai connaître, dans les meilleurs délais possibles, votre avis sur la position de la Commission, afin que notre transmission à l'Organisation Mondiale de la Santé comporte, aussi, l'avis du Service.

N./Réf. : PH.4-73-D/29-11/745 du 29 novembre 1973.

OBJET : Dénomination commune : BENFLUOREX.

NOTE pour M. NARGEOLET

- Directeur de la Pharmacie -

A l'attention de M. SAUNIÉ

Comme suite à ma note citée en référence et à votre réponse du 18 décembre 1973 à propos de la demande de changement de dénomination commune pour BENFLUOREX, sollicitée par le laboratoire SERVIER, j'ai l'honneur de vous faire connaître l'avis de l'Organisation Mondiale de la Santé interrogée, à ce sujet, par le secrétariat de la Commission Nationale de Pharmacopée.

Il a été décidé de retenir la dénomination commune internationale BENFLUOREX, car selon les Experts de cette Organisation, "le suffixe OREX utilisé pour les agents anorexigènes "évoque aussi les substances amphétaminiques puisque la presque "totalité des substances anorexigènes sont des dérivés de la "phénéthylamine".

La Commission de Nomenclature a adopté cette recommandation conformément aux accords internationaux ; la dénomination commune française reste donc identique à la dénomination commune internationale BENFLUOREX, et les propositions du laboratoire SERVIER ont été écartées.

Nous avons notifié cette décision au Laboratoire interessé.

P. LALANNE
Chargé de Mission
au Service Central de la Pharmacie
et des Médicaments

Dossier n° : 10008

Laboratoires : SERVIER

MEDIATOR

Le principe actif :

Benzoate de {(méthyl-1(trifluorométhyl-3 phényl)-2 éthyl) amino}-2 éthyle

est pourvu d'une dénomination commune française et internationale (liste proposée 25*) :

BENFLUOREX.

La volonté du laboratoire d'écarter cette dénomination officielle a déjà fait l'objet d'un échange de notes entre le Bureau PH.4 et le Service Central de la Pharmacie. (Voir documents joints). Cette dénomination devrait être imposée par le Bureau PH.11.

Classifications

The Anatomical Therapeutic Chemical Classification System with Defined Daily Doses (ATC/DDD)

Purpose/Definition

The ATC/DDD system classifies therapeutic drugs. The purpose of the ATC/DDD system is to serve as a tool for drug utilization research in order to improve quality of drug use.

Classification structure

In the ATC classification system, the drugs are divided into different groups according to the organ or system on which they act and their chemical, pharmacological and therapeutic properties. Drugs are classified into five different levels. Drug consumption statistics (international and other levels) can be presented for each of these five levels.

Administrative status

Creation date:

The Guidelines were published for the first time in the current format in 1990.

The Index was published as a paper copy in the current format in 1990 for the first time.

The system has been in use for statistics since 1975.

Last date change: 2003

Annual updates, now in Version 6 for the Guidelines in the current format and Version 13 for the Index in the current format . Available indexes:

Reference documents

ATC Index with DDDs 2003. Guidelines for ATC classification and DDD assignment 2003.

Available formats:

The Guidelines are published in all 3 languages in paper format only.

Online searchable database.

Training and training materials:

2 days international course in Oslo, once a year. The course offers lectures and working groups.

Courses elsewhere on request. Approx. 2 additional courses annually.

Languages

The participants receive the Index and the Guidelines, copies of all the presentations, and the working group problems.

The Index is published in the following languages and formats:

English (all available indexes),

German (paper version only),

Relationships with other classifications

Spanish (paper version only)

Correspondence between revisions

The Anatomical Therapeutic Classification (AT) developed by the European Pharmaceutical Market Research Assiciation (EPhMRA). The ATC/DDD system and the AT classification have the same origin, but are developed for different purposes. Comparative tables are available.

Correspondence with international, multinational, national classifications

Relationships with other terminologies

Currently, the ICD contains no reference to any external classification of medical substances. However, guidelines for the ICD-10 section "Poisoning by drugs, medicaments and biological substances" (T36-T50) could contain suggestions on how to combine, or replace, ICD codes with specific substance codes, preferably using an internationally widespread and recommended standard system such as the ATC.

WHO International Working Group for Drug Statistics Methodology

WHO Collaborating Centre for Drug Statistics Methodology

WHO Collaborating Centre for Drug Utilization Research and Clinical Pharmacological Services

CHAPTER 5: DRUG CLASSIFICATION SYSTEMS

A drug classification system represents a common language for describing the drug assortment in a country or region and is a prerequisite for national and international comparisons of drug utilization data, which have to be collected and aggregated in a uniform way. Access to standardized and validated information on drug use is essential to allow audits of patterns of drug utilization, to identify problems in drug use, to initiate educational or other interventions and to monitor the outcomes of these interventions. The main purpose of having an international standard is to be able to compare data between countries. A recent example is the international focus on creating comparable systems for monitoring cross-national patterns of antibacterial utilization to aid work against bacterial resistance.

5.1 DIFFERENT CLASSIFICATION SYSTEMS

[*ATC classification; AT classification; EPhMRA; IMS; WHO Collaborating Centre for Drug Statistics Methodology*]

Drugs can be classified in different ways according to:
- their mode of action;
- their indications; or
- their chemical structure.

Each classification system will have its advantages and limitations and its usefulness will depend on the purpose, the setting used and the user's knowledge of the methodology. Comparisons between countries may require a classification system different from that needed for a local comparison (e.g. between different wards in a hospital). Of the various systems proposed over the years, only two have survived to attain a dominant position in drug utilization research worldwide. These are the «Anatomical Therapeutic» (AT) classification developed by the European Pharmaceutical Market Research Association (EPhMRA) and the «Anatomical Therapeutic Chemical» (ATC) classification developed by Norwegian researchers. These systems were originally based on the same main principles. In the EPhMRA system, drugs are classified in groups at three or four different levels. The ATC classification system modifies and extends the EPhMRA system to include a therapeutic/pharmacological/chemical subgroup as the fourth level and the chemical substance as the fifth level (see, for example, the classification of glibenclamide in the box below).

The ATC classification is also the basis for the classification of adverse drug reactions used by the WHO Collaborating Centre for International Drug Monitoring in Uppsala, Sweden (www.who-umc.org).

The main purpose of the ATC classification is as a tool for presenting drug utilization statistics and it is recommended by WHO for use in international comparisons. The EPhMRA classification system is used worldwide by IMS for providing market research statistics to the pharmaceutical industry. It should be emphasized that the many technical differences between the EPhMRA classification and the ATC classification mean that data prepared using the two classification systems are not directly comparable.

In 1996, WHO recognized the need to develop the ATC/DDD system from a European to an international standard in drug utilization studies. The European WHO Collaborating Centre for Drug Statistics Methodology in Oslo, Norway, which is responsible for coordinating the use of the methodology, was then linked to WHO Headquarters in Geneva. This was intended to assist WHO in its efforts to ensure universal access to essential drugs and to stimulate rational use of drugs particularly in developing countries.

5.2 THE ATC CLASSIFICATION SYSTEM

[*Structure; coding principles; therapeutic use; pharmaceutical formulations; strengths*]

The ATC classification system divides the drugs into different groups according to the organ or

system on which they act and according to their chemical, pharmacological and therapeutic properties.

Drugs are classified in groups at five different levels. The drugs are divided into 14 main groups (first level), with two therapeutic/pharmacological subgroups (second and third levels). The fourth level is a therapeutic/pharmacological/chemical subgroup and the fifth level is the chemical substance. The second, third and fourth levels are often used to identify pharmacological subgroups when these are considered to be more appropriate than therapeutic or chemical subgroups.

The complete classification of glibenclamide (see box below) illustrates the structure of the code.

A	Alimentary tract and metabolism (first level, main anatomical group)
A10	Drugs used in diabetes (second level, main therapeutic group)
A10B	Oral blood-glucose-lowering drugs (third level, therapeutic /pharmacological subgroup)
A10B B	Sulfonamides, urea derivatives (fourth level, chemical/therapeutic /pharmacological subgroup)
A10B B01	Glibenclamide (fifth level, subgroup for chemical substance)

Thus, in the ATC system all plain glibenclamide preparations are given the code A10B B01.

Medicinal products are classified according to the main therapeutic use of their main active ingredient, on the basic principle of assigning only one ATC code for each pharmaceutical formulation (i.e. similar ingredients, strength and pharmaceutical form).

A medicinal product can be given more than one ATC code if it is available in two or more strengths or formulations with clearly different therapeutic uses. Two examples of this are given below:

- Sex hormones in certain dosage forms or strengths are used only in the treatment of cancer and are thus classified under L02 - Endocrine therapy. The other dosage forms and strengths are classified under G03 - Sex hormones and modulators of the genital system.
- Bromocriptine is available in different strengths. The low-dose tablets are used as prolactin inhibitors and are classified in G02 - Other gynaecologicals. Bromocriptine tablets in higher strengths are used to treat Parkinson disease and are classified in N04 - Anti-Parkinson drugs.

Different formulations with different indications may also be given separate ATC codes, for example prednisolone is given several ATC codes because of the different uses of the different formulations (see box below).

A07E A01	Intestinal anti-inflammatory agents (*enemas and rectal foams*)
C05A A04	Antihaemorrhoidals for topical use *rectal suppositories*)
D07A A03	Dermatological preparations (*creams, ointments, lotions*)
H02A B06	Corticosteroids for systemic use (*tablets, injections*)
R01A D02	Nasal decongestants (*nasal spray, drops*) S01B A04 Ophthalmologicals (*eye drops*)
S02B A03	Otologicals (*ear drops*)

The ATC system is not strictly a therapeutic classification system. At all ATC levels, ATC codes can be assigned according to the pharmacological properties of the product. Subdivision on the basis of mechanism of action will understandably be rather broad, since a very detailed classifi-

cation of this kind would result in having only one substance per subgroup, which is better avoided (e.g. in the case of antidepressants). Some ATC groups are subdivided into both chemical and pharmacological groups (e.g. ATC group J05A - Agents affecting the virus directly). If a new substance fits in both a chemical and pharmacological fourth level, the pharmacological group is normally chosen.

Substances classified as having the same ATC fourth level should not be considered as pharmacotherapeutically equivalent since the profiles for their mode of action, therapeutic effects, drug interactions and adverse drug reactions may differ.

As the drugs available and their uses are continuously changing and expanding, regular revisions of the ATC system are necessary. An important principle is to keep the number of alterations to a minimum. Before alterations are made, any potential difficulties arising for the users of the ATC system are considered and related to the benefits that would be achieved by the alteration. Changes to the ATC classification would be made when the main use of a drug had clearly changed, and when new groups are required to accommodate new substances or to improve the specificity of the groupings.

Because the ATC system separates drugs into groups at five levels (described above), statistics on drug utilization grouped at the five different levels can be provided. The information available ranges from figures showing total use of all drug products classified e.g. in main group C - Cardiovascular system (first level), to figures for the different subgroups (i.e. second, third and fourth level) to figures for the use of the separate substances.

More detailed information can be obtained at the lower (i.e. the fourth and fifth) levels. The higher levels are used if comparison of drug groups is the aim of a study (see Fig. 5). This gives a better overview and trends in drug use related to different therapeutic areas can easily be identified.

5.3 Ambivalence towards an international classification system

All international standards demand compromises and a drug classification system is no exception to this rule. Drugs may be used for two or more equally important indications, and the main therapeutic use of a drug may differ from one country to another. This will often result in several

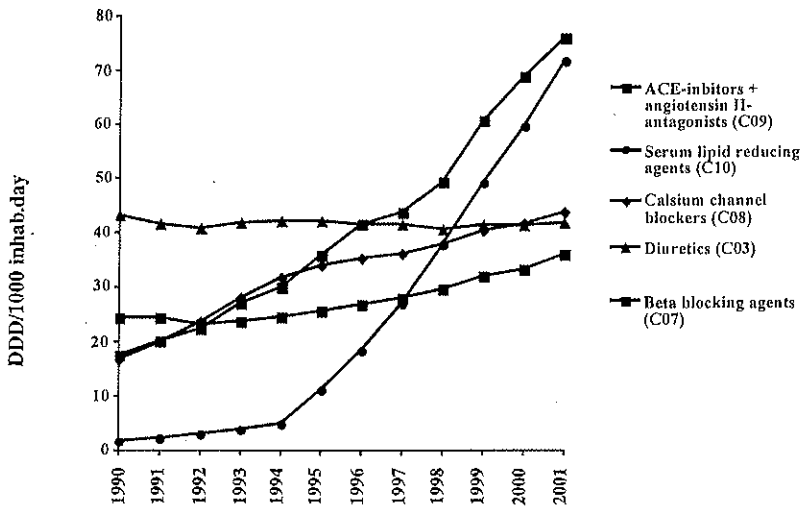

Figure 5 Total sales of drugs used in cardiovascular disorders in Norway 1990-2001. ATC/DDD version 2002

possible alternatives for classification, and a decision has to be made regarding the main use. Countries using a drug in a different way from that indicated by the ATC classification may not wish to adopt the ATC classification but prefer to develop national classification systems. However, national traditions have to be weighed against the opportunity to introduce a methodology that permits valid international comparisons of drug utilization. Indeed, there are now many examples where an enthusiastic application of the ATC/DDD methodology has been instrumental in stimulating national research in drug utilization and in developing an efficient drug control system.

5.4 Implementation of the ATC/DDD methodology

[*National drug register; dynamic system; different versions*]

As soon as the decision to introduce the ATC/DDD methodology is taken, it is essential to realize that its proper use inevitably includes an important and time-consuming first step. Each product has to be connected to the appropriate ATC code and DDD (see chapter 6). The linkage between the national drug register and ATC/DDDs has to be ascertained by persons with proper knowledge of the methodology. Experience has shown that in many countries, health authorities, health policy-makers and researchers have not always allocated adequate resources to this important initial step. Another problem is that some users seem to be unaware that the ATC/DDD methodology is a dynamic system to which changes are made continually. This has resulted in several different versions of the ATC/DDD system being used at the same time, sometimes even within the same country.

It is important to realize that adopting the ATC/DDD classification of drugs requires resources and the necessary competence to carry out the work of allocating ATC codes to the products. If possible, this work should be done on a national basis to secure consistent use of the methodology within a country. As described in the general introduction, the same substance may have several different ATC codes depending on the application form and, to some extent, even the strength. For combination products, specific guidelines have been established for allocating ATC codes. Allocating DDDs to the products necessitates many of the same considerations as the allocation of the ATC code. However, in order to link the drug list with sales figures or prescription figures to obtain drug utilization statistics, it is necessary to make appropriate calculations such as the number of DDDs per drug package.

Finally, a given country will nearly always have medicines and combination products for which no ATC codes or DDDs exist. In these cases, it is important to consult the WHO Collaborating Centre for Drug Statistics Methodology in Oslo and request new ATC codes and DDDs. Once ATC codes and DDDs have been linked to the national drug lists, it is necessary to update the drug list regularly in accordance with the annual updates of the ATC/DDD system.

The publication *Guidelines for ATC Classification and DDD Assignment* (see General reading) gives the information necessary for allocating ATC codes and DDDs at a national or local level. All officially assigned ATC codes and DDDs are listed in the *ATC Index with DDDs* (see General reading), a publication that is also available in electronic format and is updated every year. Training courses in the ATC/DDD methodology are arranged annually in Norway and from time to time in other countries. Further information is available on the web site of the WHO Collaborating Centre for Drug Statistics Methodology at http://www.whocc.no.

De : Sabel DIALLO
Destinataire : Catherine REY-QUINIO
Date : 06/28/07 9:33
Objet : Rép. : Code ATC Mediator

CC : Anne PHAM-BA; Carole FOSSET; France ROUSSELLE

Bonjour,

Le nouveau code ATC de Médiator proposé d'après vous ne correspond pas au contexte. Par conséquent, il faut peut être vous référer à la lettre des Affaires Réglementaires du 03/07/2001, envoyée au SNIP et signée par Mr TROUVIN qui stipule que : **" Le titulaire de l'AMM d'un médicament contenant une substance active n'ayant pas de code ATC doit effectuer une demande de création de code auprès de l'OMS et transmettre ensuite pour information à l'Afssaps le code ATC complet de niveau 5 attribué par l'OMS. Une lettre sera envoyé dans ce sens par l'Afssaps au titulaire lors de l'octroi d'une AMM ou du rectificatif . L'actualisation de la rubrique 5.1 du RCP ne pourra être effectuée qu'à l'occasion d'une demande de rectificatif concernant les données cliniques de l'AMM du médicament. La demande faite par le titulaire ne donnera pas lieu à une redevance spécifique. Ainsi, le code ATC attribué par l'OMS sera intégré dans l'AMM lors de la notification du rectificatif concernant les données cliniques".**

Cordialement

Sabel Diallo

>>> Catherine REY-QUINIO 28/06/07 09:02 >>>
Bonjour,

Merci pour vos réponses à toutes.

Le Code **ATC A10X** (voir mail ci dessous) tel que proposé ne correspond pas au contexte passé, présent et futur de ce dossier. De ce fait, d'un commun accord entre l'évaluation et la Pharmacovigilance nous ne pouvons à ce stade avaliser ce que souhaite la firme.

A ce stade du dossier et de cette procédure (pour rappel, envoi du projet de RCP modifié avec retrait d'une des indications et modification du code ATC), la question est de savoir si - indépendamment de notre avis "scientifique - QUELLE MARGE DE MANOEUVRE NOUS DISPOSONS ? Ou en quelques mots, l'Afssaps peut elle s'opposer à la contre- proposition de la Firme ?
Quelle est la procédure réglementaire sur ce point ? Devons nous adresser un courrier de refus à la firme après passage en Groupe de leur réponse voire en COM d'AMM?
La firme souhaite déposer une demande auprès de l'OMS et proposer son nouveau code ATC ? Est ce la procédure normale ?
Pouvons nous nous y opposer auparavant (si la firme n'a pas déjà effectué cette démarche?)

Merci d'avance de votre réponse qui va conditionner notre démarche future sur ce dossier que je souhaiterais clore avant juillet.

Une réponse rapide serait la bienvenue.

Cordialement

Catherine

>>> Sabel DIALLO 06/26/07 10:22 >>>

Bonjour Carole,
Au vue des documents reçus, je suis d'accord avec le laboratoire pour mettre le code ATC A10X- AUTRES MEDICAMENTS DU DIABETEparce que l'indication et les propriétés pharmacodynamiques le justifient. Il ne me semble pas prématuré d'accorder ce code ATC dans la mesure où il n'a été précisé nulle part que c'est un hypoglycémiant oral qui est attribué à des substances actives bien identifiées.
Le jour où ces résultats complémentaires seront concluants (inspection de l'essai clinique MOULIN, positionnement plus précis du benfluorex dans l'arsenal thérapeutique du diabète de type 2...), le benfluorex pourra être considéré comme hypoglycémiant oral et donc être positionné sous MEDICAMENTS HYPOGLYCEMIANTS, INSULINES EXCLUSES (A10B).
J'espère avoir répondu à ta question. Je suis à ta disposition si tu veux d'autres précisions.
Bonne journée

Bonjour Sabel,

Comme convenu par téléphone, tu trouveras ci-joint la lettre de procédure contradictoire que nous avons adressée au labo Servier le 29 mai dernier. Compte-tenu du changement d'indication, nous leur avons proposé le code A16AX divers médicaments des voies digestives et du métabolisme.
Le labo nous propose en retour le code A10X Autres médicaments utilisés dans le diabète.

D'un point de vue scientifique, Catherine Rey-Quinio considère que le code proposé par la firme semble "mettre la charrue avant les boeufs" puisqu'en aucun cas à ce stade nous ne pouvons dire s'il s'agit d'un médicament à utiliser dans le diabète (les dernières Recos Diabète d' ailleurs ne citent même pas MEDIATOR). Aussi, cela semble prématuré d'accorder ce code à MEDIATOR ; l'acceptation de ce code ancrerait chez les prescripteurs un effet thérapeutique pour lequel nous n'avons pas de certitude formelle à ce jour.

Nous sollicitons ton avis sur la possibilité de maintenir notre proposition, à savoir A16AX divers médicaments des voies digestives et du métabolisme.

Carole FOSSET - Code ATC Mediator

De : Carole FOSSET
Destinataire : ALLIEZ, Emilie; CHAMPART, Anne-Marie; REY-QUINIO, Catherine
Date : Ven, Juin 29, 2007 12:35
Objet : Code ATC Mediator
CC : DIALLO, Sabel; FORNAIRON, Sophie; France ROUSSELLE; PHAM-BA, Anne
Pièces jointes : DIALLO, Sabel; FORNAIRON, Sophie; France ROUSSELLE; PHAM-BA, Anne

Bonjour,

Je vous confirme que dans la mesure où Servier a l'attention de proposer à l'OMS un reclassement en A10X pour le code ATC de MEDIATOR, la seule marge de manoeuvre dont nous disposons est d'adresser nos commentaires à l'OMS, lors de la phase de consultation (cf. procédure ci-jointe).
En conséquence, serait-il possible que l'unité Outils de l'information nous informe en temps utile du démarrage de cette procédure de consultation ?

En parallèle, dès que nous recevrons (ces jours-ci) les commentaires de Servier sur le RCP, nous pourrons notifier le rectificatif d'AMM en attribuant comme code ATC provisoire AXX (ou XX ?).

Bien à vous,

Carole

XXIII- MEDIATOR [Pages : 15 à 17]

Avant de débuter le débat sur cette spécialité, le Président demande aux éventuels membres de la commission ayant un conflit d'intérêt avec le laboratoire de s'abstenir de participer au débat.

Après présentation et discussion des conclusions du Groupe de Travail DEUG sur les données d'efficacité et des conclusions de la CNPV sur les données de sécurité d'emploi, les conclusions suivantes ont été émises :

1. La COM d'AMM souhaite que les modifications d'ajout d'effets indésirables suivants tels que décidés par la CNVP soient mentionnés au sein de la rubrique 4.8. du RCP : « *troubles de fonctions cognitives: désorientation temporo-spatiale, troubles du comportement : agitation, délire, troubles de la perception (hallucinations)* ».

2. La COM d'AMM suit l'avis DEFAVORABLE émis par le Groupe DEUG au maintien de l'indication : « *Adjuvant au régime adapté dans les hypertriglycéridémies. L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée* », les données soumises ne montrant en effet qu'une efficacité très modeste et inconstante dans les études soumises sur les triglycérides et une absence d'efficacité sur les autres paramètres lipidiques tels que le LDL-cholestérol.

3. La COM d'AMM suit également l'avis du Groupe DEUG pour le maintien de l'indication : « *Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* » dans son libellé actuel. En l'attente de données plus complètes sur l'efficacité du benfluorex en association aux autres antidiabétiques oraux, la COM d'AMM n'a pas souhaité modifier le libellé actuel. A ce jour, seule l'étude MOULIN a permis de montrer une efficacité du benfluorex sur l'HbA1c en association à un sulfamide hypoglycémiant. D'autres études sont en cours dont une étude multicentrique, randomisée visant à comparer l'efficacité du benflurex (150 mg bid ou 150 mg tid) à la pioglitazone (30 mg une fois par jour ou 45 mg deux fois par jour) en association à un sulfamide hypoglycémiant.

4. Après un débat sur la robustesse des résultats de l'étude MOULIN et ses conséquences, la commission propose une inspection de l'étude MOULIN, , seule étude à ce jour ayant montré une efficacité sur les paramètres glucidiques devra être effectuée. Une saisine sera adressée en ce sens à la DIE (Direction de l'Inspection des Etablissements).

5. Les membres de la commission d'AMM souhaite qu'une communication soit fait sur l'usage hors AMM.

Au total, le libellé de l'indication retenu est le suivant : «*Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale* ».

XXIV- AVIS SUR LE SEUIL D'ETHANOL DANS LES SOLUTIONS BUVABLES ADMINISTREES A L'ENFANT

Le dossier a été approuvé à l'unanimité.

XXVI- FICHE PATIENTS (le rhume de l'adulte)

Le dossier a été approuvé à l'unanimité.

XXVII- MISE AU POINT SUR L'UTILISATION DE LA SPECIALITE TYSABRI® 300 MG (NATALIZUMAB) DANS LE TRAITEMENT DE LA SCLEROSE EN PLAQUES [Pages : 18 à 29]

Le plan de gestion des risques a été présenté aux membres de la commission ainsi que la constitution du groupe référent qui aura pour mission d'établir de façon prospective des recommandations en cas de besoin afin de mieux encadrer les risques liés à ce médicament.

Dans le but d'établir un consensus, le Président demande aux membres de relire ce document et d'envoyer dans les meilleurs délais leurs commentaires, afin qu'il en soit tenu compte le plus rapidement possible. La version finale sera jointe en annexe du procès verbal de la Commission d'AMM.

Introduction

Le benfluorex a été commercialisé en France de 1976 à 2009 sous le nom de Médiator après avoir obtenu son AMM en France en 1974. Il appartient à la famille des fenfluramines dont les principaux autres représentants ont été : La dl fenfluramine (Pondéral), avec une AMM française obtenue en 1965 et l'isomère d, la d-fenfluramine ou dex-fenfluramine (Isoméride) qui a obtenu son AMM en France en 1985. Isoméride et Pondéral ont été retirés du marché en 1997 suite à la mise en évidence d'effets indésirables graves à type de valvulopathies cardiaques et d'hypertension artérielle pulmonaire. Ces deux médicaments avaient les indications des médicaments de la classe des anorexigènes.
Le Médiator a été positionné sur le marché (avec une AMM correspondante) comme adjuvant au traitement des hypertriglycéridémies et comme adjuvant au régime chez les diabétiques en surcharge pondérale**, mais pas comme anorexigène.**

Historique du développement des anorexigènes

Ce sont les composés amphétaminiques qui ont été décrits les premiers comme ayant des propriétés anorexigènes, c'est-à-dire capables de réduire l'appétit. C'est en 1937 que Davidoff et Reifenstein décrivent pour la première fois les propriétés anorexigènes de l'amphétamine chez l'homme, et que Ehrich et al en font la démonstration expérimentale chez le rat.. Ces observations chez l'homme seront ensuite confirmées par Nathanson et al en 1939.
A peu près à la même époque, les expériences d'Hetherington et al publiées en 1940 montrent que les lésions de l'hypothalamus ventromédian chez le rat étaient susceptibles de provoquer une hyperphagie et d'entrainer l'obésité.
Ces travaux pionniers ont inauguré le développement de la physiologie et de la pharmacologie de la faim et de la satiété aboutissant au développement de nombreux médicaments anorexigènes mis sur le marché dans le monde pour le traitement de l'obésité.
Dans le numéro 17 du journal Thérapie de 1962, Jacques-R Boissier présente une revue de la pharmacologie des anorexigènes en développant la physiologie de l'appétit et de la faim ainsi que les méthodes pharmacologiques d'investigations des médicaments anorexigènes.

Il énonce donc en 1961 : « Tous les anorexigènes peuvent être considérés comme des phényléthylamines substituées. Il existe une filiation chimique directe entre ces substances et les deux phényl-éthylamines naturelles que sont l'adrénaline et l'éphédrine. Ceci explique que tous les anorexigènes développeront à des degrés divers deux actions latérales : action sympathomimétique et action stimulante au niveau du système nerveux central ». Les fenfluramines, développées plus tard sont aussi des composés phényl-éthylamines substituées, y compris le benfluorex.

Les Amphétamines citées en 1962 par JR Boissier sont les suivantes :

- L'amphétamine (racémique), la l amphétamine et la d amphétamine.

Il rappelle que ces composés possèdent essentiellement des actions sympathomimétiques et stimulantes du système nerveux central. L'isomère dextrogyre (d) est le plus pshychoanaleptique et l'isomère levogyre (l) le plus sympathomimétique. Il énonce « ceci explique que, à côté d'une action anorexigène indéniable, il se développe très souvent des effets secondaires indésirables

- La métamphétamine (dont les actions pharmacologiques sont identiques à celles de

l'amphétamine), - la phénylpropanolamine : Son action anorexigène s'accompagne d'une faible stimulation centrale mais de fortes réactions cardiovasculaires (tachycardie, hypertension artérielle) limitant l'intérêt de son effet anorexigène en pratique.

- Les phénylmorpholines : Deux substances appartiennent à ce groupe, la phenmétrazine et la phendimétrazine. C'est la phenmétrazine qui a été le plus étudiée. Elle est douée d'une action anorexigène avec des actions centrales et cardiovasculaires nettement inférieures à celles observées avec l'amphétamine. Sa toxicité est nettement plus faible chez la souris. Cependant, chez l'animal, l'anorexie s'accompagne de symptômes d'excitation du SNC, d'hypertension et de modifications pathologiques de l'ECG. Les dangers de la phemétrazine ont fait l'objet à l'époque de nombreuses publications avec , comme avec les amphétamine, la fréquence des manifestations psychotiques.
- La Benzphétamine. Son action anorexigène chez l'animal est comparable à celle de la phenmétrazine.
- La phentermine (2 methyl-amphétamine) : Elle ne contient pas de carbone assymétrique, il n'y a donc pas d'isomères optiques. Son action anorexigène est comparable à celle des composés précédents et son action centrale identique à celle de la phenmétrazine.
- La chlorphentermine : Cette substance, dérivée de la précédente par fixation d'un chlore sur le noyau en para, était utilisée sous forme de chlorydrate. Son action anoréxigène est comparable à celle des précédentes. Son action stimulante est très inférieure à celle de l'amphétamine, presque nulle aux doses anorexiantes. L'action sympathomimétique, très inférieure à celle des amphétamines, existe cependant.
- Amphépramone (diéthylpropion) : La dose anorexigène efficace est la moitié de celle de la d-amphétamine. Bien qu'ayant quelques propriétés de réduction de la motilité chez la souris, les études cliniques ont montré des phénomènes d'excitation, mais moindres qu'avec l'amphétamine.

Mécanisme d'action analysé par JR Boissier en 1962 :
Le mécanisme de l'action anorexigènes de l'amphétamine se situe au niveau du système nerveux central par une action au niveau hypothalamique. Le centre de l'appétit serait déprimé. L'injection d'amphétamine au niveau du centre hypothalamique de l'appétit et non pas au niveau du centre ventro-médian de la satiété, entraine l'arrêt de la prise de nourriture. Une action pschychotrope intervient également, provoquant chez le sujet traité, une sensation de bien-être et de force qui lui permet d'accepter le régime restrictif qui lui est proposé et d'adopter un nouveau rythme alimentaire contraire à ses habitudes et à ses gouts.

Modèles animaux expérimentaux
Les modèles animaux sont basés sur l'évaluation de la prise de nourriture chez l'animal, soit en administration aigue soit chronique. D'après Le Douarec (Thérapie 1979), la comparaison des résultats obtenus tend à recommander de travailler chez le chien et le rat. La reproductibilité des résultats'un laboratoire à l'autre est estimée satisfaisante. Les variations de poids ne sont prises en compte que lors des administrations chroniques.
Plusieurs méthodes ont été aussi développées pour analyser le comportement alimentaire : Test d'amassement chez le rat décrit initialement par Blundell (1971), mesure de la durée des repas, des intervalles entre chaque repas et comportements fondamentaux des animaux, test de discrimination (choix) ou d'aversion (Roskowsky 1963), test sur la boite à levier de de Skinner (activation d'un levier qui délivre un pellet d'aliment), modèles expérimentaux d'obésité et d'hyperphagie (rat obèse hypothalamique, souris obèse à l'aurothioglucose). Le Douarec conclue cependant dans son article de Thérapie 1979 que la souris, obèse ou

anormale ne semble pas un animal de choix à cause surtout de sa relative insensibilité aux anorexigènes.

Relation structure activité :
Tous les anorexigènes dérivent sans exception de la phényl-éthylamine. L'existence d'un azote basique par un double chainon carboné semble induire automatiquement des propriétés stimulantes du système nerveux central.
Quelques règles sont énoncées par JR Boissier :

- la présence d'un oxygène, surtout alcoolique secondaire, sur le carbone en alpha du noyau augmente les propriétés sympathomimétiques (éphédrine, phénylpropanolamine, amphépramone)
- Une double substitution sur le carbone en beta du noyau diminue l'action stimulante (phényl-ter-butylamines)
- Il en est de même lorsque l'azote est substitué par un radical lourd (benzphétamine)
- Une substitution, surtout chlorée, en para sur le noyau, diminue considérablement l'action stimulante, mais diminue légèrement l'action anorexigène (chlorphentermine).
- La substitution de l'azote ou du carbone par des radicaux méthyle augmente considérablement, lorsquelle est isolée, l'action pshycho-analeptique (amphétamine, méthamphétamine).

Il ajoute : Ces règles ne sont qu'indicatives et ne doivent pas être considérées comme absolues.

Dans cette revue de JR Boissier, est mentionnée la toxicité pulmonaire de la chlorphentermine, dérivé chloré en para du noyau phényl, à type d'histiocytose pulmonaire. En fait, il s'agit d'une phospholipose par accumulation de phospholipides par inhibition de la phospholipase par la chlorphentermine.

Peu de temps avant cette publication de JR Boissier de 1962, apparait en 1960, la publication d'un résumé du congrès de la Société Américaine de pharmacologie et de thérapeutique tenu à Seattle, par Albert Weissman et al sur un analogue fluoré (en position para sur le cycle phényl et non pas chloré en position para comme avec la chlorphentermine) de l'amphétamine, le chlorydrate de (dl-beta-p-trifluoromethylphenyl) isopropylamine. **Ce composé n'est autre que la dl-nor-fenfluramine. Des différences entre les isomères de position de la dl-norfenfluramine ont donné trois isomères différents selon la position de la substitution du cyle phényl en ortho, meta ou para. la substitution en meta donne la plus grande puissance de l'effet anorexigène (Beregi et al 1970).** Sa pharmacologie se caractérise par un effet anorexigène sans stimulation notable du système nerveux central. La conclusion des auteurs est la suivante : "It is concluded that P-1727 (numéro de code attribué dans cette publication) retains much of the anorectic potency of amphetamine in rats without concomitant behavioral stimulation, as measured by operant conditioning techniques".
Ces résultats confirment ainsi les propositions de JR Boissier sur les effets de la substitution du noyau phényl.

C'est à partir de cette publication princeps d'A Weissman que le développement de composés trifluorés de la phenyl-ethylamine s'est effectué, donnant naissance au groupe des fenfluramines et notamment la dl fenfluramine, la d-fenfluramine et le dl-benfluorex .

La pharmacologie comparée des amphétamines et des fenfluramines a été présentée en particulier en 1979 par JC Le Douarec et H Schmitt dans un numéro entier de la revue thérapie en 1979. Il n'est pas cependant pas fait mention dans cette revue, du benfluorex, bien qu'il soit sur le marché depuis 1976.
Ce médicament a été en effet positionné et développé dès le départ par les laboratoires Servier, non comme un anorexigène mais comme un médicament des troubles métaboliques (hypertriglycéridémie et diabète).

Pharmacologie comparée des fenfluramines et des amphétamines

Amphétamines

Les effets des composés amphétaminiques sont une stimulation du système nerveux central et un effet de type sympatho-mimétique en périphérie. La stimulation du SNC induit entre autres stimulation, une stimulation de l'éveil, de l'humeur, une réduction de la sensation de fatigue, une augmentation de la confiance en soi et de la capacité de se concentrer et un effet anorexigène. Tous ces effets des amphétamines sur le SNC résultent d'une augmentation de la libération de noradrénaline, dopamine et sérotonine à partir des terminaisons mono-aminergiques centrales. L'effet anorexique de l'amphétamine résulte des effets centraux sur la libération de dopamine.
Les effets de stimulation de la libération des monoamines cérébrales par l'amphétamine aboutit progressivement à une déplétion des stocks de ces mono-amines et à une réduction de l'effet pharmacologique lors des administrations répétées (tachyphyllaxie bien connue des composés amphétaminiques).
L'effet sympathomimétique indirect périphérique induit une stimulation cardiaque avec tachycardie et hypertension artérielle.
Les anorexigènes amphétaminiques ont également des effets complexes sur le métabolisme glucidique et lipidique. Dès 1972, Charbonnier et al rapportait les effets du clobenzorex sur les lipides plasmatiques et la glycémie.
L'isomère D, la dex-amphétamine est 3 à 4 fois plus puissante que l'isomère L en ce qui concerne les effets excitateurs sur le SNC. En revanche, c'est l'isomère l qui est plus le puissant comme sympathomimétique indirect en périphérie.

Fenfluramines

Les fenfluramines ont en fait été développées dans un but d'obtenir une meilleure sélectivité sur l'effet anorexigène des dérivés substitués de la phénylethylamine. L'hypothèse initiale étant qu'il devrait être possible de séparer les effets anorexigènes des effets stimulants du système nerveux central. Ceci était vérifié avec la chlorophenethylamine, substituée en para avec un atome de chlore (cf supra). Les équipes de recherche des laboratoires Servier se sont ainsi basées sur la publication initiale de Weisman présentant pour la première fois en 1960 la phényléthylamine substituée en position para sur le cycle phényl par un trifluorométhyl (CF3) comme étant anorexigène sans stimulation du système nerveux central.
A partir de cette amine primaire, très proche donc de la nor-fenfluramine qui elle est substituée avec CF3 en position meta, les chercheurs des équipes Servier ont donc passé en revue un nombre considérable de produits (280 au total) pour finalement sélectionner la fenfluramine, la dex-fenfluramine et le benfluorex pour leur équilibre entre propriétés

anorexigènes et les autres propriétés , notamment celles sur le système nerveux central et les propriétés sympathomimétiques périphériques.

Les fenfluramines ont des propriétés anorexigènes en diminuant la prise alimentaire et en stimulant la satiété par une action sur les neurones sérotoninergiques du système nerveux central par inhibition du recaptage neuronal de la sérotonine et stimulation des récepteurs sérotoninergiques centraux. Les effets anorexigènes de la fenfluramine sont 3 à 5 fois moins importants que ceux de l'amphétamine.
Les fenfluramines n'ont que très peu les propriétés des amphétamines dérivant de la stimulation de la libération de la dopamine et de la noradrénaline. La fenfluramine est plutôt sédative expérimentalement alors que les amphétamines sont stimulantes globalement sur le système nerveux central . Les fenfluramines, comme la chlorphentermine, sont également dépourvues des propriétés sympathomimétiques indirectes périphériques de l'amphétamine (Le Douarec et Schmitt , Thérapie 1964, H Schmitt et le Douarec, Thérapie 1979).

Les tests évaluant le comportement alimentaire chez le rat avaient abouti notamment à la conclusion que l'amphétamine agit plutôt sur l'appétit alors que la fenfluramine agit plutôt sur la satiété (Blundell 1976).
La fenfluramine a des actions périphériques sur le métabolisme : Elle augmente la captation du glucose par le muscle strié en présence d'insuline et favoriserait ainsi l'utilisation des substrats énergétiques.
La D-fenfluramine est plus active et plus puissante que l'isomère L.

A noter que dès 1974, Lullman-Rauch et Reil ont décrit les mêmes altérations tissulaires pulmonaires à type de phospholipose chez le rat et le cobayes suite à l'administration de fenfluramine. Ces lésions étaient similaires à celles observées avec la chlorephentermine sur les poumons et sont de mécanismes différents (inhibition de la phospholipase) de l'hypertension artérielle pulmonaire bien connue avec les anorexigènes (cf paragraphe suivant).

Données pharmacocinétiques de la Fenfluramine (dl-fenfluramine)

Administrée par voie orale, la fenfluramine est rapidement (Cmax atteint en 4 heures) et complètement absorbée au niveau du tractus gastro-intestinal.
La principale voie de métabolisation hépatique se fait par N-dééthylation pour former son métabolite principal actif, la dl-norfenfluramine qui sera désaminée et hydroxylée pour former le m-trifluorométhyl-phényl propane-diol puis l'acide m-trifluorométhyl benzoïque. Celui-ci sera conjugué avec la glycine pour former l'acide m-trifluorométhyl hippurique. Les autres métabolites sont mineurs et ne représentent que 1 à 2 % de la dose administrée.
La fenfluramine est distribuée dans tout l'organisme et franchit la barrière hémato-encéphalique.
L'excrétion dans les urines se fait sous forme inchangée et sous forme métabolisée. Elle est fonction du pH urinaire :
- Dans l'urine acide, environ 23% de la dose est excrétée sous forme inchangée et environ 17% sous forme de norfenfluramine. le reste étant constitué d'acide m-trifluorométhyl hippurique.
- Dans l'urine alcaline, environ 2% de la dose est excrétée sous forme inchangée et en norfenfluramine.

- Dans l'urine neutre, 3 à 10% peut être excrétée sous forme inchangée et 3 à 14% en norfenfluramine.
Jusqu'à 5% de la dose est éliminée dans les fèces en fenfluramine et en norfenfluramine.
La fixation aux protéines plasmatiques est de l'ordre de 30%.
La demi-vie d'élimination plasmatique est de 24,2 heures.

Données pharmacocinétiques de la D-fenfluramine

Après administration orale, l'absorption de la d-fenfluramine est rapide et pratiquement totale. Le pic de concentration plasmatique est atteint 4 heures après la prise. La biodisponibilité absolue est de 83 % environ.
La fixation aux protéines plasmatiques est de 40,7 %. La d-fenfluramine se distribue rapidement et largement dans tout l'organisme (substance hautement lipophile). Son volume de distribution est de 913 +/- 378,9 litres. Elle traverse facilement la barrière hémato-encéphalique.
La principale voie de métabolisation hépatique est la N-dééthylation conduisant au métabolite principal actif, la d-norfenfluramine qui est désaminée et hydroxylée pour former le m-trifluorométhyl-phénylpropane-diol puis l'acide m-trifluorométhyl benzoïque. Celui-ci sera conjugué avec la glycine pour former l'acide m-trifluorométhyl hippurique. Les autres métabolites sont mineurs et ne représentent que 1 à 2 % de la dose administrée.
La demi-vie d'élimination de la dexfenfluramine est de 18,3 heures et celle de la d-norfenfluramine est de 32 heures. Plus de 90% est éliminée dans les urines en 3 à 4 jours, essentiellement sous forme de métabolites. Le taux de dexfenfluramine et de d-norfenfluramine dans l'urine est augmenté à pH acide et diminué à pH alcalin. Toute la dose est éliminée en 168 heures. Moins de 1% de la dose administrée se retrouve dans les fèces.

Rôle des métabolites dans l'action pharmacologique des fenfluramines

Le Douarec, en 1971, a affirmé le rôle central de la norfenfluramine dans l'activité de la fenfluramine. Nous savons aussi par son témoignage que la norfenfluramine a été envisagée comme médicament anorexigène et testée comme telle chez l'homme. Les premiers essais cliniques ont rapidement été interrompus devant une toxicité trop importante de la norfenfluramine (proceedings du congrès des Bahamas sur les anorexigènes, 1971).

Goudie et al. en 1974 (psychopharmacologia) ont confirmé chez le rat les propriétés anorexigènes de la nor-fenfluramine, associées à des effets sédatifs lors de son administration aigue mais à des effets stimulants sur le système nerveux central chez le rat lors de son administration chronique. Ces données confirment les observations initiales de A Weissman dès 1960. Goudie et al concluent qu'une partie au moins des effets de la fenfluramine est due à celle de son métabolite principal la nor-fenfluramine : « The data reported in this paper provide evidence which implicates Norfenfluramine as a mediator of the actions of fenfluramine ».

En 1975, Broekkamp et al. (Journal of pharmacy and pharmacology, 1975, vol. 27) confirment le rôle de médiateur principal de la norfenfluramine dans les effets anorexigènes de la fenfluramine.

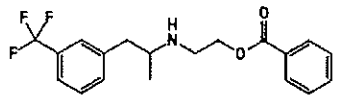
La publication de T Menzini du groupe de S Garattini (1991), a comparé les effets anorexigènes de la d-fenfluramine et de son métabolite principal la d-norfenfluramine chez le rat, le cobaye et la souris. Il en ressort que la d-Norfenfluramine est plus active que la fenfluramine dans les trois espèces, la plus sensible étant le cobaye et la moins sensible étant la souris. Le métabolite d-norfenfluramine joue un rôle majeur dans l'effet anorexigène de la fenfluramine chez le cobaye, y contribue chez le rat et n'ajoute rien chez la souris.

Pharmacologie du Benfluorex

Le benfluorex (initialement S992) a été sélectionné par les équipes de recherche des laboratoires Servier (Le Douarec et al, Beregi et al) lors de leur screening pharmacologique des composés phénylethylamine trifluorés substitués car il présentait un effet anorexigène plus important que celui de la fenfluramine après prise orale, chez le chien et chez le rat. Il était de surcroit 10 fois moins toxique expérimentalement chez l'animal (J Duhault et C Malen) mais a été développé pour être utilisé chez l'homme à des doses plus de 10 fois supérieures (450 mg/j) à celle de l'isoméride (30 mg/j) et 8 fois supérieures à celles du pondéral (60 mg/j). Dès ces premières investigations, la question se posait de savoir si l'activité du benfluorex résultait de son effet propre ou par l'intermédiaire de ses métabolites.

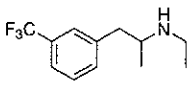
Le benfluorex a une action anorexigène (de type sérotoninergique comme la fenfluramine) et une action périphérique (comme la fenfluramine) sur le métabolisme lipidique et glucidique. Il diminue la production hépatique de glucose et agirait sur la néoglucogénèse, améliorant la sensibilité à l'insuline et l'insulino-résistante musculaire, d'où son indication comme « adjuvant au régime adapté chez les diabétiques avec surcharge pondérale ».
C'est sur ses propriétés métaboliques périphériques que le benfluorex a été développé et positionné dans ses indications thérapeutiques.

Benfluorex



Formule chimique : benzoate de méthyl-1 (trifluorométhyl-3 phényl) – 2 éthylamino -2 éthyle, chlorydrate

Fenfluramine



La dénomination commune internationale attribuée par l'OMS en 1971 a toujours été « benfluorex », attestant son appartenance à la catégorie des substances anorexigènes.

Cependant,le code ATC (classes thérapeutiques) de la classification de l'OMS du benfluorex a toujours été différent de celui de la fenfluramine et dexfenfluramine. Il correspondait avant le retrait à « Autres médicaments du diabète » alors que les fenfluramines ont toujours été

classées en «anorexigènes ».

L'effet anorexigène s'il apparait indiscutable se traduit lors des traitements chroniques chez l'homme par une réduction modeste du poids, comme cela a été le cas en fait, d'une manière générale avec tous les anorexigènes (perte de 1 ou 2 kg par rapport au placebo), en partie par développement d'un phénomène de tachyphyllaxie, bien démontré avec l'amphétamine (par épuisement des stocks de neuromédiateurs centraux, la sérotonine plus spécifiquement pour les actions des fenfluramines). Cependant, une grande variabilité inter-individuelle existe et certains patients peuvent présenter des pertes de poids plus importantes.

Dans l' étude de Moulin (benfluorex versus placebo), la perte de poids n'est pas significative par rapport au placebo.
Chez la souris diabétique ob/ob aucune réduction de poids ni de prise de nourriture n'est observée par rapport aux souris témoins. Mais, comme l'énonçait Le Douarec en 1979, les modèles expérimentaux de souris obèses sont très peu sensibles à l'action des anorexigènes.

Données pharmacocinétiques du benfluorex

Après administration par voie orale, il est en fait complètement et très rapidement métabolisé par des estérases plasmatiques et intestinales en S422. Ce métabolite primaire est alors lui-même dégradé en deux métabolites secondaires le S1475 **et le S585 la dl-norfenfluramine** (qui se sépare elle-même en ses deux isomères L et D). Cette dernière est elle-même secondairement désaminée et hydroxylée pour former le m-trifluorométhyl-phénylpropane-diol puis l'acide m-trifluorométhyl benzoïque. Celui-ci sera conjugué avec la glycine pour former l'acide m-trifluorométhyl hippurique éliminé par voie urinaire.
Les concentrations circulantes dans le plasma de benfluorex sont trop faibles pour être détectées même avec les techniques récentes de dosage incluant la LC-MS-MS (limite de quantification = 0.4 ng/ml dans l'étude de bioéquivalence soumise par les laboratoires Merck Génériques pour leur dossier de générique de benfluorex en 2006).
Les activités des métabolites S422 et S1475 sont a priori inexistantes aux concentrations plasmatiques obtenues chez l'homme aux doses thérapeutiques (concentrations inférieures à 100 nanoM pour la Camx du S-422 après 150 mg , 3 fois / j de benfluorex chez le sujet sain pendant 10 jours). In vitro le S422 n'est actif sur le métabolisme des acides gras et du glucose qu'à des concentrations supérieures à 10 microMolaires (voire milimolaires) (Kohl et al, Mazière et al, Bailey et al) alors que le S1475 est pratiquement inactif (Kohl et al).
De plus, la demi-vie d'élimination plasmatique de la Nor-fenfluramine est de 20 ± 6.2 h et celle du S est de 4 ± 1.2h dans l'étude de bioéquivalence déposée par les laboratoires Merck Génériques / Mylan dans le cadre du dépôt d'AMM d'un médicament générique de benfluorex en 2005. Ainsi, c'est dl-norfenfluramine qui va s'accumuler lors des administrations répétées et non pas le S422. Les niveaux de concentrations plasmatiques à l'équilibre seront ainsi plus élevés en dl-norfenfluramine qu'en S-422 (cf tableau annexe 2).
Le benfluorex peut donc être considéré comme un précurseur du métabolite actif la nor-fenfluramine.
En 1993 les laboratoires Servier ont réalisé une étude pharmacocinétique chez le sujet sain. nt les niveaux d'exposition des produits parents et des métabolites de la fenfluramine, de la d-fenfluramine et du benfluorex, administrés aux doses thérapeutiques usuelles soit 30 mg/j de d-fenfluramine, 60 mg/ j de fenfluramine et 450 mg/j de benfluorex pendant 10 jours.
Les données pharmacocinétiques montrent qu'à l'état d'équilibre et aux doses thérapeutiques, le niveau d'exposition (Cmax et AUC) pour la Norfenfluramine est

comparable après administration de benfluorex, fenfluramine et d-fenfluramine. Dans le cas de la d-fenfluramine, l'exposition relative (AUC) à la d-norfenfluramine représente environ 50% de l'exposition de la dexfenfluramine,. Cette valeur est de 37 % pour la fenfluramine. A l'inverse, pour le benfluorex, la d-norfenfluramine ne représente qu'environ 4% de l'exposition aux autres métabolites S422 et S1475.

Dans la mesure ou c'est le métabolite actif la d-norfenfluramine qui apparait rendre compte de la majorité de l'effet anorexigène, les différences de doses développées entre les trois fenfluramines « parentes » correspondent à l'ajustement des doses nécessaires à administrer pour obtenir une efficacité thérapeutique anorexigène similaire (en relation donc avec un niveau de production similaire du métabolite actif la d-norfenfluramine).

Mécanismes des actions périphériques pulmonaires et cardiaques des substances fenfluraminiques (Fenfluramines, norfenfluramine et benfluorex) : interactions avec les récepteurs sérotoninergiques périphériques (cardiaques et pulmonaires)

Des récepteurs sérotoninergiques de type 5HT1 se retrouvent au niveau pulmonaire et 5HT2 au niveau des valves cardiaques.
La famille des récepteurs 5-HT2 englobe trois types de récepteurs transmembranaires couplés à la protéine G: 5-HT_{2A}, 5-HT_{2B} et 5-HT_{2C}.
La présence de sérotonine extracellulaire est transduite par ces récepteurs via $G\alpha_q$ (sous-unité α de la protéine G)- PLCβ (phospholipase Cβ) et induisant une augmentation du calcium cytosolique et l'activation de la protéine kinase C (PKC). Néanmoins, la transduction du signal par ces récepteurs peut emprunter différentes voies qui dépendent du type de cellules dans lesquelles ils sont exprimés et du niveau de l'expression de ces récepteurs.
Ces différentes voies peuvent être divisées en trois catégories :

- génération d'un second messager
- mitogénèse
- anti-apoptose

Les conséquences majeures de la transduction par les récepteurs 5-HT_{2B} sont les réponses mitotiques et anti-apoptotiques qui ont un rôle essentiel dans le développement et tout particulièrement dans le développement cardique.

La *fenfluramine et la d-norfenfluramine* ont une faible affinité pour les récepteurs sérotoninergiques de type 5-$HT_{1D/1B}$. La d-norfenfluramine a une faible affinité pour le récepteur 5-HT_7 mais en revanche, la fenfluramine et la d-norfenfluramine ont une plus forte affinité pour les récepteurs 5-HT_{2A}, 5-HT_{2B} et 5-HT_{2C} : ce sont des agonistes partiels pour 5-HT_{2A} et des agonistes complets pour 5-HT_{2C}.
La d-nor-fenfluramine a une plus grande affinité pour les récepteurs 5HT2B que pour les récepteurs 5TH1B. C'est un agoniste entier vis-à-vis des récepteurs 5HT1B et 5HT2B.
Les interactions des différentes substances pharmacologiques en cause avec les récepteurs sérotoninergiques sont encore compliquées par le fait que les propriétés agonistes partielles des différentes substances peuvent venir réduire les actions des agonistes entiers que présentent certains de leurs métabolites comme la nor-fenfluramine sur les récepteurs 5HT1B et surtout 5HT2B.
Cependant, aucune donnée expérimentale n'a documenté l'impact de la présence des différents métabolites sur les effets de la d-nor-fenfluramine in vivo.

Récepteurs sérotoninergiques, fenfluramines et hypertension artérielle pulmonaire
Les dérivés fenfluraminiques peuvent induire des Hypertensions Artérielles Pulmonaires (HTAP) par une interaction complexe et spécifique avec les actions de la sérotonine au niveau du tissu artériel plumonaire. D'autres médicaments retirés du marché ont été reconnus responsables de l'apparition d'HTAP, comme l'aminorex (retiré du marché en 1968 en Autriche, Allemagne et Suisse ou il était commercialisé) et la phentermine (interdite en France en 1999 avec tous les amphétaminiques).

Les mécanismes et récepteurs en jeu dans les effets toxiques pulmonaires de la sérotonine ne sont probablement pas les mêmes qu'au niveau valvulaire cardiaque. Le développement d'une HTAP par l'action des fenfluramines fait intervenir une interaction complexe et spécifique au niveau artériel pulmonaire entre le transporteur transmembranaire de la sérotonine et les récepteurs 5HT1B des cellules musculaires lisses pulmonaires. Il existe une synthèse

importante de sérotonine au niveau pulmonaire par l'action de la tryptophane hydroxylase qui synthétise la sérotonine au niveau des cellules de l'endothelium pulmonaire à partir du tryptophane. La sérotonine ainsi formée au niveau de l'endothelium va stimuler les récepteurs sérotoninergiques des cellules musculaires lisses de l'artère pulmonaire et entrainer d'une part une vasoconstriction de l'artère et des artérioles pulmonaires et d'autre part une hypertrophie et prolifération des cellules musculaires lisses des artères pulmonaires, **entrainant ainsi une augmentation des résistances artérielles du territoire pulmonaire et donc une HTAP lors d'une stimulation chronique sérotoninergique.**

Les fenfluramines ainsi que la phentermine agissent en inhibant le transport transmembranaire de la sérotonine (par compétition de substrat au niveau du transporteur), ce qui induit une plus grande concentration de la sérotonine face aux récepteurs 5HT1B des cellules musculaires lisses. Il en résulte ainsi une hyperstimulation de ces récepteurs à l'origine du développement de l'HTAP. Les fenfluramines et leurs métabolites, la d-norfenfluramine en particulier stimulent également directement les récepteurs sérotoninergiques de types 5HT1B.

Les HTAP ont été beaucoup plus fréquemment observées avec la d-fenfluramide (l'isoméride)qu'avec qu'avec le benfluorex : Ainsi jusqu'au 31 Décembre 1997, 66 cas d'HTAP en relation avec la prise d'Isoméride avaient été notifiés à l'AFSSAPS par les centres de pharmacovigilance (n'incluant donc pas tous les cas notifiés auprès des laboratoires Servier) alors que 18 cas ont été rapportés avec le pondéral et un seul avec le médiator (jusqu'en décembre 1997 également par les CRPV).

Plueisrs explications peuvent en rendre compte :

- soit l'amplitude de l'effet de la d-norfenfluramine, métabolite actif commun, est réduite par la présence des différents métabolites du benfluorex ou surtout par la présence de l'isomère l de la nor-fenfluramine en tant qu' agonistes partiels. Cette hypothèse est soulevée par Rothman et al 2000 pour la fenfluramine et son interaction avec les récepteurs 5HT2 « In the case of fenfluramine, d-fenfluramine and l-fenfluramine have lower efficacy (40%) at the 5HT2B receptor than d-norfenfluramine (75%) and achieve blood levels twice that of norfenfluramine. This indicate that the parent drugs would partially antagonize activation of the 5HT2B receptors by d-norfenfluramine ». Ceci pourrait donc s'appliquer à la fenfluramine mais pas au benfluorex puisque ce dernier est d'emblée hydrolysé et transformé en S422 (inactif aux concentrations plasmatiques atteintes en thérapeutique) puis à la d et l norfenfluramine. Seule l'interaction entre ces deux énantiomères pourrait donc expliquer une réduction de l'effet de la d-norfenfluramine.
  Le résultat de l'interaction entre agonistes dépend des différentes affinités et des différentes activités des agonistes vis-à-vis des recepteurs 5HT1B au niveau des artères pulmonaires et 5HT2b au niveau cardiaque.
- Plus probablement, le niveau des ventes d'isoméride a en fait été beaucoup plus important que celui du benfluorex pendant les années de la commercialisation de l'isoméride (de 1985 à 1997). 7 millions de patients environ en France ont reçu l'isoméride pendant cette période alors que le nombre total de patients ayant pris du benfluorex en France a été d'environ 5 millions sur une période trois fois plus longue (cf figure en annexe 4). Le nombre de patients exposés à l'isoméride a donc été beaucoup plus important dans les années 1985-1997 que celui des patients exposés au benfluorex, ce qui peut expliquer pourquoi les HTAP ont été détectées surtout d'abord avec l'isoméride. Le pondéral a été mis sur le marché le premier en 1965, mais le niveau de ses ventes a aussi été beaucoup plus faible par rapport à celui de l'isoméride, puisque le nombre de patients traités par pondéral est estimé autour de 2 Millions de 1972 à Octobre 1992.

- Pour certains cas d'HTAP, les patients avaient pris successivement de l'isoméride puis du benfluorex après le retrait de l'isoméride. Dans ces cas les HTAP ont plutôt été rapportées à l'isoméride et non pas au benfluorex.
- Le fait que le benfluorex n'a pas été présenté comme anorexigène (mais quand même utilisé comme tel en partie) a probablement réduit la détection de sa responsabilité dans la survenue de certains cas d'HTAP et a peut être réduit par ce fait le nombre des notifications de cas d'HTAP.par les médecins.
- Le fait que le benfluorex soit à prendre en trois prises par jour peut avoir réduit son observance par rapport à celle de l'isoméride (deux prises / j) pouvant rendre compte lors des traitements chroniques d'une exposition plus faible en nor-fenfluramine avec le benfluorex par comparaison avec l'isoméride.
- Enfin, la commercialisation du pondéral a démaré avec un dosage à 30 mg seulement pour être remplacé plus tard par le pondéral retard dosé à 60 mg. Ceci peut expliquer le moindre nombre de cas d'HTAP notifiés avec le pondéral par rapport à l'isoméride (moindre dosage et plus faible nombre de patients traités).

Valvulopathies

Récepteur sérotoninergiques 5-HT-$_{2B}$ et valvulopathies.

La famille des récepteurs 5-HT2 englobe trois types de récepteurs transmembranaires couplés à la protéine G: 5-HT$_{2A}$, 5-HT$_{2B}$ et 5-HT$_{2C}$.
La présence de sérotonine extracellulaire est transduite par ces récepteurs via Gα_q (sous-unité α de la protéine G)- PLCβ (phospholipase Cβ) et induisant une augmentation du calcium cytosolique et l'activation de la protéine kinase C (PKC). Néanmoins, la transduction du signal par ces récepteurs peut emprunter différentes voies qui dépendent du type de cellules dans lesquelles ils sont exprimés et du niveau de l'expression de ces récepteurs.
Ces différentes voies peuvent être divisées en trois catégories :

- génération d'un second messager
- mitogénèse
- anti-apoptose

En plus de réguler les fonctions cellulaires (e.g contraetion-relaxation du muscle lisse), les conséquences majeures de la transduction par les récepteurs 5-HT$_{2B}$ sont les réponses mitotiques et anti-apoptotiques qui ont un rôle essentiel dans le développement et tout particulièrement pour le cœur.

La stimulation du récepteur 5-HT-$_{2B}$, présent sur les valves mitrales et aortiques humaines, est estimée responsable de l'induction de valvulopathies cardiaques chez l'Homme (Fitzgerald LW et al., Mol.Pharmacol. 2000;57: 75-81) par stimulation du développement et de l'activité des fibroblastes présents au sein du tissu valvulaire. La stimulation des fibroblastes induit la production et l'accumulation de protéines de type collagène induisant ainsi une infiltration fibreuse des valves et des cordages.

Jusqu'au début des années 2000, le mécanisme de développement des valvulopathies était inconnu, les études de pharmacologie expérimentale ont graduellement permis d'élucider ce mécanisme.
C'est en 2000 que la norfenfluramine a été identifiée comme possédant une action agoniste sur les récepteurs 5-HT-$_{2B}$ (Fitzgerald LW et al., Mol.Pharmacol. 2000;57: 75-81). La fenfluramine elle-même et la d-fenfluramine sont également des agonistes (pleins ou partiels) des récepteurs 5HT2B.(Rothman, 2000).

La susceptibilité individuelle varie d'un patient à l'autre expliquant que les patients qui développent une HTAP ne développent pas forcément une valvulopathie associée et réciproquement.
De plus, la cinétique de développement des lésions cardiaques et pulmonaires est aussi différente. Les lésions valvulaires peuvent apparaître au bout de 3 mois d'exposition aux fenfluarmines alors que le développement d'une HTAP peut prendre plusieurs années.
Les premiers cas de valvulopathies induites par la prise de dérivés fenfluraminiques datent de 1997, raison de leur retrait du marché aux USA.

Type et fréquence des lésions valvulaires

Les lésions observées sont un épaississement de la valve aortique et pour la valve mitrale ou tricuspide, un épaississement de la valve avec épaississement des cordages et rétraction de l'appareil valvulaire entrainant une régurgitation de la valve atteinte (mitrale, aortique ou tricuspidien).
L'aspect anatomopathologique est celui d'une valve épaissie, blanchâtre recouverte d'une sorte de plaque recouvrant la valve et entourant les cordages, sans altération propre du tissu valvulaire lui-même.

Ces lésions ressemblent à celles observées chez les patients présentant des tumeurs carcinoïdes secrétant de fortes quantités de sérotonine, ou lors de traitements chroniques avec les dérivés de l'ergot de seigle, type méthysergide dont le métabolite la méthyl ergonovine est le plus puissant agoniste connu des récepteurs 5HT2B. Les lésions valvulaires observées en présence de tumeur carcinoide touchent cependant préférentiellement la valve tricuspide car la majeure partie de la sérotonine circulante veineuse va être métabolisée lors de son passage dans la circulation pulmonaire après avoir été recaptée par le transporteur des cellules endothéliales pulmonaires.

D'après la publication de 2003 de Hopkins-Paul-N (BMC-Cardiovascular-disorders), le risque d'apparition d'une fuite aortique avec les dérivés fenfluraminiques est multiplié par un facteur 19 (IC 95% 16 à 23) et celui de fuite mitrale par un facteur 6 (IC 95% 4 à 8.6).
Dans une méta-analyse publiée en 2002 dans l'American Heart Journal (Sachev-Molly et al), le risque de lésion valvulaire est estimé augmenté d'un facteur 2.2 lorsque la durée de traitement est supérieure à 3 mois.
Enfin, dans une série publiée en 2008, chez 5743 patients traités par fenfluramines (Dahl-Charles et al BMJ) dans un seul centre cardiologique américain, la prévalence de la régurgitation aortique était de 19.6% et de 11.8% pour la valve mitrale. La durée de la prise de fenfluramine a été retrouvée comme facteur favorisant. Une HTAP a été retrouvée fréquemment associée à la fuite mitrale mais pas à la fuite aortique. Avec un suivi de 30 mois, la fuite aortique s'est aggravée dans 15% des cas, est restée stable dans 63% et s'est améliorée dans 21% des cas. Les chiffres correspondant pour la fuite mitrale ont été de 25%, 47% et 28%. **Une chirurgie valvulaire a été effectuée chez 38 patients (0.66%), avec dans 25 cas des lésions très évocatrices d'une étiologie médicamenteuse type agoniste sérotoninergique.**

Actions métaboliques périphériques du benfluorex

Le benfluorex et ses métabolites ont une action périphérique sur le métabolisme du glycogène. Ils diminuent la production hépatique de glucose et agissent sur la néoglucogénèse, améliorant la sensibilité à l'insuline et l'insulinorésistance musculaire. Le benfluorex n'aurait pas d'action sur l'insulinosécrétion.

Action périphérique sur le métabolisme du glycogène.
Des études *in vitro* sur modèles cellulaires ont montré que benfluorex et son principal métabolite (S422) ont un double effet sur le métabolisme du glycogène.
1. Sur hépatocytes de rat en culture, on observe une augmentation de la synthèse de glycogène stimulée par l'insuline et une diminution de la glycogénolyse stimulée par le glucagon (Melin, 1991). La glycogénolyse hépatique est diminuée par une inhibition d'une enzyme : le glycogène phophorylase.
2. La production hépatique de glucose est diminuée avec un effet sur la néoglucogénèse par une inhibition de la PEPCK (phosphoenol pyruvate carboxykinase) (Tielens, 1993 ; Zorzano, 1996). Les travaux de Kohl et Pégorier (Kohl, 2002) ont permis de préciser cet aspect du mécanisme d'action. L'expression des gènes codant pour les enzymes de différentes voies métaboliques a été étudiée sur hépatocytes isolés.
Le benfluorex et son métabolite principal S422 ont un effet direct et dose-dépendant sur l'expression de la PEPCK, enzyme-clé de la néoglucogénèse. Cet effet est quantifié: l'expression étant réduite à un niveau correspondant à 24 % et à 12 % de la valeur contrôle, pour le principe actif et son métabolite respectivement, à la concentration de 100 micromolaire.
3. Le benfluorex exerce, de plus, un effet inhibiteur sur l'expression de la CPT I (carnitine palmityl tranférase), enzyme responsable du transport des acides gras à longue chaîne à l'intérieur de la mitochondrie, étape préalable à la β oxydation.
Ainsi, la réduction de la production hépatique de glucose serait liée pour partie à la réduction de la β oxydation, privant la voie de la néoglucogénèse de ses substrats énergétiques.

Action sur l'insulinosensibilité.
Etudes chez l'animal. Plusieurs études, portant sur des modèles animaux d'insulinorésistance et/ou de diabète, ont montré que le benfluorex améliore la tolérance au glucose et l'insulino-sensibilité en utilisant la technique du clamp euglycémique hyperinsulinique (Brindley, 1991; Portha, 1993; Serradas, 1993; Storlien 1993). Le principe de cette technique repose sur une perfusion d'insuline exogène à débit continu associée à une perfusion variable de glucose, adapté de façon à maintenir la glycémie constante. Si la dose d'insuline est suffisante pour inhiber la production hépatique de glucose, la quantité de glucose perfusé est le reflet de la sensibilité à l'insuline, plus elle sera importante, plus la sensibilité est élevée.
Le benfluorex améliore l'insulino-résistance musculaire avec une augmentation du transporteur de glucose GLUT-4 (Sevilla, 1999; Storlien, 1993 ; Zorzano 1996) et de l'oxydation du glucose (Bailey, 1992).
Le benfluorex n'a pas d'effet direct sur la sécrétion d'insuline à l'état basal dans des conditions de stimulation (induction par le glucose ou l'arginine) chez le rat diabétique (Portha, 1993; Serradas, 1993).
Etudes chez l'homme. Chez l'homme, l'effet insulino-sensibilisateur du benfluorex a été étudié dans 3 études de clamp hyperinsulinique euglycémique (Bianchi, 1993 ; De Feo, 1993 et Ricchio, 1993).

Deux de ces études ont étudié la production hépatique de glucose; une étude (De Feo) a montré une diminution de cette production; l'autre étude (De Ricchio) n'a pas mis en évidence de variation.
Une étude complémentaire de Bianchi réalisée en 1996 n'avait pas montré d'amélioration de la consommation de glucose sous benfluorex.

Conclusions. Sur la base de ces éléments, aucune certitude sur le mécanisme d'action de cette molécule n'a pu être mis en évidence. L'ensemble des résultats a conduit à mettre en place deux études pivot visant à confirmer l'efficacité hypoglycémiante du benfluorex chez les patients diabétiques de type 2 (Moulin 2006, Del Prato 2003). L'effet hypoglycémiant dans l'étude Moulin s'est traduit par une réduction de 0.82% dans le groupe benfluorex versus +1% dans le groupe placebo après 18 semaines de traitement. L'étude REGULATE a par la suite comparé l'efficacité du benfluorex à celle de la pioglitazone.
Cependant, sur l'ensemble des données de ces études cliniques chez les patients diabétiques, compte tenu de la relative faible amplitude de l'effet sur la glycémie, des critiques méthodologiques, ainsi que la non fiabilité de certains résultats (cf inspections des centres de l'étude Moulin), l'indication du benfluorex comme médicament anti-diabétique n'a pas été retenue par l'AFSSAPS et seule l'indication du benfluorex comme adjuvant au régime chez le diabétique en surcharge pondérale a été maintenue.

Conclusion :

1. Les fenfluramines (fenfluramine, d-fenfluramine et benfluorex) ont été initialement développées par les laboratoires Servier pour séparer les effets anorexigènes des effet stimulants du système nerveux central qui sont ceux de l'amphétamine.

Ce sont des composés trifluorés, substitués en meta du cycle phényl, de la molécule de base des anorexigènes, la phényléthylamine.

Leur effet principal anorexigène passe par des mécanismes sérotoninergiques centraux (inihibition du recaptage de la sérotonine par les terminaisons nerveuses sérotoninergiques et stimulation des récepteurs sérotoninergiques centraux).
Les complications pulmonaires et valvulaires cardiaques observées lors des traitements au long cours par les fenfluramines sont dues à la stimulation des récepteurs sérotoninergiques 5HT1B (pour l'artère pulmonaire) et 5HT2B pour les valves cardiaques, avec l'inhibition du recaptage de la sérotonine qui joue également un rôle dans le développement de l'HTAP.

Ils possèdent aussi des effets périphériques sur le métabolisme lipidique et glucidique qui in fine n'ont pas été considérés comme thérapeutiquement suffisants pour un libéllé d'AMM comme médicament du diabète.

Une partie au moins de leurs effets provient de l'activité de leurs métabolites et en particulier de leur métabolite principal la d-nor-fenfluramine.

2. Le benfluorex est complètement métabolisé et ne circule dans le plasma qu'à des concentrations indétectables, car il est immédiatement transformé en son métabolite S422, puis en métabolite S1475 et en norfenfluramine.

Cette caractéristique métabolique du benfluorex conduit les laboratoires Servier eux-mêmes à

Annexe 1-37

écrire, en 1999, que le benfluorex est un précurseur (*« a pro-drug »*) de son métabolite S422, sans attribuer toutefois à ce dernier la moindre activité pharmacologique et alors même que le S422 est de surcroît transformé partiellement en norfenfluramine.

Répétons que la norfenfluramine a des propriétés anorexigènes puissantes et représente l'amine de base qui a servi au développement des autres composés, notamment les fenfluramines.

Après administration de dexfenfluramine (ISOMERIDE®), de fenfluramine (PONDERAL®) et de benfluorex (MEDIATOR®) aux doses préconisées en thérapeutique, les niveaux des concentrations plasmatiques de la norfenfluramine (exposition : Cmax et AUC) sont similaires : 25-30 ng/ml pour la Cmax de d-norfenfluramine (cf tableau de l'annexe 2).

Les métabolites soit sont inactifs (S-1475) soit inactifs (S-422) aux concentrations plasmatiques obtenues lors de l'administration des doses de 450 mg / j en trois prises. De plus la demi-vie du S 422 est beaucoup plus courte (4h) que celle de la norfenfluramine (20h), cette dernière atteignant ainsi des niveaux de concentrations à l'équilibre trois fois supérieurs à celles du S-422 en termes d'AUC 0-24h..

Les différences entre les doses préconisées pour les trois fenfluramines (dexfenfluramine 30 mg/j, fenfluramine 60 mg/j et benfluorex 450 mg/j) correspondent en réalité aux doses nécessaires pour atteindre une même concentration plasmatique de norfenfluramine et, ce faisant, pour obtenir un effet anorexigène comparable.

Le benfluorex doit donc être considéré comme un précurseur de la substance véritablement active : la nor-fenfluramine.
Et d'ailleurs, il est remarquable de relever la conclusion de Goudie et al en 1974 sur le rôle de la norfenfluramine, peu avant la mise sur le marché du médiator : « The data reported in this paper provide evidence which implicates Norfenfluramine as a *mediator* of the actions of fenfluramine »...

2. Classification par les mécanismes d'action.

Les progrès réalisés au cours de la dernière décade dans le domaine des amines cérébrales concernant leur localisation, leur métabolisme et leurs effets, ont tout naturellement été appliqués à l'étude du mécanisme d'action des anorexigènes qui font l'objet de l'article suivant (Prof. H. Schmitt).

PHARMACOKINETICS AND METABOLISM

CLINICAL STUDIES

PHARMACOKINETICS AND METABOLISM

The pharmacokinetic and metabolism parameters were measured in healthy human volunteers. In this study, similar results were obtained with men and women, therefore all data were pooled.

This report summarizes the results obtained from various studies carried out between 1971 and 1996.

1. ABSORPTION

^{14}C-benfluorex was rapidly absorbed into plasma : the plasma concentration peak was reached one to two hours after administration of the compound and reached a value of 2.6 □g. equivalent. ml^{-1} (table 1, figure 1) (1, 2). The blood/plasma ratio was 0.4 over the first ten hours after administration. Later, the ratio increases, which suggests the formation of more lipophilic metabolites.

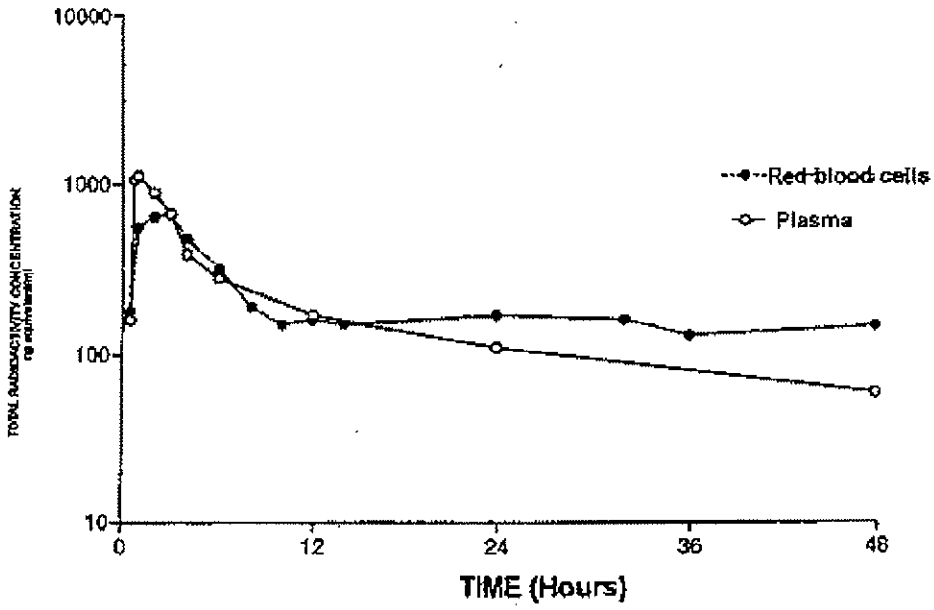
Urinary elimination is greater than 90 %, expressed as a percentage of the radioactivity administered, and in cumulative values for a period of more than 72 hours. This indicates that the drug is well absorbed from the gastrointestinal tract.

Table 1
Pharmacokinetic parameters measured after oral administration of 14C-benfluorex (Mean ± standard deviation) (1)

Parameter	*Human*
Dose (mg)	109
Cmax (□g equiv/ml)	2.6 ± 0.2
Tmax (h)	1.4 ± 0.3
AUC (mg equiv/ml)	23.8 ± 3.9
Vd/F (L)	124 ± 6
Vd/F (% body weight)	1.8 ± 0.1
t1/2 (h)	0.2 ± 0.2
terminal t1/2 (h)	34.0 ± 11.0
AUC (mg equiv/h/ml)	23.8 ± 3.9
Urine (1) (%)	94.0 ± 6.3
Faeces (1) (%)	0.5 ± 0.1
Total excreted (%)	94.5 ± 6.0

(1) % of the dose eliminated for a period greater than or equal to 72 hours
F = biovailability
Vd = volume of distribution

Figure 1
Concentration of total radioactivity in the plasma and in red blood cells



2. TISSUE UPTAKE AND DISTRIBUTION

The data concerning the volume of distribution are approximate for two reasons : a) the drug was metabolised completely and b) was the only measurement carried out. According to table 1, the volume was relatively low (124 litres) which suggests low uptake of radioactive metabolites in the tissues and confirms their polar nature.

The rapid hydrolysis of the unchanged drug makes difficults the measure of plasma proteins binding. Furthermore the binding of metabolites has not been systematically studied. However, one study has shown that protein binding of S 585, the most lipophilic metabolite, is low (17 %) (3). It is highly unlikely that any more polar metabolites bind to plasma proteins in a stronger way .
In general, therefore, plasma protein binding is not a major feature of this compound.

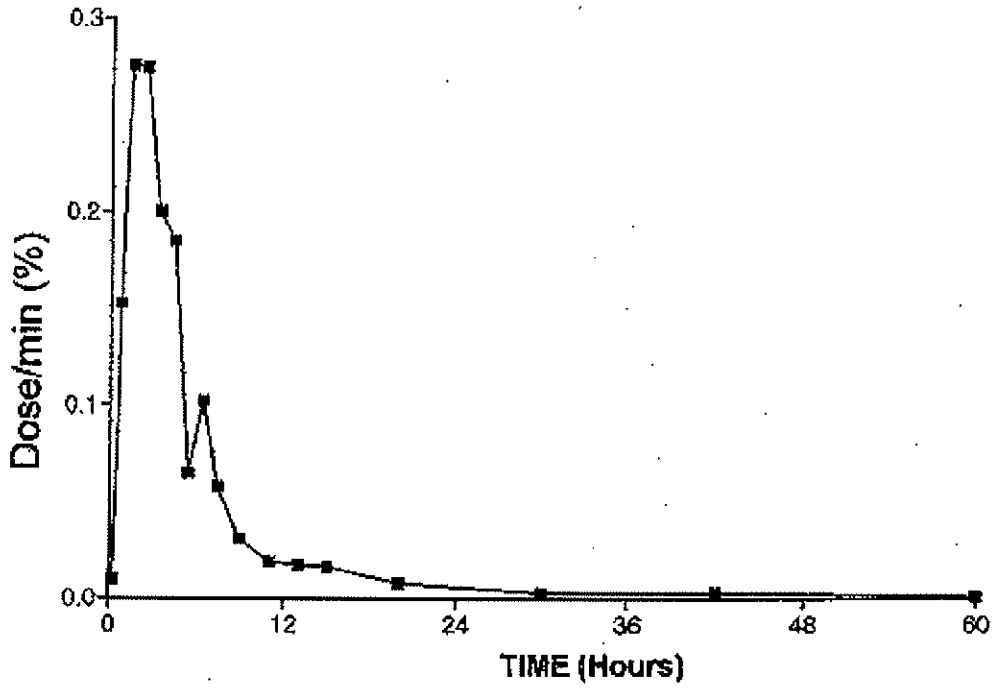
3. ELIMINATION

After the absorption phase, radioactivity is eliminated with a biphasic profile : the half-life of the product was found to be approximately 0.2 hours for the initial phase and 34 hours for the terminal phase (1) (table 1). After, the first 72 hours the radioactivity was found to be near to the limit of detection in all subjects (approximately 0.05 mg equivalent/ml^{-1}). The values of half-life radioactivity during the terminal phase varied between subjects : the values range between 18.6 and 44.9 hours. However, the measurement of the area under the curve, which is the most important pharmacokinetic parameter since it allows to measure levels at the steady state, was similar in all studied subjects (19.8 - 26.3 mg equivalents/h/ml).

Urinary elimination

Urinary elimination of radioactivity was rapid in healthy subjects : 90 % of the dose administered was detected during the first 24 hours. The urinary excretion peak of total radioactivity (0.275 % of the dose/min) coincided with the plasma concentration peak (figure 2). The corresponding calculated clearance was similar to normal renal blood flow (approximately 120 ml/min). These results confirm a weak protein binding and show that neither mortal absorption nor secretion take place in the renal tubules. Then radioactivity declined slowly. After 72 hours elimination was practically completed (87-99 % of the dose administered).

Figure 2
Percentage of radioactivity excreted in urine in healthy volunteers after oral administration of benfluorex (2.5 mg/kg) in solution (n=4)



Faecal elimination

Faecal elimination of radioactivity was low (< 0.5 %). This result confirms that the drug and its metabolites are completely absorbed from the gastrointestinal tract.

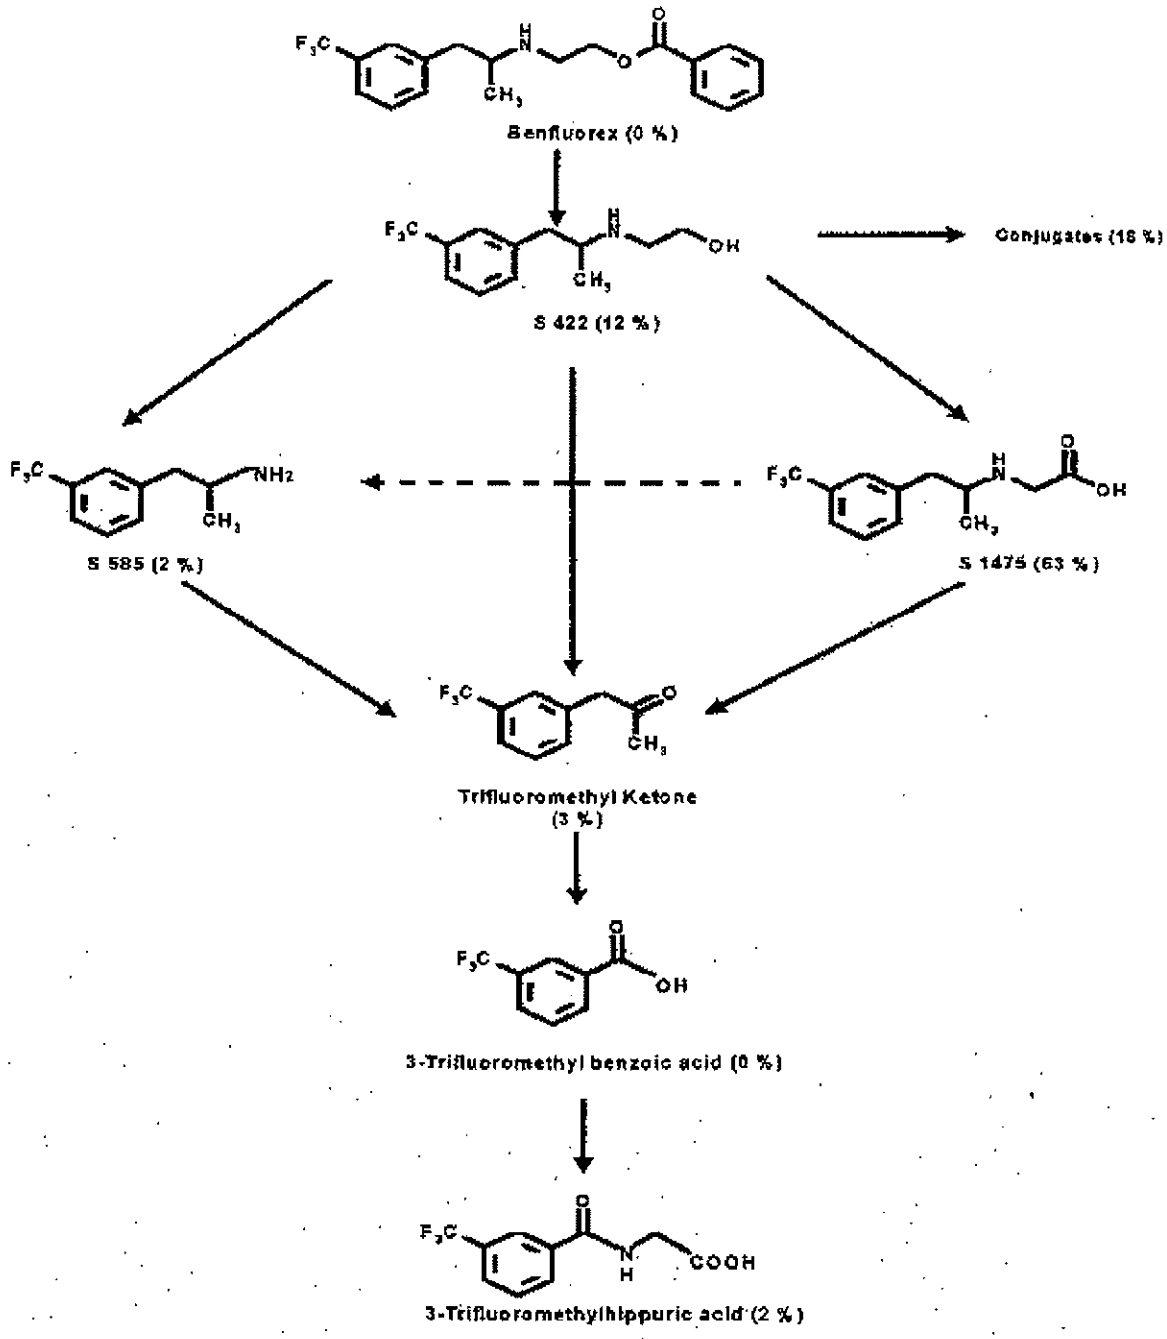
4. METABOLISM

In previous studies, it has been demonstrated the rapid metabolism of benfluorex by circulating esterases, and so no traces of the compound have been found in various body fluids (4) no trace of the product was found in various body fluids. In the original studies (5, 6), radioactive material was not available. Subsequently, radioactive labelling of the compound have allowed a more systematic approach. The identification and quantification of the different metabolites was therefore possible. The results of these various studies (non radioactive and radioactive) are in agreement. Thus, this report also cites the most recent studies and it is based on data obtained from studies using the labelled compound.

Urine

As previously reported, benfluorex could not be detected in the various body fluids. It should be therefore considered to be a prodrug. In humans, at least nine metabolites were detected in the urine (7). Four main steps are : a) hydrolysis of the drug by plasma esterases into a primary metabolite, followed by b) conjugation, c) oxidation of the aliphatic nitrogenic side chain and d) deamination to yield more polar compounds (figure 3).

Figure 3
Metabolic pathways suggested for benfluorex in humans
(% of the dose eliminated between 0 and 24 hours) (1)



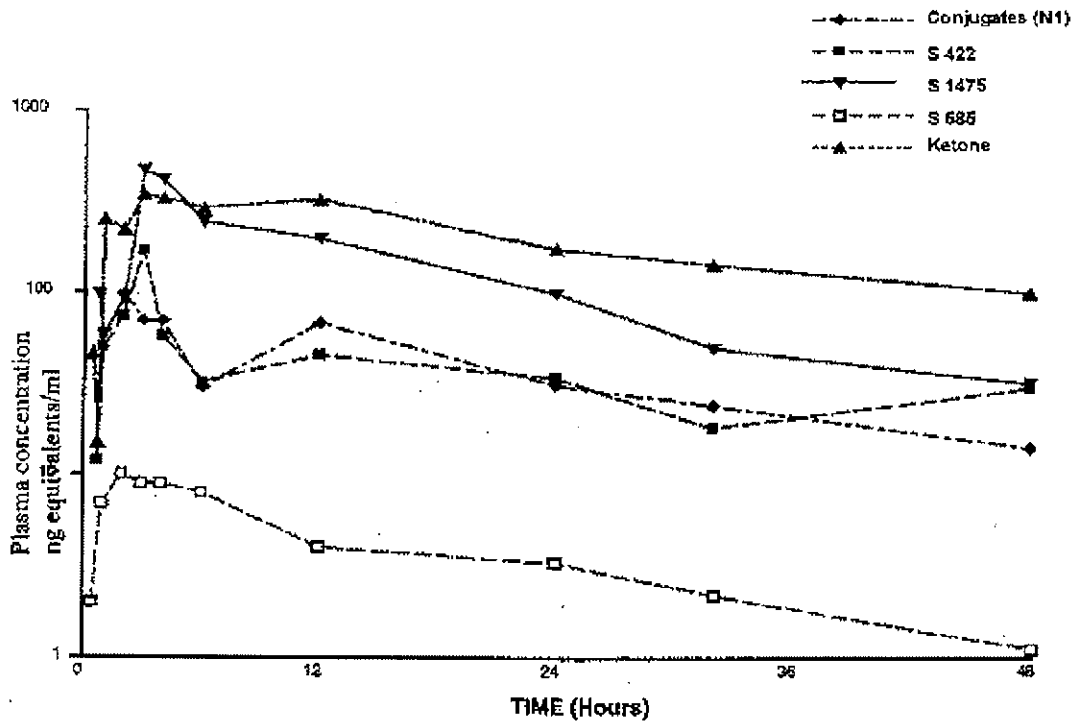
All the major metabolites (> 95 %) have been identified using mass spectrometry and their chromatographic properties have been compared to synthetic standards. Benfluorex undergoes rapid hydrolysis to a primary metabolite, S 422 (approximately 12 %).

If the results obtained before and after enzymatic hydrolysis in urine are considered, it is clear that this metabolite combines to the glucuronide and sulphate conjugates (approximately 18%) (1, 8). S 422 is then oxidised either into a) a carboxylic acid, the S 1475, the main metabolite in humans (approximately 63 %), or b) a primary amine S 585, which represents only 2% of the dose. It is therefore likely that a small quantity of metabolite S 1475 was conjugated. Nevertheless, further studies are required to confirm this hypothesis.
These substances are then deaminated to yield more polar metabolites ; fristly trifluoromethylbenzylketone (ketone) (approximately 3 %), and secondly : trifluoromethylhippuric acid (TFH) (approximately 2 %) a glycine-conjugated compound obtained by oxydation of trifluoromethylbenzoic acid (TBB). All the metabolites identified in the urine represent more than 95 % of the radioactive dose administered.

Plasma

Single dose
Because of the difficulties of mesuring the low levels of the more polar metabolites of benfluorex in plasma, relatively little work has been undertaken to investigate levels of the circulating metabolites.
Oral administration of a single dose of radiolabelled benfluorex (approximately 110 mg) to a healthy volunteer allows to estimate the levels of circulating metabolites of benfluorex (figure 4). The major metabolite was the same as the one found in urine : the carboxylic acid derivative (S 1475). The plasma peak (approximately 400 ng/ml) was found between 3 and 4 hours after oral administration and represents 40 % of the radioactive plasma components. The terminal half-life of this compound is approximately 14 hours. Another polar compound, the deaminated ketone derivative, was also detected in relatively large quantities with a peak of 300 ng/ml three hours after administration. The primary metabolite of benfluorex, S 422, had a peak at 170 ng/ml. Metabolite N1 (approximately 100 ng/ml) is the glucose conjugate of S 422. The levels of S 585 remained low (approximately 33 ng/ml).
These data were obtained after separation by thin-layer chromatography, followed by scraping of the plates and counting.

Figure 4
Concentrations of metabolites of ^{14}C-benfluorex in the plasma of healthy volunteers after oral administration



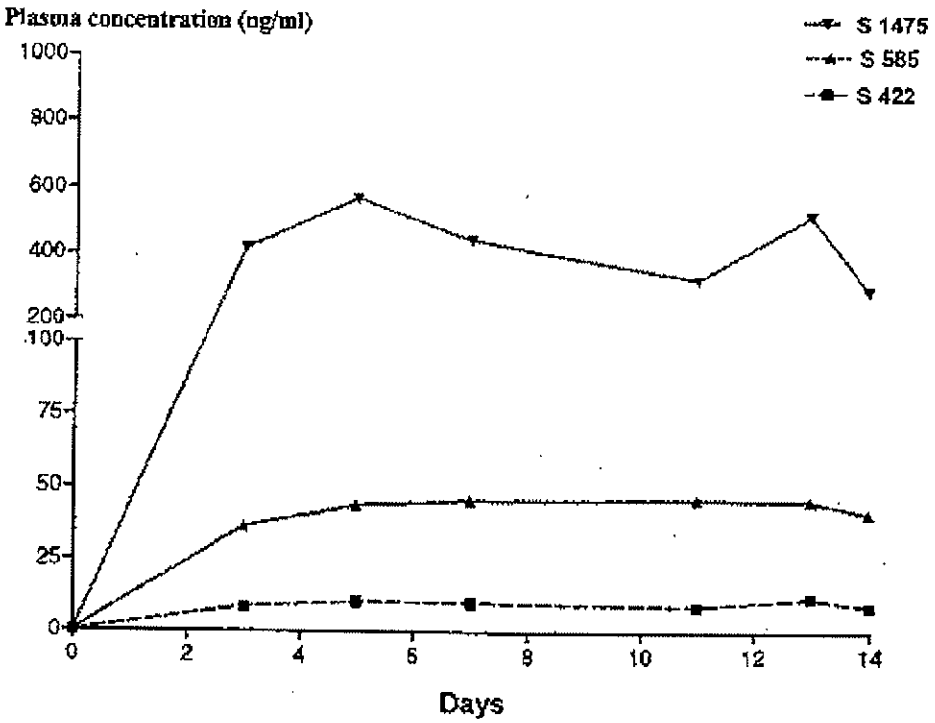
Repeated doses

Figure 5 shows the results of quantification by HPLC of the metabolites in six healthy volunteers after repeated administration of a dose (150 mg), three times per day, over a period of 14 days (9).

The steady state for the principal metabolite, S 1475 (approximately 1000 ng/ml), was reached after four to five days of administration. For S 422 (approximately 18 ng/ml) and S 585 (approximately 50 ng/ml) the steady state was reached later, seven to ten days after the start of treatment.

Level of S 585 remained relatively constant for the entire duration of the treatment whereas some fluctuations appeared for the other metabolites. This was due to differences in the half-life elimination times. The more rapid elimination of S 1475 (elimination half-life : 3 hours) compared to S 422 (elimination half-life: 7 hours) is difficult to explain from a kinetic point when the metabolic route is considered. Nonetheless, three hypotheses are possible : (a) S 1475 is formed directly from benfluorex, (b) S 1475 has a longer half-life as suggested by radioactive studies, (c) S 422 has an "artificially" prolonged half-life due to slow release from the tissues or to recirculation of the product from conjugates. From currently available results it is not possible to confirm these hypotheses.

Figure 5
Mean plasma concentrations of metabolites of benfluorex after the administration of 3 x 150 mg of benfluorex tablets over a period of 14 days (n = 6)



5. PARTICULAR SITUATIONS AND DRUG INTERACTIONS

Precautions should be taken in the prescription of this drug in patients with renal disorders. In fact, as described previously, the elimination of the two main metabolites, S 1475 and the glucuronide of S 422, is essentially urinary. Furthermore, although the conversion of benfluorex into its metabolites occurs in plasma by hydrolysis, subjects suffering from liver failure should be followed up carefully.

No studies have looked at the specific problems of the interaction of benfluorex with other drugs. However, the results of the bioavailability studies do not indicate any problems. In addition, no interactions were reported during clinical or pharmacovigilance studies over a long period of widespread use.

6. SUMMARY

Benfluorex is rapidly metabolised and it can be considered to be a prodrug of S 422. This is then metabolised into at least eight other metabolites. The main metabolites were identified and quantified in urine as products of oxidation and deamination. The extensive radioactivity elimination in urine combined with a lack of a significant quantity of metabolites in faeces shows that the drug is well absorbed and that no other accumulation occurs.

The specific measurement of metabolites in plasma after chronic administration shows that the steady state is reached in less than one week and remains constant, suggesting no induction or inhibition of metabolism. After stopping treatment all metabolites are eliminated during a few days period ; no accumulation phenomena occurred.

PHARMACOKINETICS AND METABOLISM

CLINICAL STUDIES

1. PHARMACOKINETICS AND METABOLISM

The pharmacokinetic and metabolism parameters were measured in healthy human volunteers. In this study, similar results were obtained with men and women, therefore all data were pooled.

This report summarizes the results obtained from various studies carried out between 1971 and 1996.

1.1. Absorption

^{14}C-benfluorex was rapidly absorbed into plasma : the plasma concentration peak was reached one to two hours after administration of the compound and reached a value of 2.6 µg. equivalent.ml^{-1} (table 1, figure 1) (1, 2). The blood/plasma ratio was 0.4 over the first ten hours after administration. Later, the ratio increases, which suggests the formation of more lipophilic metabolites.

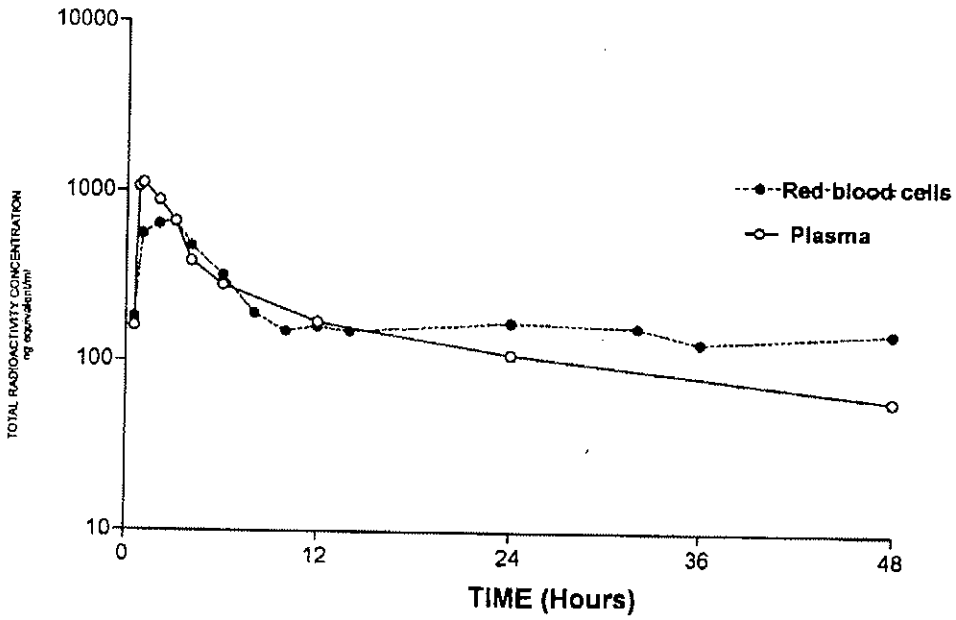
Urinary elimination is greater than 90 %, expressed as a percentage of the radioactivity administered, and in cumulative values for a period of more than 72 hours. This indicates that the drug is well absorbed from the gastrointestinal tract.

Table 1
Pharmacokinetic parameters measured after oral administration of 14C-benfluorex (Mean ± standard deviation) (1)

Parameter	*Human*
Dose (mg)	109
Cmax (µg equiv/ml)	2.6 ± 0.2
Tmax (h)	1.4 ± 0.3
AUC (mg equiv/ml)	23.8 ± 3.9
Vd/F (L)	124 ± 6
Vd/F (% body weight)	1.8 ± 0.1
t1/2 (h)	0.2 ± 0.2
terminal t1/2 (h)	34.0 ± 11.0
AUC (mg equiv/h/ml)	23.8 ± 3.9
Urine (1) (%)	94.0 ± 6.3
Faeces (1) (%)	0.5 ± 0.1
Total excreted (%)	94.5 ± 6.0

(1) % of the dose eliminated for a period greater than or equal to 72 hours
F = biovailability
Vd = volume of distribution

Figure 1
Concentration of total radioactivity in the plasma and in red blood cells



1.2 Tissue uptake and distribution

The data concerning the volume of distribution are approximate for two reasons : a) the drug was metabolised completely and b) was the only measurement carried out. According to table 1, the volume was relatively low (124 litres) which suggests low uptake of radioactive metabolites in the tissues and confirms their polar nature.

The rapid hydrolysis of the unchanged drug makes difficults the measure of plasma proteins binding. Furthermore the binding of metabolites has not been systematically studied. However, one study has shown that protein binding of S 585, the most lipophilic metabolite, is low (17 %) (3). It is highly unlikely that any more polar metabolites bind to plasma proteins in a stronger way .
In general, therefore, plasma protein binding is not a major feature of this compound.

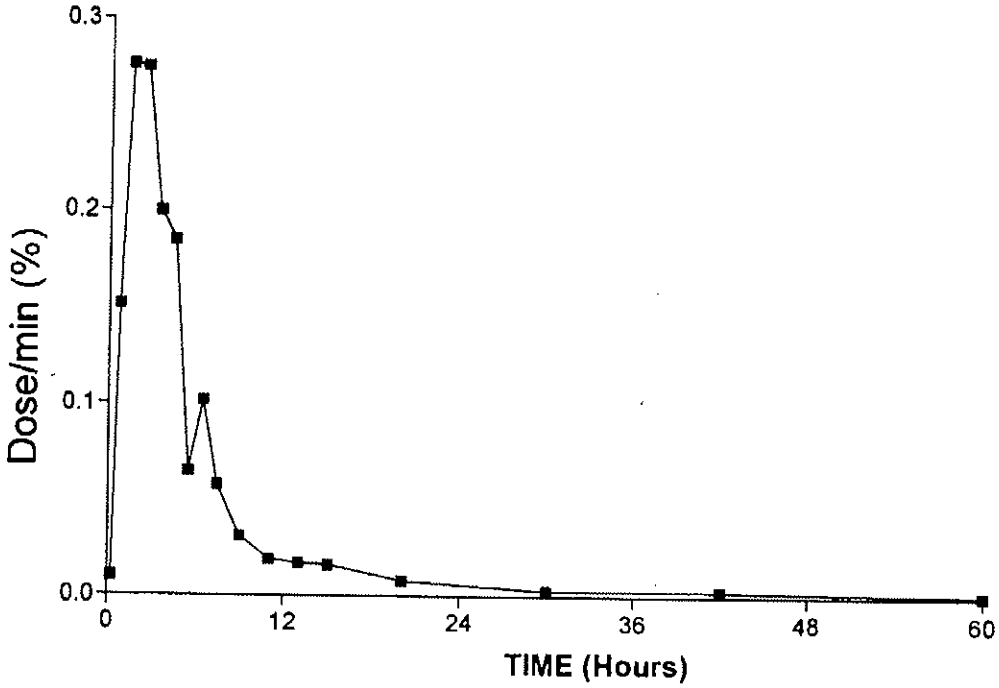
1.3 Elimination

After the absorption phase, radioactivity is eliminated with a biphasic profile : the half-life of the product was found to be approximately 0.2 hours for the initial phase and 34 hours for the terminal phase (1) (table 1). After, the first 72 hours the radioactivity was found to be near to the limit of detection in all subjects (approximately 0.05 mg equivalent/ml^{-1}). The values of half-life radioactivity during the terminal phase varied between subjects : the values range between 18.6 and 44.9 hours. However, the measurement of the area under the curve, which is the most important pharmacokinetic parameter since it allows to measure levels at the steady state, was similar in all studied subjects (19.8 - 26.3 mg equivalents/h/ml).

1.3.1 Urinary elimination

Urinary elimination of radioactivity was rapid in healthy subjects : 90 % of the dose administered was detected during the first 24 hours. The urinary excretion peak of total radioactivity (0.275 % of the dose/min) coincided with the plasma concentration peak (figure 2). The corresponding calculated clearance was similar to normal renal blood flow (approximately 120 ml/min). These results confirm a weak protein binding and show that neither mortal absorption nor secretion take place in the renal tubules. Then radioactivity declined slowly. After 72 hours elimination was practically completed (87-99 % of the dose administered).

Figure 2
Percentage of radioactivity excreted in urine in healthy volunteers after oral administration of benfluorex (2.5 mg/kg) in solution (n=4)



1.3.2 Faecal elimination

Faecal elimination of radioactivity was low (< 0.5 %). This result confirms that the drug and its metabolites are completely absorbed from the gastrointestinal tract.

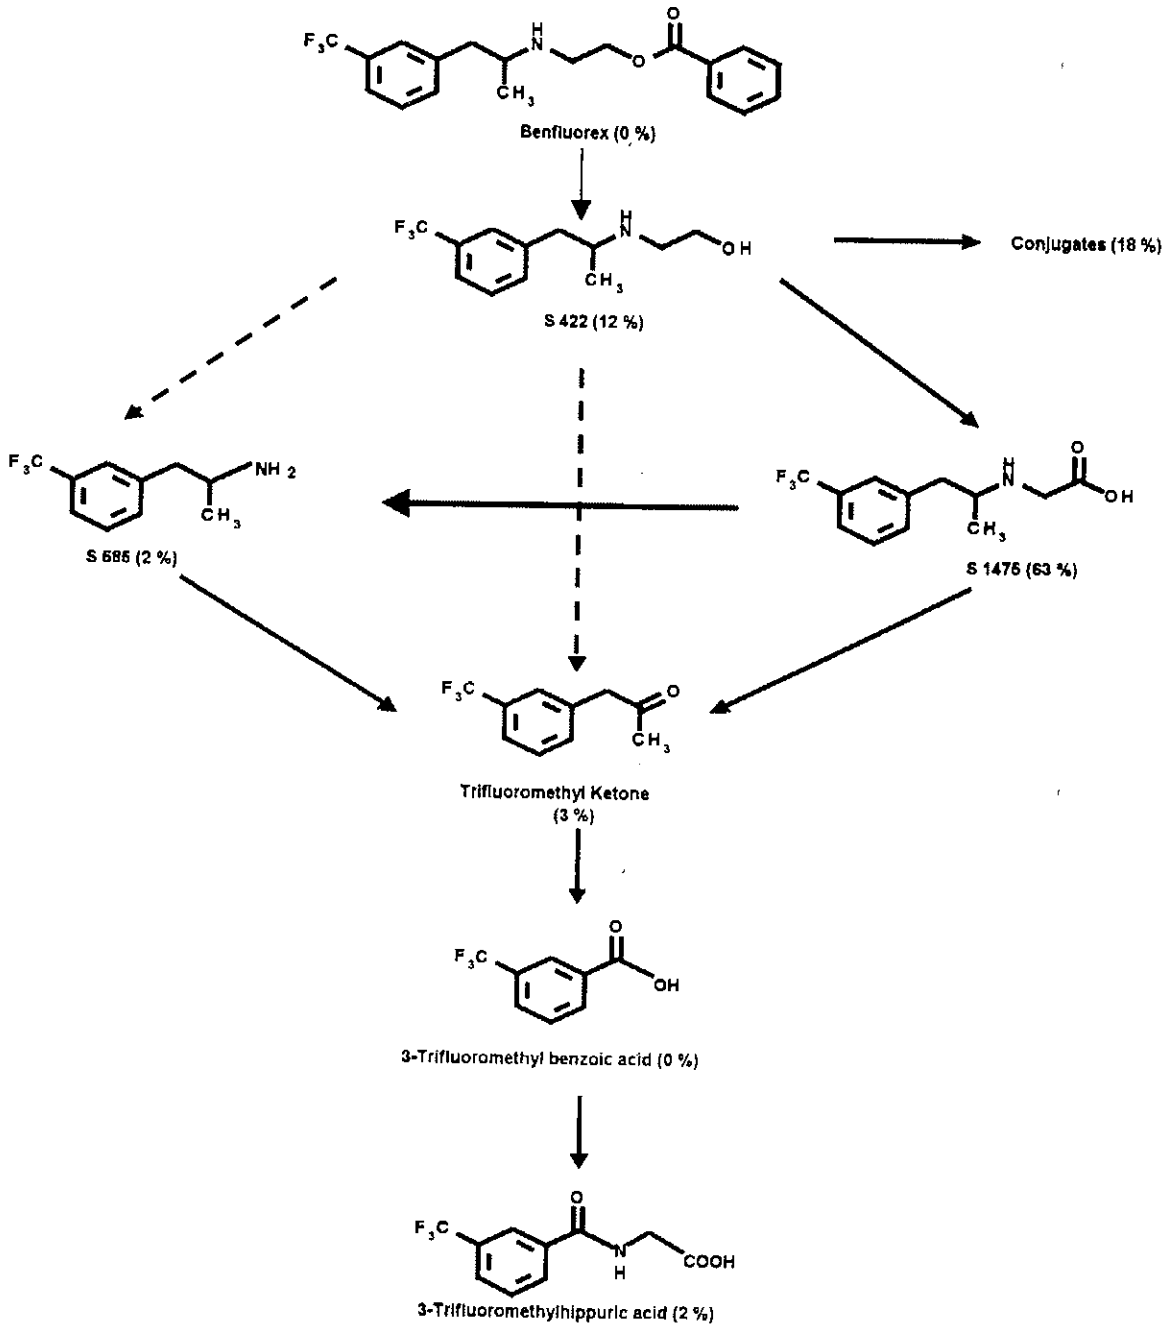
1.4 Metabolism

In previous studies, it has been demonstrated the rapid metabolism of benfluorex by circulating esterases (4). In the original studies (5, 6), radioactive material was not available. Subsequently, radioactive labelling of the compound have allowed a more systematic approach. The identification and quantification of the different metabolites was therefore possible. The results of these various studies (non radioactive and radioactive) are in agreement. Thus, this report also cites the most recent studies and it is based on data obtained from studies using the labelled compound.

1.4.1 Urine

In humans, at least nine metabolites were detected in the urine (7). Four main steps are : a) hydrolysis of the drug by plasma esterases into a primary metabolite, followed by b) conjugation, c) oxidation of the aliphatic nitrogenic side chain and d) deamination to yield more polar compounds (figure 3).

Figure 3
Metabolic pathways suggested for benfluorex in humans
(% of the dose eliminated between 0 and 24 hours) (Richards, 1985)



All the major metabolites (> 95 %) have been identified using mass spectrometry and their chromatographic properties have been compared to synthetic standards. Benfluorex undergoes rapid hydrolysis to a primary metabolite, S 422 (approximately 12 %).

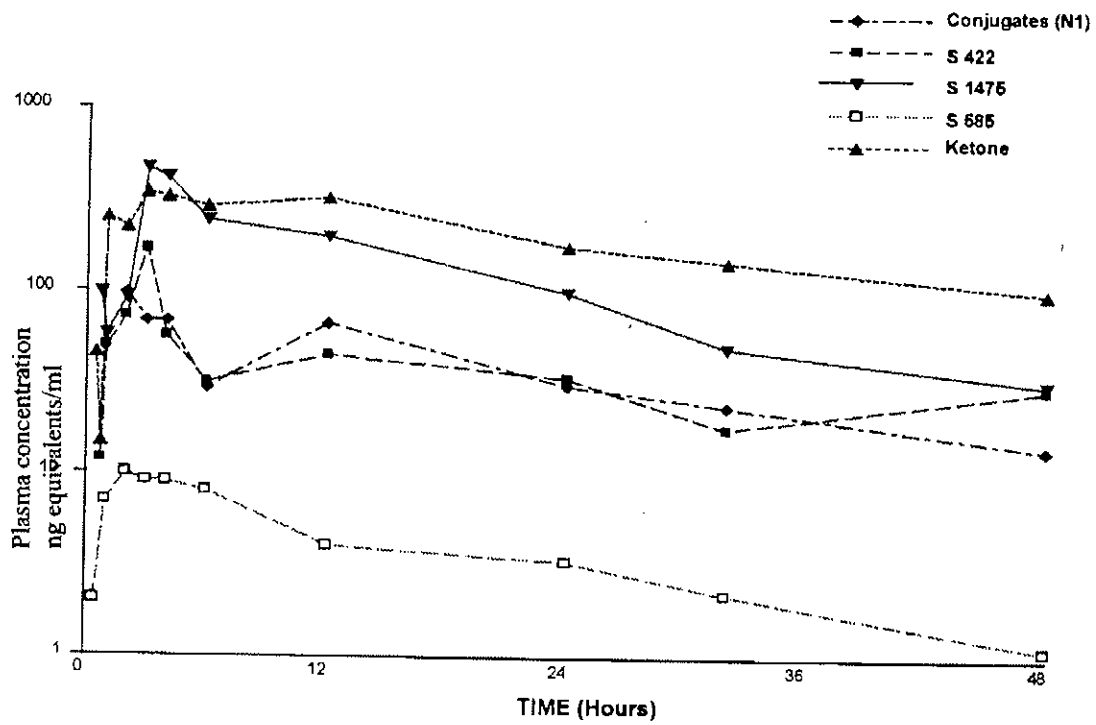
If the results obtained before and after enzymatic hydrolysis in urine are considered, it is clear that this metabolite combines to the glucuronide and sulphate conjugates (approximately 18%) (1, 8). S 422 is then oxidised either into a carboxylic acid, the S 1475, the main metabolite in humans (approximately 63 %), or to a lesser extent to a primary amine S 585 ((dl)-norfenfluramine), which represents only 2% of the dose. It is therefore likely that a small quantity of metabolite S 1475 was conjugated. Nevertheless, further studies are required to confirm this hypothesis.
These substances are then deaminated to yield more polar metabolites ; fristly trifluoromethylbenzylketone (ketone) (approximately 3 %), and secondly : trifluoromethylhippuric acid (TFH) (approximately 2 %) a glycine-conjugated compound obtained by oxydation of trifluoromethylbenzoic acid (TBB). All the metabolites identified in the urine represent more than 95 % of the radioactive dose administered.

1.4.2 Plasma

1.4.2.1 Single dose

Because of the difficulties of mesuring the low levels of the more polar metabolites of benfluorex in plasma, relatively little work has been undertaken to investigate levels of the circulating metabolites.
Oral administration of a single dose of radiolabelled benfluorex (approximately 110 mg) to a healthy volunteer allows to estimate the levels of circulating metabolites of benfluorex (figure 4). The major metabolite was the same as this one found that this one found in the urine : the carboxylic acid derivative (S 1475). The plasma peak (approximately 400 ng/ml) was found between 3 and 4 hours after oral administration and represents 40 % of the radioactive plasma components. The terminal half-life of this compound is approximately 14 hours. Another polar compound, the deaminated ketone derivative, was also detected in relatively large quantities with a peak of 300 ng/ml three hours after administration. The primary metabolite of benfluorex, S 422, had a peak at 170 ng/ml. Metabolite N1 (approximately 100 ng/ml) is the glucose conjugate of S 422. The levels of S 585 (dl)-norfenfluramine) remained low (approximately 33 ng/ml).
These data were obtained after separation by thin-layer chromatography, followed by scraping of the plates and counting.

Figure 4
Concentrations of metabolites of ^{14}C-benfluorex in the plasma of healthy volunteers after oral administration



1.4.2.2 Repeated doses

The pharmacokinetics of benfluorex and the quantification of the metabolites have been examined in six healthy volunteers after repeated administration of a dose (150 mg), three times per day, over a period of 14 days (9).

The steady state for the principal metabolite, S 1475 (approximately 1361 ng/ml), was reached after four to five days of administration. For S 422 (approximately 22 ng/ml) and S 585 (dl)-norfenfluramine (approximately 59 ng/ml) the steady state was reached later, seven to ten days after the start of treatment.

Level of S 585 remained relatively constant for the entire duration of the treatment whereas some fluctuations appeared for the other metabolites. This was due to differences in the half-life elimination times. The more rapid elimination of S 1475 (elimination half-life : 3 hours) compared to S 422 (elimination half-life: 7 hours) is difficult to explain from a kinetic point when the metabolic route is considered. Nonetheless, three hypotheses are possible : (a) S 1475 is formed directly from benfluorex, (b) S 1475 has a longer half-life as suggested by radioactive studies, (c) S 422 has an "artificially" prolonged half-life due to slow release from the tissues or to recirculation of the product from conjugates. From currently available results it is not possible to confirm these hypotheses.

1.5 Particular situations and drug interactions

Precautions should be taken in the prescription of this drug in patients with renal disorders. In fact, as described previously, the elimination of the two main metabolites, S 1475 and the glucuronide of S 422, is essentially urinary. Furthermore, although the conversion of benfluorex into its metabolites occurs in plasma by hydrolysis, subjects suffering from liver failure should be followed up carefully.

No studies have looked at the specific problems of the interaction of benfluorex with other drugs. However, the results of the bioavailability studies or in vitro studies in human hepatocytes do not indicate any problems. In addition, no interactions were reported during clinical or pharmacovigilance studies over a long period of widespread use.

1.6 In vitro metabolism

Benfluorex is metabolised by isolated human hepatocytes but not human liver S9 or liver microsomal fractions. The metabolism of benfluorex, by human hepatocytes, to three metabolite components, S 422, S 1475 and (dl)-norfenfluramine, correspond with the same principal metabolites of benfluorex identified following oral administration of benfluorex (150mg) to healthy volunteers.

The principal metabolites of benfluorex (S 422, S 1475 and (dl)-norfenfluramine) do not inhibit any of the CYP-marker substrate activities at a concentration equal to the reported Cmax plasma level.
Cytochromes P450 1A1, 1A2, 2C9, 2C19, 2E1 and 3A4 (heterologously expressed in bacculo- virus or lymphoblastoid systems) do not support the metabolism of benfluorex. These results indicate a non-cytochrome P450-dependent primary route of benfluorex metabolism.

1.7 Summary

Benfluorex is rapidly metabolised to form an alcohol derivative S 422. This compound is then metabolised into at least eight other metabolites. The main metabolites were identified and quantified in urine as products of oxidation and deamination. The extensive radioactivity elimination in urine combined with a lack of a significant quantity of metabolites in faeces shows that the drug is well absorbed and that no other accumulation occurs.
The specific measurement of metabolites in plasma after chronic administration shows that the steady state is reached in less than one week and remains constant, suggesting no induction or inhibition of metabolism. After stopping treatment all metabolites are eliminated during a few days period : no accumulation phenomena occurred.

DU CÔTÉ DE L'INDUSTRIE PHARMACEUTIQUE

Les laboratoires Français de Thérapeutique, vous connaissez ? Ils font comme par hasard partie du groupe Boehringer-Ingelheim (avec les laboratoires Badrial).

Un parfait exemple de traficotage de marché !

La mode est aux antiagrégants plaquettaires.. Les prescriptions augmentent... Il vaut mieux donc multiplier les produits, pour mieux se partager le gateau...

Notons encore que le PERIDAMOL coûte 18,75 F pour 30 comprimés, et la PERSANTINE 75, toujours pour 30 comprimés, 25,45 F. Cette baisse de 6,70 F n'est pas une mauvaise chose, mais nous oblige à nous interroger rétrospectivement sur le prix de la PERSANTINE 75...

Le groupe Boehringer-Ingelheim, qui par ailleurs cherche à apparaître comme un informateur scientifique du corps médical, n'est qu'un honteux fabricant de devises. AU PILORI !

SUR LA SELLETTE

1. — *Les laboratoires Diamant et le groupe Hoechst-Roussel,* pour le « nouveau » produit IDARAC (Floctafenine), « antalgique périphérique ».

Pour planter le décor, rappelons que les laboratoires Diamant font partie du colossal groupe « franco-allemand » Hoechst-Roussel avec entre autres : Roussel, Cassenne, I. S. H., Houdé, etc.

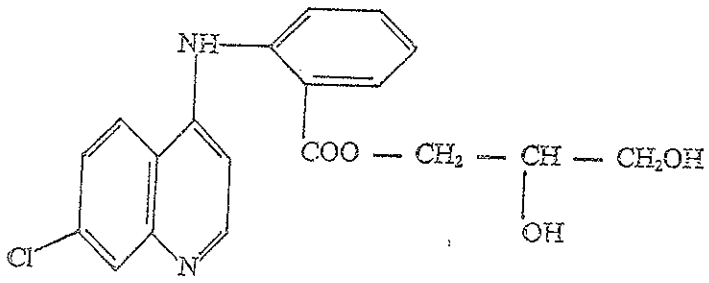
Précisons que pour 1975 les premiers produits du groupe (ventes par les officines ayant atteint plus de dix millions de francs de chiffre d'affaires) sont les suivants :

1 - Glifanan (Roussel)
2 - Dibencozan (I. S. H.)
3 - Dupéran (Cassenne)
4 - Diammaglobulines (Diamant)
5 - Adalgur (Roussel)
6 - Angioxine (Roussel)
7 - Baronorme (Roussel)
8 - Indusil (Diamant)
9 - Staporos (Roussel)
10 - Glyo 6 (Houdé)
11 - Dinintel (Diamant)
12 - Intensain (Diamant)
13 - Rubitracine (Roussel)
14 - Rythmodan et Sédo (Roussel)
15 - Myocoril (Houdé)
16 - Synalar (Cassenne)
17 - Stimugène (Cassenne)

On voit ainsi tout l'intérêt porté aux antalgiques par ce groupe : quatre produits parmi les cinq premiers.

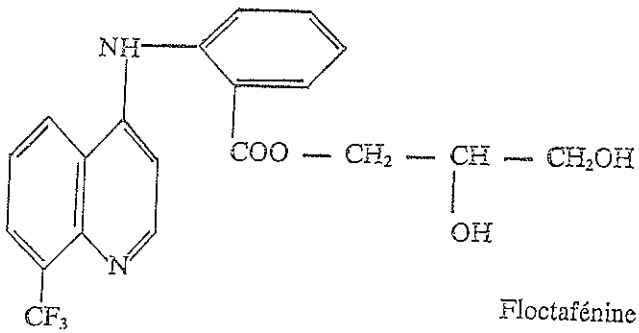
Annexe 1-40

Le GLIFANAN est maintenant un « vieux » produit (D. C. I. de 1961) comprimés à 200 mg de glafénine, boîte de 18 comprimés, 10,85 F :



Glafénine

Le tout jeune IDARAC lui, est fait de 200 mg de floctafénine, boîte de 20 comprimés, 12,80 F :



Floctafénine

Comme on peut s'en rendre compte, la différence sur le plan chimique est loin d'être majeure !...

Le sera-t-elle sur le plan clinique ?

On peut en douter, notamment en lisant le chapitre des précautions d'emploi :

« Il est prudent d'éviter l'administration d'Idarac chez les sujets ayant présenté des incidents de type allergique à la glafénine. »

Et en remarquant l'absence d'étude comparative avec son jumeau GLIFANAN dans les documents fournis par le laboratoire.

Devinette :

IDAFLAN et GLINARAC sont dans un bateau.
GLINARAC tombe à l'eau.
Qu'est-ce qu'il reste ?
Des diamants pour HOECHST-ROUSSEL...

Annexe 1-40

2. — *Les laboratoires Servier* pour le MÉDIATOR.

Cinquième au classement par le chiffre d'affaires, ils sont le champion français de la « promotion médicale », c'est-à-dire de la publicité, de la relance postale, de la visite médicale etc. (1er rang pour les dépenses consacrées à ce domaine en 1975).

Chaque médecin a d'ailleurs pu mesurer cette suprématie, en soupesant et en tâtant les luxueux papiers reçus en surabondance durant ce trimestre à propos du MÉDIATOR.

« *Il arrive qu'un nouveau médicament soit une découverte...* » C'est là le mot d'ordre clef de ces laboratoires en vue de faire prescrire MÉDIATOR. De quoi faire hésiter un régiment d'incrédules...

Et cela d'autant plus que les indications sont quasi universelles : « Contre les hyperlipidémies, qu'il s'agisse d'hypercholestérolémie, d'hypertriglycéridémie, d'hyperlipidémie mixte. »

« Chez les diabétiques, dans le diabète patent... en traitement d'appoint important, dans le diabète asymptomatique. »

« Chez tous les athéroscléreux potentiels ou avérés. »

Ça en fait du monde tout ça !

Ça en fait des centaines et des centaines de milliers de boîtes à vendre !

Et pas pendant deux jours !

Pendant des années !... Et à 28,10 F la boîte, ça fait du 84,30 F le mois de traitement !...

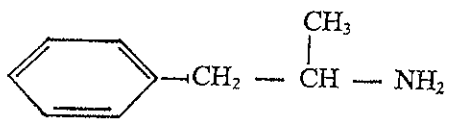
Pour cet enjeu financier si important, les laboratoires Servier méritent bien de passer un moment sur la sellette...

Finalement c'est quoi le Médiator ?

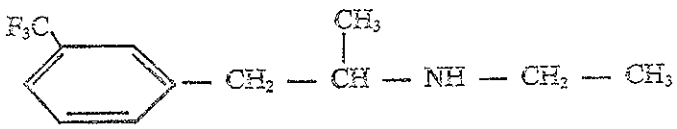
Du Benfluorex ; et « benfluorex », c'est toujours écrit le plus petit possible, dans un coin de page, comme si la terminaison OREX de cette dénomination commune internationale (déposée en 1971) gênait son propriétaire (le suffixe OREX correspond aux anorexigènes dans la nomenclature de l'O. M. S.).

« *Médiator nous a demandé plus de dix ans de recherche* » nous dit Servier... Mais pourquoi donc ne nous dit-il pas que son MÉDIATOR, sur le plan chimique, est un dérivé de l'amphétamine, et un dérivé d'un autre produit de son laboratoire, l'anorexigène PONDÉRAL ?

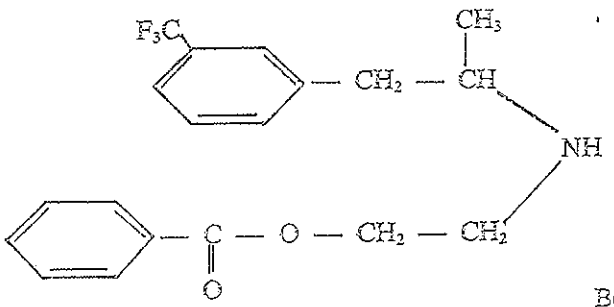
Qu'on en juge :



Amphétamine



Fenfluoramine (PONDERAL *)



Benfluorex (MEDIATOR *)

Donc : MÉDIATOR = PONDÉRAL + l'acide benzoïque branché en bout de chaîne.

Chacun sait que la chimie ne peut pas tout expliquer. Quelquefois l'action d'un produit est totalement modifiée du fait d'un changement minime dans la molécule. C'est peut-être le cas du benfluorex.

Mais tout de même... Pour un produit « *à vocation internationale* » qui se veut être prescrit des années en continu, il est indispensable que les prescripteurs soient prévenus dès le départ de ce tout petit détail. Pour mieux surveiller les réactions des malades par exemple...

Les laboratoires Servier sont trop expérimentés en matière de lancement de produit pour ne pas y avoir pensé.

Alors... dissimulation volontaire ?...

Ça agit comment, ce produit ?

Là, nous renvoyons le lecteur à la documentation des laboratoires Servier dans laquelle sont réunis des exposés très détaillés sur le cycle de Krebs, le Co-enzyme A, et bien d'autres choses encore (« *les lipides brûlent au feu des glucides* »).

Les discours biochimiques impressionnent toujours les prescripteurs ignorauts que nous sommes. Ça fait savant, ça fait sérieux, ça fait honnête...

Mais en fin de compte, honorés confrères, il ne faut pas se laisser impressionner par la grandeur des mots. Les malades ne

sont pas traités par des démonstrations biochimiques sur papier glacé, mais par des produits efficaces.

Le mode d'action du MÉDIATOR n'a pas grand intérêt pratique si l'on n'a pas répondu auparavant à la question suivante :

Ce produit est-il utile, est-il efficace ?

Là, bien sûr, dans les documents présentés, il y a des courbes. Elles montrent que chez les quelque dizaines (voire centaines) de malades étudiés, la glycémie, les lipides baissent plus ou moins selon les conditions d'expérimentation. Et finalement nous dit Servier :

« *C'est à vous qu'il appartient maintenant de juger du progrès que représente* Médiator *chez vos malades hyperlipidémiques, ou présentant un trouble de la tolérance au glucose, donc menacés ou déjà atteints par l'athérosclérose.* »

ALORS LA, NON !

Cette phrase du « *dévoué confrère* » est une mystification, une subtile escroquerie, reposant sur une idée fausse, répandue autant dans le corps médical, que dans la profession pharmaceutique.

Non ! nous les médecins de base, les prescripteurs de quartier, nous ne pouvons absolument pas « juger » un tel produit. Ni d'ailleurs un spécialiste de ville, un hospitalier, ou un Professeur Duduche.

De tels produits, pour des indications aussi floues que le diabète, les hyperlipidémies, l'athérome... etc., ne peuvent être jugés valablement qu'avec une méthodologie statistique et épidémiologique sur plusieurs années. Toute autre évaluation individuelle, à petite échelle, ou de courte durée, NE PEUT AVOIR AUCUNE VALEUR.

L'expérience des antidiabétiques oraux à ce propos est particulièrement instructive. Ils sont prescrits en grande quantité depuis 20 ans ; ils font régulièrement baisser la glycémie ; mais il semble de plus en plus probable qu'en fin de compte, ces produits augmentent la mortalité des diabétiques par maladie cardio-vasculaire (voir à ce sujet : « Diabète : qu'ajouter au régime ? » in *Concours médical*, 20/11/1976, 98-42).

Alors, pour MÉDIATOR, on n'est pas pressé...

On attendra encore quelque temps, voire quelques années...

Mais dans quelques années, quand on commencera à savoir un petit bout de la vérité, ça en fera déjà des millions de boîtes de MÉDIATOR vendues !... Et avec tout cet argent, les laboratoires Servier auront bien vécu... et aussi inventé « benflobis », pour lequel il faudra dix ans de plus pour affirmer quelque chose... et... avec tout cet argent...

Qui médit a tort... ?
Peut-être pas.
En tout cas, question information, en l'absence d'organisme d'information indépendant, on est loin du compte !...

Le 23 décembre 1976

Dr James LARNAQUE.

Après n'avoir reçu les visiteurs médicaux que pour leur faire lire le texte diffusé à l'initiative de notre syndicat et pour en discuter, je leur ai fermé ma porte depuis un an. Et pourtant :

— JE NE VAIS PAS PLUS MAL.
— J'UTILISE MOINS DE MÉDICAMENTS.
— JE CONNAIS MIEUX LES MÉDICAMENTS QUE J'UTILISE.

Alors...

Ils m'avaient dit : « Vous redemanderez bientôt à nous revoir... Comment serez-vous informé ?... »

Je n'ai pas eu de syndrome de manque. J'achète à la pharmacie les médicaments d'urgence dont j'ai besoin. Cela ne grève pas mon budget. J'achète les ouvrages et publications dont j'ai besoin.

L'information sur les nouveaux médicaments me vient par quatre voies :

— les publicités insérées dans les revues (non négligeable)
— les additifs au dictionnaire *Vidal*
— les conseils de mes correspondants
— les lectures d'articles ou livres de thérapeutique.

J'accède au médicament de manière plus active. Je me fais une idée du médicament avant de l'utiliser. Comme conséquence, le nombre de substances (et surtout des spécialités) inclues dans mon arsenal thérapeutique a diminué en même temps que s'améliorait la connaissance que j'avais de ces substances.

Supprimer le contact avec les visiteurs médicaux, c'est supprimer l'une des sources de cette éternelle rengaine (l'autre étant l'E. P. U. officiel) : « Vous ne pouvez pas ignorer... » « Tout bon médecin doit savoir... » distillée à leur manière par les visiteurs médicaux. Donc plus d'appel à la mauvaise conscience systématique, frustrante et incitatrice à la consommation.

Ma conclusion : la visite médicale est non seulement inutile, mais encore elle est toxique.

Antisurcharges alimentaires

Pour qui sait examiner une formule développée — mais encore faut-il avoir l'occasion de tomber dessus — le benfluorex, principe actif du Médiator, est un dérivé de la molécule du Pondéral, coupe-appétit bien connu commercialisé par le même laboratoire. « Il arrive qu'un nouveau médicament soit une découverte », comme on peut lire sur les publicités du Médiator. C'est reconnaître que bien des médicaments « nouveaux » n'apportent rien : phrase dangereuse, surtout lorsqu'on veut vendre une amphétamine modifiée par adjonction d'un radical organique en en faisant « le traitement logique des surcharges lipido-glucidiques athérogènes »...

Chaque comprimé est dosé à 0,150 g de chlorhydrate de benfluorex. L'excipient contient de l'amidon de maïs, de la carboxyméthylcellulose sodique, de la cire blanche, du stéarate de magnésium, du mono-oléate de glycérol, du polysorbate, de la polyvidone, de la silice colloïdale, du sucre blanc officinal, du talc, de l'oxyde de titane, le tout en quantité suffisante pour un comprimé dragéifié terminé à 0,700 g .

Quand on relit la littérature concernant le Pondéral, publiée en tout cas avant que ne sévisse « la censure scientifique » dont se plaint en public son fabricant, on constate qu'il s'agit d'« une thérapeutique rationnelle de l'obésité » puisque « Pondéral augmente l'assimilation périphérique du glucose et accélère la métabolisation des lipides tout en diminuant leur synthèse ». Le rapprochement de ce texte (*Vidal 1974*, page 1306) avec les phrases décrivant le mécanisme d'action du Médiator permet de constater que la parenté des deux médicaments n'est pas que chimique. La similitude des axes promotionnels, qui a dû échapper à bien des prescripteurs, aurait-elle pour but d'installer sur l'orbite des antigraisses un coupeur d'appétit appartenant à une catégorie de plus en plus décriée et en voie de ne plus être remboursée par la Sécurité Sociale ? Quoi qu'il en soit, si le Médiator était capable, par une sorte de miracle, d'agir aussi bien sur les surcharges lipidiques que sur les surcharges glucidiques dont on connaît l'importance dans la genèse de l'athérosclérose, dans son extension et dans son aggravation, ce serait le médicament du siècle. Il

se vendrait dans le monde entier (ce qui n'est pas le cas) et ne serait pas oublié des principaux traités de pharmacologie.

La somnolence (qui était un effet secondaire curieux du Pondéral) se retrouve avec le Médiator. L'anorexie est évidemment très marquée, personne ne peut s'en étonner. Les douleurs abdominales, les nausées, les vomissements ne sont pas rares. Des vertiges et des intolérances cutanées ont cutanées ont été signalés.

Les dérivés de l'amphétamine ne doivent pas être associés aux IMAO (Marplan, Niamide, etc.), aux antidépressions tricycliques (Concordine, Laroxyl, etc.). La prise simultanée d'hormones thyroïdiennes est déconseillée.

Le Médiator est contre-indiqué en cas de grossesse et de pancréalite chronique. Sa parenté avec les amphétamines devrait rendre très prudent en cas d'hypertension artérielle, d'insuffisance cardiaque, et chez les sujets anxieux ou présentant des antécédents de suicide.

Peut-être le Médiator peut-il rendre des services dans le diabète avéré avec troubles lipidiques ? Il s'est montré capable de modifier certaines courbes d'hyperglycémie provoquée dans certains états prédiabétiques. On pourrait admettre ainsi qu'il intervient favorablement dans certaines hyperglycémies génératrices d'hypertriglycéridémie. Tout cela est du domaine de la spéculation intellectuelle et ne doit pas faire oublier l'importance primordiale du régime alimentaire dans les états de surcharge, ni la supériorité incontestée des normolipémiants comme le clofibrate (Athérolip et Lipavlon, Dabical, Clarésan et Clofibral).

Le fabricant recommande, en traitement d'attaque, un comprimé à chacun des 3 principaux repas. Par la suite, la posologie peut être abaissée à 2 comprimés quotidiens, parfois 1 seul.

PAPERS AND SHORT REPORTS

Pulmonary hypertension and fenfluramine

J G DOUGLAS, J F MUNRO, A H KITCHIN, A L MUIR, A T PROUDFOOT

Abstract

Pulmonary hypertension developed in two women who had been taking fenfluramine for over eight months for weight reduction. On withdrawing the drug symptoms and electrocardiographic evidence of pulmonary hypertension disappeared in both cases. In one patient, however, the evidence recurred after rechallenge with fenfluramine.

These findings are strong evidence that fenfluramine may cause pulmonary hypertension. Hence any patient taking the drug should report immediately any deterioration in exercise tolerance.

Introduction

Fenfluramine is an anorectic drug widely prescribed for obesity. Adverse effects include dry mouth, drowsiness, lethargy, nausea, diarrhoea, nightmares, and depression, particularly after sudden withdrawal.[1,2] Aminorex fumarate, which is chemically related, has been associated with pulmonary vascular hypertension[3,4] but there are no reports implicating fenfluramine. We describe two patients in whom pulmonary hypertension was associated with fenfluramine.

Case 1

A 26-year-old nurse presented in May 1975 with a two-month history of increasing breathlessness and tiredness. She had had two episodes of exertional syncope together with mild exertional chest pain and by the time of admission was unable to walk more than 50 m on the flat. In 1964 and 1969 she had been admitted for diarrhoea secondary to chronic ulcerative pancolitis and since then had received courses of iron for recurrent anaemia. For nine months before admission she had been taking fenfluramine 160 mg daily, having completed an 18-month course only six months before the start of the second course. One month before—that is, about four weeks after her symptoms began—she had also started an oral contraceptive (norethisterone 1 mg and mestranol 0·05 mg per tablet). She had not taken any oestrogen or progesterone preparation before.

On admission she weighed 61 kg and had bilateral ankle oedema. Jugular venous pressure was raised 3 cm and a right ventricular heave was noted. The pulmonary second sound was greatly accentuated, and a soft ejection systolic murmur was audible at the lower left sternal edge. The electrocardiogram showed right axis deviation with P pulmonale and changes compatible with right ventricular hypertrophy and strain (fig 1). A chest x-ray picture showed prominence of the main pulmonary arteries but the heart shadow was normal. Lung volume measurements were normal but the $Tc_{L}o$ was reduced to 5·01 mmol/min/kPa (14·96 ml/min/mm Hg) (predicted normal 8·79 ± 1·44 mmol/min/kPa; 26·24 ± 4·30 ml/min/mm Hg). A perfusion lung scan using ^{99m}Tc macroaggregates and a ventilation scan using ^{133}Xe were normal. Right heart catheterisation showed the pulmonary artery pressure to be raised at 50/20 (mean 32) mm Hg, but the mean "wedge" pressure was only 9 mm Hg. Pulmonary angiography showed slight enlargement of the main pulmonary arteries with possible exaggerated tapering of the pulmonary vasculature but with no abrupt vessel cut-off.

Fenfluramine and the oral contraceptive were stopped and she was given thiazide diuretics. Three weeks later her symptoms had disappeared and she was able to go dancing. The pulmonary second heart sound was less accentuated and no cardiac murmurs were audible. One year after presentation her chest x-ray picture had returned to normal and the electrocardiogram was within normal limits (fig 1). Repeat right heart catheterisation showed a pulmonary artery pressure of 19/5 (mean 11) mm Hg.

Case 2

A 45-year-old housewife weighing 98·4 kg was referred for weight reduction in August 1978. One year before she had been given fenfluramine and lost 4·5 kg without obvious ill effects. She had regained weight, however, despite simple dietary restriction. Systematic inquiry and clinical examination showed nothing abnormal, blood pressure was 130/80 mm Hg, and a chest radiograph and electrocardiogram (fig 2) were normal. The serum thyrotrophin concentration

oedema, many factors make it unreliable, such as differences in body position, level of inspiration, tube-to-object distance, current and voltage, and the existence of prior lung disease. Furthermore, we have noticed that the *x*-ray appearances may lag behind the clinical state of the patient, as judged by respiratory function, by as much as 36 hours during both the development and the resolution of pulmonary oedema. A more accurate diagnosis may be made by using lung functions such as the alveolar-to-arterial oxygen-tension gradient or the shunt fraction, which would be easy to measure with a pulmonary artery catheter in place.

Secondly, although the patients in the Brighton study had normal serum albumin concentrations, this is only one determinant of the colloid osmotic pressure, accounting for 65-70%.[2] The remaining 30-35%, comprises the other serum proteins and any colloidal fluids used in therapy. Moreover, temperature elevation, pH, position of the patient, and anticoagulant therapy may all affect the colloid osmotic pressure, and the application of a tourniquet to collect the blood sample will increase the measured value. Therefore it would be more accurate to measure the actual colloid osmotic pressure from an arterial or central venous blood sample. The colloid osmotic pressure has been shown to fall, often dramatically, in patients with acute myocardial infarction with circulatory shock,[3 4] and the majority of patients with normal hydrostatic (pulmonary capillary wedge) pressures but with low colloid osmotic pressure have developed pulmonary oedema.

Thirdly, one has to interpret the measured hydrostatic pressures with care. If the transducer is placed at the level of the sternal angle, and the catheter tip is in the dependent region of the lung, as it often is, there may be a hydrostatic pressure difference of 20 cm H_2O, equivalent to about 15 mm Hg. The value obtained for the pulmonary artery end-diastolic pressure would be an underreading by this amount for the dependent region of the lungs, and it is there that the oedema often forms. Furthermore, the use of the pulmonary artery end-diastolic pressure as an index of left atrial filling pressure may not be accurate in these clinical circumstances. It has been shown that the pulmonary vascular resistance rises early in the formation of pulmonary oedema with different causes, and this creates a gradient between the pulmonary artery end-diastolic and the pulmonary capillary wedge pressure.[5] Therefore if clinical pulmonary oedema is present, the pulmonary artery end-diastolic pressure may give a higher reading than the left atrial filling pressure. In this situation the pulmonary capillary wedge pressure would be a more accurate representation of the left atrial filling pressure.

I completely agree with the authors that careful pressure monitoring is important in the management of these patients, and therefore feel that attention to detail in these respects may improve the outcome for these critically ill patients.

Pulmonary hypertension and fenfluramine

SIR,—I read with interest the paper by Dr J G Douglas and others (3 October, p 881), in which the authors seek to demonstrate a parallel between fenfluramine and aminorex in the pathogenesis of pulmonary hypertension. Cardiopulmonary pathology resulting from the use of aminorex appeared as an epidemiological phenomenon shortly after the drug was marketed. Aminorex is an aminooxazoline, unlike fenfluramine, which is a phenylethylamine; contrary to the authors' statement, the compounds are not chemically related.

On the two cases reported, I should like to offer the following observations. In the first case the patient was a non-obese woman (61 kg) taking a large dose (160 mg/day) of fenfluramine nearly three times that usually recommended for mild obesity (60 mg/day). The admission to hospital occurred four weeks after she first started to take oral contraceptives. The disappearance of her symptoms was temporally related to administration of the thiazide diuretic as well as withdrawal of the oral contraceptive and fenfluramine. In the second case the woman was also being treated for hypothyroidism. The findings on cardiac catheterisation indicated a global cardiac insufficiency, with left and right heart failure. She received bendrofluazide and this may well have been the major contribution to the improvement in her symptoms, rather than withdrawal of the drug.

Oral contraceptives have been implicated in the aetiology of pulmonary hypertension in young women,[1 2] and pulmonary hypertension has been described in obese patients without significant alveolar hypoventilation, reflecting left ventricular insufficiency.[3-5] In both cases reported, a known aetiological factor for pulmonary hypertension and an immune disease (ulcerative pancolitis, hypothyroidism with thyroid antibodies) was present.

The relevance to man of the observations in dogs by Engelhardt *et al*[6] is doubtful, and Prime[7] showed the stability of pulmonary pressure in man following administration of fenfluramine for up to three months. It is noteworthy that no cases of this nature have been previously published since the drug was first marketed in 1963, and the relationship between pulmonary hypertension and fenfluramine in the two cases described is by no means clear.

Tricyclic antidepressant poisoning and prolonged external cardiac massage during asystole

SIR,—I am grateful to Drs D A Orr and M G Bramble for their article emphasising the potential for resuscitation from tricyclic antidepressant overdose even after prolonged periods of asystole (24 October, p 1107). I am, however, somewhat concerned that their comment, "Asystole caused by a drug overdose does not carry the same prognosis as asystole secondary to acute myocardial infarctions," might suggest less heroic efforts in resuscitating patients with organic heart disease. We know that life-threatening arrhythmias complicating angina pectoris or acute infarction do not necessarily predict long-term survival and need not correlate with the extent of myocardial damage—possibly the best long-term prognostic factor.[1]

I have personally resuscitated a patient with acute myocardial infarction after two hours of asystole. His subsequent course in hospital was uneventful and he has returned to a vigorous lifestyle without brain damage. The presence of extensive cardiopulmonary disease, advanced age, malignancy, etc might well suggest less heroic resuscitation measures; however, since the majority of patients we will see with asystole or other malignant arrhythmias will probably have ischaemic heart disease, not tricyclic drug overdose, we must be committed, within reason, to salvage as many of these lives as possible. The Seattle experience certainly indicates the potential for aggressive resuscitation efforts.[2] We must also not forget other young adults with "healthy myocardiums"—for example, victims of mitral valve prolapse, coronary artery spasm, electrocution, and others who die suddenly—whose potential for recovery mandates intensive efforts in resuscitation. These efforts may save many useful lives, and even ultimately unsuccessful efforts at resuscitation might provide badly needed organ donors to salvage other young lives from the suffering of blindness, renal failure, congestive heart failure, and other diseases amenable to transplantation therapy.

Non-steroidal anti-inflammatory drugs and frusemide-induced diuresis

SIR,—I was interested in the three case reports of Drs A C Yeung Laiwah and R A Mactier (12 September, p 714) relating to use of ibuprofen and naproxen in older patients with congestive heart failure and diuretic therapy. They describe the antagonistic effect on the diuretic by these non-steroidal anti-inflammatory drugs. They rightly point out that this effect is likely to be seen in patients in whom renal prostaglandins assume clinical importance (for example, those with compromised renal function, systemic lupus erythematosus, severe cardiac failure, etc). They conclude that non-steroidal anti-inflammatory drugs should be avoided in such patients.

Although no one will disagree with this suggestion, it is worthy of note that one such non-steroidal anti-inflammatory drug, sulindac, may not have this deleterious effect. Sulindac is considered a pro-drug since it is absorbed in its inactive sulphoxide form. Only the reduced sulphide is effective in inhibiting prostaglandin synthesis. Although it is well recognised that the precise relationship between prostaglandins and renal function is controversial,[1] Ciabattoni and colleagues have shown that the renal prostaglandin system is probably not inhibited by sulindac in humans at doses which inhibit platelet cyclo-oxygenase.[2] Likewise, sulindac has a paradoxical effect in Bartter's syndrome, a condition that responds to other non-steroidal

Transcutaneous ultrasound measurement of blood-flow in internal mammary artery to coronary artery grafts

D. P. DE BONO N. J. SAMANI T. J. SPYT T. HARTSHORNE
A. J. THRUSH D. H. EVANS

Transcutaneous doppler ultrasound was used to examine internal-mammary-artery (IMA) blood-flow in 26 patients with IMA coronary bypass grafts. The ungrafted right IMA could be seen in all of 19 patients, the grafted left IMA in 16 of 26, and the grafted right IMA in 3 of 7.

The velocity profile recorded from the proximal part of the grafted IMA is distinct from that of an ungrafted artery, with a systolic peak which reflects graft capacitance in the face of high intramyocardial resistance, and a diastolic peak which represents graft conductance when intramyocardial resistance is low. Total graft blood-flow can be estimated from the mean velocity and the measured vessel diameter; resting flows ranged from 22 to 79 ml/min. In recently grafted patients, resting graft blood-flow correlated with myocardial "run-off" estimated from preoperative arteriograms; graft blood-flow increased appropriately with exercise.

This simple, non-invasive technique to measure IMA graft blood-flow may find applications for routine postoperative follow-up of patients with IMA grafts and for studies on the physiology and pharmacology of coronary artery blood-flow.

Lancet 1992; **339**: 379–81.

Introduction

The internal mammary (or internal thoracic) artery is now the preferred source for bypass grafts to the left anterior descending coronary artery.[1,2] In some patients, the right internal mammary artery (IMA) may also be used as a graft to the right or circumflex coronary arteries. A simple, repeatable, and non-invasive technique to assess IMA graft blood-flow would be useful for clinical follow-up of patients with such grafts, and for the study of coronary physiology and pharmacology. Duplex ultrasound has been extensively used to measure blood-flow in peripheral and cerebral blood vessels;[3] we describe use of this technique in the assessment of IMA graft function.

Patients and methods

26 consecutive patients (25 men, 1 woman) were studied as part of routine follow-up in a cardiology clinic at intervals from 6 weeks to 12 months after coronary artery bypass surgery in which at least one IMA was grafted. Informed consent was obtained and the study was approved by the local ethics of medical research committee.

The proximal IMA was imaged with transcutaneous ultrasound by use of a 7·5 MHz mechanical sector probe with 3 MHz offset doppler (Diasonics, Bedford, UK). The two transducer positions used were lateral to the upper sternal margin just below the clavicle, and above the clavicle with the ultrasound beam angled downwards and forwards. For intracoronary doppler studies we used a monorail 20 MHz catheter tip transducer (Schneider, Beulach, Switzerland) during routine coronary angiography.

Preoperative coronary arteriograms were recorded on 35 mm cine-film and reported according to the Green Lane (Auckland) semi-quantitative analysis scheme,[4] which assigns a "myocardial score" for the distribution of individual vessels as well as incorporating an assessment of the degree of stenosis. From the original reports of the preoperative arteriograms we aggregated myocardial scores for all vessels supplied by the IMA graft downstream of the principal native vessel stenosis: for example, a sequential graft to the left anterior descending and two diagonal coronary arteries would aggregate the myocardial scores of all these vessels. The myocardial score was modified to take account of competing native coronary flow by multiplying the score by 1 in the case of total proximal occlusion, by 0·5 if proximal occlusion was by a single stenosis of or below 70% normal vessel diameter, and by 0·75 if the proximal stenosis showed more than 70% occlusion but was not complete. This "run-off" score was compared with measured IMA graft flow.

Statistical comparisons were made with the Mann Whitney test, Wilcoxon's test for paired observations, and Spearman's correlation coefficient. Results are presented as median (range) for flow data, and as mean (standard deviation) for vessel diameter and flow per beat, for which data distribution was close to a normal distribution.

Evans, PhD), **University of Leicester, Leicester, UK**. Correspondence to Prof David de Bono, Clinical Sciences Wing, Glenfield General Hospital, Leicester LE3 9QP, UK.

We suggest that our patient had a dissection of the vertebral artery due to the violent neck movements associated with the scrambler. Although our patient anticipated temporary dysequilibrium and nausea from the scrambler, she had not thought that these might be longlasting effects. This very rare complication of amusement park rides might be prevented by avoiding excessive neck movements.

Pulmonary hypertension and dexfenfluramine

SIR,—Dexfenfluramine is used as adjuvant therapy for obesity. Pulmonary hypertension has been described with D, L-fenfluramine but not with the pure D-isomer, dexfenfluramine.

A 30-year-old woman was admitted to hospital at 34 weeks' gestation. She had no history of cardiac or respiratory disease. She had taken dexfenfluramine for six months between July, 1989, and March, 1990, and stopped after reaching her desired body weight. In March, 1990, shortly before she became pregnant, and while on holiday 800 m above sea level, the patient complained of reduced exercise tolerance with dyspnoea and tiredness on the slightest exertion. Echocardiography before the onset of pregnancy had revealed a slightly dilated right ventricle.

The patient was admitted because of early uterine contractions but examination revealed severe dyspnoea and a respiratory rate of 28/min. There was loud pulmonary component of the heart sound and a pansystolic murmur at the left sternal border compatible with tricuspid regurgitation. She had a regular heart rate of 96/min, her blood pressure was 100/70 mm Hg, and she had increased jugular venous pressure. Arterial blood gas analysis was pH 7·53, pCO_2 2·79 kPa, pO_2 8·86 kPa, and an arterial oxygen saturation of 95% on room air. Electrocardiography demonstrated sinus rhythm and an incomplete right-bundle-branch block, and on chest radiography moderate enlargement of the right ventricle was seen. Electrocardiography disclosed advanced dilatation of the right ventricle. The pulmonary artery pressure was 84 mm Hg above right atrial pressure, and there was mild tricuspid valve incompetence. A ventilation-perfusion scan did not demonstrate pulmonary embolism.

Elective caesarean section was done under epidural anaesthesia, which was haemodynamically well tolerated. Pressures (mm Hg) during the procedure were: mean pulmonary artery (PAP) 44–59, mean systemic arterial 56–85, central venous 12–18, and pulmonary capillary wedge 15–25. Cardiac index ranged from 1·56 to 2·13 l/min per m^2. Calculated pulmonary vascular resistance (PVR) was 542–858 dyn/s per cm^5. Postoperatively her pulmonary hypertension worsened and did not respond to prostaglandin E_1 or diuretic therapy (PAP 52–77 mm Hg, PVR 551–1231 dyn/s per cm^5). On day 3 she had a cardiac arrest and on day 4 she died in right ventricular failure. Necropsy revealed right heart hypertrophy and plexogenic pulmonary arteriopathy.

Primary pulmonary hypertension predominantly affects women of childbearing age and often gets worse during pregnancy.[1] A relation between anorectic drugs and pulmonary hypertension has been known for a long time and three cases of pulmonary hypertension in women taking fenfluramine have been described. In two patients, pulmonary hypertension resolved upon withdrawal of the drug, but it reappeared in one of them after reingestion of fenfluramine.[2] Another case of pulmonary hypertension resistant to therapy was described after fenfluramine ingestion for several months.[3] Dexfenfluramine is thought to have few side-effects (sedation, lethargy, and dry mouth in the short term[4] and no extra risks during long-term therapy[5]). Fenfluramine and dexfenfluramine are related to amphetamine, and both sympathomimetic and serotoninergic effects of the pulmonary vascular system are to be expected. Serotonin was responsible for the development of pulmonary hypertension in animal studies with anorectic drugs.[6] Apart from two cases reported to the French Centre for drug control pulmonary hypertension associated with dexfenfluramine has not been recorded. In the fatal case reported here the evidence suggests that the sequence of dexfenfluramine intake, followed by a stay at moderate altitude, and subsequent pregnancy triggered irreversible primary pulmonary hypertension. The indication for dexfenfluramine has been questioned in a *Lancet* editorial[7] because the drug adds little to other weight-reducing measures. Even if anorectic agents only rarely cause or contribute to the development of pulmonary hypertension, it seems reasonable to advise that they are not tried until all other measures have been exhausted.

SIR,—Drug-induced pulmonary hypertension has been associated with phenformin, but anorectic drugs such as aminorex and fenfluramine[1-5] have been more frequently involved. We report reversible pulmonary hypertension caused by dexfenfluramine.

A 26-year-old woman was referred to our hospital in October, 1990, with pulmonary hypertension, and no significant medical history before January, 1990. She had taken dexfenfluramine from December, 1989, to January, 1990, at a daily dose of 15–30 mg. She had never taken any other medication. She experienced exertional dyspnoea and palpitations toward the end of January, 1990. Because nasal plastic surgery was scheduled, she underwent a medical examination in February, 1990. An electrocardiogram showed signs of cor pulmonale; both pulmonary arteries were enlarged on standard chest radiography but computed angiography showed no pulmonary embolism. The surgery was done in April, 1990. Because her dyspnoea had worsened, she was re-examined in July, 1990. She had a pulmonary regurgitant murmur and a split second heart sound; chest radiography was normal; an electrocardiogram still showed signs of cor pulmonale. Catheterisation studies pointed to primary pulmonary hypertension, at which point the patient was referred here but she did not consult us until October, when she no longer had either dyspnoea or palpitations, and no abnormality of the respiratory or cardiovascular systems was found during physical examination. Chest radiography showed a mild enlargement of pulmonary arteries. Electrocardiogram, arterial blood gases, and lung function were normal, as was a perfusion lung scan, conventional pulmonary angiography, and phlebocavography. Catheterisation studies (cardiac output 7·4 l/min in October) were:

Date	Pulmonary artery	Capillary wedge	Right ventricular
July	82/27 (50)	5	85/0
October	34/5 (14)	5	32/0

Pressures (mm Hg) as systolic/diastolic (mean).

Use of aminorex in Germany, Switzerland, and Austria between 1967 and 1970 was followed by a 20-fold increase in the incidence of

pulmonary hypertension, which decreased when the drug was withdrawn. 2% of patients taking the drug had pulmonary vascular disease mimicking primary pulmonary hypertension. Suggested mechanisms were release of catecholamines or serotonin, the drug resembling adrenaline and amphetamine. Fenfluramine-induced pulmonary hypertension was described from 1981.[1-5] The pulmonary hypertension in the patient described here was probably due to dexfenfluramine. Other causes are unlikely: oral contraception had been stopped 2 years before the first symptoms; there was no evidence of autoimmune disorder;[1] and pulmonary angiography was normal. Re-challenge would have been unethical.

Our patient took dexfenfluramine for only 2 months and symptoms developed after 1 month. In fenfluramine-induced pulmonary hypertension the duration of treatment was 7 months to 6 years and first symptoms developed up to 1 year after the end of treatment. Pulmonary hypertension associated with fenfluramine[1-5] usually reversed when the drug was withdrawn, whereas in primary hypertension of unknown aetiology the clinical course is less favourable.[3] D,L-fenfluramine and D-fenfluramine (dexfenfluramine) share serotoninergic effects and may well therefore have some side-effects in common. The incidence of pulmonary hypertension among patients taking these widely used drugs must be very low, since so few cases have been reported. Nonetheless, patients taking dexfenfluramine or fenfluramine should be advised to report any shortness of breath.

Influence of ethanol on toxicity of paraquat and *Amanita phalloides*

SIR,—Dr Ragoucy-Sengler and colleagues (Dec 7, p 1461) reported the unexpected survival of three patients after severe paraquat intoxication. The outcome of paraquat poisoning is largely determined by the ingested dose. According to the Yamaguchi index (based on serum concentrations of potassium, bicarbonate, and creatinine and on time since ingestion of paraquat),[1] and to the Proudfoot curve (serum paraquat concentration/time after injection),[2] fatal outcome for these cases was predicted; they were all chronic rum drinkers who drank 80 g ethanol daily. Ragoucy-Sengler et al suggested that an ethanol-induced increase in cupro-zinc superoxide dismutase could protect against free-radical damage due to paraquat.

We draw attention to an equally puzzling protective effect of ethanol in poisoning with the mushroom *Amanita phalloides* (death cap). In mice injected with lethal doses of a lyophilisate from *A phalloides*, survival was greatly increased by single doses of ethanol applied 30 min before or 5 min after mushroom injection.[3] Hepatic histopathological damage (confluent necrosis) was largely prevented. Ethanol might interfere with the uptake of mushroom toxins into liver cells, either by blocking receptors or a transport system, or by causing structural disorders of membrane lipids limiting permeability and thus inhibiting entry of toxins into cells. The inhibition of toxicity by ethanol may help to explain inconsistencies in mushroom intoxication and in responses to therapy, as well as the fact that the mortality from death cap intoxication is much higher in children than in adults.[4]

These observations for paraquat and *A phalloides* suggest that the consumption of alcoholic beverages should be taken into account if the outcome of poisoning is other than expected for the toxin dose, and in evaluation of therapeutic measures. A common feature of the ethanol effect in different types of poisoning could be lipid peroxidation, which is known to take place through a free-radical-mediated mechanism after high doses of ethanol, leading to membrane derangement and diminished cellular toxin uptake. Accordingly, the seemingly paradoxical diminuition by ethanol of the damaging effects of other toxins may be a more general occurrence.

Teratogenicity of misoprostol

SIR,—Dr Schönhofer (June 22, p 1534) and Dr Fonseca and colleagues (July 6, p 56) refer to five Brazilian newborn babies with congenital malformation after alleged maternal use of misoprostol as an abortifacient during the first trimester of pregnancy.

In Porto Alegre, Brazil, we have a nationwide teratogenic information system, the only one operating in the country, that provides counselling to women or their doctors about the teratogenic risks in relation to exposure. Since 1990, 29 pregnant women called our service seeking counselling after unsuccessful use of misoprostol as an abortifacient during the first trimester of gestation. The doses taken ranged from 1 tablet (200 µg) to 56 tablets, the mean number being 20 tablets. These pregnancies were followed by ultrasonography during the second and third trimesters. All patients were asked about the use of other drugs and a special questionnaire was administered to detect further genetic or environmental risks in each case. 3 of these 29 pregnancies ended in second-trimester spontaneous abortion, 3 mothers are still pregnant, and we have lost contact with 6 others. Of the remaining 17 livebirths, we examined 8 of the babies; in 4 cases we obtained information from the paediatrician and in 5 we had only verbal information from the mother.

No major malformations were found in these 17 babies. 1 of them had a preauricular tag. Although we are aware that further epidemiological studies are needed, our preliminary data do not support the hypothesis that misoprostol is teratogenic in man.

We thank Hernando Augusto Clavijo, Roberto Giugliani, Carmem Maria Vinhas Santos, Fernando Recis, Erica Tatto, Fabricio Costa, Vee Wong, Karim Boianovsky, and Fernando Thode for their collaboration.

Azithromycin for cerebral toxoplasmosis

SIR,—A 30-year-old man had cerebral toxoplasmosis during the third week of intravenous pentamidine therapy for histologically proven *Pneumocystis carinii* pneumonia (his first AIDS opportunistic infection). A double-contrast computed tomographic (CT) scan showed ring-enhancing lesions, and serum antibodies were positive for *Toxoplasma gondii*. He was successfully treated with pyrimethamine/sulfadiazine but a rash developed. Substituting clindamycin for sulfadiazine did not help, and it became apparent that he was allergic to pyrimethamine. On suppression therapy with sulfadiazine alone he manifested allergy to this agent too. On stopping all medication, the toxoplasmosis relapsed, complete remission being again achieved by pyrimethamine/sulfadiazine but at the expense of life-threatening erythema multiforme. Secondary prophylaxis was instituted with doxycycline, but 10 weeks later the patient again relapsed with multiple ring-enhancing lesions. Clindamycin was added to

Mon Cher Collègue,

Plusieurs faits concernant Pondéral et Isomeride sont récemment survenus. Je voudrais par cette lettre les signaler au Comité National de Pharmaco-Vigilance.

1) Du fait de notre spécialisation dans la circulation pulmonaire, nous recevons de toute la France pour avis diagnostique et thérapeutique de très nombreux patients atteints d'hypertension artérielle pulmonaire primitive (HTAPP). Ces malades sont soumis à un interrogatoire précis et prospectif appréciant en particulier chez eux la prise d'anorexigènes. Nous avons ces dernières semaines terminé l'examen des dossiers de 127 patients atteints d'HTAPP que nous avons explorés durant la période 1980-1991. Il s'avère que 20 femmes sur 79 ont utilisé des coupe-faim ; dans 9 cas il s'agissait d'Isomeride et/ou de Pondéral.

2) L'interrogatoire des derniers cas montre que l'apparition ou l'aggravation des signes fonctionnels de dyspnée parait coïncider dans le temps avec la prise d'anorexigènes, en l'occurence la prise d'Isomeride.

Ces observations ont été signalées au Docteur Laurent PERRET du Laboratoire Servier en lui précisant le nom des patientes pour qu'il puisse tenir à jour le registre des cas qui ont pu lui être signalés.

Je voulais signaler ces faits à votre commission, bien que, à nos yeux, ceux-ci ne permettent pas d'établir scientifiquement une relation de cause à effet.

Je suis à votre disposition pour vous donner tous les renseignements que vous jugerez nécessaires sur ces données et observations et pour participer à toutes les actions que les organismes publics voudraient entreprendre sur ce sujet.

Je vous prie de croire, Mon Cher Collègue, à l'expression de mes meilleurs sentiments.

Docteur L.PERRET

Bureau PH

18 SEP. 1991

Monsieur le Président
de la Commission Nationale de Pharmacovigilance
Bureau PH 13
Direction de la Pharmacie et du Médicament
Ministère de la Santé

Courbevoie, le 16 septembre 1991

Monsieur le Président,

Le Professeur Pierre DUROUX, Chef du Service de Pneumologie et de Réanimation Respiratoire à l'Hôpital Antoine-Béclère à Clamart, et ses collaborateurs ont récemment procédé à une étude rétrospective des observations d'hypertension artérielle pulmonaire examinées dans leur service durant la période 1980-1991.

Cette étude rétrospective a montré dans la population féminine une proportion importante de patientes ayant utilisé des médicaments contre leur obésité (20 cas sur 79). Dans 9 cas sur 20, il s'agissait de PONDERAL ou d'ISOMERIDE.

PONDERAL (DL-Fenfluramine) est sur le marché en France depuis 1962 et est largement diffusé dans le monde. Quelques cas d'hypertension artérielle pulmonaire ont été observés à partir de 1980 (publication de DOUGLAS et coll. en 1981) et nous avons en conséquence amendé l'information au prescripteur pour signaler ces observations.

.../...

ISOMERIDE (D-Fenfluramine) a été mis sur le marché en France en 1985. En l'absence d'observations de cas d'hypertension artérielle pulmonaire au cours du développement clinique, compte tenu de la dose moindre administrée, et du profil d'effets indésirables différent (certains effets indésirables du racémique pouvant être attribués au dérivé lévogyre), l'information destinée au prescripteur ne comporte pas (présentement) de mention d'hypertension artérielle pulmonaire.

Les observations du Professeur P. DUROUX et les notifications spontanées nous ont incité à étudier cette question sur un plan épidémiologique.

En première analyse, il apparaît que l'incidence de ces cas ramenée au volume de prescriptions du médicament est extrêmement faible. Le bilan présenté par le Professeur DUROUX est purement rétrospectif et n'a par conséquent qu'une valeur épidémiologique relative. L'interrogatoire des patientes (à la recherche de médicaments amaigrissants) est très orienté et il n'y a pas de groupe contrôle, ce qui introduit un biais d'observation important.

Il y a quelques jours, plusieurs journaux suisses ont publié des informations alarmistes et en partie erronées sur cette question. En juillet 1991, nous avons décidé, en concertation avec les autorités sanitaires suisses, de modifier l'information au prescripteur de notre spécialité ISOMERIDE à la suite d'un rapport de pharmacovigilance, et sans que l'imputabilité du cas ait pu être établie.

Nous souhaiterions vous présenter et discuter avec vous au cours d'une réunion, les faits tels qu'ils se présentent aujourd'hui, et sommes à votre disposition à la date que vous voudrez bien nous fixer.

Dans cette attente, nous vous prions de recevoir, Monsieur le Président, l'expression de notre haute considération.

L. PERRET

ASSISTANCE PUBLIQUE HÔPITAUX DE PARIS

ANTOINE BÉCLÈRE

Clamart, le 27 Février 1992

Monsieur le Professeur LAGIER
Bureau de la Pharmacovigilance
Direction de la Pharmacie
Ministère de la Santé
1 place Fontenoy
75007 PARIS

HÔPITAL ANTOINE BÉCLÈRE
157, rue de la Porte-de-Trivaux
92141 CLAMART Cedex
Tél. : 45 37 44 44

Cher Monsieur,

Je vous fais parvenir l'ensemble du dossier que nous avons à notre disposition concernant la Fenfluramine et la Dexfenfluramine ainsi que les différents cas d'hypertension pulmonaire rapportés.

Nous sommes pour notre part assez inquiets de la fréquence des cas observés, en particulier dans notre série d'hypertensions pulmonaire. Notre centre est un centre de référence concernant l'hypertension artérielle pulmonaire ; depuis 4 ans, nous avons pu étudier 80 cas de cette maladie dans la population de femmes de 20 à 60 ans qui sont susceptibles de prendre de l'Isoméride. Parmi ces 80 cas, 12 patients avaient pris de l'Isoméride avec, dans 9 cas, une constitution ou une aggravation manifeste des symptômes lors de la prise du médicament.

Il existe 2 autres cas récents publiés dans le Lancet que je vous joins à notre Abstract envoyé à VIENNE. D'autre part, je suis au courant de plusieurs autres cas en FRANCE dont 2 récents, un à LYON et un en Cardiologie au VAL-de-GRACE.

Il est difficile de ne pas suspecter une relation de cause à effet entre la prise de Dexfenfluramine et de Fenfluramine et la constitution ou l'aggravation de l'hypertension pulmonaire. Nous sommes d'autant plus inquiets que, dans notre série, il n'existe pas de régression à l'arrêt du médicament comme cela a d'ailleurs été rapporté lors de l'épidémie d'Aminorex en SUISSE vers les années 60.

Le rôle des anorexigènes est sûrement complexe. D'une part, parce qu'il s'agit d'une maladie extrêmement rare et d'autre part, parce que les anorexigènes interviennent sûrement comme facteur déclenchant d'une maladie sous-jacente plus que comme seul facteur causal. D'autres facteurs tels que génétiques sont sûrement impliqués dans cette maladie, mais une fois que la maladie est constituée, l'arrêt du médicament ne permet pas forcément la diminution des symptômes et de l'hypertension pulmonaire.

Annexe 1-46

Le problème nous apparaît donc relativement sérieux du fait de la gravité de cette maladie et de la fréquence de la prise de ces médicaments actuellement en FRANCE. Mr DUROUX avait alerté la Pharmacovigilance vers le mois de Septembre-Octobre 1991, nous n'avons eu aucune réponse des autorités compétentes pour savoir ce que devenait le dossier et ce qu'il avait été décidé de faire.

Dans le cas où le Service de Pharmacovigilance continuerait donc à autoriser la prescription libre de ce produit, nous essayerons pour notre part de faire une étude cas-témoins pour essayer d'évaluer avec plus de précisions l'augmentation du risque relatif par ce médicament. Si bien sûr ce médicament doit être retiré du marché dans les prochains mois, nous ne nous lancerons pas dans cette étude de cas-témoins et donc nous aimerions avoir votre sentiment sur l'attitude à avoir.

En espérant obtenir une réponse rapide sur toutes ces incertitudes et sur la conduite à tenir dans les prochaines semaines, je vous prie de croire, Monsieur, à l'expression de mes sentiments les meilleurs.

Professeur G. SIMONNEAU

P.S. : copie de la lettre du mois de Septembre 1991 de Mr DUROUX

Protocol
International Primary Pulmonary Hypertension Study
(IPPHS)

December 1, 1992

1. BACKGROUND

Primary pulmonary hypertension (PPH) is a very rare disease. Its annual incidence is not known with accuracy [1] but is estimated to be around 1 per 500,000 inhabitants in countries like France or the U.S. [2]. However, if only the age categories 20-50 are considered, the incidence appears twice as high. Since the disease is more frequent in females, the annual incidence in 20-50 years old females could be closer to 1:200,000 or more, a still very rare phenomenon.

PPH is a very much unknown disease and epidemiological data are scarce. Except for few large case-series [3,4], there are no published epidemiological studies of the disease. As a matter of fact, the role of factors, such as age and sex, is only partially known and there is no consensus on the role of a series of factors such as the use of oral contraceptives, tryptophan, herbal diets, pregnancy, co-morbid states, systemic diseases, and others [3, 5-7]. A number of drugs have been suggested to play a role [8,9,10]. Some anorexigens have been associated with PPH since the epidemic of this disease which occurred in the early 60's where a high percentage of cases exposed to aminorex was reported [11]. Cases of primary pulmonary hypertension (PPH) have recently been reported in users of fenfluramine derivatives [12,13]. Besides, the exposure to drugs is rarely unique. Reported cases of PPH in Europe had been exposed to a variety of drugs, "fasting pills", amphetamines, thyroid compounds, and others. Underreporting of PPH cases exposed to drugs is likely to have occurred, as is generally the case in pharmacovigilance [14]. On the other hand, the suspicion that certain factors may play a role in the development of PPH is known by cardiologists and pneumologists and it has been suggested that some subjects suffering from pulmonary hypertension (PH) might be (wrongly) diagnosed as Primary PH as soon as an exposure to one of these factors is found.

Although some recent studies point out in the direction of an immunological [15] or genetic origin [16], they still remain to be confirmed. The fact that an epidemic of PPH is presently going on in HIV-infected individuals [17], and that women seem at a clearly greater risk for the disease than men [3] militate in favor of a complex phenomenon where genetic and immunologic factors might play an important role.

Indeed, the diagnosis of PPH is one of exclusion. The definition of the disease is unclear and many unexplained pulmonary hypertensions (PH) are wrongly classified as PPH without the necessary investigation for the diagnosis to be made. Exclusion of other causes of PH includes a number of steps which have been recently defined [1].

2. OBJECTIVES

2.1 General objectives

To contribute to an epidemiological understanding of primary pulmonary hypertension.

To quantitatively assess the role of several known or suspected risk factors in the development of primary pulmonary hypertension

2.2 Specific objectives

To assess the role of sex, age, obesity, medical history, concomitant illnesses, drugs, behavioral factors and exposure to selected environmental factors.

3. OVERVIEW OF THE STUDY

In order to reach these objectives, a case-control study will be conducted in five European countries (France, The United Kingdom, The Netherlands, Belgium and Switzerland) and Canada. One hundred cases and up to four matched controls will be recruited altogether, over a period of 18 months to two years. Cases will be recruited through the reporting of PPH patients by specialized centres to a local team in each country. Controls will be selected by a coordinating centre among the patients seen by the general practitioner of the case (physician-based controls) or, by default, among the patients of a physician practicing near the case's residence. Cases and controls will be interviewed by non-medically trained interviewers, face to face. Interviewers will be blinded to the objective of the study. An international coordinating centre located in Montreal (McGill University Jewish General Hospital) will monitor the study, process the data, and conduct the analysis.

4. RESULTS OF THE FEASIBILITY STUDY

Mortality data from France (INSERM) and The Netherlands indicate that approximately 20 individuals per 10 million inhabitants die each year with a primary or secondary diagnosis of PPH. Since the disease is thought to be fatal in 65-90% of the cases and taking into account possible errors in diagnosis (in both directions), it is believed that this is a conservative estimate of the incidence of the disease. The five countries altogether represent almost 150 million inhabitants. Applying the above estimate to this denominator, it is estimated that 300 cases are diagnosed each year in the five countries. Thus, the objective of recruiting 100 cases in two years would correspond to 16.6% of all the cases diagnosed during that period. The objective could be attained in 1 year if 1/3 of the cases were recruited.

One hundred and ten (110) Divisions of Pneumology and/or Cardiology of University Hospitals in France have received a letter asking them to participate in the study (two mailings). Seventy-eight of them (71%) have accepted and 1 has refused. The remainder have not responded. All the major centres have actually consented to participate, including the referring centres and transplantation centres. Of the respondents, 22 had seen no cases in the past year, 28 had seen 1 to 2 cases per year, and 9 had seen more than 2 cases per year. Nineteen (19) did not report the number of cases that they had seen.

A field feasibility study has been conducted during the month of May 1992 (4 weeks) in the Aquitaine region of France (around Bordeaux). This region represents a catchment population of approximately 4.2 million inhabitants. The heads of the divisions of Pneumology (3), Cardiology (8), Internal Medicine (6), Chest Surgery (2) and Intensive Care units (4) of the five University and Military Hospitals have been contacted in the region. Three (3) large private clinics were also surveyed. Finally, 32 local hospitals were contacted. They were all visited whenever they declared that they had diagnosed a PPH case in the preceding 16 months. Seventeen (17) cases were found. After applying the algorithm for case-ascertainment (see below), 7 cases were considered as meeting the inclusion criteria for the study. All the centres participated with enthusiasm to the feasibility study. Extrapolating these results, when applied to the whole of France, this figure would lead to 72 potential "validated" cases per year in this country.

Forty-two (42) private cardiologists and 18 pneumologists were randomly selected among the list of cardiologists practicing in the Aquitaine region. They were contacted by telephone. The objectives of this survey were: (i) to validate the patterns of referral of PPH cases seen by private cardiologists; (ii) to

possibly identify more cases of PPH that would have been missed in the hospital centres. Forty-one declared that they would refer a case of PPH for treatment and/or confirmation of diagnosis to a University Hospital, 9 to a private clinic and 10 to local hospitals. It was confirmed that most of these cases would however end up in a University Centre. These centres were among the 23 surveyed. Two potential cases of PPH had been seen by the private cardiologists in the 16 months preceding the interview. These 2 cases were among the 17 found in the survey of the University Centres.

The medical extraction form was tested on several occasions. A preliminary version had been used for the validation of the 17 cases reported in the Aquitaine area. The final version (see below) has been tested on 5 cases newly diagnosed at the Clamart Centre in France and in the U.K. It was found efficient and easy to use.

The mode of recruitment of controls (see below) has been tested with the same patients in France and the U.K. The general practitioners of the cases have been contacted by telephone. They all agreed to help in the recruitment of controls. The scarcity of the disease and the difficulties encountered with the diagnosis and treatment of these patients was declared as the main reason for trying to help.

In view of the result of the feasibility study, the International Scientific Board concluded that: (i) the recruitment of a sufficient number of cases (100) during a rather short period of time was a feasible hypothesis; (ii) the University Centres and some large private clinics were shown to be sufficient for catching the number of cases needed; (iii) the medical extraction form was appropriate.

5. METHODS

5.1 General considerations

The case control design was selected in view of the rarity of the disease at hand. A prospective cohort study was deemed not feasible. Because record-linkage databases are not available on a sufficiently large scale in the countries where the study will be conducted, the only choice left was to rely on the recruitment of cases through the reporting by clinicians. Besides, the necessity of very well defined conditions and procedures for the recognition of cases made it mandatory to obtain validated medical information which are less likely to be found in automated databases.

5.2 Cases

5.2.1 Case definition

The algorithm developed by Rich et al. [1] has been retained for the diagnosis of PPH (Appendix A). Primary pulmonary hypertension is defined as the presence of a mean pulmonary artery pressure greater than 25 mmHg at rest.

Given the total lack of a single clinical feature or laboratory test for the diagnosis, the diagnosis of PPH is achieved by exclusion of the following secondary causes:

- congenital abnormalities of the lungs, thorax and diaphragm,
- congenital or acquired valvular or myocardial disease,
- pulmonary thromboembolism (because this may be clinically silent, objective proof of absence is necessary),
- sickle cell anaemia,
- history of intravenous drug use,
- AIDS (but not HIV infection per se),
- obstructive lung disease,
- interstitial lung disease,
- central hypoventilation with hypoxemia and hypercapnia,
- definite collagen vascular disease (Lupus and others),

- parasitic disease affecting the lungs,
- pulmonary artery or pulmonary valve stenosis,
- pulmonary venous hypertension,
- active liver diseases.

5.2.2 Case-ascertainment

In order to exclude the above conditions, the following diagnostic tests results are mandatory and will be abstracted or copied from the medical records or asked to the clinicians in charge:

- chest X-ray,
- pulmonary function tests,
- lung perfusion scan,
- echocardiogram,
- cardiac catheterization (right mandatory),
- arterial blood gases

The following tests are found useful (but not mandatory):

- liver function tests - preferably a biopsy or any other diagnostic liver function tests that would exclude chronic hepatitis for instance,
- Anti-nuclear antibodies (ANA)
- CBC,
- left catheterization,
- HIV serology,
- pulmonary angiogram,
- sleep studies - oximetry, polysomnography,
- high resolution CT-SCAN.

Case ascertainment will be achieved on the basis of the data collected from medical charts with the Medical Extraction Form (Appendix B).

Only the cases with the mandatory procedures listed above will be

retained for the study. In addition, cases should be diagnosed as PPH for less than 3 months at the time of reporting (incident cases).

5.3 Controls

Up to four controls per case will be recruited and matched on age, sex, physician and number of visits to the physician per year.

5.3.1 Type of controls

Physician-based controls were chosen [18]. Several issues were considered in the choice of controls:

a) Minimization of selection bias

If hospital controls had been chosen, one must have ensured that the illness for which they were hospitalized is unrelated to exposure. Because the exposure factors of interest extend far beyond the unique effect of one single factor, i.e. several risk factors for PPH will be examined, it would be almost impossible with hospital controls to ensure that the selected control illnesses would be independent of all the risk factors to be considered. This would have excluded most chronic conditions and a number of acute conditions as well.

It was felt that if randomly selected community controls were chosen, they would be less likely to be exposed to a number of risk factors (drugs, other morbid status) than the population who consults physicians. Since the use of anorectics, contraceptives, and other risk factors under study lead to visits to physician, controls might underrepresent those exposures.

In hospital-based and in community controls, referral bias might occur that would have potentially an important impact on the results (in an unknown direction a priori).

b) Minimization of information bias

Cases are unlikely to be hospitalized for a long time after the diagnosis is made, except for a few instances. It is only after a variable time that their condition worsens to the point that they are hospitalized for long duration. Thus, they are unlikely to be interviewed in the hospital since the needed time for reporting of the case, case validation and interview might take between 2 and 4 weeks. This could lead to a non-comparability of information if cases were interviewed at home and if hospital-controls were selected and then interviewed at the hospital. Physician-based controls would be preferable in this regards. This will not control for another type of recall bias, that is if cases are most likely to remember exposure to drugs and other factors than controls. This will be dealt with in more details further below in the section on "exposure assessment".

c) Feasibility

Arguments of feasibility would a priori militate in favor of hospital-based controls. However, because of all the restrictions to be applied on the type of illness to be selected, the age groups considered (PPH is most likely to occur between 20 and 40 of age), the conditions of interview, it was felt that the gain in feasibility in the recruitment of hospital- vs physician- based controls might be seriously impaired. It was felt that the feasibility would be even greater with physician-based controls.

5.4 Matching

Age and sex are known to be associated both with the outcome (PPH) and with exposure to suspected risk factors (O.C., pregnancy, exposure to other drugs, immunological susceptibility, and others).

Since the controls are selected through the physicians, matching on this variable will ensure for the control of unknown confounders that could be linked both to the probability of exposure (physician

practice) and to the probability of diagnosis (monitoring of patients by the physician).

It was felt necessary to match on the number of visits to the physician per year because controls will be selected out of the list of patients seen in a given period of 2 to 3 days by the physician. In effect, a list of all the patients seen by a physician in a long period (about one year) is often not available at the GP's office (except for computerized practices). Hence, the random selection of patients would not be possible. By selecting the controls among the patients seen in a short period, the probability of being selected will be higher for patients who visit the physician often. Therefore, a bias would be introduced whereby sicker controls would be overrepresented in the sample. Matching for the number of visits to the physician would help controlling for this bias.

Up to four matched controls per case will be included if they meet the matching variables and timing of the interview.

5.5 Inclusion / Exclusion criteria

5.5.1 Inclusion criteria

The following inclusion criteria will be applied to the study population:

- Both genders
- Age 18-70
- Resident in the country and the area of residence for more than 6 months at the index date (i.e. date of diagnosis of the case)

5.5.2 Exclusion criteria

The following exclusion criteria will be applied to the study population:

- Age less than 18 years old and greater than 70 years old

- Interviews impossible because of health condition, language or other technical conditions
- Subject refusing to participate in the study
- Subject absent of the country at the time of interview
- Conditions found to be associated with a decrease in the probability of exposure to anorectic agents and O.C. (contra-indications to the drug):
  - all contra-indications listed in each country's compendium
- Severe chronic disease: cancer, juvenile diabetes mellitus, others

6. RISK FACTORS ASCERTAINMENT AND QUESTIONNAIRES

There will be three sets of questionnaires:

- questionnaire A is the main questionnaire for risk factor ascertainment with four parts, (Part I, Part II, Part III, Part IV, see below),
- questionnaire B is an additional questionnaire for cases,
- questionnaire C is an additional questionnaire for the controls.

6.1 Main questionnaire (Questionnaire A)

The main questionnaire, as already mentioned, will be composed of four parts, mandatory ones (Part I-II) and optional ones (Part III-IV). Part I, II, III of the main questionnaire have been developed and tested with prevalent cases in France.

Part IV will be added only subsequently, in January 1993, and will then not be available for cases and controls recruited in the first months of the study.

Parts I and II will be administered to all cases and controls. Part III will be in a separate envelop handed to the cases and controls.

Part IV will be administered to all cases and to subset of controls. The first three parts will take approximately 40 minutes to be administered. The fourth will take approximately 20 additional minutes. The first three parts of the questionnaire deal with all suspected or known risk factors for PPH. They will address the following risk factors:

Part I:

- family history,
- age,
- gender,
- weight, height
- place of birth,
- smoking history (intensity / duration),
- obstetric history,
- (chemical) environment,
- alcohol / coffee intake,
- diving history,
- altitude,
- profession,
- medical history,
- diet (selected items)

Part II:

- drug history

  In the interview, exposure to drugs and diets will be assessed in three steps:

  a. open question: which drugs used in past four years?
  b. specific question: drug history in the last four years with suggestion of specific names of drugs (all therapeutic classes)
  c. packages or pictures of relevant drugs shown with a visual display

Part III:

- illicit drug abuse,
- HIV infection and other STDs

Part IV will be used to generate hypotheses regarding the etiology of PPH. It will address the following:

- history of childhood infections,
- history of infections in utero,
- exposure to selected environmental factors,
- history of exposure to drugs in utero

Questionnaires are described in more detail and included in Appendix C).

6.2 Additional questionnaires

Additional questionnaires for the cases (questionnaire B) will be aimed at describing the history of the disease (PPH), the onset of symptoms and subsequent medical developments. It will include also questions for the verification of inclusion criteria and exclusion criteria. Likewise, the additional questionnaire for the controls (questionnaire C) will be aimed at the verification of these inclusion and exclusion criteria.

7. OTHER METHODOLOGICAL ISSUES RELATED TO SUSPECTED RISK FACTORS

7.1 Protopathic bias

The possibility of a protopathic bias in the relationship between exposure to therapeutic agents and PPH has been documented. Some patients may have been prescribed a drug because they had developed dyspnea, a prodromic sign of PPH. This could lead to a spurious association with PPH. This bias will be carefully examined.

7.2 Diagnostic bias (selection bias)

Clinicians may be more likely to diagnose PPH in patients exposed

to a suspected risk factor than in unexposed individuals. This would result in an overrepresentation of cases exposed to this risk factor in the study sample compared to reality. A similar bias may occur, but to a lower extent, if PPH was diagnosed earlier in individuals exposed to suspected risk factors than in unexposed (regardless of the association between the exposure and the outcome). In this case, the probability of exposure to these factors in a given time window before the onset of symptoms would be increased. These problems will be considered through a careful examination of the reported cases, both exposed and unexposed. In particular, the time between the onset of symptoms and the diagnosis will be examined and considered between exposure groups. Also, the proportions of exposed cases will be compared between the probable PPH cases, the possible cases and the rejected ones. These potential biases will be considered in the conduct of analysis and the interpretation of results.

7.3 Reporting bias

The participating centres may be more inclined to report the cases exposed to a given risk factor than the unexposed ones. Conversely, it is possible that some centres would not report exposed cases because they would think that the association between exposure to the risk factor and PPH is known. This phenomenon, which has been documented in pharmacovigilance [4], is less likely to occur here, but will be considered nevertheless. In order to assess the importance of these biases, if any, participating centres will be regularly surveyed for their recruitment of PPH and the percentage of exposed vs unexposed cases will be evaluated. Each participating centre will be contacted by telephone every 3 months. Validated cases that were not spontaneously reported will be considered for the study. In the case of difficulty with including some non-reported cases with a lower (or higher) probability of exposure, the impact of this bias on the results of the study will be assessed and considered in the analysis and

interpretation of results.

8. SAMPLE SIZE AND STATISTICAL POWER

Sample size calculation was based on 3 major factors: 1) the prevalence of exposure in the control population, 2) power consideration and, 3) feasibility.

The sample size calculation had to take into account that there was more than one risk factor of interest. Thus, the most conservative estimate was retained. Calculations were based on anorexigens for the following reason: it is likely to produce one of the most conservative estimates because of the expected low prevalence of exposure in the control population.

According to sales figures, it was estimated that approximately 5% of the population in this age group is exposed at least once in the relevant time-window. Two-sided p values will be used. Alpha is set at .05 and the power at 0.80. The lowest detectable risk was based on clinical as well as feasibility considerations. According to the feasibility study, it has been estimated that 100 cases could be recruited during the study period. This number would allow us to detect a RR of 4.0. Such a sample size would produce a power greater than 0.80. It is likely that this number would also permit to study the effect of the other risk factors that may have a smaller RR than anorexigens but a greater prevalence in the control population. In addition, it would allow us to conduct stratified analyses in order to identify potential high risk groups.

9. STATISTICAL ANALYSES

Associations will be analyzed in three ways:

a. testing the significance of simple bivariate association between a given risk factor and the observed frequency of PPH (for each factor separately);

b. testing the significance of the contribution of a given risk factor or of a group of factors to the occurrence of PPH, after having adjusted for the effects of other risk factors (family history of PPH, oral contraceptive intake, smoking history, race etc.) using multiple regression approach which allows for the simultaneous analysis of all factors;

c. stratified analyses in order to identify high risk group. The selection of the stratifying variables is based on clinical relevance and plausibility. A priori, the stratifying variables of interest are age group and sex. However, these may be revised depending on the distribution of the study population.

Bivariate analyses: Since all hypotheses concerning bivariate associations will not a priori specify the direction, two-tailed tests will be used. The chi-square test will be used to assess the significance of the heterogeneity of the distribution of the risk factor between cases and controls. A crude odds ratio (OR) will be reported and 95% confidence intervals will be obtained with the test-based method.

Multivariate logistic regression: The relative risk (RR) for PPH within each exposure group will be estimated by the odds ratio (OR). The adjusted OR for each independent predictor will be obtained from an unconditional logistic regression model. The matching variables, sex, age group and number of visits to the GP will be included in the model to assess residual confounding. Because PPH is a rare illness, it is not likely that more than one

case will originate from the same GP. As a result, GP will not be included in the multivariate logistic regression.

Stratified analyses: Stratification of the data by age group and sex will allow us to identify high risk groups. An OR specific to each level of the stratifying variable will be obtained. Homogeneity of the stratum-specific ORs will be assessed by the Breslow-Day test.

Significance level will be set at .05. Data manipulation, bivariate and stratified analyses will be conducted using the SAS statistical package. Unconditional multivariate logistic regression will use the EGRET statistical package.

10. ORGANIZATION OF THE STUDY

The framework for the organization of the study in each country includes six steps:

(i) Recruitment of participating centres. As already done in the feasibility study in France, the head of the Cardiology and Pneumology divisions of all the University Hospitals in the five countries will receive a letter signed by two leading clinicians (one cardiologist and one pneumologist), by the Chair of the IPPHS and sometimes a local epidemiologist, asking for their collaboration in the identification of cases of PPH.

All participating centres will receive a folder containing an outline of the study, the present study protocol, reminders of the inclusion and exclusion criteria, the algorithm for PPH diagnosis of Appendix A and pre-stamped and pre-addressed postcards for the reporting of cases (Appendix D). They are also invited to an educational session on PPH and the IPPHS.

(ii) Reporting of cases by the hospital centres. Pre-stamped cards (Appendix D) will be made available to each centre for the reporting of a case. Each case will be assigned an identification number. Centres will only have to post the card (or fax it) to the local team. The places where the reporting of cases will be received are: Hôpital Bichat (Prof. M. Aubier, France); Hammersmith Hospital (Prof. C. Oakley, United Kingdom); Limburg University (Dr. H. Petri, The Netherlands); Institut d'Hygiène et d'Épidémiologie (Dr. X. Kurz, Belgium). A place will have to be named for Switzerland. Copies of the cases will be faxed to the International Coordinating Centre in Montreal.

(iii) Telephone screening. A physician in each local team (preferably a cardiologist or a pneumologist) will telephone the clinician who reported the case and fill out a screening form where questions will be asked regarding the procedures applied to verify the case. All the mandatory procedures listed in section 5.2.2 will have to have been performed to accept the case (screening form with Appendix E). Clinicians will be informed of the criteria chosen by the panel for the diagnosis of PPH to be made.

(iv) Case ascertainment. If the case is retained, a physician from the local team will visit the reporting centre for the extraction of data from medical charts with the Medical Extraction Form from Appendix B. When in doubt, a referee expert will be asked to review the case (one has been identified in each country). All cases will subsequently be reviewed by an independent panel of three experts. This panel will be blinded as to the source of the case and exposure status. It will classify the cases into 3 groups: (a) accepted cases; (b) possible cases; (c) rejected. It is expected to recruit 100 accepted cases. The possible cases will be kept for comparative studies and control potential biases (see above). In Appendix F are summarized the steps to be followed for

the recruitment and validation of cases. Forms will be sent to the International Coordinating Centre (Montreal) for coding, verification and processing.

(v) Recruitment of controls. The recruitment of controls will follow the chart represented in Appendix G. This will consist in three steps:

1. A list of patients seen by the case's-GP will be generated. This will require the following steps:
   - Identification of the GP by the case: name of the GP obtained by phone or at the hospital (consent form to be mailed and signed by the case is with Appendix I);
   - Information of the GP by telephone and mail (simultaneously). An agreement by the GP to participate;
   - Mailing of a pad (Appendix H) to the GP for the listing of all patients seen in 1 week. Each sheet on the pad is made of two parts: on the left side, space is allowed for the name and telephone number of the patients; on the right side, information is registered by the GP for each patient on sex, age, number of visits in the last 12 months, together with the sequential number of the patient.

2. Selection of controls
   In order to protect confidentiality, only the right side of the sheets are sent (or faxed) by the physician to the local research team. The GP keeps the left side, with the patients IDs. An epidemiologist from the local team identifies 6 controls for the case (4 + 2 replacements). The epidemiologist informs the GP of the sequential number selected and offers him/her: (a) either that s/he (the GP) would contact the selected controls to inform them of the

study and of the fact that an epidemiologist will call them if they agree; (b) or that the epidemiologist would write to (or call) the control, in the name of the GP. Solution (a) would be much preferable (in the feasibility study, the three GPs preferred to contact their patients themselves).

3. The epidemiologist contacts the control patients by telephone and finalises the conditions of their recruitment and the conditions of interview (consent formS to be filled by the patients with Appendix I).

(vi) Interviews. It has been decided that the number of interviewers should be kept to a minimum. Interviews will be conducted by 3 interviewers in France, 2 in the United Kingdom, 1 (bilingual) in Belgium, 1 in The Netherlands. One of the French interviewers will conduct the interviews in Switzerland.

As an example, if 50 cases and 200 controls were recruited in France, then each French interviewer will interview 25 cases and 100 controls. Since cases and controls will, by definition, live in the same area, this will represent 25 sets of interviews of 5 subjects. It is felt that these interviews can be conducted over a period of 2.5 days, including preparation and transportation. Thus, two half-time interviewers will be recruited, one for each half of the country (North and South). The same basis will be used for other countries at the pro rata of recruitment of cases.

Interviewers will be non-medically trained individuals who will be blinded vis-à-vis the objectives of the study. They will receive an initial training and will be regularly supervised for their work. Blinding vis-à-vis the status of the subjects (cases and controls) seems impossible to achieve in regard of the content of the additional questionnaires. The interviewers will be however trained to counteract this factor. Interviews will be conducted

face to face, preferably at the subject's home or in a quiet environment.

(vii) Blood samples (this section is not funded yet). Cases and controls will be asked if they volunteer for a collection of blood. If so, a trained nurse will be sent to collect the blood. It is estimated that 50% of cases (50 cases) and 25% of controls (100 controls) will accept. This blood will be frozen at -70° C and stored for future studies on immunological and genetic factors.

11. ETHICAL CONSIDERATIONS

The study being sponsored by a pharmaceutical company which has an interest in some of the factors investigated, several measures were taken to ensure for the independence of the study. Firstly, the members of the Scientific Board were selected independently by the Chair of the IPPHS. They are all scientists affiliated with academic institutes with no personal interest in the result of the study. Secondly, the following clause regarding publication has been introduced in the contract between SERVIER and the Centre for Clinical Epidemiology of the McGill University Jewish General Hospital where the study will be coordinated:

> PUBLICATION OF RESULTS
>
> In accordance with the International Scientific Board of the study, "the Centre reserves the right to disseminate information or to publish any and all material resulting from the IPPHS without need for approval by ADIR (SERVIER). The Centre shall provide ADIR (SERVIER) with a copy of any proposed publication intended for any third party forty five days in advance of the proposed publication date. ADIR (SERVIER) will not be entitled to require any modification but it would be its privilege to make suggestions to the authors.

These suggestions will be submitted to the international Scientific Board of the Study. ADIR (SERVIER) at its election shall be entitled to receive in any such publication an acknowledgement of its sponsorship of the IPPHS."

The issue of potential early stopping of the study in the case of an obvious increased risk associated to drugs was discussed by the International Scientific Board, together with the method to determine such an increase if any. It was decided that it should not be the decision of the panel to stop the study, since the authorities of each country will receive all the relevant information about exposed cases. The authorities of each country will have all the data necessary for them to take a decision regarding those drugs. It is felt that the policy decisions should be totally separated from the scientific ones. The International Coordinating Centre will conduct a descriptive analysis at 50 cases recruited or after one year of recruitment in order to identify a potentially major association and will report to the ISB. The protocol will be submitted to local Ethical Committees in each country, including the country where the International Coordinating Centre is located (the Montreal Jewish Hospital).

12. TIMETABLE

The projected timetable for a study period of 2 years is included in Appendix J.

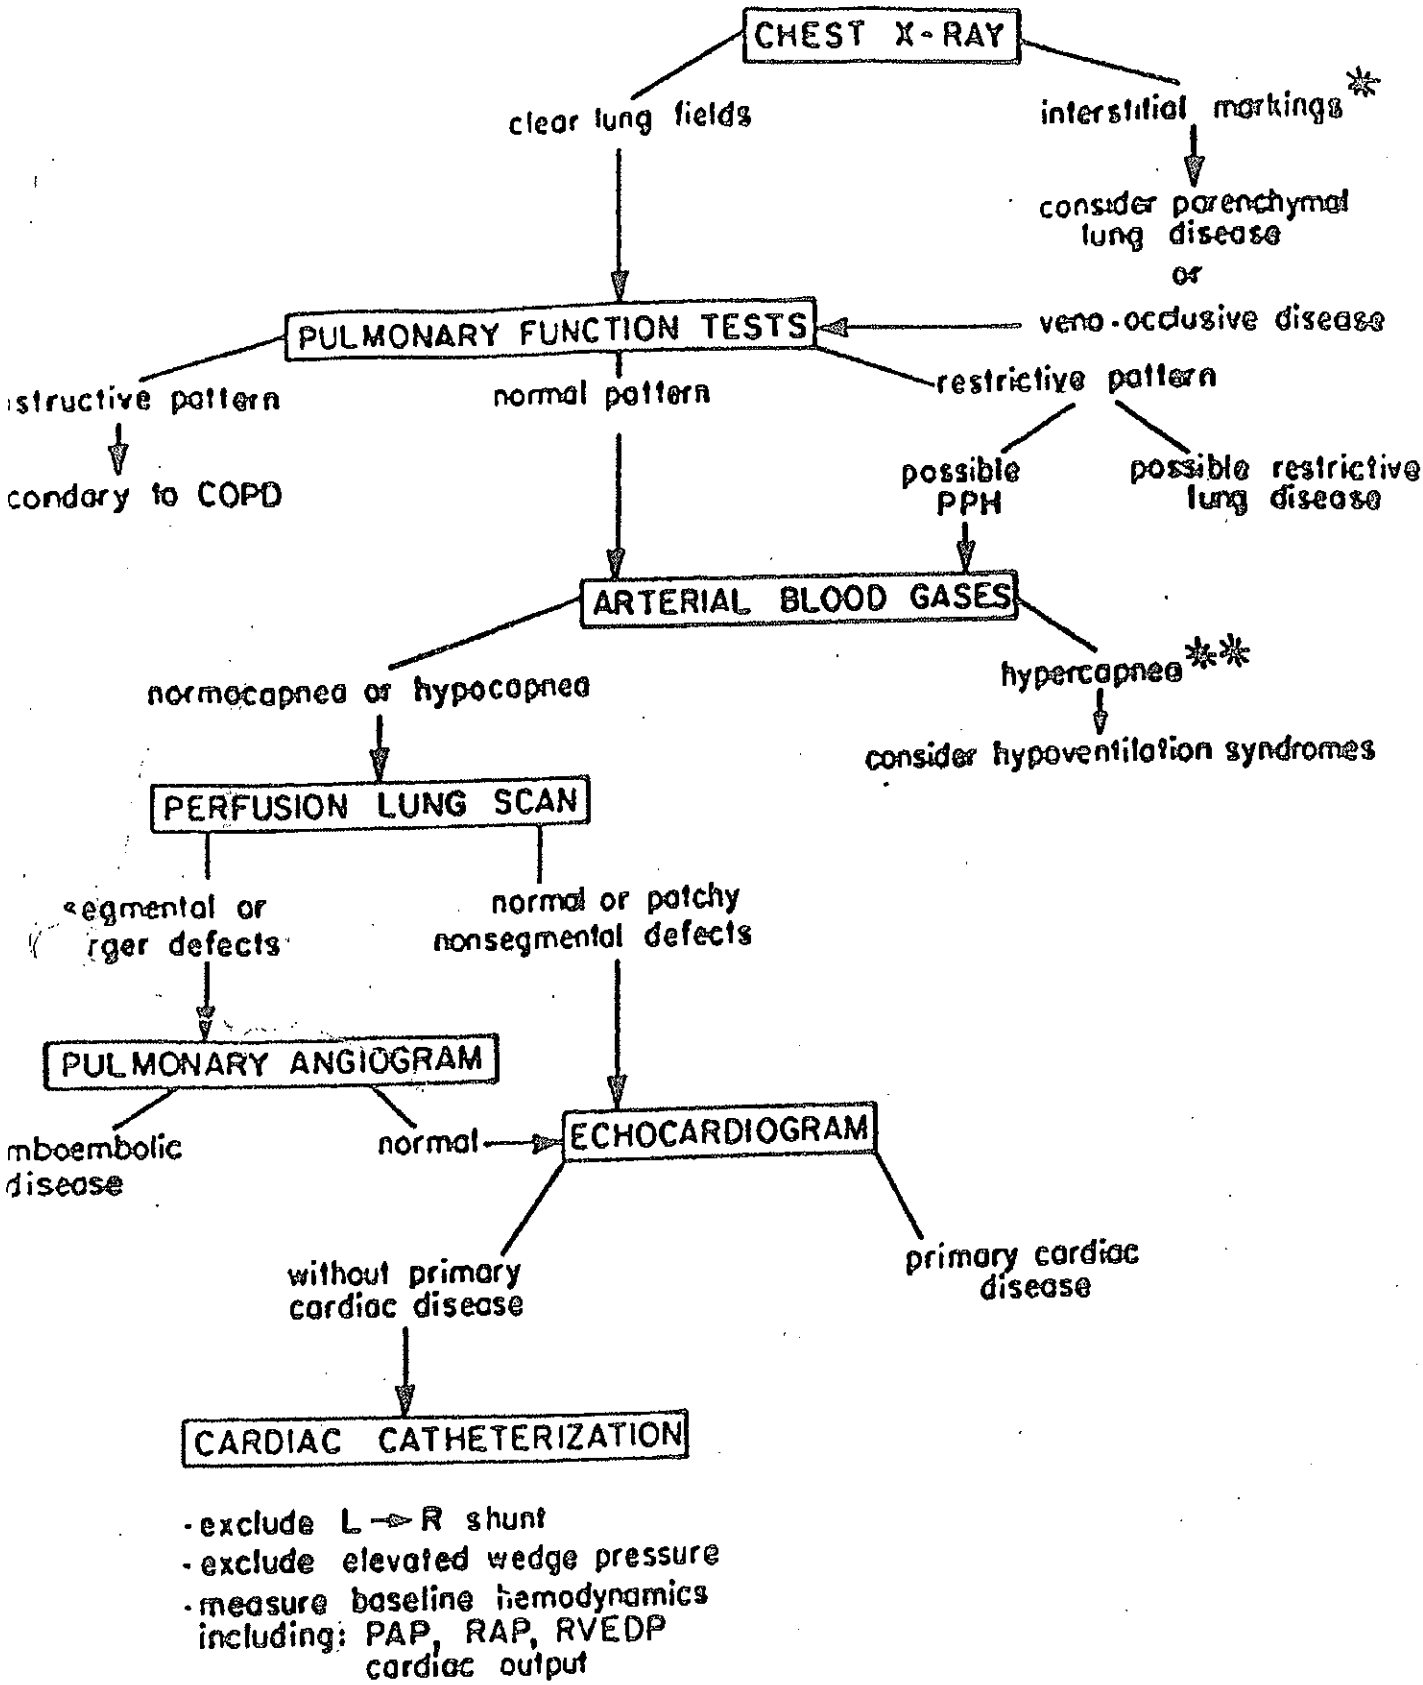
Algorithm for the diagnosis of PPH

From Rich (1988)

Appendix A

ALGORITHM FOR THE DIAGNOSIS OF PPH



* Consider HRCT

** Consider sleep studies

Note on Complementary examinations:

Whenever one "mandatory examination" was missing, the international review panel was asked to decide if the case should be dismissed or kept.

Note on Exclusion criteria:

The conditions were excluded only if it was felt that they could account for the elevated pulmonary pressure.

Draft Outline of Protocol
International Case Control Study of
Primary Pulmonary Hypertension
ICCSPPH

April, 1992

1.0 INTRODUCTION

A number of spontaneous reports referring the use of anorexigenic drugs, particularly the ones containing fenfluramine (F) and dexfenfluramine (DF) in France, Belgium and other european countries, among cases of Primary Pulmonary Hypertension (PPH) have been collected. The Servier Laboratory has been receiving reports of PPH during approximately thirty years of commercialization of those drugs. In Montreal, a statistical analysis of some of the Servier's Laboratories reports has been done. The National Committee of Pharmacovigilance of France (NCPF) has recommended lately a nationwide study of products containing F and DF (Besançon) while, over the years, the Servier Laboratories has introduced changes in the manufacture of those specific drugs.

PPH is a rare and not well known disease. There are no epidemiologic studies treating this subject. Its incidence is also not known. The risk factors associated with PPH were never investigated in a thorough epidemiologic fashion generating a variety of supposed opinions and ideas concerning the "primary" concept of this disorder.

The data available rest mostly over the report of case series. The U.S. case report however, analyzed in a systematic manner the presence of certain factors. In 5% of the patients studied for instance, anorexigenic drugs were involved but the F and the DF drugs are not marketted in this country.

In France, the reports provided by a specialized center named Clamart indicate that the exposure to F and DF was noted in 6.9% of the subjects in the past, and a current exposure in a time frame of 4.5 years, was found to be 5.6%, summing up to a total of 12%. Taking into consideration the antecedents of aminorex, the plausibility that this product has some effect over this specific disease is elevated. The F and the DF are widely used in France. It is estimated that the number of patients treated each year with those drugs reaches around 280 thousand persons. That is approximately 5% of the women in the age group of 20 to 55 years. The point prevalence of exposure in the general population is thought to be low but, long term prevalence of exposure is possibly high.

A number of other risk factors have been suggested such as other anorexigenic, other drugs, oral contraceptives, pregnancy, genetic traits, etc. They will have to be listed and studied exhaustively, so that data about incidence of PPH; about the role of each risk factor, if each one of them is a starter or a contributor; about the eventual reversibility of the disorder; about the harzard function of PPH vis a vis each risk factor; about the effect of duration of exposure; about the risk to have PPH after a drug or a risk factor is discontinued and, so forth.

In that context, the Servier Laboratories have accepted to support this International

Epidemiological Study of PPH (IPPHS). In order to write the present protocol draft, a panel of independent experts was created. The members of this International Scientific Board (ISB) were identified by Professor Abenhaim, of the McGill University in Montreal, Canada. The Servier Laboratories were not consulted about the composition of this panel. The panel has been extended to include scientists from the U.K., the Netherlands and Switzerland. The members are listed in appendix A.

2.0 OBJECTIVES

2.1 GENERAL OBJECTIVES

1- To estimate the incidence of PPH.

2- To estimate quantitatively the association between different risks factors and the syndrome usually labelled as PPH.

3- To determine the causal or contributive role of each risk factor studied.

2.2 SPECIFIC OBJECTIVES

1- To compute the incidence rates of PPH for the regions of Bordeaux and Toulouse in France and possibly for Belgium.

2- To determine the odds ratio for each risk factor cited by the scientific literature and by the experts in field, including drugs, especially anorexigenic drugs and particularly the F and the DF drugs.

3- To determine quantitatively the interactions among risk factors studied.

3.0 METHODOLOGY

3.1 DESIGN

A prospective cohort type of study design would demand conditions and efforts not quite realistic given the rarity of the PPH disease. The use of existing data bases is also inadequate since the prevalence of exposure to certain products in North American countries, where such data bases exist, is inexistent. Furthermore, the diagnostic of PPH requires precise criteria that certainly would not be easily found on such data banks.

Therefore, we recommend a multicenter case control study. In order to gather the most possible number of cases, this study will be conducted in France, Switzerland, The Netherlands, Belgium and United Kingdom where cases have been notified in the past and where one of the risk factors to be studied, or the F and the DF drugs, are widely utilized.

3.2 CASE DEFINITION

3.2.1 INCLUSION CRITERIA (to be completed)

1- An algorithm for PPH case validation will later be produced having as reference Rich's scheme to reach a PPH diagnosis.

2- All PPH prevalent cases of less than one year and incident cases are going to be considered in the preliminary phase of the study. For the analytic study however, only the PPH cases diagnosed shortly after the start date of the study are going to be eligible.

3- Others to be defined.

3.2.2 EXCLUSION CRITERIA (to be completed)

1- Cases considered unclear according to the judgement of experts.

2- Cases, for the case-control study, that were not interviewed.

3- Others to be defined.

3.3 OPTIONS OF CONTROL GROUP (to be discussed and decided)

1- Patients of the cases's general practitioner.

2- Patients of a random sample of physicians of a pre-established list and thereafter matching of cases and controls of the same physician.

3- Next of kin controls.

4- Other population-based controls.

Courrier envoyé par voies électroniques.

Madame, Messieurs,

Cette note vous a été adressée essentiellement en préparation de notre dernière rencontre. Je prendrai cette occasion pour résumer les conditions de déroulement de l'étude internationale "IPPHS" sur l'hypertension pulmonaire primitive (HTAP), ses conclusions et les suites qui y ont été données, par le sponsor principal (Servier) et les autorités de santé. Je dirai enfin ce qu'il en a été lors de l'exercice de mes fonctions de directeur général de la santé.

1) L'étude IPPHS

J'ai été contacté par les laboratoires Servier à l'automne 1991 alors que j'étais professeur de pharmaco-épidémiologie à l'université McGill au Canada (où j'ai passé 20 ans), pour commenter 7 cas d'HTAP exposés à l'une ou l'autre de leurs fenfluramines (Isoméride ou Pondéral). J'ai conclu à la plausibilité du lien, du fait notamment de l'antécédent de l'épidémie d'HTAP liée à l'aminorex dans les années 60. Après plusieurs réunions, dont certaines avec l'équipe de Clamart qui avait observé certains de ces cas, Servier, et des experts français et étrangers, ainsi qu'après des échanges avec des membres de la Commission de pharmacovigilance, nous avons convenu en 1992 de réaliser une étude dite 'cas-témoins', internationale (France, Royaume Uni, Belgique, Pays Bas), que je coordonnerais depuis le Canada avec l'appui de collègues américains et canadiens. Le comité scientifique comportait, outre des épidémiologistes et statisticiens, un nombre important de cliniciens de chacun des pays et d'Amérique du Nord. Menée avec une méthodologie qui a été jugée par le Medical Research Council du Canada -qui l'a évaluée de façon indépendante-, comme 'exceptionnelle', et par un responsable de l'agence française du médicament comme 'irréprochable', l'IPPHS a recherché des cas d'HTAP dans 220 centres cliniques en Europe, et des témoins auprès d'une centaine de médecins généralistes. Elle a mobilisé plus d'une quarantaine de personnes. Grâce à cet effort, elle a pu produire des résultats de la plus haute qualité sur une grande variété de facteurs associés ou non à l'HTAP (ce qui correspondait à son objectif général). Dès début 1994 un risque significativement élevé d'HTAP associé à la prise d'anorexigènes a été mis en évidence dans l'analyse

intermédiaire de la cinquantaine de premiers cas et de la centaine de premiers témoins, analyse remise aux autorités sanitaires des quatre pays et présentée à l'agence française du médicament. Ce rapport concluait à une augmentation "significative" du risque d'HTAP liée aux expositions passées aux anorexigènes et que "La différence entre ces produits n'est pas statistiquement significative". Nous ajoutions : "Ce résultat est cohérent avec l'hypothèse a priori de l'étude". L'agence nous a enjoint de mener l'étude à son terme. Nous avons présenté un second rapport dans les jours qui ont suivi la collecte du dernier cas, soit le 7 mars 1995 (plus de 400 HTAP possibles nous ont été rapportées, dont 95 rencontraient les critères d'inclusion ; nous les avons appariées à 355 témoins indemnes de la maladie). Dans cette analyse, aucune ambigüité n'était permise, elle montrait un risque significativement élevé d'HTAP lié aux anorexigènes, et augmentant nettement avec la durée de prise. Le lien était plus clair avec les fenfluramines (Isoméride, Pondéral) qu'avec les anorexigènes amphétaminiques étudiés - le clobenzorex (Dinintel), le mefenorex (Incital), le fenproporex (Fenproporex Deglaude), l'amfépramone (Tenuate Dospan, Prefamone, Anorex)-, mais du fait de la consommation conjointe fréquente, il était difficile de les distinguer en termes de risque. De plus, plusieurs cas (mais aucun témoin) avaient consommé des 'préparations magistrales' pour perdre du poids dont le contenu nous était alors inconnu mais dont la comptabilisation avec les anorexigènes dans une analyse faisait grimper significativement le risque évalué (d'un facteur 4 à 7). Ce rapport concluait à propos de l'HTAP:
"L'ampleur de l'association avec les anorexigènes, la temporalité de l'association, la relation avec la durée d'utilisation et la cohérence des résultats avec les observations précédentes confirment l'hypothèse d'un lien de causalité".

Le rapport a été présenté par nous au Comité technique de pharmacovigilance (CTV) le 26 avril 1995 et à la Commission nationale de pharmacovigilance (CNPV) le 28 avril 1995, en même temps que les résultats d'une enquête nationale de pharmacovigilance sur les mêmes produits anorexigènes confiée au Centre régional de pharmacovigilance (CRPV) de Besançon. Il est important de noter que, comme le stipulait une convention signée par nous avec le président de la CNPV en 1993 (document fourni), nous avions signalé tous nos cas d'HTAP exposés aux coupe-faim à la pharmacovigilance de Servier, qui les avait fait partager dans cette enquête nationale. Inversement, nous avions pu vérifier que l'IPPHS n'avait pas manqué un nombre significatif de cas rapportés en PV (par des centres ne participant pas à l'IPPHS).

En s'appuyant sur ces éléments, rapportés le 28 avril 1995, la CNPV a recommandé la restriction drastique de la prescription des coupe-faim, en la limitant par une prescription initiale hospitalière aux personnes souffrant d'une obésité morbide, se qui se traduisait par une chute vertigineuse des expositions – but souhaité.

Nous avons présenté ces résultats, toujours avec le soutien financier de Servier (cf. 4 ci-après), qui s'en est d'ailleurs acquitté sans difficulté, dans plusieurs congrès et avons organisé deux symposiums internationaux (dont l'un en plénière d'un congrès international à Montréal), sur le sujet.

Servier nous a fourni en mai 1995 un financement de continuité (portant jusqu'à septembre 1996), que nous avons d'abord employé à compléter la documentation des préparations magistrales auprès des cas et des témoins, par visites directes chez leurs pharmaciens : celles retrouvées se sont presque toutes avérées contenir de la fenfluramine, et il est apparu que leur consommation s'effectuait toujours sur le long terme. Ce qui a fait grimper de 4 à 6 le risque relatif associé aux anorexigènes et de 10 à 23 le risque relatif pour les prises de plus de 3 mois.

Nous avons aussi, grâce à ce financement, analysé plus à fond les données pour la publication. Celle-ci a eu lieu en août 1996, dans le New England Journal of Medicine. Nous concluions sans ambigüité au rôle causal des anorexigènes, principalement des fenfluramines, dans l'HTAP. Grâce à la disponibilité du contenu des préparations magistrales, ce qui augmentait aussi la puissance de l'étude pour certaines expositions, il apparaissait en effet que le risque se concentrait sur les fenfluramines, celui associé aux autres coupe-faim amphétaminiques n'étant pas statistiquement significatif (mais ne pouvant être exclu)[1]. Cette conclusion à la causalité était un fait sans précédent pour les fenfluramines – les autres anorexigènes pouvant s'appuyer à cet effet sur l'antécédant de l'aminorex- et assez rare en épidémiologie pour être noté.

2) J'en viens maintenant à la question du Médiator au regard de notre étude.

Afin d'éviter le fameux 'biais de mémoire' souvent reproché aux études basées sur des interrogatoires de patients[2], nous interrogions les patients sur 21 grandes catégories d'indications de traitement, en leur présentant à chaque fois une liste des 5 médicaments les plus vendus pour ces pathologies, soit 105 médicaments en tout. La perte de poids représentait une de ces indications, avec 5 anorexigènes identifiés (Isoméride, Pondéral, et 3 amphétaminiques). Le Médiator était identifié parmi les médicaments du traitement des troubles des lipides sanguins, sans doute du fait de son indication comme adjuvant dans le traitement des hypertriglycéridémies. Nous n'avons pas analysé séparément les 105 médicaments listés, ni les milliers rapportés spontanément par les patients, pour que l'étude n'encoure pas la critique classique du 'tripatouillage à l'aveuglette des données' (data dredging), qui aurait fait perdre toute crédibilité, voire significativité statistique, à nos résultats[3]. Nous n'avons donc pas

[1] Les odds ratios bruts étaient similaires pour les fenfluramines vs. les autres amphétaminiques, mais les premières avaient des effectifs plus élevés et accaparaient la 'force' des estimations dans les modèles.

[2] C' est un biais très important à éviter en épidémiologie et d'ailleurs, cette question a été soulevée dans l'éditorial critique du New England Journal of Medicine en Août 1996 rédigé par des consultants de la firme, ainsi que par de nombreux autres intervenants que le laboratoire Servier a mobilisés pour évaluer nos résultats sur cette question (voir entre autres, Lane, D. and Kramer, M., Journal of Clinical Epidemiology , 1999 Dec;52(12):1279-87)

[3] Cette critique a été formulée récemment, par exemple, par l'Afssaps et par l'OMS à l'encontre d'une étude française sur le vaccin hépatite B et la sclérose en plaques, où on a reproché aux auteurs d'avoir testé trop de produits sans hypothèse a priori, et décidé de ne pas retenir le risque que cette analyse avait fait ressortir pour un produit (voir entre autres, WHO Global Advisory Committee on Vaccine Safety: response to the paper (in press) by Y. Mikaeloff and

spécifiquement examiné le Médiator dans l'étude, car on ne nous a ni signalé qu'il était utilisé comme anorexigène, ni sa parenté chimique avec les fenfluramines. Ceci est d'autant plus étonnant que, selon ce que j'ai appris il y a quelques jours, une enquête nationale de pharmacovigilance avait été lancée aussi sur le Médiator, du fait de sa parenté chimique avec les coupe faim, enquête dont le résultat a été rapporté en juillet 1995 par le même centre régional de pharmacovigilance de Besançon quelques semaines seulement après celle d'avril 1995 faite sur les anorexigènes. L'enquête du CRPV sur le Médiator a semble-t-il observé que tous les cas d'HTAP rapportés étaient aussi exposés à un anorexigène. Ni Servier, ni aucun de nos autres interlocuteurs ne nous en a fait part. L'examen actuel de notre rapport de 1995 montre que seuls 2 cas d'HTAP (2%) et 18 témoins indemnes de cette maladie (5%) avaient rapporté un traitement pour une hyperlipidémie : je ne sais pas si l'un des 2 cas prenait du Médiator, mais même si c'était le cas pour les deux, une simulation statistique (faite aujourd'hui) montre que nous n'aurions pu conclure au risque de ce produit en 1995 dans notre étude. Donc, même si on nous avait signalé ce soupçon, nous n'aurions pas pu conclure à un risque dans notre analyse de 1995. Mais j'en aurais été au courant, ce qui ne fut à aucun moment le cas.

3) J'en viens maintenant à ce qui s'est passé en Amérique du Nord.

Nous avons eu la surprise d'apprendre, au cours de l'été 1995, qu'une demande d'autorisation de mise sur le marché pour la version américaine de l'Isoméride (Redux) était déposée. Malgré notre témoignage à la FDA, le produit a été autorisé fin novembre 1995 pour une utilisation au long cours dans le traitement de l'obésité, et avec autorisation de publicité directe au consommateur. Nous avions pourtant indiqué lors de notre audition publique à la FDA que, si on prenait en compte les préparations magistrales, le risque d'HTAP au long terme était multiplié par 23. Mais les Etats-Unis faisaient face à une épidémie d'obésité morbide et ils ont jugé que le jeu en valait la chandelle. Je dois dire que j'ai été très choqué par la possibilité de prescription incontrôlée et massive que cette décision signifiait car les données d'efficacité (essentiellement une étude française du Pr Guygrand) ne présentaient aucune mesure d'efficacité convaincante en termes de morbidité cardiovasculaire ou autre. Le pire était que, dès l'annonce de la décision de la FDA (en novembre 1995), la prescription de Pondimin (équivalent américain du Pondéral) et de phentermine (un amphétaminique anorexigène) a explosé (notamment sous la forme de la combinaison dite 'fen-phen' pour fenfluramine-phentermine). Ces molécules et leur génériques étaient sur le marché depuis longtemps, mais assez peu utilisées.

Nous avons donc entrepris, avec les cliniciens nord-américains qui nous avaient aidés dans l'IPPHS, et notamment le Professeur Stuart Rich de Chicago, une campagne de sensibilisation aux risques du produit. Devant l'absence d'étude - étude que nous réclamions-, j'ai décidé d'utiliser les sommes disponibles de la

---

colleagues in Neurology entitled "Hepatitis B vaccine and the risk of CNS inflammatory demyelination in childhood", October 2008).

subvention de continuité de l'IPPHS pour financer une étude de surveillance, dite 'Surveillance of North American Pulmonary Hypertension' (SNAP) dans plusieurs grands centres américains. A compter de cette date, nos relations avec Servier, jusque là sans aucun problème, se sont nettement dégradées, notamment avec la filiale nord-américaine de la firme (et non avec l'Institut de recherche international Servier, basé en France). C'est ce qui transparaît dans une lettre découverte beaucoup plus tard par les avocats des victimes, lors d'une perquisition au siège de Wyeth-Ayerst, où la présidente de Servier Amérique déclare à son homologue américain qu'il faut trouver des moyens de nous 'neutraliser'. Après le temps nécessaire au développement du protocole, le recrutement des centres et l'obtention des accords des comités d'éthique, SNAP a recruté des cas d'HTAP et des témoins à compter de septembre 1996, jusqu'en décembre 1997. SNAP conclura : "L'ampleur de l'association avec l'HTAP , l'augmentation de l'association avec la durée d'utilisation et la spécificité de la fenfluramine sont cohérents avec les études précédentes indiquant que les fenfluramines ont un lien de causalité à l'HTAP". Aux Etats-Unis, l'essentiel des expositions aux anorexigènes étaient le fait de fenfluramines et/ou phentermine.

Notre publication dans le NEJM a connu une grande publicité, aidée en cela par le fait que les éditorialistes choisis par la revue et qui la critiquaient étaient des consultants réguliers de la firme, ce que j'ai révélé à la presse (ils avaient d'ailleurs témoigné en faveur du produit lors de l'audition à la FDA). Ces démarches ont pour le moins agacé Servier Amérique. Divers types de pressions se sont exercées, dont une campagne très vive contre l'évolution de nos résultats entre 1995 et 1996, occultant le fait que nous avions bien indiqué dès 1995 dans le rapport et à la FDA que la prise en compte des préparations magistrales faisait grimper l'évaluation du risque. D'autres pressions se sont déroulées en 1997.

La découverte des valvulopathies par l'équipe de la Mayo Clinic (dont un membre, Michael McGoon, avait participé activement à notre équipe de l'IPPHS) fut le coup de grâce aux produits, retirés du marché mondialement par les firmes pharmaceutiques à partir de septembre 1997.

A noter que nous avons favorisé l'émergence de l'étude SOPHIA (Study Of Pulmonary Hypertension In America) qui a pris le relais de SNAP, c'est à dire à compter de la fin 1997. Le retrait des produits et la publicité sur leurs risque rendait le contrôle du biais de notoriété quasi impossible. SOPHIA conclut néanmoins qu'en l'absence d'une épidémie observable :
" L'association (observée) entre les dérivés de la fenfluramine et l'HTAP est chérente avec les élévations du risque observées précédemment"

4) Aux fins de transparence, il me semble important d'exposer les financements des études.

Le budget de l'étude IPPHS a été défini globalement avec les laboratoires Servier et un observateur (clinicien ayant observé des cas). Initialement fixé à 2 millions

de dollars, il a atteint environ 2,5 millions[4], soit une moyenne, sur 3 ans, et en tenant compte de l'équipe nord-américaine, d'environ 150 000 dollars par an et par pays (fourchette de 50 à 300 000 environ). Le financement se faisait au Centre d'épidémiologie clinique du Jewish General Hospital (JGH) de l'Université McGill (où j'enseignais) et au Centre de recherche sur les risques Inc (CRR), société que je dirigeais, en accord avec le JGH, pour faciliter les dépenses de terrain, notamment hors Canada. Un accord de reversement des sommes non dépensées par le CRR au JGH a été signé et les comptes vérifiés (équivalent de rapport de commissaire aux comptes) du CRR déposés auprès du JGH. Le dernier financement de l'IPPHS et de toutes ses suites a eu lieu en 1996.

Les derniers honoraires versés par Servier pour l'IPPHS (interprétation des cas et des résultats, présentations de l'étude auprès des autorités et divers intervenants) remontent également à 1996.

Par ailleurs, j'ai mené deux autres études financées par Servier dans ma carrière:

a) Une analyse d'une base de données anglaise sur les hypoglycémiants, dont le rapport complet a été déposé auprès du Conseil de pharmacologie du Québec en 1994. L'ensemble du financement (très limité) s'est terminé à cette date. Les jeunes chercheurs qui y avaient contribué ont publié deux articles, l'un méthodologique en 1994, l'autre de résultat en 1997, avec une simple relecture de ma part dans ce dernier cas.

b) Une étude sur l'insuffisance veineuse. Cette étude devait comporter, par contrat, une *'Composante A'* (épidémiologie clinique et développement d'instruments de mesure) et une *'Composante B'* (essai pharmaco-économique d'un des produits de Servier). La Composante B a été annulée du fait de la dégradation des rapports avec Servier suite à l'IPPHS. La collecte des données de la partie A par nos équipes s'est déroulée jusqu'à son terme en 1997, mais le dernier financement reçu de Servier est antérieur. Les chercheurs ont publié sur ces données de la composante A pendant plusieurs années (jusqu'en 2006), en mettant mon nom dans certaines des publications au titre du rôle initial que j'y avais joué.

5) J'en viens maintenant à mon activité à la direction générale de la santé.

J'ai pris mes fonctions en août 1999 et les ai quittées en août 2003. A ma connaissance, aucun produit avec l'indication d'anorexigène n'était sur le marché pendant cette période. On ne m'a à aucun moment indiqué que le Médiator avait fait l'objet de questions sur son utilisation détournée à cette fin, ni d'une enquête pour sa parenté chimique avec les fenfluramines. J'ai la faiblesse de penser que, si cela avait été le cas, j'aurais agi comme je l'avais fait auparavant vis à vis de ces

[4] Par comparaison, l'étude SOPHIA (Study Of Pulmonary Hypertension In America), menée par Harvard pour confirmer nos résultats aux Etats-Unis, financée par Wyeth-Ayerst, a eu, selon mes informations, un budget de 6 millions de dollars. Elle a recruté plus de patients que l'IPPHS mais dans seulement 12 centres. Bien que confirmant les résultats de l'IPPHS, la méthodologie de SOPHIA a été jugée moins valide par les revues scientifiques du fait notamment du biais de notoriété après le retrait des fenfluramines et a connu beaucoup de difficultés de publication.

produits, et fait prendre, s'il le fallait, les mesures nécessaires. Le fait est que je n'en ai jamais été saisi.

J'ai pu récupérer les archives pour l'ensemble des points abordés dans cette note et les tiens à votre disposition.

Je vous prie de recevoir, Monsieur l'Inspecteur général, mes salutations distinguées.

Professeur Lucien Abenhaim

COMPTE RENDU

Nous nous sommes réunis à Strasbourg, le 5 mai 1993, pour décrire les rapports entre l'IPPHS et le Réseau français de Pharmacovigilance.

Deux impératifs s'imposent :

a) éviter d'introduire un biais dans le recrutement des cas d'hypertension artérielle pulmonaire par un a priori sur le rôle des médicaments;

b) respecter le fonctionnement du réseau français de Pharmacovigilance qui implique la déclaration obligatoire des effets indésirables des médicaments au centres régionaux.

L'IPPHS conserve des liens étroits avec le réseau de Pharmacovigilance selon les points suivants :

1. Lorsque des cas d'HTAP sont signalés aux chercheurs de l'IPPHS, avec une référence explicite à la responsabilité possible d'un produit pharmaceutique (quel qu'il soit), il est du devoir des chercheurs d'enjoindre les cliniciens à rapporter ces cas aux centres régionaux de Pharmacovigilance concernés.

2. Les chercheurs ne seront cependant pas "proactifs" à ce niveau, c'est-à-dire qu'ils ne procèderont pas à la déclaration eux-mêmes, puisque le principe d'une étude cas-témoins est, au plan méthodologique, de recruter les cas et les témoins sans égard a priori à leur exposition.

3. En cas de demande exprès de la Commission de Pharmacovigilance, si celle-ci y était amenée par un impératif quelconque - nous nous engageons à ouvrir les dossiers de recherche collectés et à lui fournir les données dont nous disposerons.

4. Le Professeur B. BEGAUD, membre du Conseil scientifique de l'IPPHS, peut agir comme relais (informel) avec le Professeur P. BECHTEL, Directeur du Centre régional de Pharmacovigilance de Besancon, chargé de l'enquête officielle de Pharmacovigilance sur la dexfenfluramine.

I - OBJECTIFS DE LA REUNION

Cette réunion avait pour objectifs :

- d'échanger des informations entre différents intervenants dans l'évaluation du dossier,
- de contribuer à juger de l'évolution de la situation,
- de faire le point sur les données disponibles à ce jour.

II - MISE A JOUR DE L'ENQUETE OFFICIELLE

1) Le nombre de cas

• Madame M. DAVID (C.R.P.V. de Besançon) présente un point évolutif des données recueillies au cours de l'enquête officielle de pharmacovigilance.

• L'enquête officielle, présentée devant la Commission Nationale de Pharmacovigilance le 17 Juin 1993, avait permis de recueillir jusqu'au 1er Décembre 1992 :

- 28 observations concernant la dexfenfluramine et,
- 11 observations concernant la fenfluramine.

A ce jour :

- 10 nouvelles observations concernent la dexfenfluramine et,
- 5 concernent la fenfluramine,

Cependant, ces nouveaux cas n'ont pu être encore expertisés par M. le Pr WEITZENBLUM.

5 dossiers recueillis par les C.R.PV mais transmis à l'I.P.P.H.S. n'entrent pas dans cette analyse.

La répartition de ces cas selon les critères établis par M. le Pr WEITZENBLUM se fait comme suit :

ISOMERIDE

ENQUETE (jusqu'au 01/12/92) / (Nouveaux cas)
28 (10)

	TOTAL	C.R.P.V.	A. BECLERE	LABO (non CRPV, non A.Béclère)
H.T.P.	14+(5)	4+(1)	5+(1)	5+(3)
H.T.P. (dossiers incomplets)	4+(3)		2+(2)	2+(1)
H.T.P. Post capillaire	3+(1)	1		2+(1)
H.T.P. Modérée	2+(1)			2+(1)
C.I.A.	2		1	1
DIVERS	3			3
TOTAL	28+(10)	5+(1)	8+(3)	15+(6)

PONDERAL

ENQUETE (jusqu'au 01/12/92) / (Nouveaux cas)
11 (5)

	TOTAL	C.R.P.V.	A. BECLERE	LABO (non CRPV, non A.Béclère)
H.T.P.	3+(2)		1+(1)	2+(1)
H.T.P. (dossiers incomplets)	3+(1)	1	1+(1)	1
H.T.P. Post capillaire	1+(1)			1+(1)
H.T.P. Modérée	4+(1)	1		3+(1)
TOTAL	11+(5)	2	2+(2)	7+(3)

2) Les évolutions

En matière d'évolution de la maladie chez ces patients atteints d'hypertension artérielle pulmonaire, on relève :

- parmi les 38 cas (10)* où l'ISOMERIDE® est cité :

  - 7 améliorations (1),
  - 16 stables (5),
  - 5 transplantations pulmonaires (1), dont 2 décédés (0),
  - 6 patients en attente d'une transplantation pulmonaire (2) dont 4 décédés (2),
  - 1 patient décédé d'une décompensation rapide (1),
  - 3 évolutions inconnues (0),

- parmi les 16 cas où le PONDERAL® est cité :

  - 3 améliorations (1),
  - 4 stables (1),
  - 3 patients en attente d'une transplantation pulmonaire (0) dont 2 décédés (0),
  - 2 évolutions inconnues (1),
  - 1 patient décédé accidentellement.

Au total, concernant les évolutions défavorables, 7 patients sont décédés (dont 4 étaient en attente d'une transplantation pulmonaire), 2 sont en attente d'une transplantation pulmonaire et 5 ont été transplantés (dont 2 sont décédés).

3) Les facteurs de risque

La revue des différentes observations met en évidence la présence de nombreux facteurs de risque connus de l'hypertension artérielle pulmonaire tels que l'hypertension artérielle, l'obésité, les contraceptifs oraux, la préexistence d'une dyspnée, un traitement prolongée ainsi que le syndrome de Raynaud et la migraine.

Mr SIMONNEAU réfute cependant les contraceptifs oraux comme un facteur de risque et rappelle par ailleurs que ces traitements sont habituellement poursuivis chez les femmes présentant une hypertension artérielle pulmonaire primitive.

M. BECHTEL précise que ces hypertensions artérielles pulmonaires semblent apparaître pour des posologies élevées ou des traitements prolongés, ce qui pourrait être lié à un problème de métabolisme dû au polymorphisme métabolique de la fenfluramine.
On ne possède d'ailleurs pas d'étude de corrélation dose/concentration pour cette molécule. M. BECHTEL va collaborer avec le service de M. DUROUX pour étudier ce polymorphisme.

La multiplicité de ces facteurs associés souligne les difficultés rencontrées lors d'une approche classique de pharmacovigilance et la nécessité de disposer d'une étude épidémiologique.

()* : cas notifiés depuis le 01/12/92

III - L'I.P.P.H.S.

- M. ABENHAÏM rappelle quelques caractéristiques de l'étude I.P.P.H.S.
Cette étude doit permettre le recrutement de :
  - 100 cas incidents (diagnostic fait après le 01/09/92),
  - 400 témoins appariés selon l'âge et le sexe,

ainsi que des cas prévalents (diagnostic fait entre le 01/01/92 et le 31/08/92) afin de disposer d'une base de comparaison.

Les effectifs sont calculés pour mettre en évidence un risque supérieur à 4.

- En France, le recrutement a effectivement débuté après le 30 septembre 1992 et dans les autres pays concernés (Royaume-Uni, Pays-Bas, Belgique, Suisse) à compter du 1er mars 1993. Au total, 150 centres participent à cette étude.

- A ce jour, environ 150 cas d'H.T.A.P. ont été recueillis, dont 66 ou 67 cas incidents correspondant à l'ensemble des critères déterminés.
Pour l'analyse intermédiaire, 49 cas ont été interviewés, tous revus par le Comité Scientifique International, ainsi que 129 témoins.

La répartition, selon les pays, se fait comme suit :

France	31
Royaume-Uni	8
Belgique	7
Pays-Bas	3
Total	49

Le codage et l'informatisation de ces dossiers est en cours de réalisation.
Au rythme actuel, la fin des inclusions pourrait avoir lieu courant l'été 94. L'analyse intermédiaire ne pourra être disponible qu'au cours de la seconde semaine de Mars 1994.

Le problème du recrutement des témoins est soulevé, notamment le problème de l'appariement sur le poids.

Le recrutement de témoins et l'interview de l'ensemble des patients sont longs. Il est indispensable pour chacun d'eux d'établir l'histoire de vie du patient afin de retrouver la période d'apparition d'une première dyspnée (date index) à partir de dates signifiantes dans la vie d'un individu.

Deux types de validation ne pourront être réalisées avant l'analyse intermédiaire.
Il s'agit de :

- l'étude du biais de déclaration des cas,
- la validation de l'information collectée.

IV - CONCLUSIONS

Cette absence de validation est susceptible d'affecter considérablement la fiabilité des décisions éventuellement engendrées par les résultats de l'analyse intermédiaire, ce d'autant que le nombre de témoins paraît insuffisant.

Ces résultats doivent donc être analysés avec circonspection. Dans ces conditions, l'utilité même de disposer d'une telle analyse intermédiaire, y compris vis à vis de l'avenir de l'étude, peut être remise en cause.

Cependant, cette analyse intermédiaire dont la possibilité est prévue dans le protocole initial a déjà été officiellement demandée au Comité Scientifique International de l'I.P.P.H.S. par les autorités françaises car, le nombre de cas d'H.T.A.P. survenant en France pose un réel problème de Santé Publique.

Compte tenu de l'absence de résultats de l'analyse intermédiaire et de faits nouveaux, la Commission Nationale de Pharmacovigilance ne semble pas devoir être immédiatement saisie de ce dossier.

WARNING

The recruitment of patients in the IPPHS is not yet terminated. Thus, the findings reported in the present document only involve half the number of patients originally planned in the protocol and less than one third of the needed control group.

Hence, the results presented here should be interpreted with extreme caution, even if some of these results reach the conventional levels of so-called "statistical significance".

A final report will be released at the end of the study with analyses made on the entire study population. Considering the work already done in the implementation of the study and the analysis, and at the present pace of recruitment, we are confident that the recruitment of cases will be completed during the summer of this year, that is exactly on schedule.

This report is endorsed by all the members and scientific advisors of the IPPHS. It will be released, at his request, to Professor Jean-Louis IMBS, President of the French Pharmacovigilance Commission (letter dated January 24, 1994) and to Dr Laurent Perret, President of the Institut de Recherche Internationales Servier (IRIS). Results should remain strictly confidential and the present document is not to be circulated under any circumstances, nor cited.

We wish to thank the Institut de Recherches Internationale Servier who has sponsored this study and has allowed us to work in total independence.

1. INTRODUCTION

The following report summarizes the findings obtained in an intermediate analysis of data so far collected in the International Primary Pulmonary Hypertension Study (IPPHS), a large scale epidemiologic case-control study conducted in 5 European countries (France, United Kingdom, Belgium, The Netherlands and Switzerland). The complete protocol may be found in Appendix.

Two major factors prompted the conduct and the release of an intermediate analysis of the IPPHS data. First, this analysis was planned in the original protocol where it was stated that it should be done upon the recruitment of 50 cases. Not doing it would be considered as a breech of the protocol. Second, it was formally requested by the French Pharmacovigilance Commission.

While an intermediate analysis is almost considered as standard procedure in clinical trial settings, such an analysis is rarely officially released in the context of observational studies where retrospective data are collected. The conduct of the study has in itself no impact on the risk factors studied since the exposures occured several months or years before the outcome at end.

The objectives of the intermediate analysis were:

1. To identify potential problems with the ongoing study in order to eventually reappraise the study methods. This includes potential biases, logistics problems and inconsistencies in the type and formats of the variables collected

2. To conduct a preliminary assessment of the effect of risk factors selected a priori on the occurrence of PPH.

2. METHODS

2.1 Feasibility study

A feasibility study was conducted in may 1992 in France. Four approaches were taken:

1. One hundred and ten (110) Divisions of Pneumology and/or Cardiology of University Hospitals in France have received a letter asking them to participate in the study (two mailings). Seventy-eight of them (78%) have responded and 1 has refused. The remainder have not responded. All the major centres have actually consented to participate, including the referring centres and transplantation centres. Of the respondents, 22 had seen no cases in the past year, 28 had seen 1 to 2 cases per year, and 9 had seen more than 2 cases per year. Nineteen (19) did not report the number of cases that they had seen. Nine other centers later on accepted to participate.

2. A field feasibility study has been conducted during the month of May 1992 (4 weeks) in the Aquitaine region of France (around Bordeaux). This region represents a catchment population of approximately 4.2 million inhabitants. The heads of the divisions of Pneumology (3), Cardiology (8), Internal Medicine (6), Chest Surgery (2) and Intensive Care units (4) of the five University and Military Hospitals have been contacted in the region. Three (3) large private clinics were also surveyed. Finally, 32 local hospitals were contacted. They were all visited whenever they declared that they had diagnosed a PPH case in the preceding 16 months. Seventeen (17) cases were found. After applying an algorithm for case-ascertainment, 7 cases were considered meeting the inclusion criteria for the study. Extrapolating these results, when applied to the whole of France, this figure would lead to 72 potential "validated" cases per year in this country.

3. Forty-two (42) private cardiologists and 18 pneumologists were randomly selected among the list of cardiologists practicing in the Aquitaine region. They were contacted by telephone. The objectives of this survey were: (i) to validate the patterns of referral of PPH cases seen by private cardiologists; (ii) to possibly identify more cases of PPH that would have been missed in the hospital centres. Forty-one declared that they would refer a case of PPH for treatment and/or confirmation of diagnosis to a University Hospital, 9 to a private clinic and 10 to local hospitals. It was confirmed that most of these cases would however end up in a University Centre. These centres were among the 23 surveyed. Two potential cases of PPH had been seen by the private cardiologists in the 16 months preceding the interview. These 2 cases were among the 17 found in the survey of the University Centres.

4. Mortality data from France (INSERM) and The Netherlands indicate that approximately 20 individuals per 10 million inhabitants die each year with a primary or secondary diagnosis of PPH.

From these results, we concluded that the incidence of PPH in a country like France was in the order of 2 per million inhabitants and per year.

The five countries involved in the study altogether have 150 million inhabitants, with a maximum expected number of 300 incident cases per year. It was estimated that 50% of the cases would meet the inclusion criteriae for the study and that 50% of them could be recruited, i.e: a maximum of 75 per year. To allow for the uncertainty in the incidence, it was planned that 100 cases could be recruited over 2 years.

2.2 Main study

Centres

The IPPHS has been launched in september 1992. Its objectives are to identify risk factors for primary pulmonary hypertension (PPH). All suspected risk factors are considered. A large series of other variables are explored in the absence of epidemiologic data on the disease.

In the 5 countries, all centres susceptible to see PPH cases were contacted in order to sollicitate their participation.

Centres were asked to report their cases by sending a pre-addressed post-card to the local research team (LRT) established in each country (Switzerland was managed by the same LRT as France). All the Centres were contacted regularly (every three months) by telephone in order to verify that all their cases were reported. They also received regular reminders by mail. In France, a special series of conferences was organized in 7 cities where the main referal centres for PPH are located (Paris, Strasbourg, Lyon, Marseille, Nice, Bordeaux and Nantes). More than 40 clinicians from the participating Centres in the five countries attended a special one day symposium at the Conference of the American College of Chest Physicians in Chicago where the rationale and methods of the study were presented.

Cases

Inclusion criteria: The required tests are detailed in the protocol attached in appendix.

Only cases who were diagnosed as PPH after september 1st, 1992, were considered as "incident cases" and thus eligible for this study. The date retained for the diagnosis was the date of the catheterization. Cases diagnosed before but reported to the study teams were considered as "prevalent cases" and were not used for this study. However, clinical data were collected for a number of those cases, in particular those diagnosed between January 1st, 1992 and August 31, 1992. For the analytical part of this intermediate analysis (case-control analysis), the study population was restricted to only those 50 cases who were incident, alive, interviewed and who had matched controls.

Screening: A screening of cases reported is made over the phone or on site by a physician who verifies that the inclusion criteriae for the study are met.

Extraction of medical data: Whenever a case is considered as admissible for the study, a pulmonary physician or a cardiologist, appointed by the LRT in each country, goes on site to review the medical chart and extract the data for the study.

Case validation: All of these cases have been reviewed by the International Review Committee (experts from the United States and Canada) and only those who were considered as very likely or

likely PPH cases were retained. Results of all tests (including catheterization) were considered, and copies of X-Rays, CT-Scans and other imaging techniques were obtained for the majority of cases. When these images were not available to the review committee, cases were given a lower rank of appropriateness for the study.

Controls

Up to four controls per cases are recruited. As stated in the protocol, controls are patients who consult the same general practitioner (GP) as the case. If not possible, another GP practicing in the case's neighborhood was selected. However, due to logistics reasons, all matched controls have not been interviewed at the time of this intermediate analysis. Hence, other individuals who met the matching criteria for these cases were found elsewhere: controls of cases who died before the interview or who were rejected after the interview, controls of prevalent cases (not considered in this intermediate analysis), controls of other cases included in the analysis who have several controls.

Interviews

Interviews were conducted by specially trained interviewers who were blinded on the objectives of the study. They had no medical background. Drug use was elicited through a five step procedure (see below).

Index date

The index date corresponds to the date of onset of symptoms of the case (mainly dyspnea). This date was used as the index date for the matched controls. All exposure were considered only if they had started before this index date.

General Variables

The following variables were included in the analyses:

1. *Demographic characteristics:* age, gender, race (not reported).
2. *Clinical profile:* catheterisation data, chest x-ray, lung perfusion scan, angiogram, symptoms, pulmonary function tests, blood chemistry, blood gases, anti-nuclear antibodies.
3. *Other disease characteristics:* family history of PPH.
4. *Medical history:* due to the large number of disease types, past diseases and co-morbidity were classified, for this analysis, into ICD-9 broad classes, with the exception of cardiovascular and respiratory diseases which were more detailed.
5. *Medical family history:* classified into ICD-9 broad classes
6. *Blood group:* A, B, O and Rhesus.
7. *Pregnancies:* pregnancies before the index date.

8. *Obesity:* Obesity before the index date was assessed by the body mass index (weight divided by height squared). The highest weight in the past was used as a marker for obesity before the index date. The cut-off to define obesity was databased and defined as the upper 25th percentile of the distribution of body mass indices among controls (BMI=30).
9. *Habits:* smoking, coffee, tea, herbal tea, alcohol, food habits (cheese, chocolate, paté, smoked meat, game meat, yeast extracts) were considered before the index date and after.
10. *Behaviour:* conducive to weight loss or preoccupation with figure: use of artificial sweeteners, natural foods, past episode of anorexia, dieting, weight loss before index date, plastic surgery before index date, sports.
11. *Low or high pressures:* Altitude, plane trips, scuba diving

Drugs

Analyses of drug exposure was conducted in two different perspectives:

1. Testing of hypotheses: the association between drugs selected a priori and the occurrence of PPH was assessed with the following: anorexigens (amphetamine-like drugs, fenfluramine, dexfenfluramine), oral contraceptives, thyroid extracts.

2. Generating hypotheses: some associations were discovered during the bivariate analyses and are reported.

For the adjustment of models, co-medications were classified into broad classes according to the Anatomical Therapeutical and Chemistry Classification (1993).

Ascertainment: only drug use as reported in the face to face interview were considered for this intermediate analysis. The information appearing in the cases medical charts were not used in order to maintain comparability of data between cases and controls. However, in a later stage, these informations will be used to validate the questionnaire data and also to estimate potential information biases in the study. Five methods were used to obtain this information: 1) history of life events drug use; 2) medical history/drug use; 3) drug spontaneously reported; 4) eliciting of drug use by presentation of drug listings; 5) presentation of a visual display with selected packages.

Parameters: The following parameters were used to study past exposure to drugs:

- *time window:* in the absence of an accepted model for the physiopathologic process of the disease, it was decided that any exposure that acts on the vasoreactivity would be considered as a potential risk factor for the disease process and that this effect could be immediate or delayed. Exposure was considered for all times before the index date. A

specific analysis was done for exposure that occured between August 1989 and the index date, because of the better accuracy of data available for this period. Exposure after the index date was documented but not considered in risk analysis models. (Note: persons who had exposure in more than one of these time periods were considered as exposed provided that they had exposure before the index date).

. *duration of exposure:* the duration of exposure during the risk period was measured in number of days of treatment before the index date. Occasional and intermittent use were recorded as a categorical variable. Because of the small numbers involved, this results are not reported with the intermediate analysis.

Anorexigens: Anorexigens where more indepthly studied tahn other drugs. Their use was expressed in the following categories:

1) Use of fenfluramine or dexfenfluramine (F/DF) only;
2) Use of amphetamine-like drugs only (including Amfepramone, Mazindol, Clobenzonese, Fenproporex),
3) Multiple use of anorexigens, at least one product being F DF;
4) Multiple use of anorexigens, at least one product being amphetamine-like;
5) Use of both F/DF and amphetamine-like drugs;
6) Use of at least one anorexigen.

Statistical analysis

Descriptive analyses: categorical data are reported as frequency distributions and continuous data are reported by the mean, standard deviation, median, minimum and maximum values. When necessary, heterogeneity between countries or genders were assessed by the chi-square statistics (for categorical data) and the Z statistics (for continuous data).

Bivariate analyses: In these analyses, data from cases were compared to those from controls. Hence, only the information available on both groups was used. Differences between cases and controls were assessed by the chi-square test for categorical variables and the Z score statistics for continuous variables.

Adjusted odds ratios: The magnitude of the effect of selected risk factors on the occurrence of PPH was assessed by the odds ratio, an estimate of the relative risk. In order to control for possible confounders, multivariate analyses were conducted. The main variables in the models were exposure to the drugs of interest (see above). In addition, the following variables were included in the models: marker of obesity (see above), systemic hypertension, pregnancies, behaviour conducive to weight loss (other than drug use) (see above). The odds ratios presented are also controlled for a series of variables which were statistically different between cases and controls. All these analyses were matched.

The uncertainty associated with odds ratio estimates was assessed by the 95% bilateral confidence interval. All statistical analyses were conducted using the Statistical Analysis System (SAS), version 6.0. Multivariate analyses were conducted using the Egret Statistical package.

Country effect: The characteristics of patients reported to the study may differ in the countries included in the study. The influence of drug use on the reporting may vary as the publicity made on the study and possible associations differ. This would also allow to identify possible differences associated with the varying prevalence of some exposures from country to country.

Effect of the reporting centre: some centres may be specialized in treating PPH with defined characteristics. One centre having reported more than half of the cases recruited in France, those cases were compared to the cases from other centres on a number of variables.

3. RESULTS

3.1 Study population

Three hundred and six (306) centres were contacted in the five countries, of which 223 (72.9%) have accepted to participate in the study. The distribution of centres by country are presented in Table 1.

Two hundred and fifteen (215) cases of PPH were identified altogether (Table 2). After a first creening, 105 of them did not meet the inclusion criteria for the study (in Belgium and the Netherlands, the screening was mainly done on site and the number of cases not admissible was not recorded). Reasons for exclusion were based on the date of diagnosis, the availability of catheterization data, age and other criteria listed in the protocol. A total of 110 incident cases of PPH (diagnosed after September 1st, 1992) were considered admissible after the first screening. The detailed description of the study population recruited so far is presented with Table 3.

Sixteen (16) patients died after reporting or were actually dead at the time of reporting.

The Review Committee has assessed 89 cases, of which 68 were accepted for the study, 15 were rejected, 6 have not been categorized yet. Among the 83 categorized, the success rate was 81.9%.

Three (3) cases could not be interviewed for various reasons (refusal, unable to be contacted, unable to be interviewed, leaved the country). For 16 patients, medical data were not extracted by the time of the intermediate analysis and 9 others had not been

interviewed.

It is worth noting that there are several elligible cases in process of data collection. If the same rate of success applied to this set of subjects as for the cases so far, we would have approximately 20 more cases available in the next few weeks.

One hundred and twenty three (123) matched controls could be used for the intermediate analysis, that is an average of 2.46 controls per case.

The distribution of cases and controls per country available for the intermediate analysis is presented in Table 4.

3.2 Clinical presentation of cases

All the available incident cases were used to describe the clinical profile of PPH cases. Table 5 presents the data for the main clinical parameters. The clinical characteristics of the case patients in our study are extremely similar to the patients included in the NIH registry. One can consider the cases as corresponding truly to primary pulmonary hypertension as defined by internationally recognized standards.

3.3 Comparison of cases and controls

- General risk factors

1. *Habits:* As shown in the table 6.1, cases and controls before the onset of symptoms of PPH were very comparable in their smoking and drinking behaviours as well as in their eating habits. As expected, cases changed their habits after the onset of symptoms (results not shown).

2. *Behaviour conducive to weight loss or preoccupation with figure:* According to the markers used in the study, cases and controls were as likely to be conscious of their weight or figure, with the exception of laxative and anti-obesity preparation use before the onset of symptoms where a greater proportion of cases were using these products (table 6.2).

3. *Obesity:* Cases had a greater body mass index (BMI) than controls (median 28.30 versus 25.50).

4. *Pregnancy:* There was no significant difference between cases and controls in pregnancies before the onset of symptoms of PPH, 36 cases (76.6%) and 91 controls (85.1%)(p=.204) having had at least one pregnancy.

5. *Blood group:* No statistically significant differences (Table 6.3).

6. *Sexual partners:* The majority of interviewees answered they only had 1 sexual partner in the last 10 years. 24.0% of cases and 21.5% of controls have had 2 or more. The difference between cases and controls was non significant (p=.614).

7. *Other suspected risk factors:* there was no difference between cases and controls in their exposure to altitude, utilization of planes and the practice of scuba diving (Table 6.4).

Co-morbidity and family history

Cases reported less comorbid conditions before the index date than controls. This was particularly the case for heart disease and musculo-skeletal complaints, where the adjusted odds ratios were borderline to significance (OR = 0.5 and 0.3 respectively, with p=0.06 in both instances).

For most conditions, cases and controls were fairly homogeneous with respect to family history. However, significantly more controls than cases had a family history of heart disease disease (63.6% versus 46.0%, p=.033) and of arthritis (29.8% versus 12.2%, p=.017) (Table 6.5).

These statistical differences between cases and controls was controlled for in the multivariate analyses (all presented adjusted odds ratio). As stated in the discussion further below the differences in co-morbid conditions and familial history are not likely to have confounded the results presented here.

All classes of drugs

Table 7 presents the results of the bivariate analyses for the exposure to all drugs studied, presented by ATC sub-classes. Of the 68 comparisons made, only two appeared significant, that is the use of laxatives and of anti-obesity preparations.

Exposure to anorexigens

Tables 8.1 to 8.5 and 9.1 to 9.5 show the distribution of exposure to anorexigens in cases and controls of the four countries were incident cases were available for the case-control analysis (France, the United Kingdom, Belgium and The Netherlands).
Four categories for individual drug consumption were first considered:

1) use of at least fenfluramine or dexfenfluramine (F/DF)
2) use of at least one amphetamine-like anorexigen
3) use of F/DF and of an amphetamine-like anorexigen
4) use of at least one anorexigen.

Table 8.1 shows that 6.5% of controls had used at least one of these drugs in the past (all exposures). The exposure varied greatly between countries (Tables 8.2 to 8.5), France and Belgium

having approximately the same level of exposure in controls (10.5% and 9% respectively), while none of the controls in the U.K. and Netherlands were exposed. This absence of exposure in the later country is likely to be due to the very small numbers involved (50 controls altogether), but the differences observed reflect well the differences in the sales of these drugs in France and Belgium on the one hand vs UK and The Netherlands on the other hand.

When only the exposure between August 1989 and the index dates were considered (Tables 9.1 to 9.5), 3.3% of all controls had taken an anorexigen, the numbers being 5.3% and 4.5% in France and Belgium. The time window considered being in practice of about 2 years for most cases, these percentages of exposure appear to be very close to sales figures. The percentage of cases exposed were accordingly of 20.0% for all countries altogether. Thirty percent (30.0%) of cases had used an anorexigen.

The percentage of cases exposed at any time in the past varied also between countries, from 43.3% in France to no exposure in the Netherlands (Tables 8.2 to 8.5). The latter figure is however based on only 4 cases. In Belgium, one case who had been exposed to F/DF and to an amphetamine-like drug was reported as non exposed in Tables 8.4 and 9.4 apparently because of technical problems. We found out this only after all the analyses were done. If this case was counted, the percentage of cases exposed (corrected number: 28.6%) would become closer to that of France, in particular for the shorter time window.

The homogeneity of the reporting of cases was assessed by comparing the main reporting centre in France to all the other centres of that country (Table 10). In this analysis, the exposure to F/DF only, to amphetamines-like drugs only, to F/DF+amphetamines-like drugs and one anorexigen at least are reported. It appears that the percentage are very comparable, for both time-windows considered, and for all the categories of exposure, despite the relatively smaller numbers.

Tables 11.1 and 11.2 present the relative risks associated to anorexigens after adjustment for the risk factors which were selected a priori and for those who appeared significant in the bivariate analyses (hypertension, high BMI, pregnancy, oral contraceptives, laxatives). It appears that the use of at least one anorexigen was associated with a relative risk (estimated by the odds ratio) of 5.3 and 5.7 respectively for each time-window (best estimates). The best estimate of the relative risk was 5.5 and 6.2 for all past exposures to amphetamine-like drugs and fenfluramine derivatives. Although the confidence intervals are wide (and include 1 for amphetamine-like drugs), the results appear very stable across time windows and with differing combinations of exposure tested.

When exposure to only one of these compounds was considered, the best estimates of the relative risks were smaller (2.7 and 4.0),

and it was higher when exposure to both these categories of compounds had occured (8.7).

Table 12 presents the multivariate analysis with the effect of the main suspected risk factors, also controlled for co-morbidity. As expected, the best estimate of the relative risk for anorexigens remains of the same order of magnitude (5.8). None of the other factors appear significant, altough a tendency might be demonstrated for hypertension (best estimate of 2.3), oral contraceptives (1.8) and laxatives (3.3).

4. DISCUSSION

Recruitment

We have recruited 74 validated incident cases (including the dead) in France, 11 in Belgium and 11 in the Netherlands over 15 months. Considering that many cases could not been kept in the study because of our very strict inclusion criteria, these figures are not inconsistant with the number of cases expected each year (2 per million according to our feasibility study). It is likely that we have missed a number of incident cases, but we do not feel that this could be a very important phenomenon. Actually, we had estimated in our feasibility study that 72 admissible per year would occur annually. Our criteria for admissibility in the feasibility study were less strict than those actually applied in the main study. We have contacted very frequently all the centres involved. The local research teams have positively harassed the participating centres. In our systematic visit to the main centres of 7 French cities, (Paris, Strasbourg, Lyon, Marseille, Nice, Bordeaux, Nantes) we had no basis to consider that a large number of cases could have been missed.

The only country which clearly differs from the others as far as the recruitment of cases is concerned, is the UK were only 14 cases could be considered for the study so far. However, 66 cases had been identified (compared to 107 in France for instance). The ratio of identified cases to inclusion is greatly in disfavor of the UK. Among possible explanation are the smaller rate of catheterization and the delay for referal to specialized centres. Both these phenomenons would result in a lower rate of inclusion in the study. On the basis of this intermediate analysis, it appears urgent to analyze the reasons for this discrepancies.

Switzerland has joined the study only lately. Only francophones cases are considered because of the load involved in the traduction of the material in the 3 other official langages of that country. Thus, the catchment population for the study is about 1.5 million. With a rate of recruitment similar to the other countries, 0 to 2 cases were expected over the period of recruitment, while none were found.

A number of other incident cases are in the process of data collection. On the basis of the present rate of success in the validation of cases and conduct of the interviews, approximately 20 other cases should be available very soon.

The recruitment of controls is doing well. It is a little bit slower than the recruitment of cases, but this is to be expected in view of all the steps involved to obtain access to the controls to be interviewed.

Sample size

Another important weakness lies in the small number involved at this stage. Only a few cases more in one or another cell of the database would result in significant differences. Association that do not appear "statistically significant" now could very well be confirmed when more subjects are involved. The absence of exposure to anorexigens in some categories of controls, in some countries, is an exemple of the lack of accuracy of the estimates, since the drugs are marketed in all the countries considered. This weakness will be largely overcome by the end of the study, when three times as many control subjects will be available.

Validity of the results

Cases and controls were extremely comparable for all the risk factors studied. The only differences found were on comorbidity and familial history of heart and musculo-skeletal diseases, were controls were found to have more of these diseases than cases. It is difficult to know what this phenomenon means at this stage. The four hypotheses proposed are:

i) selection bias of physician-based controls (the visit to a GP being prompted by a complaint): this could in particular explain the difference in mild conditions such as muscult-skeletal disorders);

ii) selection bias of cases: cases with preexisting heart conditions were excluded because of the doubt on the primary nature of their PPH. They were not excluded from controls.

iii) underreporting of mild conditions by cases;

iv) chance alone.

All these hypotheses should be explored rigourously in the next phase of the study. It was originally planned to match the controls to the cases on the basis of the number of visits to physician per year. This appeared impossible to be done in practice. Doing it would have possibly controlled for this bias. We could explore further the possibility to a posteriori perform a matching of cases and controls on this variable. We could also consider heart disease as an exclusion criteria for controls. Underreporting of co-morbid conditions should also more indepthly be assessed in cases. Another possibility is to recruit the next controls through another source (e.g community controls).

In any case, it is unlikely that these biases, if they exist, may have confounded the results presented here. To be a confounder, a variable should be associated both with exposure and to the outcome. musculo-sketal disorders do not fit with this definition. Heart disease might be associated with the risk of PPH (actually here it would diminish the probability of being considered as a case). It is unlikely that it was associated with the other exposures, although it should be explored. Very reassuring are the facts that for almost all the risk factors studied, including smoking and other habits that might be associated with heart disease, we did not find any difference between cases and controls. Thus, it is very unlikely that this could have had an effect on the variables that are found significantly associated with PPH in the result section.

Reporting biases

The potential reporting biases could not be controlled for at this stage. There has been a wide publicity especially in France around the possible association between anorexigen, and in particular fenfluramine and dexfenfluramine, and PPH. That could have affected the reporting in both directions: some clinicians could have been more likely to report cases exposed, while other could consider anorexigen-exposed cases as "non primary". We have hints that both phenomenons have occured for a little number of cases. We do not know what the magnitude of these phenomenons are. We are in the process of validating the reporting.The participating centres will be audited in the next months: (i) all centres who reported cases will be visited in the next months to ensure that there was no biases in the reporting and (ii) a sample of non reporting centres will be visited as well. (iii) cases included in the study will be compared to non included ones. The fact that there is no difference in the percentage of cases exposed identified in the main reporting centre from France as compared to all other centres is reassuring. The delay of diagnosis in anorexigen exposed PPH patients could be shorter, which would result in a higher proportion of cases exposed in the study than is actually the case.

Questionnaires

The questionnaire has not been fully validated yet. In order to keep the interviewers blind to the objectives of the study, we have not been able to perform some checks. These will be done at the end of the study. In all studies using questionnaires, there is room for recall biases. An obvious possibility is that cases would be more likely to recall their exposure to anorexigens derivatives than controls. In France especially, there has been a wide publicity made towards cardiologists and pulmonary physicians regarding the possibility of the association between fenfluramine derivative use and PPH. Many of the cases interviewed had already been specifically asked by their physician about those drugs. This recall bias could have artificially increased the relative risk presented for those drugs. However, we have no indication that the the exposure of controls has been underestimated.

Consistency

Despite the limitations above-mentioned, it is worth noting that the results regarding anorexigens present a certain consistency. First, the exposure of controls closely paralels sales figure for these drugs in the different countries. The differences in exposures between France and Belgium on the one hand vs the UK and the Netherlands on the other hand is not surprising in view of the differences in sales figure. The analyses being matched, these difference were taken into account in the results reported here. The exposure of cases in France is the same when comparing the main reporting centre to all the other centres. The same magnitude of the odds ratio is found when examining different time-windows, different anorexigens (F/DF vs amphetamine-like drug) and controlling for possible confounders or other significant variables. It is also worth noting that the relative risk seems to increase when several exposures occured to different anorexigens as opposed to exposure to only one of them (i.e. from 4.0 for F/DF alone to 8.7 for F/DF+amphetamine-like drugs). It is difficult to know whether the apparently slightly higher odds ratios in the shorter time window (august 1989 to index date) corresponds to an actual exposure-disease phenomenon or if it is explained by the fewer numbers involved, when only 1 case more exposed would produce this apparent increase. Also, F/DF had a much larger part of the market in this time-window.

5. INTERPRETATION OF THE RESULTS

Relative risks (odds ratio): The results are presented in the form of odds ratios. An odds ratio of 1 signifies that the cases and the controls do not differ in terms of their exposure to a given risk factor. An odds ratio inferior to 1 indicates to what proportion cases are less exposed than controls. An odds ratio superior to 1 indicates to what extent cases are more exposed than controls (e.g.: an odds ratio of 5 indicates that cases are 5 times more frequently exposed than controls).

Whenever a study is unbiased, one can consider that a contemplated odds ratio is a valid estimate of the actual relative risk of having a disease in the patients presenting with the exposure at hand, For instance, in this study, if the results are unbiased, patients exposed to anorexigens would have about 5 times more frequently a primary pulmonary hypertension than comparable non exposed individuals.

Best estimates and Confidence intervals: The so-called best estimate presented for an odds ratio is the value that was observed with the available data. The 95% confidence intervals indicate that, given the available sample size, one is confident that the true odds ratio would 95% of the time fall between the boundaries of the confidence intervals. If one of the boundaries includes 1, it is conventionally considered that the best estimate is less reliable since in more than 5% of the time, with the given sample size, the true odds ratio could actually point in the inverse direction than the presented best estimate. The width of the confidence interval is only a function of the sample size at hand and should be interpreted in keeping in mind other informations available. For instance, The lower bound of the odds ratio for F/DF+amphetamine-like drugs is 0.7 while the lower bound for F/DF alone is 1.1: this reflects well that the boundaries of the confidence interval is mainly a function of the number of subjects available for the analysis.

Causality: In interpreting odds ratios or relative risk to infer that an exposure is a cause of a disease one should, especially when the relative risk is small: i) rule out possible confounders; ii) obtain an understanding of the potential mechanisms of action; iii) examine dose-response relationships. In this study, we have assessed a very wide number of potential confounders and verified to what extent they could bias the results presented, We have not been able to find any reason to believe that the results could be confounded. However, there are still some possibilities that unknown confounders or variables not

controlled for could exist. For instance, the fact that laxatives are asociated with a higher relative risk of PPH is intriguing. One can hardly see why such an exposure could induce the development of PPH. It is very much possible that this association occured by chance alone, in view of the small number involved. It is also possible that the use of laxatives is a marker of an underlying confounder that was not controlled for. If this was the case, the same explanation could possibly apply to anorexigens. In the latter instance, the number of cases and controls exposed is somewhat higher, and the role of chance in the observed results is accordingly much lower. But one cannot at this stage exclude that the use of these drugs is a marker of an underlying phenomenon, although one can hardly know which one. Finally, anorexigens could act as "triggers" in susceptible individuals rather than actually causing the disease. It should be possible to better analyse all these phenomenons when more cases and controls will be available, with the study of time-to-events and of the personal characteristics of cases exposed as compared to controls.

SUMMARY AND CONCLUSIONS

1. The International Primary Pulmonary Hypertension Study (IPPHS) was launched in september 1992. Five countries participate in the study (France, the United Kingdom, Belgium, The Netherlands and Switzerland). Two hundred and six (206) clinical centres participate in the study. Its objective are to identify risk factors for primary pulmonary hypertension (PPH), a rare but very serious disease, with an annual incidence estmated to be around 2 cases per million inhabitants per year.

2. 215 cases of PPH were identified so far from the 5 countries, of which 110 were incident cases, diagnosed after september 1st, 1992. 15 cases were rejected by the expert review committee, 16 had deceased before reporting, before the extraction of medical data or before interview, 3 were impossble to interview (numbers not mutually exclusive). 50 cases could be used for this intermediate analysis. 20 more cases are in the process of validation. The recruitment of cases in the IPPHS is going as expected. The number recruited so far meet the objective set in the protocol and the target number of 100 validated cases within 2 years after the launch of the study are very likely to be met. Also, the quality of the cases correspond to international standards and fully respect all the inclusion and exclusion oriteria for the study.

3. Up to four controls are recruited by case. They are identified through general practionners. The recruitment of controls is doing well. It is a slower than the recruitment of cases, but this is to be expected in view of all the steps involved to obtain access to the controls to be interviewed. 123 controls, matched to the 50 cases, could be used for this intermediate analysis. These controls are very much comparable to the cases on all the requiered variables. Exception to this are some variables associated with co-morbidity, which are not likely to have confounded the results presented here. This should be easily controlled for in the future and was actually controled for in the presented intermediate analysis.

4. Cases and controls are interviewed by specially trained interviewers with a material adapted to each country. The questionaire are in the process of validation. A very wide range of factors are studied. A priori hypotheses concerned anorexigens, oral contraceptives, use of thyroid extract, obesity, hypertension, pregnancy and familial history of the disease. Hypothesis generating is undergone on lifestyle habits (smoking, dietary habits, consumption of alcohol, cafeine, etc), morbid conditions, family history of diseases, exposure to all classes of drugs and other factors. Exposures considered are only those which occured before the beginning of symptoms of PPH (index

date).

5. Univariate, bivariate and multivariate anlyses, were conducted for this intermediate analysis. This analysis had been planned in the protocole of the study, when 50 cases would be available. Its objective are to identify potential areas for adaptation of the study protocol and logistics. The numbers available are small and thus limited the extent of the analysis to be performed.

6. The results of the intermediate analysis are provided to the head of the French Commission for Pharmacovigilance, afer its official request. They are also, accordingly, provided to the Institut de Recherches Internationales Servier, who sponsored the study, and to other regulatory authorities which submit a formal request to the chairman of the IPPHS. The report of the intermediate analysis has been approved by the international scientific board of the study and its scientific advisors, who have all work in complete independence.

7. The best estimate of the relative risk of PPH is 5.8 (1.7-20.1) for all past exposures to anorexigens. Exposure to fenfluramine or dexfenfluramine (F/DF) or to amphetamine-like drugs in isolation are associated with relative risks of 4.0 (1.1 -14.5) and 2.7 (0.2-38.1) respectively, the difference between these product being non statistically significant. The use of both F/DF and amphetamine-like drugs seems to increase the relative risk up to 8.7 (0.7-103.7). The very wide confidence intervals reflect the small sample size available. The results concerning anorexigens appear quite consistant when different time windows are studied, as well as when different combinations of exposure are considered. Despite the wide confidence intervals, it is felt that the best estimates presented here do reflect the order of magnitude of the actual odds ratio associated with these drugs. This result is consistent with the a priori hypothesis of the study.

8. An intriguing finding is the higher relative risk for the exposure before to laxatives [3.3 (0.4-31.5)]. This finding might be due to chance alone or indicate that patients using drugs to loose weight and who develop primary primary hypertension share an unknown risk factor for the disease. This will have to be explored further in the subsequent stages of the study.

9. The mechanisms underlying the observed association cannot be proposed at this stage. Factors explaining a potential individual susceptibility remain to be assessed.

10. There are some indications that two other highly prevalent risk factors which were listed among the a priori hypotheses for the study could be associated with PPH, although the associations are weak and may disappear or be confirmed at later stages of the recruitment. Oral contraceptive use is associated with an odds ratio of 1.8 (0.6-5.9) in this sample and essential hypertension with an odds ratio of 2.3 (0.4-12.6). This will have to be confirmed when the study will be completed. The interaction between all the risk factors for PPH will have to be studied.

11. None of the validation studies for the control of potential reporting and information biases has been completed so far. The study is going well and should be completed on schedule. Some adjustments to the protocol and in the logistics of the study have to be decided.

12. The International Scientific Board of the IPPHS strongly feels that the study should be completed in order to consolidate the data and to analyse the possible role of oral contraceptives, hypertension, laxatives and patterns of exposure to anorexigens, as well as other factors

Table 1: Participating Centres

CONCLUSIONS DE LA REUNION

"STRATEGIE THERAPEUTIQUE DE L'OBESITE"

MARDI 31 MAI 1994

♦

Cette réunion a rassemblé des spécialistes en nutrition, endocrinologie, diabétologie, gynécologie, pédiatrie, pneumologie, médecine interne, pharmacologie, pharmacovigilance et des médecins généralistes. D'autre part, l'avis des spécialistes en hypertension et en cardiologie a été pris.
(La liste des participants est jointe en annexe).

La réunion est présidée par le Directeur de l'Evaluation.

OBJET DE LA REUNION

L'objet de la réunion est d'établir, dans le cadre d'une bonne approche thérapeutique de l'obésité, les indications et les conditions d'utilisation des anorexigènes et plus particulièrement de la dexfenfluramine (Isoméride®) et de la fenfluramine (Pondéral®). En effet :

- Il est bien connu par des études rétrospectives et prospectives que l'obésité est un facteur de surmorbidité et surmortalité cardio-vasculaire.
  L'obésité agit sur plusieurs facteurs de risque : hypertension artérielle, diabète, dyslipémie, et il est établi qu'une perte de poids est bénéfique sur ces pathologies.
  L'obésité est en outre un facteur de risque indépendant (développement de l'athérosclérose).

- Cependant, les résultats intermédiaires d'une étude épidémiologique internationale sur l'hypertension artérielle primitive (International Primary Pulmonary Hypertension Study ou I.P.P.H.S.) examinés le 10 Mai 1994 par la Commission Nationale de Pharmacovigilance, objectivent l'existence d'une association entre l'HTAP primitive et la prise de dexfenfluramine et de fenfluramine : le risque relatif est voisin de 5. Ce risque semble concerner également les autres médicaments anorexigènes ; les résultats définitifs de l'étude pourront le confirmer.
  La durée du traitement pourrait influer sur la survenue de l'HTAP primitive. Il n'existe pas d'observation validée d'HTAP associée à une exposition de dexfenfluramine et fenfluramine de moins de 3 mois.

Par ailleurs la prévalence de l'HTAP primitive est en France de l'ordre de 2 cas par million d'habitants par an. La gravité de cette pathologie est majeure ; en effet l'équipe du Prof. Duroux (Antoine Béclère, centre de référence de l'HTAP) rapporte que sur 31 patients, 1/3 sont décédés, et 17 sont sur liste d'attente de transplantation pulmonaire ou cardio-pulmonaire et sont actuellement traités par perfusion continue de prostacycline (traitement contraignant et particulièrement onéreux).

Le nombre de personnes (essentiellement des femmes) actuellement traitées en France par dexfenfluramine et fenfluramine est d'environ 750.000 par an. Le nombre de personnes traitées globalement par anorexigènes est de l'ordre de 1,1 million par an, ce qui rapporté à la population féminine adulte, représente environ 10 % par an.

Ces traitements non remboursés, sont prescrits à la demande, et semblent actuellement le plus souvent utilisés dans des situations non justifiées (traitement cosmétique de surpoids modeste).

Compte tenu, d'une part des bénéfices potentiels sur les facteurs cardio-vasculaires et d'autre part des risques en particulier celui de l'HTAP, quelle est la place des anorexigènes, et plus particulièrement de la dexfenfluramine ?

DISCUSSION

1) **De l'avis des spécialistes en nutrition du groupe**, la dexfenfluramine et la fenfluramine sont des médicaments efficaces, et utiles. Ils les prescrivent en moyenne chez moins de 10 % de leurs patients.

   Des études cliniques ont montré que l'efficacité du produit était spécifiquement supérieure au placebo, sur des durées de traitement de 3 mois et 1 an, en traitement adjuvant au régime. Le taux de répondeurs au traitement est de l'ordre de 33 % à 1 an de traitement (perte supérieure à 10 % du poids initial).

   L'obésité tend à être reconnue comme un état chronique, justiciable d'une pharmacothérapie adaptée à long terme.

   L'effet thérapeutique du traitement se traduit par :

   - une amélioration de l'adhérence des patients au traitement diétique,
   - une induction d'une perte de poids lorsqu'un traitement diététique adapté s'est avéré improductif,
   - une augmentation de la fréquence de stabilisation du poids à long terme (en évitant les rechutes),
   - une stabilisation du poids chez les sujets en phase dynamique ascendante.

Les indications de ce traitement pourraient être :

- l'obésité patente, avec un indice de masse corporelle (*) supérieure à 30,
- dans les cas d'indice de masse corporelle entre 27 et 30 :
  - une obésité androïde, plus particulièrement chez les sujets de sexe masculin,
  - une obésite associée à un facteur de risque secondaire poids-dépendant : hypertension artérielle, diabète non insulino-dépendant, hypertiglycéridémie et hypolipoprotéinémie de haute densité.
- les indications d'un traitement de durée plus brève, peuvent-être :
  - une prise de poids à l'arrêt du tabac,
  - un surpoids dû à un contexte socio-psychologique temporaire.

L'usage intermittent de ce type de traitement est nocif, la variance du poids étant un risque propre, indépendant du poids initial.

2) **L'avis des autres spécialistes du groupe diffère.**

Ils estiment l'efficacité de ce traitement comme mineure, voire marginale, ou même inexistante.
A long terme, ce traitement est jugé comme ayant un taux constant d'échec sur l'obésité.
Au plus, il est considéré par certains, comme une aide psychologique à l'adhésion au traitement diététique.

On ne dispose pas de données montrant que les anorexigènes permettent effectivement de réduire la mortalité et la morbidité cardio-vasculaire liées à l'obésité.

En cardiologie, l'excès de poids constitue un facteur de risque coronarien et sa prise en charge est un des éléments du traitement global du patient.
Les patients obèses sont pris en charge sur le plan nutritionnel et les anorexigènes n'ont pas de place dans la pratique habituelle des cardiologues.
Une réduction de poids est toujours difficile à obtenir chez des patients hypertendus.
Dans le cas de pathologie coronarienne au premier plan, une perte de poids modérée est souvent obtenue chez des patients motivés, soit après un premier accident cardiaque, soit en pré-opératoire avec maintien de la réduction pondérale après l'intervention.

L'intérêt des produits anorexigènes dans le diabète non-insulino-dépendant mérite d'être mieux documenté et des études sont en cours de publication.
Certains diabétologues ne prescrivent pas d'anorexigènes, les considérant inefficaces à long terme, et cherchant à éviter que, chez ces patients peu observants, leur prise se fasse au dépend du traitement anti-diabétique oral.
D'autres diabétologues les prescrivent comme adjuvant au traitement antidiabétique, en 2ème intention après échec d'un traitement diététique, dans le cas d'obésité sévère.

De même, la dexfenfluramine n'est pas prescrite dans les obésites prises en charge en gynécologie, ni dans les obésités communes en pédiatrie où l'induction de modifications comportementales donnent des résultats satisfaisants à long terme.
Les seules indications en pédiatrie pouvant revendiquer ce traitement sont des situations particulières telles que le syndrome de Willie-Prader et apparentés, les séquelles de neurochirurgie ou du traitement des tumeurs cérébrales.

CONCLUSIONS

1) Il est conclu, de façon unanime, pour la dexfenfluramine et la fenfluramine , que :

- l'indication doit être restreinte au "traitement de 2ème intention, après échec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle (*) supérieur à 30". (Ce type de patients représente environ 6 % de la population française),

- Par ailleurs :

  . la durée du traitement ne doit pas dépasser 3 mois,

  . le traitement est contre-indiqué chez l'enfant,

  (NB : cependant, dans de rares cas, des traitements plus prolongés peuvent être conduits par des spécialistes hospitaliers en nutrition et en pédiatrie, sous couvert d'un suivi attentif.)

2) L'information devra être modifiée pour les anorexigènes autres que la dexfenfluramine et la fenfluramine.
Cependant, la révision de l'ensemble des anorexigènes ne pourra être arrêtée qu'après obtention des résultats définitifs de l'étude I.P.P.H.S., et confirmation d'une association significative entre ces substances et la survenue d'une HTAP.

3) Une information sur l'obésité et les approches stratégiques médicamenteuses sera adressée par l'Agence aux praticiens. Cette information définira des règles de bonnes pratiques médicales de prise en charge globale de l'obésité et précisera la place de la pharmacothérapie.
Une première rédaction doit être proposée par les spécialistes en nutrition du groupe.

4) D'autre part, il paraît nécessaire de réaliser une enquête pour définir les profils de patients actuellement traités par anorexigènes. L'intérêt évident de cette enquête est de mieux connaître les sous-populations traitées (objectif uniquement esthétique, surpoids modéré, obésité patente, pathologies associées).
Une enquête identique, renouvelée après un délai de 1 à 2 ans, permettra de suivre les modifications du comportement des prescriptions apportées par la diffusion des bonnes pratiques de prise en charge de l'obésité, et par les changements des indications et des conditions d'utilisation des anorexigènes.

5) De la même façon, l'évolution et la fréquence de HTAP primitive sera suivi en fonction du temps, en France, par la Pharmacovigilance.

(*) L'indice de masse corporelle est égal au poids (en kg) divisé par la taille au carré (en m^2).

Conseiller Scientifique : M. LAGIER

Experts: M.ABENHAIM, M. APFELBAUM, M. AUBIER, , M. DUROUX,
M. FOURNIER, M.GUY-GRAND, Mme KREFT-JAIS, M. LELOUCH, Mme MORIDE,
M. NICOLAS, M. WEITZENBLUM.

Rapporteurs à la commission: M.BECHTEL, Mme DAVID.

Représentants des laboratoires: M.HALIMI, M.LERIDANT, Mme NATHAN, M.PERET, M.WAGNIARD.

Assistaient à la réunion : N. DAVID, F. MANCEL, M. REIDIBOYM, M. BERDAI, Mme SAINT SALVI.

Unité de Pharmacovigilance : Mme CASTOT, M. GIL, Mme LEGER,

Etaient excusés: M. BAUMELOU, M. DE LA SELLE, M. GISLAIN, M. GUIZE,
M. LECOMPTE, M.LENOIR, M. LEVERGE, M.NETTER.

La Commission Nationale de Pharmacovigilance a pris connaissance des données de pharmacovigilance relatives à la dexfenfluramine et à la fenfluramine, des résultats de l'analyse intermédiaire de l'étude épidémiologique cas-témoin internationale sur l'hypertension artérielle pulmonaire primitive menée par l'I.P.P.H.S. Study Group et coordonnée par le Pr Lucien ABENHAIM (Université McGill, Montréal), des avis d'experts pneumologues et nutritionnistes et de ceux des représentants des laboratoires titulaires d'AMM des produits concernés (Groupe SERVIER).

Elle a estimé qu'il existe une association entre l'hypertension artérielle pulmonaire primitive et la prise de fenfluramine ou de dexfenfluramine.

Ce risque est faible mais porte sur une pathologie grave. Il semble aussi concerner les autres médicaments anorexigènes, les résultats intermédiaires de l'étude épidémiologique indiquant une augmentation, mais non significative du risque relatif.

En conséquence, la Commission Nationale de Pharmacovigilance souhaite :

1) – promouvoir une meilleure utilisation du médicament :

– en encadrant les conditions de prescription : réévaluation des indications dans l'optique du seul traitement de l'obésité vraie avec morbidité associée et respect strict d'indications, de la posologie et de la durée de traitement limitée à 3 mois pour la dexfenfluramine.

– en mentionnant au niveau de la rubrique "Mise en Garde", le risque d'hypertension artérielle pulmonaire primitive et l'arrêt de traitement en cas de dyspnée.

– en informant les prescripteurs de ces dispositions.

2) – qu'une attention particulière soit portée à l'identification de la durée de traitement comme facteur de risque possible de survenue d'une hypertension artérielle pulmonaire primitive, dans le cadre de l'enquête officielle de pharmacovigilance.

3) – la poursuite de l'étude épidémiologique internationale jusqu'à son terme.

Par ailleurs, la Commission Nationale de Pharmacovigilance souhaite la mise en place d'un groupe de travail associant les divers spécialistes impliqués dans le traitement de l'obésité. Ce groupe sera chargé de la réévaluation des conditions d'utilisation des anorexigènes, en tenant compte du rapport bénéfice/risque. Il est notamment attendu une définition de la durée optimale du traitement.

Enfin, la Commission Nationale de Pharmacovigilance souhaite que l'enquête officielle de pharmacovigilance soit étendue à l'ensemble des classes des anorexigènes.

CONFIDENTIEL

CONCLUSIONS DE LA COMMISSION NATIONALE DE PHARMACOVIGILANCE DU 10 MAI 1994

La Commission Nationale de Pharmacovigilance a pris connaissance des données de pharmacovigilance relatives à la dexfenfluramine et à la fenfluramine, des résultats de l'analyse intermédiaire de l'étude épidémiologique internationale sur l'hypertension artérielle pulmonaire primitive menée par l'I.P.P.H.S. Study Group et coordonnée par le Pr Lucien ABENHAÏM (Université McGill, Montréal), des avis d'experts pneumologues et nutritionnistes et de ceux des représentants des laboratoires titulaires d'AMM des produits concernés (Groupe SERVIER).

Elle a estimé qu'il existe une association entre l'hypertension artérielle pulmonaire primitive et la prise de fenfluramine ou de dexfenfluramine.
Ce risque est extrêmement faible mais porte sur une pathologie grave. Il semble aussi concerner les autres médicaments anorexigènes.

En conséquence, la Commission Nationale souhaite :

1 - la gestion du risque de cette association en :
- encadrant les conditions de prescription : respect strict des indications, de la posologie et de la durée de traitement limitée à 3 mois pour la dexfenfluramine ; réévaluation des indications dans l'optique du traitement de l'obésité avec morbidité associée (en particulier diabète, hypertension, dyslipidémie),
- en mentionnant au niveau de la rubrique Mise en Garde le risque d'hypertension artérielle pulmonaire primitive.
- en informant les prescripteurs de ces dispositions.

2 - qu'une attention particulière soit portée à l'identification de la durée de traitement comme facteur de risque possible de survenue d'une hypertension artérielle pulmonaire primitive, dans le cadre de l'enquête officielle de pharmacovigilance

3 - la poursuite de l'étude épidémiologique internationale jusqu'à son terme.

Par ailleurs, la Commission Nationale de Pharmacovigilance souhaite la mise en place d'un groupe de travail associant les divers spécialistes impliqués dans le traitement de l'obésité.
Ce groupe sera chargé de la réévaluation des conditions d'utilisation de ces produits, en tenant compte du rapport bénéfice/risque et en définissant notamment la durée optimale du traitement.

Enfin, la Commission Nationale de Pharmacovigilance souhaite que l'enquête officielle de pharmacovigilance soit étendue à l'ensemble des classes des anorexigènes.

RÉPUBLIQUE FRANÇAISE

AGENCE DU MEDICAMENT

Saint Denis le, 13 MAI 1994

DIRECTION DE L'EVALUATION DU MEDICAMENT

UNITE DE PHARMACOVIGILANCE

AVIS AUX PRESCRIPTEURS

La Commission Nationale de Pharmacovigilance réunie le 10 mai 1994 a pris connaissance des données de pharmacovigilance relative à la dexfenfluramine et à la fenfluramine, et des résultats de l'analyse intermédiaire de l'étude épidémiologique internationale sur l'hypertension artérielle pulmonaire primitive menée par l'I.P.P.H.S. Study Group et coordonnée par le Pr Lucien ABENHAÏM (Université McGill, Montréal).

Elle a estimé qu'il existe une association entre l'hypertension artérielle pulmonaire primitive et la prise de fenfluramine ou de dexfenfluramine. Le risque en est extrêmement faible, mais il porte sur une pathologie grave. Il peut, de plus, concerner les médicaments anorexigènes dérivés des amphétamines.

En conséquence, l'Agence du Médicament porte à l'attention des prescripteurs l'avis de la Commission Nationale qui a estimé nécessaire de :

- rappeler la nécessité de respecter strictement les indications, la posologie et la limitation de la durée du traitement à 3 mois pour la dexfenfluramine,
- mentionner au niveau de la rubrique Mise en Garde le risque d'hypertension artérielle pulmonaire, figurant déjà dans la rubrique Effets Indésirables de la monographie des médicaments contenant de la fenfluramine et de la dexfenfluramine

L'Agence du Médicament, sur proposition de la Commission Nationale de Pharmacovigilance, met en place un groupe de travail associant les divers spécialistes impliqués dans le traitement de l'obésité, afin de réévaluer dans les meilleurs délais les conditions d'utilisation des médicaments anorexigènes.

THE INTERNATIONAL PRIMARY PULMONARY HYPERTENSION STUDY (IPPHS)

SUMMARY REPORT No. 1

1. Overview of sociodemographic, clinical and general characteristics of the study population.

2. Global analysis of suspected risk factors.

3. Detailed analysis of anorexigens.

March 7, 1995

Annexe 1-54

DO NOT CITE OR QUOTE

FOREWORD

This is a summary report of the International Primary Pulmonary Hypertension study. This large scale international study was conducted in five countries, with the aim of producing an epidemiological understanding of this rare but very serious disease.

This report is far from complete. It summarizes the results obtained for the most general risk factors for the disease. The analysis presented here has been structured to mainly produce detailed estimates of the odds ratios associated with anorexigen use and related factors. This was justified by our commitment vis-à-vis the regulatory authorities of France, the United Kingdom, The Netherlands, Belgium and Switzerland to provide them with results on this issue as soon as possible. In fact we issued an interim report one year ago which was used for interim regulatory decisions.

Many more in-depth analyses would be of interest, whether on the clinical aspects of the disease, the general risk factors, or even suspected risk factors which were only broadly addressed here. The database we have developed should allow us to explore some of the relations more fully and, possibly, to qualify associations which were not examined in detail here.

THE IPPHS GROUP:

The International Coordination Centre: Prof. Lucien Abenhaim, Dr. Yola Moride, Mr. Thierry Ducruet, Dr. Jacques Benichou.

The International Scientific Board & Scientific Advisors: Prof. Lucien Abenhaim (chair), Prof. M. Aubier, Prof. Bernard Begaud, Dr. Jacques Benichou, Prof. William Dab, Prof. Maurits Demedts, Prof. Tim Higenbottam, Dr. David Langleben, Prof. Robert Naeije, Prof. Celia Oakley, Prof. Stuart Rich, Prof. Gérald Simonneau, Dr. Bruno Stricker, Prof. C.A. Wagenvoort, Prof. Emmanuel Weitzenblum, Prof. E.F.M. Wouters.

The Local Research Teams: Dr. François Brenot, Dr. Aniceï Chaslerie, Dr. Claudine Peiffer, Dr. Marion Delcroix, Dr. Xavier Kurz, Dr. Denise Walckiers, Dr. Ellen Pouw, Ms. Miriam Sturkenboom, Dr. Hans Petri, Dr. David Dutka, Dr. Mark Ryan, Dr. Neal Uren.

The Expert Review Panel: Prof. Stuart Rich (Chair), Dr. David Langleben, Dr. Michael McGoon, Dr. Lewis Rubin.

Participating Centres: The list of centres who participated in the study can be found in Appendix A4.

This report will be forwarded to the authorities of several countries, under the scientific responsibility of the undersigned members of the IPPHS Group. However, the authors of the study are all the members of the IPPHS Group which are listed above.

4) For the amphetamin-like anorexigens (ALA of non-fenfluramine like drugs) the statistical power of the study is far to low to conclude that a significant association between exposure and PPH exists. For instance, the 95 % two-side confidence interval for the ALA odds ratio ranges from 0.7 to 56.2. Moreover, for some drugs like mefenorex the number of exposed cases is null.

Answers to questions raised by the representants of the producers of amphetamin-like anorexigens at the Commission of Pharmacovigilance of June 19, 1995 and in the comments commissioned by DIAMANT Laboratories.

Prepared by : Lucien ABENHAIM, MD, ScD
Department of Epidemiology and Biostatistics
McGill University (Canada)

1 - Selection of cases

The critic indicates that 40 % of the included cases were exposed to anorexigens vs 10 % of the controls. (figures of 34,8 % and 10,1 % respectively are provided in the note summarizing the discussion at the Commission de Pharmacovigilance). It sees room for selection bias in these differences.

However, the numbers used are not appropriate. More elements are provided below, although most of them can be retrieved from the report.

Actual numbers and proper comparisons

Firstly, Point 4.1.1.4 of the report could have been misinterpreted. It should be understood as : "(Among those) of the 109 non-included cases which have been interviewed, 11 were exposed to a definite anorexigen and 2 to an unclassified product". This corresponds to one term of a sensitivity analysis which was not fully reproduced in the report. Actually, 59 of the 109 non-included cases were not interviewed.

Secondly, if one counts all products in the one hand (the number of "40 %" exposed included cases accounts for, I guess, the 20 definite exposures, the 11 unclassified and the 6 after the index date), one should also count them on the other hand (11, 2 and 2 respectively for non-included cases). The cited percentage of 10,1 % of exposure for the non-included cases incorporates all non-interviewed cases and does not take into account the 4 unclassified exposures or exposures after the index date. Reported on the 50 interviewed, the exposure of non-included cases is 15/50 (30 %), as compared to exactly 38,9 % for included cases. The 50 non-included cases comprise incident, but also prevalent and rejected cases, the latter having by definition a lower expected exposure than included cases.

Thirdly, very few of the 109 non-included cases met the inclusion criteria for the study. In all fairness, the exposure of included cases should be compared to non-included cases meeting all the inclusion criteria. Defined as above, four (4) of the twelve (12) interviewed non-included cases meeting all the inclusion criteria for the study (except validation by the Expert Committee) were exposed. Their exposure (33,3 %) is similar to those included (the small difference is due to the slightly higher proportion of UK cases reported after the end of the study).

Expert Review Panel

We have reviewed the section of this report corresponding to the validation of cases of primary pulmonary hypertension and declare it conform.

IICH, S. (CHAIR)

ANGLEBEN, D.

McGOON, M.

ACKNOWLEDGEMENTS

This study would not have been possible without the contribution of researchers from the International Coordination Centre, the Local Research Teams in France, Belgium, The Netherlands and the U.K. and the other members of the IPPHS group. They are all full co-authors of this study.

Dr. Yola Moride was the cornerstone of the organization of the study. She contributed greatly to the development of the study protocol, the coordination of the study in the field, the interim analysis and the creation of the database.

There is not enough space to describe the patient expertise displayed by Dr. Anicet Chaslerie in the coordination of the study in France, both for epidemiological aspects and the logistics; the accurateness of the investigations of Dr. Claudine Peiffer into the medical charts and hospital departments, and the multiple collaborations of Dr. François Brenot. They recruited and validated two-third of the cases included here, screening hundreds of reports in the process. Dr Patrick Blin completed the feasibility study.

The team from Belgium, coordinated by Dr. Xavier Kurz and animated by M. Delcroix and D. Walkiers, recruited the highest number of included cases per million inhabitants in the study and also provided us with an incidence study for Belgium which is a very valuable scientific contribution per se.

The Dutch team of Miriam Stuifkenboom and Dr. Ellen Pouw, in addition to the recruiting of cases and controls in the Netherlands, have added to the study the validation of the questionnaire (not reported here) and an ever-challenging perspective. Dr. Hans Petri launched the study in his country, giving it its important initial impetus.

No European initiative today would be complete without the United Kingdom. Drs. Neil Uren, Mark Ryan and David Dutka were our "relay team" in the U.K. They recruited a fair amount of cases and controls and obtained an excellent collaboration from GPs. The U.K. also contributed greatly to the validation studies (not reported here).

General practitioners in all countries helped us identify potential controls, obtained consent from them and helped us contact them. The Institut de Recherches en Médecine Générale (IRMG) and the Société de Formation à la Thérapeutique des Généralistes (SFTG), through the efforts of Drs. Liard and Falcoff, were extremely helpful in recruiting the general practitioners.

Interviewers were responsible for the actual collection of information. This required travelling to remote parts of each country, by train, car, and sometimes more awkward means. Medical archivists of the JGH skillfully coded hundreds of questionnaires and thousands of drugs, even when under the pressure of time constraints.

Such a study could not be reported adequately without a Thierry Ducruet. Thierry positively spent nights and days on the statistical analysis and one can be sure that whatever is shown here is really present in the data. This is of inestimable value. Dr. Jacques Benichou came to help us in Montreal in the summer, the fall and winter, but he saw more computers, print-outs and tables here than lakes, leaves and snow. Prof. Alexander Walker accepted to review our final data presentation and made very useful suggestions.

I am extremely grateful to Linda Carfagnini, a name that everybody now knows in the academic centres, local research teams, board members offices and almost all the participating centres, as the "sesame" by which so much happened. All my acknowledgements to Liza Bouchard and to the staff of the Centre for Clinical Epidemiology and Community Studies from the McGill Jewish General Hospital, who provided the administrative support to this study.

The Medical Research Council of Canada peer-reviewed this project and approved its funding under the "MRC-Industry" Program (grant #9404UO-27203-UI-A). The Ministry of Public Health and Environment of Belgium also supported the study in that country.

I would like to sincerely thank the Institut de Recherches Internationales Servier (IRIS), who supported this study. It is worth noting that, despite the important funds involved and the issues at stake, the independence of the study was completely respected from the start to the end. Worth noting also is that the IRIS helped us disseminate the results of the interim analysis to the regulatory authorities, the scientific community and the media and has committed itself to supporting the communication of the results from this report through a special symposium to be held in Montreal on May 5, 1995.

Last but not least, I would like to thank the more than 600 individuals who agreed to participate in this study. Some of them, the so-called "controls", were patients referred from general practitioners, who voluntarily contributed their time to this study with no compensation. Extremely few of the potential "controls" approached refused to participate, which is an indication that, when asked to contribute to an important endeavour, one can count on more people than one might expect.

The most important contributors to this study were those who suffered from this very serious, stressful disease known as "primary pulmonary hypertension". They are referred to in this report as "cases", a dry technical term which should not be misinterpreted as a lack of care on our part. As epidemiologists, our hope is that this work will contribute to the knowledge of this disease, from which they suffer or suffered. We know that their participation was motivated by this consideration and not by any individual interest. I hope that the attention paid to this disease has helped some of them in some way.

EXECUTIVE SUMMARY

. The International Primary Pulmonary Hypertension Study (IPPHS) was launched in ctober 1992. The study was coordinated in Montreal and five countries participated rance, The United Kingdom, Belgium, The Netherlands and Switzerland).

. The general objective of the study was to develop an epidemiological understanding f primary pulmonary hypertension and of the risk factors potentially contributing to s occurence. The specific objectives of the study were: (A) to investigate the role f several suspected risk factors: (i) anorexigens (all classes); (ii) obesity; (iii) systemic ypertension; (iv) recent pregnancies; (v) oral contraceptives; (vi) thyroid extracts; (vii) xposure to high altitude. (B) to generate hypotheses on the potential role of a number f other factors: (i) familial history of morbidity; (ii) personal medical and surgical istory; (iii) blood groups; (iv) smoking; (v) dietary habits; (vi) weight loss behaviour; vii) all other classes of drugs.

. The IPPHS was a case-control study. Incident cases diagnosed after September 1, 992, were identified from more than 100 centres who actively participated in the tudy, of which 35 provided at least one retained case. Cases were all screened by cardiologist or a pulmonary physician and verified by an Expert Review Panel in lorth America, which obtained the data from medical extraction forms, and when vailable, copies of X-Rays, perfusion lung scans and pulmonary angiograms. Controls vere identified within lists of consecutive patients seen by the case's GP or an lternate GP. Controls were matched to the case on age (+/- 5 years), gender, ountry and number of visits to the physician per year.

4. Two hundred and ninety eight (298) cases of PPH were identified between October 1992 and September 1994 (included), among which a number did not meet the nclusion criteria (49 prevalent cases diagnosed before September 1992, 33 found to e secondary pulmonary hypertension, 26 were dead or died before interview, 15 were younger than 18 y.o. or older than 70 y.o., 17 were reported after September 1994 or could not be evaluated on time by the Expert Review Panel, 16 could not be nterviewed, refused, were not resident of the country or were lost to follow-up, 9 did ot have a catheterization, 3 suffered from an excluded disease and 1 chart was not ound; number are not mutually exclusive). Eleven (11) cases had AIDS and could not e used for the case control analysis and 23 more cases were rejected by the nternational review panel.

5. Ninety five (95) cases could finally be used for the case-control analysis, with 355 matched controls. They were very similar on all parameters used for comparison (age, gender, occupation, familial history of disease, personal preexisting morbidity except those under scrutiny, use of all subclasses of drugs except suspected drugs).

- Cumpreheusin epidemio by F de Rivera
- Objectifs : anorexigens - obesité = vendies mais Conclusion

6. Cases responded to the classical definition of primary pulmonary hypertension, and are in particular very similar to the cases included in the NIH registry, the French and the British series. They were 44.7 years old in average (SD = 12.3), and there were 2.3 women for 1 man. Dyspnea was the initial symptom in 91% of the cases, with a severity of grade III of the New York Heart Association classification, at the time of first admission. The median delay between the onset of symtoms and the diagnosis (catheterization) was 16 months. The mean pulmonary arterial pressure was 57.3 (+/- 12.8). All other tests were typical of primary pulmonary hypertension. Controls had an identical age and gender distribution.

7. Cases and controls were interviewed by specially trained interviewers who were kept blind on the specific objectives of the study (they had no medical background). Univariate, bivariate and multivariate analyses were conducted. In the later, only suspected risk factors were investigated, with also a number of factor retained on the basis of the bivariate analysis. This Summary Report No. 1 only presents an overview of the general, sociodemographic and clinical characteristics of the patients, and a global analysis of suspected risk factors. It presents a detailed analysis of the anorexigens.

8. No significant differences were found between cases and controls on their familial history of disease, preexisting morbidity, dietary habits, lifestyle characteristics (weight loss behaviour), exposure to almost all ATC sub-classes of drugs, stays in high altitude, recent and total number of pregnancies, surgical history, use of oral contraceptives, thyroid extracts, hashish and marijuana.

9. Small differences were observed in the distribution of blood groups (B being slightly over represented in cases), familial history of cancer, consumption of game meat, use of analgesics and haematological drugs. Those differences were not further explored in this report.

10. Smoking and having tried to lose weight by several means (excluding anorexigens), were significantly more frequent in cases than in controls. They were controled for in the multivariate analysis.

11. Four cases had experienced cirrhosis. Three cases were HIV positive. 11 more cases of AIDS cases were excluded. The analyses were controlled for these variables, either directly or indirectly.

12. A lifetime prevalence of body mass index greater or equal to 30 was associated with an adjusted odds ratio of 2.4 (1.3-4.7). The same relationship with PPH was maintained whatever the subgroup analyses.

13. The prevalence of treated systemic hypertension before the onset of symptoms was higher in cases than in controls, but the confidence interval of the odds ratio was included one [OR = 2.5 (0.8-7.2)]. Similar estimates were found in other models.

14. 6.5% of the controls had used an anorexigen at least once in the past. The percentage was 3% for the last year before the index date (5% in France), thus very closely paralleling expectations based on sales figures. The proportion of controls exposed was also consistent with sales figures across countries. Cases had used an anorexigen much more frequently: 21.1% for all past exposures and 18.5% for the one-year time-window (all countries combined). Dexfenfluramine had been used by 16 cases and 19 controls, fenfluramine by 3 cases and 3 controls and amphetamine-like anorexigens by 6 cases and 6 controls. In the UK and in The Netherlands, the prevalence of exposure to anorexigens was extremely low and did not allow an estimate of exposure-related risk.

15. The adjusted odds ratio for the exposure to at least one anorexigen was 3.8 (1.6-8.7) if all past exposures were considered, and 5.3 (1.9-14.4) for the one year-time-window. There was no apparent difference in the point estimates of the odds ratios between the type of anorexigens studied. In the one year time-window, exposure to dexfenfluramine fenfluramine and/or only was associated with an odds ratio of 5.8 (1.6-16.2), while amphetamine-like anorexigens only had a odds ratio of 6.4 (.7-56.2).

16. Duration of use of anorexigens was correlated with the observed odds ratios, which were of 1.9 (0.5-6.9) for short durations of use (3 months or less) and 9.1 (2.6-31.5) for longer durations.

17. The validation studies and sensitivity analyses performed demonstrated a good robustness of the observations.

18. The study confirmed that the incidence of the diagnosed disease in the general adult population in Belgium and France is in the order of 2 cases per million inhabitants per year.

19. The absolute risk of PPH in anorexigen users with the highest prevalence of risk factors (longer duration of use and a BMI greater or equal to 30) could be estimated to be less than 1 in 10.000 or less in groups. In all other groups the risk would be substantially lower.

CONCLUSIONS

1. The study demonstrated that the use of anorexigens and a BMI greater or equal to 30 are independent risk factors. In addition, it is suggested that systemic hypertension is an independent risk factor for the disease although it did not maintain significance in the multivariate analysis.

2. The magnitude of the association ~~association~~ with anorexigen use, the temporality of the association, the relation with the duration of use as well as the consistency of the results with previous observations support the hypothesis of a causal relationship. The exact role of the anorexigens in the risk of PPH cannot however be definitively established due to the lack of knowledge of the pathogenic mechanisms, the lack of specificity of the effect within the class of anorexigens, the non-exclusion of all potential confounders and the low absolute risk. From this study, the factors of individual susceptibility could not be identified.

3. The study confirms the role of cirrhosis as a risk factor for PPH. The roles of obesity and systemic hypertension are important new observations which merit further investigation. In a substantial number of PPH cases, no risk factor was indentified.

I. INTRODUCTION

1 Background[1]

imary Pulmonary hypertension is a term used to define a subcategory of pulmonary ypertension which occurs mainly in females in the third to fourth decade of life. It a very rare disease usually associated with a poor prognosis.

lthough the name of the disease stems from its distinction from pulmonary ypertension secondary to known cardiac or pulmonary causes, PPH should not be onsidered as only pulmonary hypertension for which no cause is found. The clinical resentation, the usual age of onset, the progression of the disease and the autopsy eatures make PPH a clear separate clinical entity and distinguish it from secondary ulmonary hypertension, even if its diagnosis requires the careful exclusion of econdary causes. The terminology used to define the pathologic changes is, owever, heterogenous. The World Health Organization first classified PPH into lexogenic pulmonary arteriopathy, thrombotic pulmonary arteriopathy and pulmonary eno-occlusive disease. A recent consensus panel from the American College of Chest hysicians included pulmonary capillary hemoangiomatosis.

The epidemiologic knowledge on the disease is very scant. The largest case-series, such as the NIH registry, the French case-series and the British case-series, have confirmed the female predominance (2:1) and that the age mode is in the late fourth and early fifth decade. Indices commonly used to quantify the occurrence of a disease, such as incidence, prevalence and mortality, are not available in the literature. From the feasibility study which preceded this study, we had estimated that the annual incidence (number of new cases per year) could be 2 cases per million per year or less in a country like France. Different numbers have been proposed by others.

Case reports and an epidemics have suggested the role of numerous risk factors for the disease but very few of them have been confirmed.

Several cases of familial primary pulmonary hypertension point to the existence of a genetic factor. Abnormalities of the pulmonary vascular bed which may cause a predisposition to the disease have also been suggested.

Pregnancy is often cited as a risk factor, as sporadic cases of the co-existence of primary pulmonary hypertension and pregnancy have been reported. One of the

---

1 *The list of references used can be found in the bibliography. Individual references are not indicated in the text.*

or methamphetamine inhalation. Also, crack cocaine and intravenous drug use (IVDU) were reported in PPH cases, including newborns who had been exposed in utero.

Several drugs have been reported to be associated with PPH. Oral contraceptives and thyroid extracts are frequently mentioned. Non steroidal anti-inflammatory drugs (AINS) have also been implicated. Prolonged indornethacin use in mothers was found to be associated with PPH in newborns, but confounding by indication was not completely ruled out. There is, however, some evidence of biological plausibility. Similar observations were made in newborns whose mothers had a history of exposure to naproxen.

Veno-occlusive disease was found in patients treated by chemotherapy-related drugs (mitomycin-C, nitrosourea, cyclophosphamide). Two cases of pulmonary hypertension believed to be associated with a treatment by phenformin have been reported.

Reports have been published of amphetamine-associated primary pulmonary hypertension. Amphetamine-like drugs are used as anorexigens. The most common reports of drug-exposed PPH cases involve anorectic agents (anorexigens). Concerns were raised following the dramatic increase in the number of PPH cases diagnosed in a Swiss medical clinic in the 1960s. Half of the patients were somewhat overweight and females predominated. Later, 582 cases of PPH were identified in Germany, Switzerland and Austria, among which 68% had claimed they had used the drug Aminorex alone or in combination with other anorectic agents. From this, and another study, the incidence in patients who used Aminorex was estimated to be about 0.5-3%, corresponding to a relative risk of 1000. However, the investigation was not epidemiologic stricto sensu.

Since then, other anorectic agents have been reported to be associated with primary pulmonary hypertension. Sporadic PPH cases and one case-series were published which implicated fenfluramine derivatives. It was the latter which prompted the conduct of this study, although its goals are much broader.

1.2 Objectives of the Study

General Objectives:

To develop an epidemiologic understanding of primary pulmonary hypertension and of the risk factors potentially contributing to its occurrence.

hypotheses is that pregnancy and labour increase the demand on the heart-pulmonary system. Another frequently cited hypothesis is trophoblastic embolism. It is also suggested that pulmonary hypertension secondary to pulmonary thromboembolic disease and Eisenmeger's syndrome could be misdiagnosed as PPH.

The role of autoimmune connective tissue disease in primary pulmonary hypertension has been debated. Several series have confirmed that antinuclear antibodies titers were elevated in PPH patients. Some authors think that pulmonary hypertension in this case should be considered as secondary rather than primary.

Reports have repeatedly associated portal hypertension with primary pulmonary hypertension. The prevalence of PPH in cirrhotic patients was reported to be higher than expected in several cirrhosis case-series and, conversely, portal hypertension is sometimes noted in PPH patients. The issue commonly discussed is whether portal hypertension preceded primary pulmonary hypertension or if both were part of a common disease process.

Several cases, and even case-series, of HIV infected or AIDS patients with PPH have been reported worldwide. The mechanism of occurrence is not known and potential confounders have not all been ruled out.

It has been suggested that several environmental risk factors might play a role. Altitude is one of them, because of the common observation of elevated pulmonary pressures in subjects living in very high altitude.

Dietary factors have also been suggested. The occurrence of pulmonary hypertension originating from pulmonary venous occlusion after digestion of bush tea has been suggested. L-tryptophan, a food supplement used for ailments such as insomnia, depression, premenstrual syndrome, has been recently linked to the newly recognized Eosinophilia-Myalgia Syndrome (EMS), among which a few cases had pulmonary hypertension. However, despite the similarity to PPH this syndrome should be considered as a separate entity.

In the early 1980s an epidemic of atypical pneumonia with a high prevalence of pulmonary hypertension occurred in Spain. It was referred to as the "Toxic Oil Syndrome". It was found to be associated with the consumption of rapeseed oil, which was suspected to be contaminated by chemicals. This syndrome is not always recognized as typical PPH.

Substance abuse has been reported to be a risk factor for primary pulmonary hypertension. Cases of PPH have been reported associated with chronic glue (toluene)

Specific Objectives:

1) To investigate the role of several suspected risk factors: (i) anorexigens (all classes); (ii) obesity; (iii) systemic hypertension; (iv) recent pregnancies; (v) oral contraceptives; (vi) thyroid extracts; (vii) cocaine use; (viii) exposure to high altitude.

2) To generate hypotheses on the potential role of a number of other factors: (i) familial history of morbidity; (ii) personal medical and surgical history; (iii) blood group; (iv) smoking; (v) dietary habits; (vi) weight loss behaviour; (vii) all other classes of drugs.

This report produces data pertaining to all these general and specific objectives. It addresses the role of the suggested risk factors and in particular anorexigens, (specific objective #1) in a more detailed fashion.

1.3 Organization of the study and ethical issues

The study was peer-reviewed by the Medical Research Council of Canada, who approved it for MRC-Industry funding grant # 9404-00-27203-UI-A. The funds were provided by the Institut de Recherches Internationales Servier under a sponsorship agreement which ensured complete independence of the investigators and freedom of publication. The Ministry of Public Health and Environment of Belgium also supported the study in that country. It was launched under the auspices of the International Primary Pulmonary Hypertension Study Group which consists of an International Coordinating Centre, an independent International Scientific Board, Local Research Teams in each country, an Expert Review Panel and a large number of participating centres (Appendices A1 to A4). The board includes members who sit on national or European regulatory boards, but who participated in their own names.

The IPPHS was launched in October 1992 in France and in January 1993 in the other countries. An interim report, which included the analysis of 50 cases and 123 controls, was released to the regulatory authorities of the five countries participating in the study. The interim results were also shared with the main participating centres in each country who were invited to a special workshop in Paris in June 1994, as well as with the international scientific community at a Symposium on Pulmonary Circulation held in Prague in July 1994.

II. METHODS

2.1 Overview of the Study:

The IPPHS was a case-control study launched in October 1992. The complete protocol can be found in Appendix B1 and the results of the feasibility study can be found in Appendix A5. Health centres were contacted in France, the United Kingdom, Belgium, The Netherlands, and Switzerland (see Table 1). Of the 306 centres contacted, 223 agreed to participate. Table 1 displays the actual participation of centres. Incident cases of primary pulmonary hypertension were sought in each of the five countries. For each case, 4 controls were sought and matched on age (+/- 5 years), gender and number of visits to physician per year. Controls were physician-based. The goal was to recruit 100 cases and 400 matched controls.

2.1.1 Inclusion Criteria

Included were subjects of both genders, between 18 and 70 years old inclusively, resident in the reporting country for more than 6 months, who were able to, and accepted to, participate in the interview and who did not suffer from an active chronic disease (Table 2).

2.1.2 Cases

2.1.2.1 Definition: Only incident cases diagnosed after September 1st, 1992 were considered. The date of diagnosis was defined as the date of the first right heart catheterization. The diagnosis of primary pulmonary hypertension required the documentation of pulmonary hypertension and the ascertainment of the absence of secondary causes for the disease. The list of secondary conditions and tests required to validate the diagnosis is presented in Tables 3 and 4. For comparison purposes, a number of other cases were also evaluated (but not used in the case-control analysis).

2.1.2.2 Identification: Efforts were made to obtain an exhaustive recruitment of cases diagnosed in all the participating centres. The Centres were contacted or visited at least every three (3) months by telephone in order to identify cases which may not have been reported. The Centres had the opportunity to declare new cases to Local Research Teams in each country by sending pre-addressed postcards and they also received mailed reminders on several occasions.

2.1.2.3 Ascertainment: This process was approached in two stages. First, a cardiologist or pulmonary physician appointed by the Local Research Team verified that the inclusion criteria were met and that all the required information was available

for each case. They completed the Medical Extraction Form presented in Appendix B2. In a second step, the forms were sent to the Expert Review Panel together with copies of X-rays, perfusion lung scan and echocardiogram. This Panel, blind on exposure, classified cases into three groups: "A", "B" and "C" (see Expert Review Panel report in Appendix A6 for details). Only "A" and "B" cases were retained for the case-control analysis. They represented 80.5% of incident live cases evaluated.

2.1.2.4 Cases included: Two hundred and ninety-eight (298) cases were reported or identified for the study. Of those, 95 could be retained for the case-control analysis. Table 5 summarizes the reasons for exclusion (detailed reasons are displayed in Appendix A7 to A11 by country).

2.1.3 Controls

2.1.3.1 Definition and rationale: The aim was to recruit four physician-based controls per case. A detailed description of the rationale for the choice of this type of controls can be found in a previous publication (Appendix B3).

In summary, we did not opt for hospital controls because many cases were diagnosed (and subsequently reported) by highly specialized centres with nation-wide recruitment of patients. Consequently, the definition of the "catchment population" of the respective centres from which cases originated was not straightforward. Due to the large number of risk factors investigated, it was also difficult to identify hospitalized conditions which would be free of biases.

Physician-based controls were preferred to community controls mainly on the basis of feasibility and for purposes of validation. Firstly, the interviews were very long and required a significant commitment from subjects, which was obtained thanks to the intervention of their GP. Secondly, the intention was to validate the exposure to drugs (as well as medical history) from the GP's notes and/or medical files. Another issue was the insidious onset of the disease, lasting for several months or even years. This may have led to numerous contacts between the cases and the physicians before the diagnosis was made. This was a concern at the launch of the study considering the uncertainty around the index date for the disease (see below). It was felt that physician-based controls would better represent the source population from which the cases originated, especially in terms of the degree of accessibility to the health care system.

2.1.3.2 Selection of controls: Cases were asked to identify their general practitioner, who was then contacted by the hospital physician of the case and/or the local research team coordinator. In case of refusal to participate from the GP, or in the absence or lack of an appropriate control for a given case, controls were chosen among the patients of another GP practising in the same area. In some instances, it was necessary to use controls from more than one GP.

GPs were asked to provide a list of 100 consecutive patients to the Local Research Team for selection of controls (see Appendix B8). Sets of properly matched controls were identified by an independent epidemiologist for each country. Usually 4 controls were interviewed for each case, but in a few instances, a greater number of controls were available while in others, less or no controls could be found. In the latter case, GPs were asked to submit another list of consecutive patients. In some instances, it was necessary to select controls from another GP from the same country.

Four hundred and ninety-two (492) controls were interviewed. Of these, 355 were included in the case-control analysis. A significant number of other controls (137) could not be used either because their matched case had died before being interviewed, was subsequently found unsuitable for the study, was not evaluated by the Expert Review Committee or was a prevalent case. In addition, a number of interviews were forwarded to us too late to be included in this database (Table 6). Those controls were used for validation studies reported later in this report.

2.1.4 Interviews

2.1.4.1 Methods of Interview: An in-depth interview of each subject was conducted using questionnaires and visual aids (see Appendix B4 and B7). For each country, a specific questionnaire was developed in order to account for differences in drug tradenames, but the structure remained identical across countries.

The interviews were conducted by specially trained interviewers who had no medical background and who were blind as to the specific objectives of the study. A general questionnaire (Appendix B4) was first administered on sociodemographic and individual characteristics, medical, surgical, obstetrical history, habits, exposure to high pressure and high altitude, familial medical history and other general variables. In order to elicit drug use in a more specific way, a multi-step procedure was applied.

Subjects were questioned in detail on their personal life events since August 1, 1989 for cases interviewed before December 31, 1993 and since August 1, 1990 for subjects interviewed after that date. They were then asked about all sickness events

(mild to severe) for the same period. These two preliminary steps were intended to establish "landmarks" in the memory of the recent past back to 3 years. Each of these events was recorded on a calendar (Appendix B5). During the detailed interview, efforts were made to precisely draw the period of exposures on a calendar-like diagram available for each risk factor.

A calendar of drug use was established by three (3) different methods: (i) spontaneous reporting of drugs which were used at the time of the landmarks; (ii) presentation of lists of approximately 80 different brand names, chosen from amongst the most prescribed drugs in each therapeutic class, for each country (Appendix B5); (iii) presentation of a visual display with selected packages and/or tablets (Appendix B6). Exposure to anorexigens was treated in the same way as exposure to any of the other products investigated.

Subjects could also report their exposures before the time covered by the detailed interview, but exact dates were not systematically sought. Finally, a sealed questionnaire assessing the use of illicit drugs and sexual habits was given to the patient (Appendix B7).

2.1.4.2 Summary of Factors Investigated: The categorization of the factors assessed during the interview is summarized below. The order of presentation is from the more general to the more specific.

A) General characteristics

Sociodemographics: age, gender, occupation (10 classes), ethnicity.

Clinical characteristics: initial symptoms (for cases only); blood, pulmonary and cardiac tests.

Blood groups: ABO, Rhesus factor.

Morbidity

. Familial medical history: classified according to the ICD-9 broad classes.
. Personal medical history: detailed and later classified into broad classes (presence/absence before the index date).
. Personal surgical history (number of minor and major surgeries before index date) classified according to the Canadian Classification of Diagnostic, Therapeutic and Surgical Procedures.

Habits & Lifestyle:

. Smoking: current and 4 years before interview (Y/N)
. Alcohol: current use, use 4 years before interview and frequency.
. Selected dietary habits: coffee, tea, herb tea, colas, chocolate, cheese, paté, smoked meat, game meat, yeast extracts (before index date and after): current use and use 4 years before interview as well as frequency.
. Weight loss behaviour: This variable was constructed a priori by combining information obtained on unstable weight, use of laxatives, phytotherapy (when used for weight loss), isolated use of diuretics (except when systemic hypertension and/or use of a non-diuretic antihypertensive was mentioned). Presence of weight loss behaviour was defined as the presence of at least one of these factors reported before the index date.
. Number of sexual partners, before the index date.

B) All drugs (except those suspected a priori)

All classes were investigated, with approximately 80 specific products in each country (Appendix B5). Any use before the index date was considered.

C) Suspected risk factors

High altitude or high pressure

. Exposure to high altitude or high pressure: living in high altitudes for more than 6 months (in total), scuba diving, taking planes frequently.

Suspected health-related risk factors

. HIV: was recorded only in cases (when present in the medical charts).
. Cirrhosis: was defined as reported by the case, with a review of liver function tests and other clinical information, by a physician. "Alcoholic" or "post-hepatitic cirrhosis" was defined on basis of interviews.
. Systemic Hypertension: use of non-diuretic anti-hypertensive drugs in non-cardiac patients and for hypertension reported during an interview and confirmed by the use of at least one anti-hypertensive medication, including diuretics (before the index date). Excludes portal hypertension.
. High Body Mass Index: highest and lowest body-mass index (weight divided by squared height) in life-time. A BMI equal or greater than 30 was chosen as the cutoff to define obesity.
. Obstetrical history: total number of pregnancies and presence/absence of a recent pregnancy (less than 1 year before index date)

Suspected drugs (except anorexigens)

. Oral contraceptives
. Thyroid extracts
. Illicit drugs: marijuana, hashish, cocaine. Any use reported before the index date was considered.

D) Anorexigens

A detailed assessment is reported in the text.

2.1.5 Timing of events and exposures

2.1.5.1 Index date: The index date for the study of risk factors corresponds to the date of onset of symptoms of the case (dyspnea mainly). The same index date was applied to controls. Exposure was considered only if it had started before this index date. Because of the uncertainty in timing, uses of drugs which had occurred in the same month as the first symptoms were considered as "undetermined" in the main analyses and were addressed in the sensitivity analysis.

2.1.5.2 Time windows: In the absence of an accepted model for the pathophysiological process of the disease, all past exposures before the index date were considered for all risk factors except anorexigens. For anorexigens, it was

decided a priori to also use a one-year time-window before the index date. Any exposure which started or ended during these time-windows was considered as exposure for the relevant time-window.

2.2 Statistical analysis

The analysis includes three parts:

1. Description of the sociodemographic and clinical characteristics of the study population.
2. Bivariate analysis for general and suspected risk factors.
3. Multivariate analysis of retained risk factors.

These analyses were performed using SAS, statistical package version 6.13 (UNIX) and EGRET version 026.6.

2.2.1 Descriptive statistics

The sociodemographic characteristics of the cases and controls and the clinical features of the cases are described. Categorical variables are reported as frequency distributions and continuous data are reported by the mean, standard deviation, median, minimum and maximum values. When necessary, heterogeneity between countries, genders and other strata was assessed by the chi-square statistics (for categorical data). The significance level was set at .05.

2.2.2 Bivariate analysis

Cases and controls were compared on the frequency of exposure to the risk factors listed under section 2.1.4.2 (general potential risk factors and suspected drugs (except anorexigens) risk factors). Again, the presentation goes from the general to the specific.

Only the information available on both groups was used. In these analyses all past exposures before the index date were considered (time window not specified). Differences between cases and controls were assessed by the chi-square test for categorical variables and the Fisher exact test when one cell had less than ten (10) subjects.

The magnitude of the bivariate association between exposure to each of the potential risk factors and PPH was estimated by the use of matched odds ratios for the main suspected risk factors which had a significantly ($p < .05$) different prevalence in cases and controls in the bivariate analysis. Matched odds ratios of exposure between different strata of potential confounders were also calculated. All odds ratios are presented with their 95% bilateral confidence intervals. The body mass index (BMI) was dichotomized into BMI ≥ 30 and BMI < 30. Hypertension and smoking were dichotomized into yes/no categories.

For anorexigens, subjects were classified into 4 categories: (I) exposed to a defined product before the index date; (II) unclassified exposure (use of an unknown drug to lose weight or exposure at an unspecified date); (III) exposed after the index date; (IV) unexposed. Category (I) was considered as exposure and categories (III) and (IV) as unexposure. Two sets of analyses were conducted: one on all past exposure and one on exposure within the one-year time window.

2.2.3 Multivariate analysis

The magnitude of the effect of the selected risk factors on the occurrence of PPH was assessed by the adjusted odds ratio, an estimate of the relative risk. In order to control for potential confounding, multivariate analyses were conducted (conditional logistic regression).

2.2.3.1 Main model

The main variables in the models were exposure to the drugs of interest (anorexigens). Exposure to anorexigens was defined as exposure to any of the individual products during the relevant time-window. The main models used category "I" as exposure to anorexigens and "III" + "IV" as non-exposure. Models were controlled for unclassified exposure "II". In the sensitivity analysis, "II" was also considered as exposure. In addition, the following variables were included in the model: marker of obesity, systemic hypertension and smoking. Cases with IVD use or cirrhosis were withdrawn from the main models. The models are also controlled for weight loss behaviour, unclassified weight loss drug used. Interactions were further tested in the models: between anorexigens and BMI, anorexigens and hypertension. None was significant. The odds ratios presented are also controlled for a series of variables which were statistically different between cases and controls in the bivariate analysis. The uncertainty associated with odds ratio estimates was assessed by the 95% bilateral confidence interval.

2.2.3.2 Type of anorexigens: For the study of individual anorexigens, it was a priori decided to group fenfluramine and dexfenfluramine (F/DF) on the one hand and all amphetamine-like anorexigens (ALA) on the other hand. ALA included the amphetamine-like drugs specifically addressed in the questionnaire and those spontaneously reported by the interviewees (amfepramone, clobenzorex, fenosolone, fenproporex, mazindol, preludine).

The study of different profiles of use was planned as follows: (i) Use of F/DF only; (ii) Use of ALA only; (iii) Use of F/DF at least (with or without use of ALA); (iv) Use of ALA at least (with or without F/DF); (v) Use of both F/DF and ALA.

For these analyses, all exposures in the past were considered (before the index date), whether they had occurred concurrently or at different dates. Adjusted odds ratios were calculated for each profile by using several dummy variables (statistical models can be found in Appendix A12). Exposures of cases and controls to individual fenfluramine derivatives and amphetamine-like anorexigens are reported but no adjusted odds ratios were calculated for individual drugs.

2.2.3.3 Duration of use of anorexigens: The duration of exposure during the risk period (all exposures in the past) was measured as the sum of the number of days of treatment before the index date. Duration was categorized as: a) less or equal to 3 months (90 days); b) more than 3 months or undetermined duration which consists of responses such as occasional or episodic use.

2.2.3.4 Timing of event: Subjects were classified as a) exposed in the year before the index date (whatever previous exposure); b) exposed more than one year before the index date and not exposed in the year before the index date; c) not exposed at all in the past. Only "I" exposures (defined in section 2.2.2) were considered as exposure; categories III and IV were the reference and models were controlled for unclassified exposure (category II).

2.3 Validation studies

Studies were conducted in order to assess potential selection biases and for the validation of the questionnaires. They were conducted on all past exposures to anorexigens (category "I") before the index date.

2.3.1 Identification and reporting biases

2.3.1.1 Delay for diagnosis and severity of symptoms: These factors are compared between exposed and unexposed cases.

2.3.1.2 Main Reporting Centre effect: In each country, the exposure of the cases stemming from the main reporting centre was compared to the exposure of other cases. Results are reported for France, where one centre contributed half of the cases considered.

2.3.1.3 Included vs non-included cases: Exposure was compared between the cases included in the case-control analysis ("A" & "B" cases) and the exposure of excluded, rejected, prevalent and other reported cases which were not retained for the study.

2.3.1.4 Field studies: At the end of the study, all participating centres were contacted in order to review the cases that they reported and to potentially identify new cases which might not have been identified during the previous encounters. With a sample of these participating centres, stratified by the number of cases reported, an in-depth review of the process was conducted. Twenty-five centres were contacted or visited.

In addition, a sample of centres who had not reported any cases but had originally agreed to participate was contacted for an in-depth review. Fifteen centres were contacted for this purpose.

2.3.2 Bias in the selection of controls

2.3.2.1 Non-Included controls: Out of the 137 controls who were not included in the case-control analysis, 114 have been coded and entered in the database. The exposure of the controls, which were not used for the case-control analysis (see further above), was evaluated for anorexigens.

2.3.2.2 Exposure of controls vs sales figures The exposure of the controls included in the analysis was compared to the expected percentage of exposure to anorexigens according to sales figures in various countries.

2.3.3 Exposure misclassification

A number of analyses and studies were conducted in order to assess potential sources of information bias and their potential impact on the main results of the study.

2.3.3.1 Index date and protopathic bias: The index date was defined as the date of first symptoms, i.e. mainly dyspnea. It was felt that a certain amount of uncertainty could exist around this date. The odds ratio for anorexigen use before and after the index date (see also "protopathic bias" further below) were estimated. This comparison of the exposure of cases after the index date to the exposure of controls (for the same period) also provided some insight on the potential protopathic bias.

2.3.3.2 Unclassified exposures: Subjects who had reported the use of drugs to lose weight without being able to identify them or to precisely identify the date vis-à-vis the index date (category "II") were considered unexposed to any anorexigens in the main analysis. They were reclassified as exposed in the sensitivity analysis and the odds ratios were calculated.

2.3.3.4 Validation of questionnaires

In The Netherlands and the U.K., a validation study in which the data from the questionnaires are compared to the GPs' notes. Computerized pharmacy data is currently underway in The Netherlands. These validation studies could not be completed before this final report.

2.3.4 Country effect

Adjusted odds ratios for exposures to anorexigens were calculated for France alone.

Table 1 Participating centres

	Number of Centres :			
	Contacted in 1992	Agreed to participate	Actively* participated	Included at least one case**

III. RESULTS

Ninety-five cases (95) and three hundred fifty-five (355) controls were included in the case-control analysis. The results presented below correspond to these subjects. The results of the validation studies, which included other non-included cases and controls, are reported in section 4.

3.1 Description of the study population

Table 7 displays the number of cases and controls included per country. Most of them came from France, followed by Belgium. This is to be expected as more recruitment efforts were made in these countries. The mean number of controls per case is 3.7.

3.1.1 Sociodemographics

The mean age of cases was 44.7 y.o. (SD = 12.3), and the median was 45 (min: 21; max:70). They were almost identical in controls (Table 8). There were no notable differences between countries (Appendix A13).

The overall female to male ratio was 2.3:1. This ratio was similar in the different countries (Appendix A14).

The distribution of occupations between cases and controls was very similar (Table 9). Most cases and controls were of European ethnic origin (95.6% and 96.9%, respectively).

3.1.2 Clinical parameters

3.1.2.1 Onset of symptoms and time to diagnosis: The main symptom which led to the discovery of the disease was dyspnea. Others included syncope, angina pectoris, family history of PPH and miscellaneous incidental discoveries (Table 10). In most cases, the severity of the dyspnea at time of diagnosis was classified as Class III of the New York Heart Association Classification (Table 10).

The mean delay between onset and symptoms and right heart catheterization was 16.7 months (SD:19.3). The median delay was 16 months (range: 1-104 months). Table 10 presents the distribution of delays. Appendix A15 displays the median delays for the diagnosis by country.

3.1.2.2 Tests: Table 11 presents the results of the pulmonary function tests, right heart catheterization parameters and arterial blood gases.

3.1.2.3 Blood groups: There were slightly more cases with blood group B than controls (14.7 vs 7.8% respectively) and group AB (4.2% vs 2.8%), but the number of subjects who did not know their blood group (12.6% and 15.5% respectively) rendered the interpretation of these results difficult. There was no difference in Rhesus groups (Table 12).

3.2. Bivariate analysis

3.2.1 General characteristics (morbidity, habits, lifestyle)

3.2.1.1 Familial history of disease: Except for the 2 cases with a familial history of primary pulmonary hypertension, cases and controls did not generally differ in regards to their familial history of morbidity (Table 13). There was significantly less cancer reported in the family of cases than controls, which was not further explored here.

3.2.1.2 Personal history of morbidity and surgery: Cases and controls were very similar in their personal history of morbidity before the index date (Table 14). There was no difference in the percentage of cases and controls who had undergone surgery, either minor or major ones (results not shown).

3.2.1.3 Habits and lifestyle

Smoking: Cases were significantly more often smokers than controls, 4 years before the interview (Table 15).

Dietary habits: The drinking of alcohol, coffee, tea, herbal tea, colas, was not different. The consumption of chocolate, cheese, yeast extracts, smoked meat, did not differ between cases and controls. Game meat was used significantly more often by cases than controls in the bivariate analysis (Table 15).

Weight loss behaviour: Cases differed somewhat from controls as to their behaviour regarding weight control although the p value did not reach conventional significance ($p = 0.06$) (Table 15).

Number of partners: There was no difference in the sexual activity of cases and controls, whether measured by the number of partners (Table 15) or by the history of sexually transmitted diseases (Table 14).

3.2.2 All subclasses of drugs (except anorexigens)

Table 16 displays the exposure of cases and controls to all classes of drugs except anti-obesity preparations and drugs used to lose weight. No significant difference was found for most classes of drugs. Differences appeared for anti-asthmatic drugs (more used by cases), analgesics (less used by cases), haematological and anti-hypertensive drugs (more used by cases). Except for the latter, those differences are not further explored in this report. Appendix A16 displays the results for the individual sub-classes of drugs.

3.2.3 Stays in high altitudes and exposure to high pressure

Long stays in high altitudes were not differently reported by cases and controls (Table 17). No differences were found for scuba diving or frequent flying either (results not shown).

3.2.4 Suspected health-related factors

Results are presented in Table 18.

3.2.4.1 HIV Infection: Three cases had documented HIV infection (two of them reported IVD use). 11 more cases were not retained because they had AIDS. HIV infection could not be tested in controls.

3.2.4.2 Cirrhosis: Two cases had an alcoholic cirrhosis before the index date, 1 case had definite post-hepatitic cirrhosis, and 1 case had a possible post-hepatitic cirrhosis. No controls reported cirrhosis (Table 18). No difference had been observed in the prevalence of hepatitis (Table 14).

3.2.4.3 Hypertension: The prevalence of treated systemic hypertension was greater for cases than controls ($p = 0.08$).

3.2.4.4 Body Mass Index (BMI): Cases had more often experienced a body mass index equal or greater to 30 at least once in their life than controls had ($p < 0.001$).

3.2.4.5 Pregnancies: There were no differences in the total number of pregnancies experienced by female cases and controls. The experience of a recent pregnancy was also similar.

3.2.5 Suspected drugs

3.2.5.1 Oral contraceptives: No difference was observed between cases and controls (Table 19).

3.2.5.2 Thyroid extracts: No difference was observed (Table 19).

3.2.5.3 Illicit drugs: The use of marijuana and hashish was not reported differently by cases and controls. IVD use was more frequent in case than in controls (4 cases vs 1 control). Two (2) out of the four (4) IVD users were HIV positive, rendering these results difficult to interpret. All IVD users were cocaine users too, whether case or controls. No case and three (3) controls had used cocaine and not IVDs. Since it is disputable to consider all cases with IVD use as "PPH" cases, and because of the potential confounding by HIV infection, it was decided to withdraw all IV drug users from the main multivariate model. We do not further report on these variables in this summary report.

3.2.5.4 Anorexigens: Exposure to any anorexigen (category "I") was significantly more frequent in cases than in controls (all past exposures, Table 20). Table 21 presents the distribution of individual anorexigen use in cases and controls (all past exposure). The subclasses of fenfluramine/dexfenfluramine (F/DF) on the one hand and amphetamine-like anorexigen (ALA) on the other hand, were differently distributed between cases and controls. Table 22 presents the same information for the one-year time-window before the event.

3.2.6 Odds ratios for retained potential risk factors (crude and matched)

3.2.6.1 Anorexigens:

Table 23 presents the matched odds ratios (crude) for primary pulmonary hypertension associated with the past exposure to anorexigens, contrasting categories "I" of exposure to no exposure ("III" + "IV"). It appears that any exposure to an anorexigen in the past (all times) is associated with PPH [matched odds ratio of 4.4 (2.2-9.1)].

Table 23 also presents the odds ratios for exposure to anorexigens stratified by level of potential confounder (BMI, hypertension, smoking) for all past exposures. Small variations were observed.

3.2.6.2 Body Mass Index (BMI): In this crude matched analysis, a BMI greater or equal

to 30 (lifetime prevalence) was associated with a higher odds ratio vis-à-vis PPH [OR=3.0 (1.7-5.1)] (Table 24). The effect of a high BMI was not significantly modified when stratified by level of exposure to anorexigen (matched odds ratios were calculated), but displayed some indication for confounding between BMI and anorexigen use (Table 24). Subjects who have had a BMI of 30 or greater at least once in their life were more likely to be exposed to anorexigens (ECOR= 2.7). The odds ratios for the exposure to anorexigens for subjects who had experienced a BMI ≥30 once in their life was 5.0 (1.5-16.2) while the odds ratios for the exposure to anorexigens for subjects who had not experienced a BMI ≥30 once in their life was 2.9 (1.1-7.4).

3.2.6.3 Systemic Hypertension: PPH cases reported treated systemic hypertension more often than controls [OR=2.8 (1.1-7.0)] (Table 24). The odds ratio for hypertension was not significantly modified according to the status of exposure to anorexigens (Table 24). The effect of anorexigens was not very different in hypertensive vs normotensive patients.

3.2.6.4 Smoking: The matched odds ratio for smoking and primary pulmonary hypertension was slightly elevated [OR = 1.6 (1.0-2.6)]. The odds ratios varied between anorexigen users [OR = 0.7 (0.3-1.4)] and non-users [OR = 1.7 (1.0-3.0)].

3.2.6.5 Cirrhosis: The odds ratio was not estimated due to the small numbers in each category of cirrhosis.

3.2.6.6 HIV: The odds ratio was not estimated due to the absence of information on the status of controls.

3.2.6.7 Other factors: The odds ratio for game meat consumption and the odds ratio for cancer history in the family were 2.2 (1.1-4.2) and 0.6 (0.4-0.9) respectively. These last factors were not further explored in this analysis. Although not strictly significant in the bivariate analysis, we kept weight loss-behaviour in the multivariate analysis.

3.3. Multivariate analysis

3.3.1 Main model

Table 25 presents the results of the main model using anorexigens, hypertension, high BMI, smoking and controlling for a number of other factors such as unclassified exposure. Cases with cirrhosis or IVD use are withdrawn from the model. The odds ratio for the exposure to any anorexigens in the past remains elevated when controlled for other factors [4.1 (1.8-9.7)]. Having experienced a high BMI remained significantly associated

with the risk of disease [OR=2.6 (1.3-5.0)] while systemic hypertension was not significantly associated with the risk of disease. There was no important difference observed when the one year time-window was used, except that the association appeared slightly stronger for anorexigens [OR= 5.9 (2.1-16.5)]. No other factors showed a significant association.

3.3.2 Individual anorexigens

Table 26 shows the results of the adjusted models for subclasses of anorexigens (all exposure in the past and one-year time-window). The effect of the exposure to only F/DF was estimated by an adjusted odds ratio of 3.8 (1.7-10.0). Exposure to at least an F/DF (with or without the use of an ALA) was estimated with an adjusted odds ratios of 4.1 (1.7-10.0) for all past exposure. The odds ratio was slightly more elevated for the one-year time-window [OR 5.8 (1.6-16.2)]. Amphetamine-like agents (ALA) displayed similar profiles of risk, although the numbers were small and the estimates consequently unstable. Several users had been exposed to both subclasses of drugs in the past, resulting in an odds ratio for primary pulmonary hypertension of 5.8 (1.0-33.1).

3.3.3 Recent vs. non-recent exposure to anorexigens

When exposure to anorexigens had been terminated for more than one year before the index date, the adjusted odds ratio was of 2.4 (0.6-8.8) as opposed to 5.9 (2.1-16.9) for more recent exposure (within one year) (Table 27). However, the effect of recent exposure was different according to previous experience with the drug: The odds ratio was 4.9 (1.0-23.7) for recent users who had not used the drug in the year before, but it was smaller [2.3 (0.5-10.9)] for those with previous exposure.

3.3.4 Duration of exposure to anorexigens

Table 28 presents the distribution and the adjusted odds ratios for durations of use of anorexigens of 3 months and less (92 days), more than 3 months and undetermined durations. It appears that the risk increased notably with longer duration of use [OR = 10.6 (2.8-39.5)] and was much smaller in short term use [OR =1.9 (0.5-7.3)]. The odds ratio for BMI remained unchanged since the three durations of use tested are mutually exclusive subcategories of exposure to all anorexigens in the past. When only recent exposures were considered (within one-year preceding the index date), the odds ratios for short duration and long duration of use were not significantly different: 2.3 (0.4-12.4) and 10.6 (3.7-28.8) respectively (Total duration).

IV. VALIDATION STUDIES

4.1 Selection of cases

4.1.1 Identification and reporting biases

Several sources of identification and reporting biases were analyzed.

4.1.1.1 Delay of diagnosis

The median delay of onset of symptoms and diagnosis was 12 months in the exposed cases vs 16 months in the unexposed.

4.1.1.2 Severity of diagnosis

Exposed cases were slightly more severely affected at time of diagnosis than non-exposed (80% vs 63% respectively in NYHA class III or IV).

4.1.1.3 Main reporting centres vs other centres

In France, 22.8% (8/35) of the cases from the main reporting centre were exposed, as opposed to 30.1% (9/29) for all other cases from that country. Numbers were too small in other countries to allow for comparisons (Table 29).

4.1.1.4 Included vs non-included cases; "A" vs "B" cases

Of the 109 cases which were not included but had been interviewed, 11 (10.1%) had used an anorexigen in the past. Two additional cases had been exposed to an unknown weight-loss product.

Twenty (25.0%) out of the 80 cases classified as "A" by the Expert Review panel had used an anorexigen vs none (0%) of the 15 "B" cases and 4 (17.4%) of the 23 incident, interviewed, rejected, or screened-out cases (Table 29).

4.1.1.5 Field study of participating centres

The survey of all centres revealed that all cases which had not been reported, in fact, did not meet the inclusion criteria, or had already been reported by another centre, with the exception of 3 Belgian cases which were omitted. These were later considered for the study but could not be included in the case-control analysis because of time constraints. The study on the process of diagnosis is still ongoing at the time of this report.

4.2 Selection of controls

4.2.1 Non-included controls

Out of the 114 controls in our database which could not be used for the case-control analysis, 7 (6.1%) had used anorexigens (Table 29).

4.2.2 Sales figures

Table 30 compares the proportion of controls exposed to the expectations based on sales figures. Approximately three (3) million packages containing F/DF and seven hundred and fifty thousand (750,000) containing an ALA were sold in France in 1991. In the U.K. and The Netherlands, sales figures were much lower. Taking into account the mean duration of use, it was estimated that altogether 5% of controls would be exposed to at least one anorexigen, all countries combined (see Table 31 and sample size calculations in the protocol in Appendix B1). The actual percentage of controls exposed in the study was 6.5% when all past exposures were considered. We had calculated that in France 5% of the population in the age groups and with the gender distribution considered used at least one anorexigen each year. Exactly 5.0% of the French controls had used an anorexigen in the one-year time window. We had guessed that up to 10% of the controls could have used an anorexigen at least once in the past in France and that the prevalence would be 1% or less in the U.K. (no estimates were done for Belgium and The Netherlands). The actual percentages varied from 8.6% in France to 5.1% in Belgium, 0% in the UK and Netherlands, probably paralleling sales figures. Also, the F/DF to ALA ratio in the controls in the study was 3.3 to 1, which is similar to the ratio observed in the sales figures (see above).

4.3 Sensitivity analysis on exposure misclassification

4.3.1 Index Date

The estimates of the odds ratio for anorexigen use after the index date are presented in Table 31. The ratio was close to one.

4.3.2 Protopathic bias

The above-mentioned odds ratio for anorexigens after the index date were considered as a good indication that little protopathic bias, if any had occurred. It is however conceivable that two opposite phenomena could have occurred in cases: on the one

hand, they were more likely withdrawn from exposure when the diagnosis was made; on the other hand, some obese patients presenting with dyspnea could have been prescribed anorexigens if the physician attributed the dyspnea to the obesity. If they had occurred, these two phenomena would have cancelled each other out.

4.3.3 Unclassified exposures

If all the unclassified exposures (Category II) were considered as actual exposures to anorexigens, the odds ratio for all exposure in the past climbed sharply [OR 7.6 (3.6-16.7)] but remained similar to the general estimate for the one year time-window [OR = 5.4 (2.2-13.7)]. (Table 31)

4.3.4 Validation of questionnaires

The results of the validation of questionnaires against computerized pharmacy records or GP's notes were not available to us at the time of this report.

4.4 Country effect

The adjusted odds ratios for all past anorexigen use was 4.0 (1.6-10.2) in France. It could not be estimated independently in other countries (lack of subjects in some cases).

4.5 Recruitment

We had planned to obtain 100 validated cases in two years; we in fact included 95 validated cases in the case control analysis recruited between September 1992 and the end of September 1994. Table 32 compares the expectations of recruitment that we presented at the ACCP conference in Chicago and the actual numbers. They are almost identical.

There are marked difference, however, between the recruitment of each country. Belgium should be taken as the "gold standard" for comparison because we had publicized our efforts to obtain an exhaustive recruitment there. The idea was to produce an estimate of the annual incidence of the disease. Thirty (30) centres participated in the Belgian study. Only a few of the cardiology and pulmonary centres were missing. To the cases included (13), one should add the cases not evaluated by the Expert Review Panel (3), those not available to us on time but diagnosed during the relevant 2 year-period (7), the cases who died before the interview (4), the other incident cases not rejected by the Expert Review Panel (ERP) which were not included (3). These numbers can be found

in Appendix A8. This addition leads to 30 cases, which is a maximum since some of the added cases, if they had been evaluated by the ERP, might have been rejected. On the other hand, we probably missed some cases. Considering that there are 10 millions inhabitants in Belgium, our data led to an estimate of the annual incidence of diagnosed PPH in adults of 1.5 per million inhabitants and per year. This is very close to the 2 per million expected, which included pediatric cases.

It is not easy to directly compare this estimate with numbers obtained in other countries because the identification of all potential cases was not conducted in the same fashion. It is however obvious that the same level of recruitment was not achieved in all countries. One centre reported 35 included cases in France and the other 17 centres reported 29 cases for an average of 1.7 cases per centre. The average number of cases per centre in Belgium was 1.5, in the U.K. it was 1.1 and in The Netherlands it was 1.0 (without counting the main reporting centres). Only one case was observed by a centre in Switzerland by one active centre, thus, besides the high reporting by one centre in some countries, the participating centres reported similar numbers of included cases (Table 33). (A number of centres were active but did not report any case, because they apparently did not observe any during this period).

So it seems that the differences in recruitment are in large part explained by the differences in the number of active centres per country, besides the main reporting centre. The mean number of cases per million inhabitants are quite similar for the main reporting centre in France, Belgium and the Netherlands (and in Switzerland, actually). In the U.K., several important centres did not contribute to the study, which could explain a large part of the difference in the recruitment.

The differences in the number of participating centres are in large part explainable by the publicity given to the study in different countries (e.g. The "Tour de France" and the incidence study in Belgium) as well as the a priori definition of the centres to be contacted in some countries for logistical reasons. As a whole, the recruitment can be considered satisfactory, as the objectives were met in due time. Yet, since the recruitment is obviously not exhaustive whatever the country, it is important to discuss the potential sources of selection bias which could have occurred.

V. DISCUSSION

5.1 General Findings

The mean age, sex-ratio, and clinical presentation of cases included in the study are very similar to those observed in published case-series, and in particular to the patients included in the NIH registry. The mean age of the NIH registry was lower (38 y.o.), but included children, while we only included cases over 18 years old. It is felt that the cases included in the study represent the classical definition of primary pulmonary hypertension.

In summary, the study confirmed the role of AIDS and HIV infection and cirrhosis as risk factors for PPH. The role of IVD use is not clear since it could be partly confounded by HIV infection. Also, some cases of IVD may have a different pathology from PPH. Therefore, IVD users were withdrawn from the main analysis. Patients suffering of primary pulmonary hypertension were more frequently anorexigen users and, also had more often experienced a BMI over 30 once in their life, with a small partial confounding between those variables. The odds ratio is more important for long durations of use of anorexigens and was much smaller one year after cessation of drug use. There was no obvious difference between the different classes of anorexigens, except that some were more used than others. However, one should discuss the potential bias of the study before making any conclusions.

5.2 Selection bias

5.2.1 Selection of cases

Biases in the selection of cases could have occurred in several ways. Only the biases vis-à-vis the exposure to anorexigens will be addressed below as this is the main focus of this report.

Identification bias could have occurred if patients exposed to anorexigens were more likely to be diagnosed PPH than were non-exposed cases. Considering the severity of the disease, which is uniformly fatal in the absence of treatment, it is unlikely that a large number of these normally young patients suffering from severe dyspnea would evolve without being referred to a specialized centre at some point. The main centres specialized in PPH participated in the study in each country, plus a very large number of pulmonary medicine and cardiology centres. A similar bias would occur if exposed cases were more likely to be referred to hospitals than unexposed. This referral bias is not likely to be a significant issue in this case, for the same reasons: most of the cases originating in the community would end up in a specialized centre. Besides, if the potential association between exposure to anorexigens and PPH is known by highly specialized pulmonary physicians and cardiologists who treat those patients, it is not as well known by GPs and

other community doctors (even some specialists). The bias mentioned above would still hold, however, if there was a "forme fruste" of the disease which would be more likely to be diagnosed in cases exposed to anorexigens. The existence of even a form of the disease is not known. Exposed PPH cases actually presented with very severe dyspnea on the time of diagnosis (75% in NYHA class III).

Identification bias could also occur if exposed patients suffering from conditions closely resembling PPH were wrongly diagnosed as PPH because of their exposure to anorexigens. This was first controlled in this study by the strict, blind, review of cases by the Panel. We examined the exposure of cases according to their quality or validity of their diagnosis. If anything, "B" cases were less frequently exposed than "A" cases. The non-included interviewed cases were less frequently exposed than the included cases but more frequently than controls. This series however included true prevalent PPH cases, and some cases rejected on the basis of lack of date rather than mis-diagnosis.

As a whole it does not seem that non-PPH cases were more likely to be wrongly diagnosed PPH and reported only because of their exposure to anorexigens. The delay in the diagnosis of exposed cases was shorter than in the non-exposed. This indicates that physicians are more rapid to suspect PPH in a dyspneic patient who had used an anorexigen than in others. (The potential information bias related to this issue is discussed further below). The shortening of the delay in diagnosis would not lead to a selection bias per se, under the hypothesis that most cases will end up being diagnosed independently of exposure. It is not known to what extent the latter hypothesis is verified.

Another selection bias could originate in the preferential reporting of exposed vs non-exposed cases to the research teams. Efforts were made to obtain an exhaustive recruitment from the centres who reported at least one case. We also frequently checked with non-reporting centres. Despite numerous attempts with each centre, we were unable to find a significant number of non-reported cases (3 in the end). The proportion of cases exposed in the main reporting centre in France was similar to the proportion from other centres. If reporting bias cannot be fully excluded, it is in our opinion not likely to be a large phenomenon.

It is also possible that exposed cases were advised by their physicians to stop taking their medication which resulted in a resolution of symptoms and consequently these cases were never diagnosed.

5.2.2 Selection of controls

Another source of selection bias could originate from the selection of controls. The question is whether they adequately represent the so-called source population from which

cases originated. The rationale behind the choice of controls in this study is explained in the methods section. There is no difference between cases and controls in their sociodemographic composition, their familial history of morbidity, their personal history of disease (except for some of the suspected health-related risk factors). They also are very similar in their use of broad classes of drugs. The controls series is thus similar to the cases series as to several extraneous determinants of morbidity (other than the suspected risk factors). This is reassuring, although it is not per se a proof of the adequacy of the controls series.

Another reassuring fact is that the exposure of controls to the main risk factors studied (anorexigens) closely parallels the expectations based on sales figures for all past exposure, for the one-year time-window for all past exposure and by country.

Another concern with the selection process of controls could be the so-called "overmatching" due to the selection of controls through GPS. Overmatching is not a bias per se (it should not affect the direction of any observed relation). It is rather a question of efficiency (in other words, it would make it more difficult to observe "significant" associations if they exist). The associations were found significant for the most suspected risk factors, which makes the issue of efficiency less relevant. Also, it is theorically difficult to envision how an overmatching could have led to the observed results.

5.3 Information bias

5.3.1 Recall bias

Recall bias is a classical issue in studies based on interviews. The blinding of interviewers and interviewees on the specific objectives of the study, as well as the multiple precautions taken all along the conduct of the study, might not have controlled completely for this bias. Cases are likely to be more aware of the potential association between their disease and some risk factors, especially anorexigens, than controls. Thus they might recall more easily the use of anorexigens than controls did. The fact that controls reported anorexigen usage in proportions very close to sales figures is comforting in this respect. In the absence of under-reporting by controls, the results observed for anorexigens, if biased, would be due to an over-reporting by cases. This could happen if cases had some vested interest in reporting exposures which had not actually occurred. In Europe, liability is not a significant issue and it is not likely that such over-reporting could have a large magnitude, if any. Also, it is possible that some cases could be inclined to not report actual exposure to anorexigens, maybe because of the fear of being "blamed" for their disease (this was documented in one case). The most convincing

argument against the existence of an important recall bias in this study is the lack of difference between cases and controls as to their exposure after the index date.

5.3.2 Protopathic bias

Another source of exposure misclassification could have stemmed from the so-called "protopathic bias". Such a bias could have occurred if cases had received anorexigens after the onset of their symptoms, with the intention of mitigating these symptoms. They would thus have been wrongly classified as exposed. The fact that the odds ratio for anorexigens and PPH drops to almost one when only exposure after the index date is taken into account, excludes this hypothesis. This also is an indirect validation of the index date used in this study.

5.3.3 Time-window

In a case-control study, delays between first symptoms, diagnosis, reporting and interview could be the source of bias in several ways. Here the long delay between symptoms and diagnosis posed a problem. This could have been a source of bias if the date of diagnosis had been used as the index date, with a fixed time-window of investigation. The use of the first symptom as the index date controlled for this phenomenon (see the discussion on the validity of the index date further below). In the absence of a validated model for the disease process, we explored two different "time-window": all past exposure and exposures which occurred within one year previously to the event. When only recent exposures were taken into account, the odds ratios for anorexigens slightly increased as compared to all past exposures. Also, the odds ratio after drug discontinuation for more than one year was smaller than the odds ratio for recent exposures. This could support the notion of a physiological process with little remaining effects after exposure discontinuation. However, the number of unclassified exposure of cases more than one year before the index date was important (11 unclassified for all past exposures vs 3 in the last year, or 8 for the time-window of more than one year). The observed decrease in the odds ratio could be an artifact. It seems in any case more appropriate to chose a one-year time-window for the assessment of the odds ratio.

5.4 Confounding

Confounding is the last source of bias to be addressed. All the factors which are associated with PPH and anorexigen use are at stake here.

The first concern was that the use of anorexigens is obviously associated with the desire to lose weight, which is in turn more likely to exist in obese individuals. As obesity

appears to be a risk factor for the disease, the question is to what extent could the observed association for anorexigens be explained by confounding by obesity or any other factor associated to high BMI?

The association between the exposure to anorexigen and the experience of a high BMI (ECOR) was elevated, but it could not totally explain the observation. Indeed, when the high BMI was omitted from the multivariate analysis, the odds ratio observed for anorexigens was higher, but it did not decrease so notably when the model was controlled for BMI. This was already indicated by the matched odd ratios for anorexigens exposure which did not differ greatly whether individuals had experimented a high BMI or not although there was an indication of partial confounding. Conversely, the role of high BMI on the estimated relative risk of PPH was not significantly affected by the use of anorexigens or not. Thus, one can conclude that the experience of a high BMI only partially confounds the effect of anorexigens, but that the adjusted odds ratio produced by modelling satisfactorily controlled for this bias. No other source of confounding was obvious.

5.5 Role of risk factors

5.5.1 Anorexigens

The study confirms that the exposure to anexorigens is associated with a higher risk of PPH. The study more specifically documents the role of fenfluramine and dexfenfluramine. The estimate of the risk associated with other products such as amphetamine-like agents pointed in the same direction. The estimates were more unstable, due to the much smaller use of these later products in the recent past. (In the recent past, F/DF was used as a replacement to ALA). The fact that the use of both F/DF and ALA was associated with an estimated relative risk almost double that of the use of F/DF in isolation indicates that ALA may play a role per se in the risk of PPH.

The study of the time-window indicates that a more recent exposure (less than one year before the index date) is more relevant. It is however possible that a "depletion of susceptibles" occurred. This will have to be further analyzed. The study of the duration of use provided some important insights.

The estimate of the relative risk increased with longer duration, with a small, but not significant, increase in the odds ratio for short-duration users and a significantly higher odds ratio observed with long duration of use. There was no difference in the distribution

of obesity between users of short and long duration.

The consistency of the results was supported by the sensitivity analyses. Although the estimates of the relative risks could be lower or higher according to several hypotheses on exposure, in most cases the results did not change significantly in direction nor in magnitude. In the very extreme hypothesis where all drugs reported "to lose weight" are classified as anorexigens, the odds ratio was somewhat more elevated for the "all past" time-window, but was not for the more relevant one-year time-window. Also consistent is the fact that the exposure to several products (F/DR and amphetamines) was associated with an odds ratio superior to the one obtained for the exposure to one of these products alone. Finally, the results observed in the one-year time window, the duration of use and the stability of the estimates over different analyses all point to the consistency of the relation between exposure to anorexigens and primary pulmonary hypertension.

5.5.2 Obesity

The study indicates that obesity could be a risk factor for PPH. The odds ratio was slightly greater than 2. There is no clear explanation for this finding. Our measure of obesity was not very accurate in time since we could only interview several months after the onset of symptoms. We obtained the information on the higher BMI in life rather than the exact BMI at the time of the index date. Having experienced a high BMI could have been followed by a series of exposure which would confound the results observed. This is why we controlled all the analyses for any indication of weight-loss behaviour, use of undefined weight-loss drugs and the like. The effect of the high BMI was not affected at all. Also, obesity remained a risk factor whatever the use of anorexigens. One may wonder how obesity could increase the risk of PPH. Sleep apnea, which has been proposed as a risk factor for PPH, is known to occur more frequently in obese patients. Other physiological factors should be considered. Obesity and hypertension are known to be linked, the former being a known risk factor for the later.

5.5.3 Hypertension

The role of systemic hypertension was of borderline significance in the preliminary analysis. It remained elevated in all the multivariate models, whatever the time-window, but the estimates were unstable. This finding awaits confirmation, since this is the first empirical evidence of the possibility of such a relation.

5.5.4 Other risk factors

The study was unable to confirm the role of several alleged risk factors such as recent pregnancy, stays in high altitudes, dietary habits. The study confirmed the role of risk factors such as AIDS and HIV infections and cirrhosis. Many cases (11) were rejected because they had AIDS and 3 other had HIV infections, which confirms the significance of this risk factor, as reported recently. The relative risk in cirrhosis patients could not be estimated precisely. Two (2) out of 4 IVD users had HIV and 2 out of 3 HIV infected patients reported IVD use. Cocaine alone was not reported more frequently by PPH cases than controls.

The observations of the differences in the exposure to certain class of drugs (antiasthmatics, analgesics, haematological drugs) will have to be further explored. For antiasthmatics, the result is not confirmed by the data on preexisting morbidity; it is possible that the higher exposure of cases actually indicates the beginning of symptoms in some cases. Some of these drugs have cardiac effects and have been reported to be associated with higher mortality. Also, it could be a difference due to chance alone. No explanation can be found for the lesser use of analgesics by cases. The number for haematologic drugs are very small.

Finally, it is possible that anorexigens were used within other medications (such as phenylpropylamine which is used as a nasal degongestant and an anorexigen). Exposure to these possibilities needs further study.

5.5.5 Role of risk factors in PPH

When all of the risk factors were combined, more than half of the cases of PPH had an identifiable associated risk factor. Although causal relationships between these risk factors and PPH are largely unknown, it now appears that PPH may have clearly defined causes.

APPENDIX A5

Feasibility study

A feasibility study was conducted in May in France. Four approaches were taken:

1. One hundred and ten (110) Departments of Pneumology and/or Cardiology of University Hospitals in France received a letter asking them to participate in the study (two mailings). Seventy-eight of them (78%) responded and 1 refused. The remainder have not responded. All of the major centres have consented to participate, including the referring centres and transplantation centres. Of the respondents, 22 had seen no cases in the past year, 28 had seen 1 to 2 cases per year, and 9 had seen more than 2 cases per year. Nineteen (19) did not report the number of cases that they had seen. Nine other centers later on accepted to participate.

2. A field feasibility study was conducted during the month of May 1992 (4 weeks) in the Aquitaine region of France (around Bordeaux). This region represents a catchment population of approximately 4.2 million inhabitants. The heads of the divisions of Pneumology (3), Cardiology (8), Internal Medicine (6), Chest Surgery (2) and Intensive Care units (4) of the five University and Military Hospitals in the region were contacted. Three (3) large private clinics were also surveyed. Finally, 32 local hospitals were contacted. They were all visited whenever they declared that they had diagnosed a PPH case in the preceding 16 months. Seventeen (17) cases were found. After applying an algorithm for case-ascertainment, 7 cases were considered meeting the inclusion criteria for the study. Extrapolating these results to the whole of France, this figure would lead to 72 potential "validated" cases per year in this country.

3. Forty-two (42) private cardiologists and 18 pneumologists were randomly selected among the list of cardiologists practising in the Aquitaine region. They were contacted by telephone. The objectives of this survey were: (i) to validate the patterns of referral of PPH cases seen by private cardiologists; (ii) to possibly identify more cases of PPH that would have been missed in the hospital centres. Forty-one declared that they would refer a case of PPH for treatment and/or confirmation of diagnosis to a University Hospital, 8 to a private clinic and 10 to local hospitals. It was confirmed that most of these cases would however end up in a University Centre. These centres were among the 23 surveyed. Two potential cases of PPH had been seen by the private cardiologists in the 16 months preceding the interview. These 2 cases were among the 17 found in the survey of the university Centres.

4. Mortality data from France (INSERM) and The Netherlands indicate that approximately 2 individuals per million inhabitants die each year with a primary or secondary diagnosis of PPH.

From these results, we concluded that the incidence of PPH in a country like France was in the order of 2 per million inhabitants per year.

The five countries involved in the study altogether have 150 million inhabitants altogether, with a maximum expected number of 300 incident cases per year. It was estimated that 50% of the cases would meet the inclusion criteriae for the study and that 50% of them could be recruited, i. e. a maximum of 75 per year. To allow for the uncertainty in the incidence, it was planned that 100 cases could be recruited over 2 years.

APPENDIX A6

EXPERT REVIEW PANEL REPORT

February 20, 1995

FINAL REPORT FROM IPPHS SUBCOMMITTEE TO REVIEW CASE REPORT FORMS FEBRUARY 20, 1995

A panel of experts from North America was selected to review all of the case report forms submitted to the IPPHS, to ascertain as to whether or not they were not appropriate for inclusion into the study. The rationale behind this came from the experience of the NIH Registry on Primary Pulmonary Hypertension where 18% of the cases submitted were felt not to be consistent with primary pulmonary hypertension. Because the Data and Coordinating Center for the study was based in Montreal, it was felt that committee members should be residing in North America to make frequent travel to Montreal realistic.

The members of the IPPHS Subcommittee where as follows:

1. Dr. Stuart Rich (Chairman). Dr. Rich is Professor of Medicine and Chief of the Section of Cardiology at the University of Illinois at Chicago. He was co-principal investigator for the NIH Registry on Primary Pulmonary Hypertension, and was responsible for reviewing all of the case report forms submitted to the Registry.

2. Dr. Lewis Rubin. Dr. Rubin is Professor of Medicine and Head of the Division of Pulmonary and Critical Care Medicine at the University of Maryland School of Medicine. He has an extensive experience in the management of patients with primary pulmonary hypertension and has published extensively on this topic. He is a recognized world authority.

3. Dr. Michael McGoon. Dr. McGoon is Associate Professor of Medicine in the Division of Cardiology at the Mayo Clinic. Dr. McGoon has a career interest in primary pulmonary hypertension and is currently principal investigator at the Mayo Clinic for their diagnostic and therapeutic trials in patients with primary pulmonary hypertension.

4. Dr. David Langleben. Dr. Langleben is a member of the Cardiology Department at the Jewish General Hospital in Montreal. Dr. Langleben has both basic science and clinical science interest in primary pulmonary hypertension and its mechanisms.

Meetings

Eight meetings were held between January 1, 1993 and December 31, 1994 where all of the submitted case report forms to the IPPHS were reviewed. The meetings were held at the Jewish General Hospital in Montreal (five times), O'Hare Airport in Chicago (two times), and a hotel in Washington, DC (one time). At every instance all of the available case report forms were reviewed by the Committee and work was completed.

Case report forms were censored prior to being submitted to the Committee so that any information regarding exposure to anorexigens or other medications was removed from the case report form. The Committee went through each report form on a page by page basis to ascertain as to whether or not the information seemed to be consistent with PPH. Actual chest X-rays and lung scans were requested and reviewed when available. If errors in transcription of the data was identified it was so indicated on the form. There was open dialogue and free discussion regarding the information provided on each individual case.

Classification

All of the case report forms were characterized in one of the three classifications.

Group A. Cases based on the data presented to the Committee that were felt to have unexplained pulmonary hypertension and were appropriate to be included in the study.

Group B. Cases where important data elements were missing or some data presented was uncertain, but felt to be possibly applicable to the study. More information on these cases were requested for further review.

Group C. Cases where the diagnosis of primary or unexplained pulmonary hypertension was felt to be inaccurate and thus the case should not be included into the study.

In addition, there were cases where the Committee felt there was not enough information even to classify. In those instances, it was requested that more data be provided so that a judgement could be made.

It was also noted when chest X-rays and/or lung scans were available for review. Cases for which they were provided were designated with a plus(+), and those where it was not provided designated with a minus(-). Other information such as pulmonary angiograms and CT scans were occasionally available for review as well.

Results

In total 193 cases were reviewed by the Committee. Their classifications were as follows:

1. INCIDENT ALIVE CASES

	GROUP A	GROUP B	GROUP C
NETHERLANDS	3	4	5
BELGIUM	12	1	5
FRANCE	61	8	9
U.K.	14	4	7
TOTAL	90	17	26

2. INCIDENT DECEASED CASES

	GROUP A	GROUP B	GROUP C
NETHERLANDS	4	1	0
BELGIUM	1	1	1
FRANCE	6	4	3
U.K.	3	1	0
TOTAL	14	[illegible]	4

3. PREVALENT ALIVE CASES

	GROUP A	GROUP B	GROUP C
NETHERLANDS	3	0	1
BELGIUM	6	1	1
FRANCE	6	3	3
U.K.	5	0	0
TOTAL	20	4	5

	GROUP A	GROUP B	GROUP C
NETHERLANDS	1	1	0
BELGIUM	0	0	0
FRANCE	1	0	1
U.K.	1	0	1
TOTAL	3	1	2

As a check on the validity of the review, 10 cases were resubmitted to the Committee for re-review without their knowledge. In those 10 cases, the classification made by the Committee was identical to the initial review in nine instances. In one instance the Committee reclassified a case from Group A to Group B. In no instance was a case felt to be acceptable (Group A or B), which then on re-review was felt to be unacceptable or vice versa.

All in all the Committee felt that the case review was useful and contributed to making sure that appropriate cases were included in the study. The Committee also commended the reporting centers for their excellent job in acquiring and collating the material, and making it easy to read and interpret.

Sincerely,

Stuart Rich, M.D.
Professor and Chief
Section of Cardiology
Chairman, IPPHS Subcommittee

SR/ks

REPUBLIQUE FRANCAISE

AGENCE DU MEDICAMENT

Saint-Denis, le 03 MAI 1995

DIRECTION DE L'EVALUATION

UNITE DE PHARMACOVIGILANCE

CONFIDENTIEL
DOCUMENT
DE
TRAVAIL

SYNTHESE DES DONNEES DISPONIBLES SUR LE RAPPORT BENEFICE/RISQUE DES ANOREXIGENES A LA SUITE DE LA COMMISSION NATIONALE DU 28 AVRIL 1995

Rappel des mesures prises lors de la Commission National e de Pharmacovigilance du 10 mai 1994 :.
Au vue de l'analyse intermédiaire de l'étude IPPHS et des résultats de l'enquête nationale de Pharmacovigilance portant sur la fenfluramine et dexfenfluramine, il a été décidé :

- de poursuivre l'étude IPPHS jusqu'à son terme
- d'étendre l'enquête Nationale de Pharmacovigilance à l'ensemble des anorexigènes
- d'encadrer strictement la prescription des spécialités fenfluramine et dexfenfluramine : respect des indications, de la posologie et de la durée de prescription maximale de 3 mois.
- de mentionner le risque d'hypertension arterielle pulmonaire à la rubrique "mise en garde".
- d'informer les prescripteurs de ces dispositions.

La Commission Nationale de Pharmacovigilance du 28 Avril 1994 a pris connaissance du dossier actualisé de pharmacovigilance relatif à l'ensemble des anorexigènes et a examiné :

- les résultats finaux de l'étude IPPHS (International Primary Pulmonary Hypertension Study).
- l'enquête nationale de Pharmacovigilance coordonnée par le CRPV de Besançon.

Avec la participation d'experts pneumologues et nutritionistes, e lle a tenté d'évaluer le risque et le rapport bénéfice/risque des anorexigènes.

Annexe 1-55

I) Le risque

I-1) L'étude IPPHS montre une association significative entre la prise d'anorexigènes (toute classe) et la survenue d'Hypertension Arterielle Pulmonaire.

Facteurs de risque	Odds ratio
Anorexigènes	4,1· (1,8-9,7)
BMI≥ 30	2,6· (1,3-5)
Hypertension artérielle	2,4 (0,8-7,1)
Tabagisme	1,3 (0,7-2,3)
Perte de poids	0,9 (0,5-1,7)

Odds ratio ajustés (étude de régression logistique multivariée) des principaux facteurs de risque d'Hypertension Artérielle Pulmonaire (toute durée d'exposition confondue avant la date index)
· significatif

Anorexigènes	Odds ratio
Fenfluramine/Dexfenfluramine uniquement	3,8· (1,5-9,7)
et/ou Fenfluramine/Dexfenfluramine	4,1· (1,7-10)
Amphétaminiques uniquement	4 (0,2-65,8)
et/ou Amphétaminiques	5,4· (1,2-24,2)
Fenfluramine/Dexfenfluramine + amphétaminiques	5,8· (1-33,1)

Odds ratio ajustés par sous classe d'anorexigènes
· significatif

Durée d'utilisation	Cas : 95	Témoins : 355	Odds ratio ajustés
≤ 3 mois	5	10	1,9 (0,5-7,3)
> 3 mois	9	5	10,6· (2,8-39,5)

Odds Ratio ajustés en fonction de la durée d'exposition
· significatif

Les anorexigènes et un fort indice de masse corporelle (BMI > 30) apparaissent comme des facteurs de risques possiblement indépendants. Une durée d'exposition supérieure à 3 mois augmente considérablement le risque.

Annexe 1-55

Cette association suggère d'autant plus une causalité que : critères de Bradford Hill

- l'odd ratio est significativement élevé,
- l'étude ne présente pas de biais majeur,
- les résultats sont cohérents avec ce que l'on connait de la physiopathologie de l'Hypertension Arterielle Pulmonaire (femme jeune, obèse ...),
- elle est confirmée par des approches différentes (en particulier l'enquête de pharmacovigilance basée sur la notification spontanée),
- il existe une analogie avec l'Aminorex,
- l'intensité de l'exposition (durée et association d'anorexigènes) conduit à une augmentation du risque.

I-2) Les résultats de l'enquête officielle de Pharmacovigilance confiée au CRPV de Besançon confirme les conclusions de l'étude épidémiologique : l'Hypertension Artérielle Pulmonaire est un effet rare mais très grave (78 cas notifiés en France de 1985 à Décembre 1994 dont 22 décès, 4 transplantations pulmonaires et 4 attentes de greffe) fortement associé à la prise prolongée d'anorexigène de type amphétaminique et/ou serotoninergique.
(Les volumes des ventes en mois-traitement figurent en annexe)

La Commission Nationale de Pharmacovigilance estime, que le risque d'Hypertension Artérielle Pulmonaire lié à la prise d'anorexigène représente un problème de santé publique, en raison de la gravité de l'atteinte pulmonaire.

II) le bénéfice

Un groupe de travail DEV " stratégie thérapeutique de l'obésité " (réunion du 31 Mai 1994) avait défini les indications et apprécié le niveau d'efficacité.

II-1) **Les indications :**

Les spécialité ISOMERIDE® (dexfenfluramine) et PONDERAL® (fenfluramine) ont fait l'objet d'une modification du RCP conformément aux mesures prises. (cf annexe)

- l'indication doit être restreinte au traitement de 2ème intention , après echec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle supérieure à 30 (ce type de patient représente 6 % de la population française).

- la durée du traitement ne doit pas dépasser 3 mois

- Le traitement est contre-indiqué chez l'enfant.
(NB: Cependant dans de rares cas, des traitements plus prolongés peuvent être conduits par des spécialistes hospitaliers en nutrition et en pédiatrie, sous couvert d'un suivi attentif)

Annexe 1-55

II-2) Le niveau d'efficacité avait été apprécié de façon différente :

→ *De l'avis de certains spécialistes en nutrition, la fenfluramine et dexfenfluramine sont efficaces et utiles notamment chez les obèses ayant un indice de masse corporelle > 30, plus particulièrement lorsque l'obésité est androïde ou s'associe à d'autres facteurs de risque.*
L'efficacité de ces produits a été montrée pour des durées de traitement de 3 mois à 1 an, en traitement adjuvant du régime. Le taux de répondeurs est de l'ordre de 33 % après un an de traitement (perte supérieure à 10 % du poids initial).
L'obésité tend à être reconnue comme un état chronique justiciable d'une pharmacothérapeutique adaptée à long terme.
L'usage intermittent de ce traitement est nocif, la variance du poids étant un risque propre indépendant du poids initial.

→ *D'autres spécialistes ("hypertensologues" cardiologues, endocrinologue, diabétologues, gynécologues, pédiatres, internistes), estiment l'efficacité de ce traitement comme mineure, voire marginale ou même inexistante. A long terme, ce traitement est jugé comme ayant un taux constant d'échec sur l'obésité. On ne dispose pas de données montrant que les anorexigènes permettent effectivement de réduire la mortalité et la morbidité cardio-vasculaire liées à l'obésité.*

III) le rapport bénéfice/risque

Les experts pneumologues ont souligné l'insuffisance des mesures prises au vue des résultats intermédiaires, prises sur les seules fenfluramine et dexfenfluramine. Etant donné l'évolution fatale de l'Hypertension Artérielle Pulmonaire, ils demandent un contrôle étroit des prescriptions ainsi qu'une information pertinente mettant en exergue le risque vital.

Si certaines firmes ont présenté des propositions visant à renforcer le respect du bon usage (information des professionnels de santé, du public, recommandations strictes, mise en garde...), d'autres attendent les propositions de la Commission. Toutes sont convaincues qu'il s'agit d'un effet de classe, que le risque est important et qu'il faut limiter les indications à l'obésité vraie morbide.

Les membres de la Commission Nationale de Pharmacovigilance du 28 Avril 1995 ont envisagé 4 possibilités :

a) la suspension de l'ensemble des anorexigènes, dans la mesure ou un traitement court serait sans interêt et un traitement prolongé trop dangereux.

b) la limitation à certains spécialistes hospitaliers pour traiter un nombre limité de patients dont l'obésité serait associée à un risque vital.

c) la limitation des prescriptions aux spécialistes hospitaliers et libéraux, dans la mesure ou un traitement de 3 mois ou moins présenterait quelque interêt. La définition de ces spécialités sera difficile.

d) la prescription laissée aux généralistes.

Bien entendu, des mesures adéquates d'information s'imposent pour les 3 dernières situations et singulièrement pour les les 2 dernières, ainsi qu'un contrôle régulier des volumes de vente et si possible du bon usage thérapeutique.
Les restrictions devraient s'appliquer aux préparations magistrales.

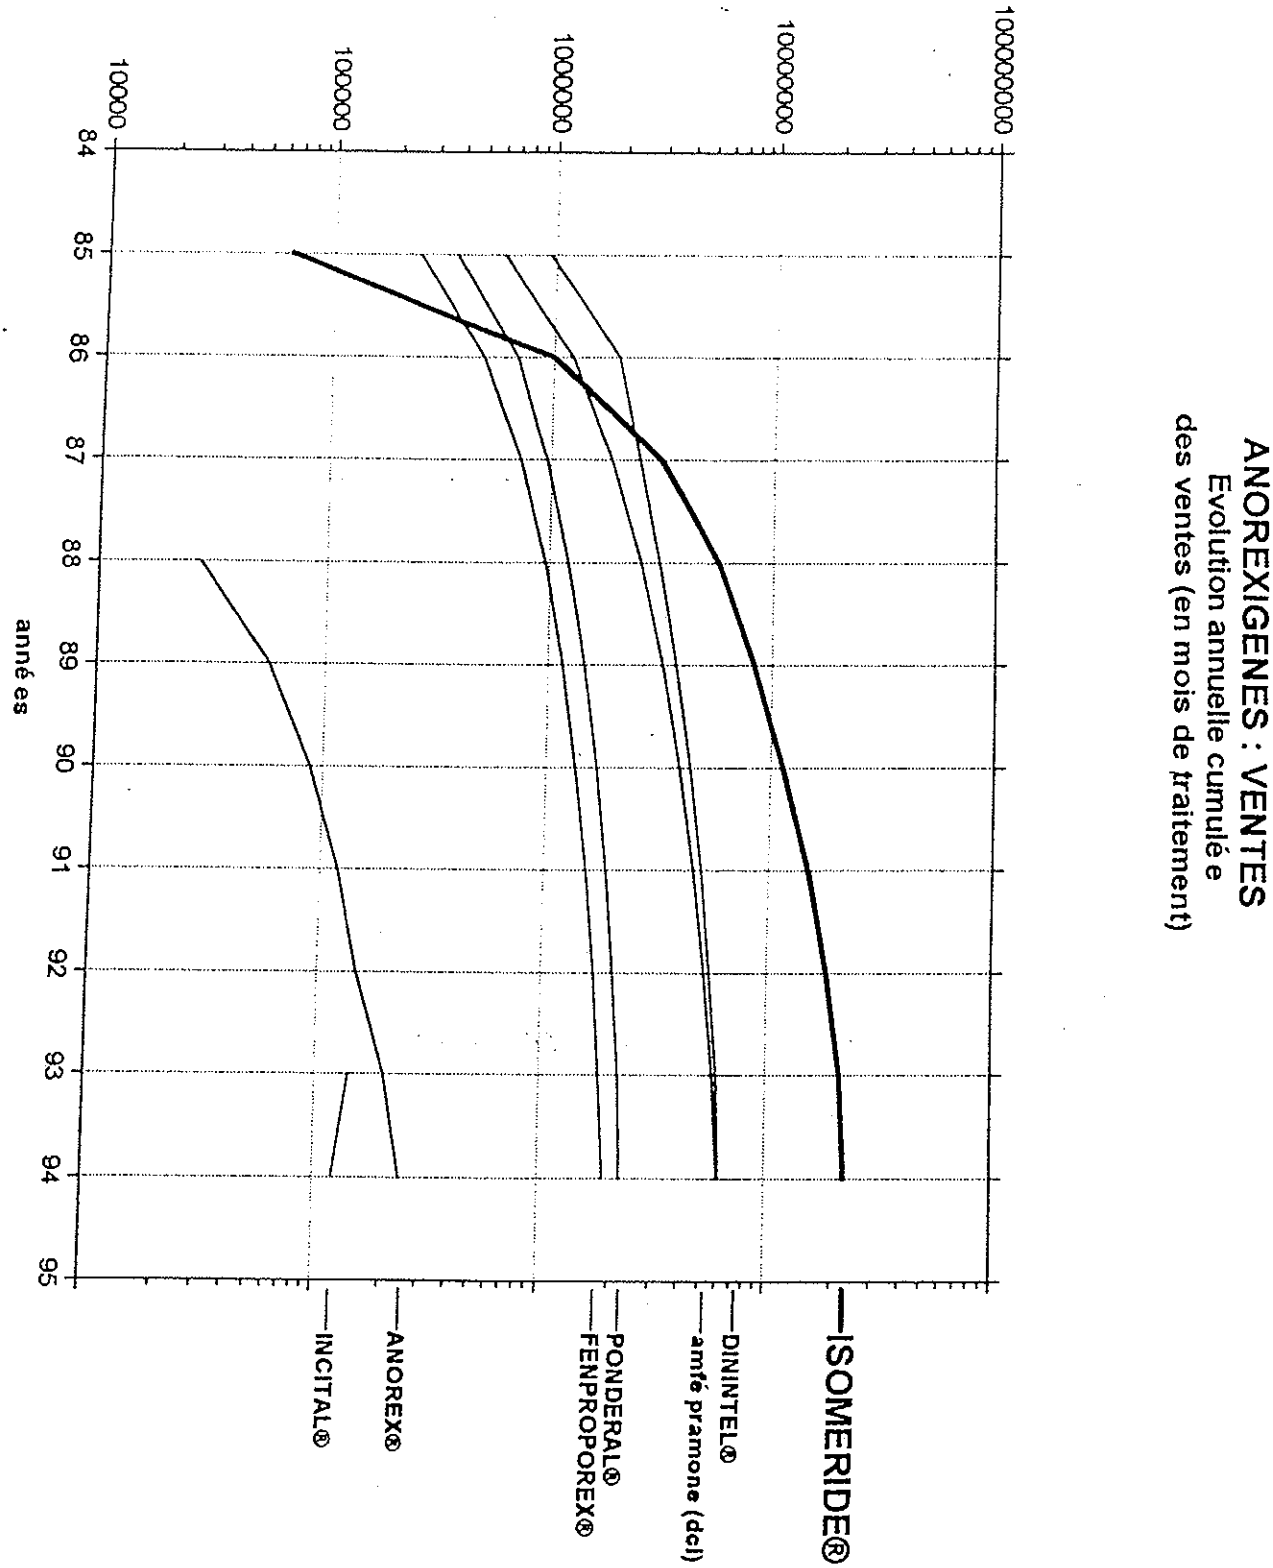
ANOREXIGENES : VENTES

Evolution annuelle cumulée
des ventes (en mois de traitement)



Enfants : 1 pulvérisation dans chaque narine 3 fois par jour.
Adultes : 1 pulvérisation dans chaque narine 4 à 6 fois par jour.

DC CONTRE-INDICATIONS
- Sensibilisation préalable connue à l'un des constituants, en particulier à la framycétine ou aux autres aminoglucosides, notamment streptomycine, kanamycine ou gentamicine (allergie croisée).
- Ne pas administrer par la méthode de déplacement de Proëtz.

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI
Mises en garde :
- Risque d'allergie.
- Risque de sélection de souches résistantes.

Précautions d'emploi :
Le traitement usuel ne dépassera pas 10 jours ; au-delà la conduite à tenir devra être réévaluée.

DC EFFETS INDÉSIRABLES
L'emploi par voie nasale peut induire une allergie aux aminoglucosides se traduisant par des manifestations cutanées de fréquence exceptionnelle.

PP PHARMACODYNAMIE
La framycétine, antibiotique bactéricide, appartient à la famille des aminoglucosides, à usage local exclusif. La framycétine, aux concentrations obtenues en applications locales, est, en raison de son activité in vitro, potentiellement active in vivo sur de nombreux germes à Gram + et à Gram - pouvant être rencontrés au niveau des voies aériennes supérieures.

AMM 328 477.1 (1978).

☆ ISOMÉRIDE 15 mg
dexfenfluramine

FORMES et PRÉSENTATIONS
Gélule (blanche) : Boîte de 60.

COMPOSITION	*p. gélule*	*p. boîte*
Dexfenfluramine (DCI) chlorhydrate ..	15 mg	900 mg

Excipient : amidon de maïs, cellulose microcristalline, lactose, silice colloïdale, stéarate de magnésium, talc. *Calibrage* : n° 3.

DC INDICATIONS
Traitement de deuxième intention, après échec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle supérieur à 30.

DC POSOLOGIE et MODE D'ADMINISTRATION
2 gélules par jour, réparties en 2 prises quotidiennes, à savoir 1 gélule le matin et 1 gélule le soir, de préférence au cours des repas.
Durée du traitement :
La durée du traitement ne doit pas dépasser 3 mois. Cependant dans de rares cas, des traitements plus prolongés peuvent être conduits par des spécialistes hospitaliers en nutrition, sous couvert d'un suivi attentif.

DC CONTRE-INDICATIONS
- Glaucome, enfant à l'exception de cas spécifiques sous couvert d'un suivi attentif par des spécialistes hospitaliers en pédiatrie, antécédents d'anorexie mentale, antécédents dépressifs, antécédents psychiatriques, propension aux abus médicamenteux, alcoolisme avéré.
- Du fait du mécanisme d'action sérotoninergique d'Isomérides, l'association aux IMAO est contre-indiquée (un intervalle d'au moins 15 jours doit être respecté).

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI
Mises en garde :
Des observations d'hypertension artérielle pulmonaire ont été rapportées chez des patients ayant reçu un traitement par la dexfenfluramine.
Compte tenu de ce risque rare mais grave,
- l'indication doit être respectée ;
- la durée du traitement est limitée à 3 mois, et le traitement ne doit pas être renouvelé ;
- toute apparition ou augmentation d'une dyspnée d'effort doit faire évoquer la possibilité d'hypertension artérielle pulmonaire, et faire arrêter le traitement.

Bien que n'appartenant pas à la classe I (stimulants) des substances interdites par la commission médicale du Comité International Olympique, l'attention des sportifs est attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors de contrôles antidopage.

Précautions d'emploi :
- Les causes organiques d'obésité doivent être éliminées avant la prescription de ce produit.
- Chez des patients généralement porteurs de facteurs de risque vasculaire et souvent à la suite d'une perte de poids rapide, de rares observations d'infarctus du myocarde et d'accidents vasculaires cérébraux ont été rapportées. L'attention est attirée sur la nécessité chez de tels sujets d'un amaigris-
- Ce produit doit être utilisé avec précaution chez les sujets présentant des troubles du rythme.
- Insuffisants hépatiques et insuffisants rénaux : en l'absence d'étude spécifique, l'administration de ce produit devra être évitée chez de tels patients.

DC INTERACTIONS MÉDICAMENTEUSES
Ne pas associer à un anorexigène à action centrale ni à un IMAO (cf. Contre-indications).
La dexfenfluramine peut potentialiser :
- les médicaments dépresseurs du système nerveux central (sédatifs),
- les antihypertenseurs,
- les effets hypotenseurs des antidépresseurs tricycliques,
- les sulfamides hypoglycémiants.

DC GROSSESSE et ALLAITEMENT
Grossesse : la dexfenfluramine n'est pas tératogène et n'altère pas la reproduction chez l'animal. Cependant, elle ne doit pas être administrée chez la femme enceinte.
Allaitement : en l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

DC EFFETS INDÉSIRABLES
- Les plus fréquemment rapportés sont : sécheresse de la bouche, nausée, constipation, diarrhée. Ces effets cèdent à la poursuite du traitement.
- Ont été plus rarement observés : asthénie, céphalées, frissons ; variations tensionnelles, hypertension, hypotension, syncope, lipothymie (spécialement en début de traitement) ; élévation des transaminases, hépatite (exceptionnellement) ; somnolence, étourdissement, troubles de l'humeur, insomnie, nervosité, dépression, état confusionnel ; diplopie, mydriase ; rash cutané, prurit, œdème de Quincke, urticaire ; pollakiurie.
- Des observations d'hypertension pulmonaire ont été rapportées chez des patients ayant reçu un traitement par la dexfenfluramine (cf. Mises en garde).

DC SURDOSAGE
Peu de données sont disponibles sur les accidents de surdosage.
Le traitement d'urgence comporte :
- un lavage d'estomac,
- une diurèse forcée avec acidification des urines pour accélérer l'excrétion du produit,
- une réanimation avec surveillance cardiaque dans les cas les plus sévères,
- à la différence des anorexigènes sympathomimétiques, l'administration de barbituriques ne doit pas être systématique.

PP PHARMACODYNAMIE
Isomérides agit sur la régulation pondérale en diminuant le niveau de réglage du pondérostat, système physiologique central qui détermine et maintient stable le poids d'un individu.
Isomérides possède une action spécifique sur les comportements alimentaires susceptibles d'induire une obésité :
- en inhibant électivement la consommation de glucides tout en respectant la consommation de protéines.
- en inhibant l'hyperphagie induite par l'insuline,
- en inhibant l'hyperphagie de situation anxiogène.

Isomérides a un mécanisme d'action sérotoninergique qui sous-tend son activité pharmacodynamique.
Isomérides inhibe la recapture et augmente la libération de sérotonine.
Dans l'obésité avec trouble du comportement alimentaire (compulsion pour les hydrates de carbone), Isomérides inhibe de façon sélective la consommation de glucides et diminue ainsi la consommation calorique globale, tout en respectant la prise de protéines.
Isomérides se différencie radicalement des anorexigènes amphétaminiques :
- absence d'effet psychostimulant,
- absence d'effet hypertenseur,
- absence de potentiel d'addiction.

PP PHARMACOCINÉTIQUE
Après administration orale, l'absorption d'Isomérides est pratiquement totale. Le pic de concentration plasmatique est atteint 4 heures après la prise.
En administration répétée, à dose thérapeutique, une gélule le matin et une gélule le soir, l'état d'équilibre est atteint vers le quatrième jour et reste stable à la concentration moyenne de 40 ng/ml.
La liaison aux protéines plasmatiques est faible (36 %).
Le produit est fortement métabolisé avec formation de d-norfenfluramine qui participe à l'activité globale du produit. Aucun dérivé de l'amphétamine n'a été mis en évidence. La clairance plasmatique est de 45 litres par heure.
L'élimination est presque exclusivement urinaire, plus de 90 % de la dose étant recueillis en 3 à 4 jours par cette voie. Le temps de demi-vie d'élimination est d'environ 18 heures.

LISTE I

PRIX indicatif : 169,00 F (60 gélules).
Non remboursable Sécurité sociale.

Information médicale : Tél. : (1) 46-41-60-60

☆ ISOMYRTINE
pholcodine, isomyrtol

FORMES et PRÉSENTATIONS
Capsule (verte) : Boîte de 20, sous plaquettes thermoformées (PVC/ALU).

COMPOSITION	*p. capsule*
Pholcodine (DCI)	18 mg
Isomyrtol	20 mg

Excipient : terpinéol, cire d'abeille jaune, lécithine de soja d'arachide. *Enveloppe de la capsule* : gélatine, glycérol, hydroxybenzoate d'éthyle sodé, parahydroxybenzoate méthyle sodé, dioxyde de titane (E 171), jaune de quinoléine (E 104), bleu patenté (E 131), eucalyptol.

DC INDICATIONS
Traitement symptomatique des toux non productives gênantes.

DC POSOLOGIE et MODE D'ADMINISTRATION
Le traitement symptomatique doit être court (quelques jours).
Réservé à l'adulte.
Chez l'adulte, la posologie maximale est de 90 mg/jour de pholcodine à répartir en 4 prises espacées de 6 heures. La posologie usuelle est de 20 à 60 mg/jour soit, en l'absence de tout autre forme pharmaceutique apportant de la pholcodine ou tout autre antitussif central : 1 capsule/prise, 3 à 4 fois par jour.
Coût du traitement journalier : 3,94 à 5,26 F.

DC CONTRE-INDICATIONS
Celles liées à la présence de pholcodine, c'est-à-dire :
- toux de l'asthmatique. L'association antitussif + bronchodilatateur n'est pas justifiée ;
- en règle générale, insuffisance respiratoire quel qu'en soit son degré en raison de l'effet dépresseur des antitussifs sur les centres respiratoires et de la nécessité de respecter la toux pour éviter l'encombrement bronchique.

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI
Mises en garde :
- Les toux productives qui sont un élément fondamental de la défense bronchopulmonaire sont à respecter.
- Avant de prescrire un traitement antitussif, il convient de rechercher les causes de la toux qui requièrent un traitement étiologique spécifique, par exemple asthme, dilatation des bronches, vérification des stases intrabronchiques, cancer, affections ORL, bronchiques, insuffisance ventriculaire gauche, quelle qu'en soit l'étiologie, embolie pulmonaire, toux cardiaque.
- Si la toux résiste à un antitussif administré à la posologie usuelle, on ne doit pas procéder à une augmentation des doses, mais à un réexamen de la situation clinique.

Précautions d'emploi :
- Sujet âgé et insuffisant hépatique : la posologie initiale sera diminuée de moitié par rapport à la posologie conseillée chez l'adulte, et pourra ensuite être augmentée en fonction de la tolérance et des besoins.
- La prise de boissons alcoolisées et de médicaments contenant de l'alcool (cf. Interactions médicamenteuses) pendant le traitement est déconseillée.

DC INTERACTIONS MÉDICAMENTEUSES
Association déconseillée :
- Alcool : majoration par l'alcool de l'effet sédatif des antitussifs centraux. L'altération de la vigilance peut rendre dangereuse la conduite de véhicules et l'utilisation de machines.
Éviter la prise de boissons alcoolisées et de médicaments contenant de l'alcool.

Associations à prendre en compte :
- Autres dépresseurs du SNC (analgésiques morphiniques, certains antidépresseurs, les antihistaminiques H_1 sédatifs, barbituriques, benzodiazépines, clonidine et apparentés, hypnotiques, neuroleptiques, anxiolytiques autres que benzodiazépines) : Majoration de la dépression centrale pouvant être à l'origine des conséquences importantes, notamment en matière de conduite automobile ou d'utilisation de machines.
- Autres dérivés morphiniques (analgésiques antitussifs) : Dépression respiratoire (synergie potentialisatrice des effets dépresseurs des morphiniques), en particulier chez le sujet âgé.

DC GROSSESSE et ALLAITEMENT
Grossesse : en l'absence de données expérimentales et cliniques, le risque tératogène n'est pas connu. Par précaution, il est recommandé de ne pas utiliser cet antitussif pendant le premier trimestre.
Allaitement : par prudence, éviter l'administration pendant l'allaitement en raison du manque de données.

☆ PONDÉRAL LONGUE ACTION 60 mg
☆ PONDÉRAL 20 mg
fenfluramine

FORMES et PRÉSENTATIONS
Pondéral longue action 60 mg :
Gélule (bleu et incolore, contenant un granule blanc) Boîte de 30.
Pondéral 20 mg :
Comprimé (blanc) : Boîte de 40.

COMPOSITION

Pondéral longue action 60 mg :	*p. gélule*	*p. boîte*
Fenfluramine (DCI) chlorhydrate ...	60 mg	1,8 g

Excipient : acetyltributylcitrate, cellulose microcristalline, hydroxypropylméthylcellulose, dihydrogénophosphate de sodium anhydre, résine acrylique, saccharose, silice colloïdale anhydre, talc, dioxyde de titane. *Enveloppe de la gélule :* gélatine, dioxyde de titane. *Colorant :* bleu indigotine. *Calibrage :* n° 3.

Pondéral 20 mg :	*p. comp.*	*p. boîte*
Fenfluramine (DCI) chlorhydrate ...	20 mg	800 mg

Excipient : amidon de maïs, gomme adragante, gomme arabique, lactose, saccharose, silice hydratée, stéarate de magnésium, talc.

DC INDICATIONS
Traitement de deuxième intention, après échec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle supérieur à 30.

DC POSOLOGIE et MODE D'ADMINISTRATION
- Pondéral longue action 60 mg : la posologie est de 1 gélule par jour. Au bout de 3 à 4 semaines de traitement, la posologie pourra, si nécessaire, être portée à 2 gélules par jour en une seule prise. Dans ce cas, l'arrêt du traitement devra comporter un palier de 8 jours à 1 gélule par jour.
- Pondéral 20 mg : la posologie est de 3 comprimés par jour.

Il est préférable d'adopter un mode de traitement discontinu par périodes de 3 à 6 semaines.
Durée du traitement :
La durée du traitement ne doit pas dépasser 3 mois. Cependant dans de rares cas, des traitements plus prolongés peuvent être conduits par des spécialistes hospitaliers en nutrition, sous couvert d'un suivi attentif.

DC CONTRE-INDICATIONS
- Glaucome.
- Enfant, à l'exception de cas spécifiques sous couvert d'un suivi attentif par des spécialistes hospitaliers en pédiatrie.
- Antécédents d'anorexie mentale, antécédents dépressifs, antécédents psychiatriques, propension aux abus médicamenteux, alcoolisme avéré.
- Du fait du mécanisme d'action sérotoninergique de la fenfluramine, l'association aux IMAO est contre-indiquée (un intervalle d'au moins 15 jours doit être respecté).

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI
Mises en garde :
Des observations d'hypertension artérielle pulmonaire ont été rapportées chez des patients ayant reçu un traitement par la fenfluramine.
Compte tenu de ce risque rare mais grave,
- l'indication doit être respectée,
- la durée du traitement est limitée à 3 mois, et le traitement ne doit pas être renouvelé,
- toute apparition ou augmentation d'une dyspnée d'effort doit faire évoquer la possibilité d'hypertension artérielle pulmonaire, et faire arrêter le traitement.
- Bien que n'appartenant pas à la classe I (stimulants) des substances interdites par la Commission Médicale du Comité International Olympique, l'attention des sportifs est attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors de contrôles antidopage.

Précautions d'emploi :
- Les causes organiques d'obésité doivent être éliminées avant la prescription de Pondéral.
- Pondéral doit être utilisé avec précaution chez les sujets présentant un trouble du rythme.

DC INTERACTIONS MÉDICAMENTEUSES
Ne pas associer à un anorexigène à action centrale.
Pondéral peut potentialiser :
- les médicaments dépresseurs du système nerveux central (sédatifs),
- les antihypertenseurs,
- les effets hypotenseurs des antidépresseurs tricycliques, des neuroleptiques,
- les sulfamides hypoglycémiants.

Annexe 1-55

DC GROSSESSE et ALLAITEMENT
Grossesse : les études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène ; en l'absence de données cliniques humaines précises, ces résultats expérimentaux ne permettent pas de préjuger d'un effet malformatif dans l'espèce humaine, bien qu'à ce jour aucune malformation n'ait été rapportée.
Par mesure de prudence, éviter de prescrire pendant la grossesse.
Allaitement : en l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

DC EFFETS INDÉSIRABLES
Les plus fréquemment rapportés sont : sécheresse de la bouche, nausées, constipation, diarrhée. Ces effets cèdent à la poursuite du traitement.
Ont été rarement observés :
- asthénie, céphalées, frissons,
- variations tensionnelles, hypertension, hypotension, syncopes, lipothymies (spécialement en début du traitement),
- élévation des transaminases, hépatite (exceptionnellement),
- somnolence, étourdissement, troubles de l'humeur, insomnie, nervosité, dépression, état confusionnel,
- diplopie, mydriase,
- rash cutané, prurit, œdème de Quincke, urticaire,
- pollakiurie.

Des observations d'hypertension artérielle pulmonaire ont été rapportées chez les patients ayant reçu un traitement par la fenfluramine (cf. Mises en garde).

DC SURDOSAGE
Peu de données sont disponibles sur les accidents de surdosage. Les cas rapportés de surdosage en prise unique se rapportent à des posologies de 300 à 2 000 mg.
Les symptômes consistent en agitation et somnolence, confusion mentale, rougeur de la face, tremblements, fièvre, sueurs, douleurs abdominales, hyperventilation, dilatation des pupilles ; les réflexes peuvent être exagérés ou diminués, certains patients peuvent présenter un nystagmus rotatoire. On peut noter une tachycardie, la tension artérielle peut être normale ou légèrement élevée. Des convulsions, un coma, des extrasystoles ventriculaires aboutissant à une fibrillation peuvent survenir à des doses plus élevées.
Le traitement d'urgence comporte :
- un lavage d'estomac,
- une diurèse forcée avec acidification des urines pour accélérer l'excrétion du produit,
- une réanimation avec surveillance cardiaque dans les cas les plus sévères.

A la différence des anorexigènes sympathomimétiques, l'administration de barbituriques ne doit pas être systématique.

PP PHARMACODYNAMIE (Uhlik '84)
La fenfluramine est un agent thérapeutique intervenant dans la régulation de l'équilibre pondéral et qui possède les propriétés suivantes :
Chez l'animal, ont été mis en évidence :
- Un mécanisme sérotoninergique :
  L'étude du site d'action de la fenfluramine permet de la distinguer des dérivés des amines sympathomimétiques psychostimulantes ; alors que l'amphétamine et ses dérivés mettent en jeu le système noradrénergique, la fenfluramine agit par l'intermédiaire des voies sérotoninergiques. Elle interviendrait davantage sur le centre de la satiété que sur celui de la faim et est dépourvue d'effets neuroexcitants. Ces particularités contribuent à conférer à la fenfluramine son originalité pharmacologique.
- Un effet sur la prise alimentaire :
  Cet effet, chez l'animal normal aussi bien que chez l'animal obèse (rat, souris, cobaye, chien et singe), se traduit par une diminution importante de la prise alimentaire globale journalière, diminution réalisée aux dépens de la taille des prises, mais sans modifier le nombre de prises alimentaires journalières physiologiques.
- Une activité métabolique :
  Chez l'animal, la fenfluramine augmente la pénétration du glucose au niveau du muscle aux dépens de la conversion et du stockage de ce substrat sous forme de graisses. La part jouée par ces propriétés métaboliques dans les effets sur la prise alimentaire et sur le poids n'est pas encore complètement précisée.
- Un effet sédatif :
  La fenfluramine est dépourvue d'effets neuroexcitants. Elle exerce de plus, chez l'animal, un effet anticonvulsivant.

Chez l'homme, en pharmacologie clinique :
- La fenfluramine réduit la prise alimentaire, mais la sécrétion salivaire à la présentation des aliments, utilisée comme témoin de l'appétit, n'est pas modifiée par la fenfluramine alors qu'elle est supprimée par l'amphétamine et ses dérivés.
- La fenfluramine accroît l'utilisation périphérique du glucose consécutive à une charge glucosée, et

entraîne une mobilisation des graisses se traduisant par une augmentation sérique des acides gras libres et du glycérol circulant.
- La fenfluramine n'entraîne habituellement pas d'effets sympathomimétiques sur le plan cardiovasculaire ; au contraire, le traitement prolongé entraîne une diminution des catécholamines circulantes qui se traduit cliniquement par une bradycardie modérée et une légère baisse tensionnelle.

Au total, la fenfluramine :
- réduit la prise alimentaire ;
- exerce une activité métabolique (augmentation de l'utilisation musculaire du glucose et mobilisation des graisses) ;
- produit un effet sédatif ;
- n'entraîne le plus souvent ni tachycardie, ni hypertension.

Ces caractéristiques expliquent la possibilité d'utiliser la fenfluramine dans certains cas où la dexamphétamine et ses dérivés sont déconseillés.

PP PHARMACOCINÉTIQUE

Administrée par voie orale, la fenfluramine est complètement absorbée au niveau du tractus gastro-intestinal et est distribuée dans tout l'organisme, puis est éliminée avec une demi-vie de 24,2 heures. La forme galénique particulière de Pondéral longue action 60 mg, comportant des granulés dont l'enrobage se dissout à des vitesses différentes, permet une absorption du médicament étalée sur le nycthémère.
Ainsi, la cinétique des taux sanguins en fenfluramine observés après la prise unique d'une gélule de Pondéral longue action 60 mg reproduit celle que l'on observe après la prise fractionnée de trois comprimés de Pondéral 20 mg. Cette forme galénique simplifie donc la posologie, permettant une seule prise quotidienne.

LISTE I
AMM 319 478.9 (1976, validée 1987, révisée 1994).
308 522.1 (1977, validée 1987, révisée 1994).
PRIX conseillé : 163,90 F (30 gélules).
52,50 F (40 comprimés).

☆ PONSTYL
acide méfénamique

FORMES et PRÉSENTATIONS

Gélule (bleu émail et ivoire) : Boîte de 20, sous plaquettes thermoformées de 10.
Suppositoire : Boîte de 8.

COMPOSITION

Gélules :	*p. unité*	*p. boîte*
Acide méfénamique (DCI)	250 mg	5 g

Excipient : lactose, stéarate de magnésium, gélatine, oxyde de fer jaune, oxyde de titane, indigotine. *Conservateur :* anhydride sulfureux. *Calibrage :* n° 1.

Suppositoires :	*p. unité*	*p. boîte*
Acide méfénamique (DCI)	500 mg	4 g

Excipient : glycérides semi-synthétiques.

DC INDICATIONS

- Traitement symptomatique des affections douloureuses et (ou) fébriles.
- Douleurs de l'appareil locomoteur.
- Dysménorrhées primaires.
- Ménorragies fonctionnelles.

DC POSOLOGIE et MODE D'ADMINISTRATION

Gélules (ne pas ouvrir les gélules) :
Adulte et enfant à partir de 12 ans :
- traitement des algies et des états fébriles : 1 g à 1,5 g par jour, soit 4 à 6 gélules par jour, en 3 prises au moment des repas.
Coût du traitement journalier : 5,28 à 7,92 F ;
- traitement de la dysménorrhée : dès le début de la douleur, 1,5 g par jour, soit 2 gélules 3 fois par jour, au moment des repas, jusqu'à disparition des symptômes.
Coût du traitement journalier : 7,92 F ;
- traitement des ménorragies : dès le premier jour des règles, 1,5 g par jour, soit 2 gélules 3 fois par jour, au moment des repas, jusqu'à la normalisation des règles, sans dépasser 5 jours.
Coût du traitement journalier : 7,92 F.

Suppositoires :
- Patients présentant des antécédents récents de rectite ou de rectorragie (suppositoires).
- Dernier trimestre de la grossesse (cf. Grossesse et Allaitement).

Relatives :
- Patients souffrant ou ayant souffert d'asthme bronchique ou d'affection allergique à survenue d'un bronchospasme pouvant être précipitée.
- Association avec un autre anti-inflammatoire, avec l'aspirine (cf. Interactions médicamenteuses).
- Association avec les anticoagulants oraux, l'héparine, les sulfamides hypoglycémiants, les sels de lithium, la ticlopidine (cf. Interactions médicamenteuses).

DC MISES EN GARDE et PRÉCAUTIONS D'EMPLOI

Mises en garde :
- En raison de la gravité possible des manifestations gastro-intestinales chez les patients soumis à un traitement anticoagulant, il convient de surveiller particulièrement l'apparition d'une symptomatologie digestive ; en cas d'hémorragie gastro-intestinale, il faut interrompre le traitement.
- La survenue d'une diarrhée liée au traitement impose l'arrêt de celui-ci.

Précautions d'emploi :
- L'acide méfénamique ne doit pas être administré chez les enfants de moins de 12 ans.
- Il y a lieu de réduire la posologie chez le sujet âgé.
- L'acide méfénamique sera utilisé avec précaution en cas d'antécédents d'ulcères gastroduodénaux.
- En début de traitement, une surveillance attentive du volume de la diurèse et de la fonction rénale est nécessaire chez les malades insuffisants cardiaques, cirrhotiques et néphrotiques, chez les patients prenant un diurétique, chez les insuffisants rénaux chroniques, et particulièrement chez les sujets âgés.
- Lors des traitements de longue durée, une surveillance hématologique complète, au moins mensuelle, est conseillée.
- Avant d'envisager le traitement des ménorragies par l'acide méfénamique, il est indispensable que les examens gynécologiques, cliniques et paracliniques habituels aient été effectués dans le but d'éliminer une cause néoplasique ou infectieuse de ménorragie, ainsi que toute cause organique relevant d'un traitement spécifique.
- S'il a été décrit une possibilité de diminution d'efficacité du stérilet, chez les patientes traitées par les anti-inflammatoires non stéroïdiens au long cours, cette possibilité semble improbable lors de leur utilisation, exclusivement en période menstruelle, pour le traitement des dysménorrhées et des ménorragies.

DC INTERACTIONS MÉDICAMENTEUSES

Associations déconseillées :
- AINS entre eux (y compris les salicylés à fortes doses) : augmentation du risque ulcérogène et hémorragique digestif (synergie additive).
- Anticoagulants oraux, héparine (voie parentérale) : augmentation du risque hémorragique (inhibition de la fonction plaquettaire et agression de la muqueuse gastroduodénale).
Si la prescription de l'AINS ne peut être évitée, surveillance clinique et biologique étroite.
- Dispositifs intra-utérins : diminution de leur efficacité.
- Lithium (décrit pour le diclofénac, le kétoprofène, l'indométacine, la phénylbutazone, le piroxicam, le pipropfène) : augmentation de la lithémie pouvant atteindre des valeurs toxiques (diminution de l'excrétion rénale du lithium).
Si nécessaire, surveiller étroitement la lithémie et adapter la posologie du lithium pendant l'association et après l'arrêt de l'AINS.
- Méthotrexate (par extrapolation à partir de l'indométacine, du kétoprofène, des pyrazolés, des salicylés) : augmentation de la toxicité hématologique du méthotrexate en particulier lorsque celui-ci est administré à haute dose.
- Sulfamides : augmentation de l'effet hypoglycémiant des sulfamides (déplacement de leurs liaisons aux protéines plasmatiques).
- Ticlopidine : augmentation du risque hémorragique (synergie de l'activité antiagrégante plaquettaire conjuguée à l'effet agressif sur la muqueuse gastroduodénale des AINS).
Si la prescription de l'AINS ne peut être évitée, surveillance clinique et biologique étroite (temps de saignement).

Associations nécessitant des précautions d'emploi :

DC GROSSESSE et ALLAITEMENT

Grossesse :
- Dans l'espèce humaine, aucun effet malformatif particulier n'a été signalé. Cependant, des études épidémiologiques complémentaires sont nécessaires afin de confirmer ou infirmer cette notion.
- Au cours du 3e trimestre, tous les inhibiteurs de la synthèse des prostaglandines peuvent exposer le fœtus à une toxicité cardiopulmonaire (hypertension pulmonaire avec fermeture prématurée du canal artériel) et rénale et, en fin de grossesse, la mère et l'enfant, à un allongement du temps de saignement. En conséquence, toute prise d'AINS est absolument contre-indiquée pendant le 3e trimestre.

Allaitement : des traces d'acide méfénamique ont été retrouvées dans le lait maternel, son utilisation est déconseillée pendant l'allaitement en raison des effets possibles sur l'appareil cardiovasculaire du nourrisson.

DC CONDUITE et UTILISATION DE MACHINES

Prévenir les malades de l'apparition possible d'étourdissements (conducteurs de véhicules, utilisateurs de machines).

DC EFFETS INDÉSIRABLES

- Effets gastro-intestinaux : à l'occasion d'études contrôlées et de traitements prolongés pendant 6 mois, ont été observées : diarrhée (5 %), nausées avec ou sans vomissement, gastralgies, dont la fréquence a pu entraîner chez certains patients l'interruption du traitement ; la fréquence des effets secondaires est diminuée par l'absorption de l'acide méfénamique pendant les repas ; l'intensité de ces effets, étant liée à la dose, diminue habituellement avec la réduction posologique et éventuellement après l'arrêt du traitement. D'autres troubles ont été rapportés : anorexie, pyrosis, ballonnement, constipation, ulcérations digestives avec ou sans hémorragie.
- Réactions d'hypersensibilité :
  - dermatologiques (éruption, rash, prurit...) ;
  - respiratoires (possibilité de survenue de crise d'asthme, en particulier chez les sujets allergiques à l'aspirine et aux autres anti-inflammatoires non stéroïdiens).
- Effets rénaux : particulièrement chez les patients âgés et déshydratés, une insuffisance rénale a été rapportée incluant une nécrose papillaire ; occasionnellement, hématurie et dysurie.
- Effets sur l'hématopoïèse : des cas d'anémie hémolytique auto-immune ont été rapportés après utilisation prolongée d'acide méfénamique pendant 12 mois et plus, généralement réversibles à l'arrêt du traitement ; ont également été observés, diminution de l'hématocrite, chez 2 à 5 % des patients en cas d'utilisation prolongée : exceptionnellement, leucopénie, éosinophilie, purpura thrombopénique, agranulocytose, pancytopénie, hypoplasie médullaire.
- Effets neurologiques : vertiges, somnolence, nervosité, céphalées, vision trouble.
- Autres effets : irritation oculaire, otalgie, transpiration, anomalies hépatiques légères, augmentation des besoins en insuline chez le diabétique, accès de palpitations, dyspnée et perte réversible de la vue colorée.
- Effets liés à la voie d'administration : l'utilisation de la voie rectale peut être la cause d'une irritation locale.

DC SURDOSAGE

En cas d'intoxication accidentelle, un lavage gastrique doit être pratiqué suivi de l'utilisation de charbon activé, absorbant puissant de l'acide méfénamique et de ses métabolites ; une surveillance des fonctions vitales doit être instaurée ainsi que le traitement symptomatique adéquat ; en raison de la forte liaison aux protéines de l'acide méfénamique et de ses métabolites, l'hémodialyse et la dialyse péritonéale sont vraisemblablement de peu d'activité.

PP PHARMACODYNAMIE

L'acide méfénamique est un anti-inflammatoire non stéroïdien, de la famille des fénamates :
- activités antalgique, anti-inflammatoire et antipyrétique ;
- activité inhibitrice de la synthèse des prostaglandines (F2α et E2), par inhibition de la cyclo-oxygénase et antagoniste des prostaglandines préformées au niveau des sites récepteurs.

REPUBLIQUE FRANCAISE

AGENCE DU MEDICAMENT

Saint-Denis, le 9 MAI 199

DIRECTION DE L'EVALUATION

UNITE DE PHARMACOVIGILANCE

DOSSIER TECHNIQUE

ENQUETE NATIONALE DE PHARMACOVIGILANCE ET ANOREXIGENES

Suite à la Commission Nationale de Pharmacovigilance du 10 Mai 1994, L'enquête de Pharmacovigilance relative aux anorexigènes serotoninergiques: la fenfluramine et dexfenfluramine, a été étendue à l'ensemble de la classe.

I) Présentation des produits

Les anorexigènes actuellement commercialisés sont au nombre de 10, il s'agit de :

ISOMERIDE® (dexfenfluramine) commercialisé par le Laboratoire ARDIX depuis 1985

PONDERAL® (fenfluramine) commercialisé par le Laboratoire BIOPHARMA depuis 1976

DININTEL® (clobenzorex) commercialisé par le Laboratoire DIAMANT depuis 1970

INCITAL® (mefenorex) commercialise par le Laboratoire PIERRE FABRE SANTE depuis 1974

FENPROPOREX DEGLAUDE (fenproporex) commercialisé par le Laboratoire DEGLAUDE depuis 1977.

MODERATAN DIFFUCAP (amfépramone) commercialisé par le Laboratoire THERANOL depuis 1974.

TENUATE DOSPAN (amfépramone) commercialisé par le Laboratoire MARION MERREL DOW depuis 1977.

PREFAMONE chronules (amfépramone) commercialisé par le Laboratoire DEXO SA depuis 1970

ANOREX (amfépramone) commercialisé par le Laboratoire CRINEX depuis 1979

et de l'Amfépramone préparations magistrales.

Les indications et modalités d'administration sont présentées dans le tableau suivant _:

Spécialités	indication	posologie	durée de traitement
ISOMERIDE® (dexfenfluramine)	Traitement de deuxième intention, après echec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle supérieur à 30	30 mg/j	inférieure à 3mois
PONDERAL® (fenfluramine)	Traitement de deuxième intention, après echec d'un traitement diététique adapté, d'obésité patente ayant un indice de masse corporelle supérieur à 30	60 mg/j	inférieure à 3mois
DININTEL® (clobenzorex)	Medication adjuvante des régimes restrictifs des surcharges pondérales	60 mg/j à 90 mg/j	cure de 3 à 6 semaines
INCITAL® (mefenorex)	Medication adjuvante des régimes restrictifs des surcharges pondérales	40 mg/j	cure de 3 à 6 semaines
FENPROPOREX DEGLAUDE® (fenproporex)	Medication adjuvante des régimes restrictifs des surcharges pondérales	20 mg/j	cure de 3 à 6 semaines
MODERATAN DIFFUCAP® (amfépramone)	Medication adjuvante des régimes restrictifs des surcharges pondérales	75 mg/j	cure de 3 à 6 semaines
TENUATE DOSPAN® (amfépramone)	Medication adjuvante des régimes restrictifs des surcharges pondérales	75 mg/j	cure de 3 à 6 semaines
PREFAMONE® (amfépramone)	Medication adjuvante des régimes restrictifs des surcharges pondérales	75 mg/j	cure de 3 à 6 semaines
ANOREX® (amfépramone)	Adjuvants des régimes restrictifs au cours des traitements de l'excès pondéral de l'adulte et de l'adolescent	75 mg/j	cure de 3 à 6 semaines

I) Analyse des effets indésirables

Un total de 1098 effets indésirables a été déclarés au Système National de pharmacovigilance ou aux laboratoires entre 1985 et Juin 1994 (Les hypertensions artérielles pulmonaires ayant été collectées jusqu'au mois de Décembre 1994)

Spécialités	Nombre d'effets indésirables	Incidence par mois traitement
ISOMERIDE® (dexfenfluramine)	832	27 557
PONDERAL® (fenfluramine)	77	29369
TENUATE DOSPAN® (amfépramone)	47	71 928
MODERATAN® (amfépramone)	13	141 811
PREFAMONE® (amfépramone)	4	170 683
ANOREX® (amfépramone)	2	123 356
Amfépramone DC	7	
Preparations magistrales	15	
total Amfépramone	**88**	**69856**
DININTEL® (clobenzorex)	63	88 070
INCITAL® (mefenorex)	23	10 156
FENPROPOREX® (fenproporex)	15	122 131
TOTAL	**1098**	

Caractéristiques de la population (cf annexe 1) :
Les femmes sont majoritairement representées.
l'age moyen des patients varie de 38.3 à 42.3 ans selon les produits,
La moyenne des BMI est de 29.25 (de 23.8 à 29.2 pour la population générale)

La nature des effets indésirables

Les effets neurologiques sont majoritaires et essentiellement représentées par la pharmacodépendance (cf annexe 2).

● **Analyse des hypertensions artérielles pulmonaires** (les observations ont été recueillies jusqu'au 31/12/94).

Toutes les hypertensions artérielles pulmonaires ont été validées par un expert .
Le diagnostic d'hypertension artérielle pulmonaire a été posé sur les critères hémodynamiques suivants :

-HPA > 25 mmHg
- Pap < 15 mmHg

Les diagnostics différentiels ont été éliminés sur les données d'un examen pertinent :

- maladie thrombo-embolique pulmonaire : scintigraphie de perfusion, angiographie si nécessaire
- pathologie respiratoire (fibrose, insuffisance respiratoire, apnée grave du sommeil) : bilan fonctionnel respiratoire, gaz du sang.
- cardiopathie gauche évoluée.

117 observations d'hypertensions artérielles pulmonaires ont été notifiées, 78 ont finalement été retenues par l'expert.

Les hypertensions artérielles pulmonaires représentent respectivement :

6.1% des effets pour l'Amfépramone

6.1% " " " le DININTEL® (clobenzorex)

11.7% des effets pour le PONDERAL® (fenfluramine)

4.6 % pour l'ISOMERIDE® (dexfenfluramine) .

Les principales caractéristiques sont mentionnées dans le tableau suivant :

	HTAP	Age	F_H	Durée de traitement	
				< 3 m	≥ 3m
ISOMERIDE® (dexfenfluramine)	57	48,4	51_6	14	39
PONDERAL® (fenfluramine)	11	49,1	11_0	-	9
DININTEL® (clobenzorex)	4	52,0	5_1	-	3
TENUATE DOSPAN® (amfépramone)	4	43,0	4_0	-	4
Amfépramone DCI, Préparations magistrales	2	34,0	2_0	1	-
PREFAMONE® (amfépramone)	0	0,0	0		
FENPROPOREX® (amfépramone)	0	0,0	0		

- Dans la plupart des cas, la durée de traitement était supérieure ou égale à 3 mois.

- La dyspnée existait avant l'instauration du traitement dans 32 observations :
ISOMERIDE® (dexfenfluramine) : 22 cas
PONDERAL® (fenfluramine) : 7cas
TENUATE DOSPAN® (amfépramone) : 2
Amfepramone : 1

L'evolution a été marquée par :
-22 décès dont 13 sous ISOMERIDE® (dexfenfluramine) , 4 sous PONDERAL® (fenfluramine) , 1 sous DININTEL® (clobenzorex) et 4 sous amfépramone.
-4 transplantations pulmonaires : 3 sous ISOMERIDE® (dexfenfluramine) et 1 sous PONDERAL® (fenfluramine) ,
-7 patients sont en attente de greffe, 6 sous ISOMERIDE® (dexfenfluramine) et 1 sous PONDERAL® (fenfluramine) .
- 6 patients traités par ISOMERIDE® (dexfenfluramine) sont améliorés et 18 sont stabilisés.

Les incidences sont représentées dans le tableau suivant :

	Nombre de mois-traitement	Incidence des HTAP
ISOMERIDE® (dexfenfluramine)	24 264 059	1/425 685
PONDERAL® (fenfluramine)	6 548 869	1/595 352
DININTEL® (clobenzorex)	5 196 120	1/1 299 030
TENUATE DOSPAN® (amfépramone)	3 164 849	1/791 212
Amfépramone total	5 937 808	1/989 635

Au total, le risque d' hypertensions artérielles pulmonaires existe avec tous les anorexigènes.
IL s'agit d'un effet rare mais grave puisque potentiellement mortel.
Les résultats de la présente enquête sont conformes aux données de l'étude épidémiologique internationale IPPHS qui démontre une association significative entre la prise d'anorexigène quel qu'il soit et la survenue d'une hypertension artérielle pulmonaire dite primitive.

ANNEXE 1

RÉPUBLIQUE FRANÇAISE

AGENCE DU MEDICAMENT

Saint-Denis, le 12 Mai 1995

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Cher Confrère,

Une étude internationale, cas/témoin, visant à préciser les facteurs de risque des hypertensions artérielles pulmonaires d'allure primitive, vient de montrer l'existence d'une association entre **la survenue d'hypertension artérielle pulmonaire et la prise d'anorexigènes**.

Le risque de survenue de cet effet indésirable, dont vous connaissez la gravité du fait de son évolution le plus souvent fatale, augmente lorsque la durée du traitement dépasse trois mois ou lorsque les anorexigènes sont prescrits en association.

L'Agence du Médicament a donc décidé, sur proposition de la Commission Nationale de Pharmacovigilance et en accord avec les firmes commercialisant des spécialités contenant ces principes actifs* de :

- limiter l'indication de ces produits au traitement des obésités patentes des patients dont l'indice de masse corporelle est supérieur à 30, constituant un facteur de risque cardiovasculaire grave,
- limiter à 3 mois les durées cumulatives de traitement,
- contre-indiquer leur association.

Le rapport bénéfice/risque de ces traitements, dans la prise en charge thérapeutique globale de l'obésité, est en cours de réévaluation par l'Agence du Médicament qui prendra si nécessaire d'autres mesures complémentaires. Parallèlement, le Ministère chargé de la santé engage la procédure nécessaire pour interdire l'utilisation des substances anorexigènes dans les préparations magistrales.

Dès à présent, nous vous demandons d'assurer le strict respect de ces nouvelles règles, tant à l'occasion de la prescription que de la délivrance, en les expliquant aux patients afin d'en empêcher toute utilisation en dehors des modalités pré-citées.

Veuillez agréer, Cher Confrère, l'expression de ma considération distinguée.

Pr J.M. ALEXANDRE
Directeur de l'Evaluation

AGENCE DU MEDICAMENT

RÉPUBLIQUE FRANÇAISE
DIRECTION GENERALE DE LA SANTE

16 MAI 1995

AVIS AUX PRESCRIPTEURS

La Commission Nationale de Pharmacovigilance réunie le 03/05/95 a pris connaissance des résultats d'une étude épidémiologique internationale sur l'Hypertension Artérielle Pulmonaire Primitive.

Cette étude montre qu'il existe une association entre la survenue de ces Hypertensions Pulmonaires et la prise de tout anorexigène* pour une durée de traitement supérieure à 3 mois.

Les résultats sont confirmés par la notification spontanée des Hypertensions Pulmonaires au système national de Pharmacovigilance.
Cette pathologie est de fréquence très faible mais de gravité extrême compte tenu de son évolution fatale. En conséquence, sur proposition de la Commission Nationale de Pharmacovigilance, l'Agence du Médicament a décidé de :

- restreindre l'indication au traitement de seconde intention, après échec d'un traitement diététique adapté, d'obésité patente avec indice de masse corporelle supérieur à 30.

- limiter la durée d'utilisation à 3 mois.

- de contre-indiquer leur association.

Parallèlement, un arrêté du ministre chargé de la santé interdit l'exécution et la délivrance de préparations magistrales et autres préparations à base de substances anorexigènes.

Un nouvel examen du rapport bénéfice/risque par la Commission Nationale de Pharmacovigilance aura lieu en Juin sur la base d'études complémentaires en cours.

Le Comité des Spécialités Pharmaceutiques de l'Agence Européenne (E.M.E.A.) a été saisi du problème.

COURRIER ARRIVÉE

AGENCE DU MÉDICAMENT

COMMUNIQUÉ DE PRESSE

Une étude épidémiologique internationale a récemment mis en évidence une relation entre la survenue de quelques cas de maladie vasculaire pulmonaire grave et souvent mortelle et la prise prolongée de médicaments anorexigènes (coupe-faim). Il s'agit des médicaments suivants :

Médicament	Laboratoire	Principe actif
ISOMERIDE	Laboratoires ARDIX	dexfenfluramine
PONDERAL	Laboratoires BIOPHARMA	fenfluramine
MODERATAN DIFFUCAP	Laboratoires THERANOL-DEGLAUDE	amfépramone
TENUATE D'OSPAN	Laboratoires MARION MERREL DOW	amfépramone
ANOREX	Laboratoires CRINEX	amfépramone
PREFAMONE	Laboratoires DEXO	amfépramone
FENPROPOREX ACTION PROLONGEE DEGLAUDE	Laboratoires THERANOL-DEGLAUDE	fenproporex
DININTEL	Laboratoires DIAMANT	clobenzorex
INCITAL	Laboratoires PIERRE FABRE SANTE	mefenorex

Ces principes actifs sont également présents dans certaines préparations magistrales à visée amaigrissante préparées en pharmacie, sur ordonnance.

Compte tenu de la gravité de cet effet indésirable, le directeur général de l'Agence du médicament a décidé, sur proposition de la Commission nationale de pharmacovigilance, de réserver ces spécialités aux obésités majeures répondant à des critères médicaux stricts, pour des durées de traitements inférieures à trois mois et uniquement après échec d'un traitement diététique adapté.

L'Agence du médicament rappelle que ces produits ne doivent en aucun cas être utilisés à des fins esthétiques.

Un nouvel examen du rapport bénéfice/risque par la Commission national de pharmacovigilance aura lieu en juin, sur la base d'études complémentaires en cours.

Parallèlement, un arrêté du ministre chargé de la santé interdit l'exécution et la délivrance de préparations magistrales et autres préparations à base de substances anorexigènes.

Pour toute information complémentaire, l'Agence du médicament met à disposition les numéros suivants : **48 13 22 99 et 48 13 23 14**

Arrêté du 2 mai 1995 désignant le préfet de région chargé de l'organisation des épreuves nationales d'admissibilité du concours de l'internat en pharmacie

NOR : *SANH9501564A*

Le ministre de l'enseignement supérieur et de la recherche et le ministre délégué à la santé, porte-parole du Gouvernement,

Vu la loi n° 68-978 du 12 novembre 1968 modifiée d'orientation de l'enseignement supérieur ;

Vu le décret n° 89-739 du 12 octobre 1989 relatif aux concours de l'internat en pharmacie ;

Vu l'arrêté du 18 novembre 1983 modifié portant création du Centre national des concours d'internat ;

Vu l'arrêté du 17 juillet 1987 modifié relatif au régime des études en vue du diplôme d'Etat de docteur en pharmacie ;

Vu l'arrêté du 12 octobre 1989 modifié relatif à l'organisation des concours d'internat en pharmacie,

Arrêtent :

Art. 1er. – Conformément aux dispositions de l'article 1er de l'arrêté du 12 octobre 1989 susvisé, l'organisation des épreuves nationales d'admissibilité est placée sous la responsabilité du préfet de la région Ile-de-France.

Art. 2. – Le directeur général de l'enseignement supérieur et le directeur des hôpitaux sont chargés, chacun en ce qui le concerne, de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 2 mai 1995.

Le ministre délégué à la santé,
porte-parole du Gouvernement,
Pour le ministre et par délégation :
Par empêchement du chef de service :
Le sous-directeur
des personnels médicaux hospitaliers,
B. BOUQUET

Le ministre de l'enseignement supérieur
et de la recherche,
Pour le ministre et par délégation :
Par empêchement du directeur général
des enseignements supérieurs :
Le sous-directeur,
S. FRANÇOIS

Arrêté du 10 mai 1995 portant interdiction de l'exécution et de la délivrance de préparations magistrales ou autres préparations à base de certains principes actifs

NOR : *SANP9501560A*

Le ministre délégué à la santé, porte-parole du Gouvernement,

Vu le code de la santé publique, et notamment ses articles L. 605 (10°), R. 5144-9 et R. 5179 ;

Considérant qu'une étude épidémiologique internationale a mis en évidence une relation entre la survenue d'une maladie vasculaire pulmonaire grave et souvent mortelle et la prise prolongée de médicaments anorexigènes ;

Considérant l'avis de la Commission nationale de pharmacovigilance du 3 mai 1995,

Arrête :

Art. 1er. – Sont interdites, à compter de la date de publication du présent arrêté, l'exécution et la délivrance de préparations magistrales ou autres préparations à base des principes actifs suivants :

- dexfenfluramine ;
- fenfluramine ;
- amfépramone ;
- fenproporex ;
- clobenzorex ;
- mefenorex.

Art. 2. – Le directeur général de la santé est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 10 mai 1995.

Pour le ministre et par délégation :
Le directeur général de la santé,
J.-F. GIRARD

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis, le 06 OCT 1995

911

COMMISSION NATIONALE DE PHARMACOVIGILANCE
(PROCES-VERBAL DE LA REUNION DU 19 JUIN 1995)

Etaient présents :

M. IMBS : Président, M. HUGUES : Vice-Président,
M. BAUMELOU, M. BEGAUD, M. CARLIER, M. CARON, Mme CHICHMANIAN, M. EVREUX, M. GHISLAIN, M. GUIZE, Mme JOUAN-FLAHAULT, Mme JOUGLARD, M. THEVENEAU (suppléant de M. LABOURE), Mme ALBENGRES (suppléante de M. MERLE), M. MOORE (suppléant de M. MOULIN), M. PAUL, M. CHOISY, Mme SOUBRIE, Mme GOUJARD (représentant Monsieur le Directeur Général de l'INSERM), Mme BARON (représentant Monsieur le Directeur Général de la Santé), M. ALEXANDRE (représentant M. le Directeur Général de l'Agence du Médicament).

Conseiller Scientifique : M. LAGIER

Assistaient à la réunion :

M. AMEDEE-MANESME
Mme BIVAS
M. CAULIN
M. LE COURTOIS
Mme MALOTAUX
Mme TISSIER

Unité de Pharmacovigilance :

Mme CASTOT
Mme LE BELLER
Mme LEREBOURS
Mme MORIN

Rapporteurs à la Commission :

Mme BAVOUX, Mme ELEFANT, Mme SOUBRIE, M. VIAL.

Experts :

M. APFELBAUM,
M. DUROUX,
M. GUY-GRAND,
M. HERSON,
M. LUBETSKY,
Mme MOSSE,
M. RODOR
M. SALTIEL,
M. BRENOT,
M. VALENSI,
M. VEXIAU,
M. WEIZENBLUM

Laboratoires :

ARDIX et BIOPHARMA :	M. HALIMI, Mme LAUDIGNON, M. de LAVENNE, Mme NATHAN, M. PERRET, M. WAGNIART
CRINEX :	M. BERGOGNE, Mme LEBRE
DEXO :	Mme GUERY
DIAMANT :	Mme AZOULAY, M. MATON, Mme VINCENT du LAURIER
LIPHA :	Mme BELLEVEGUE, M. MOSNIER, M. SCHMITT
MARION MERRELL DOW :	M. CANAVATE, Mme PRAYER
MENARINI :	M. SCHMITT pour M. BERTRAND
PIERRE FABRE SANTE :	M. DERQUENNE, M. RICARD
THERABEL :	M. MAS
THERANOL-DEGLAUDE :	M. BRUNEL, Mme LAGENTE, Mme SARTRE
WELLCOME :	Mme SAINTE CROIX LE BALEUR

Experts auprès des firmes (anorexigènes) :

M. CHARPENTIER
M. DANAN
M. FLAHAULT

Etaient excusés :

M. ANKRI, M. CHAST, M. DUPUIS, M. LARREY, M. LECOMPTE, M. LENOIR, M. LEVERGE, M. MUNERA, M. NETTER, M. ROUJEAU, M. le Directeur des Hôpitaux ou son représentant.

Annexe 1-60

I – ANOREXIGENES ET HYPERTENSION ARTERIELLE PULMONAIRE PRIMITIVE

La Commission Nationale de Pharmacovigilance a réexaminé le dossier relatif aux anorexigènes. Lors de la réunion du 3 mai 1995, les membres s'étaient jugés insuffisamment documentés sur le bénéfice de ces produits et avaient demandé à ce qu'il soit évalué en fonction des données disponibles.

Le directeur de l'évaluation a rappelé en préambule que ce dossier faisait l'objet d'un article 12 au niveau européen (sujet d'intérêt communautaire). Les conclusions de la réunion du Groupe de Travail Pharmacovigilance du C.S.P. du 2 Juin 1995 ont été communiquées aux membres de la Commission par le secrétariat de l'Unité de Pharmacovigilance.

1) Le bénéfice thérapeutique

Un groupe d'experts nutritionnistes/endocrinologistes nommés par la DEV s'est réuni, en présence du Président de la Commission Nationale de Pharmacovigilance le 29 Mai 1995, afin de définir la place des anorexigènes dans la prise en charge globale de l'obésité, à la lumière des études fournies par les firmes pharmaceutiques ; celles-ci ont été entendues le 30 Mai 1995.
Un rapport d'évaluation destinée aux Etats membres de l'Union Européenne a été rédigé et remis pour information à chaque membre de la Commission Nationale.

Ces rapporteurs affirment que l'obésité sévère constitue un facteur de risque cardio-vasculaire certain, direct ou indirect (hypertension artérielle, anomalies métaboliques...) et augmente la morbidité et la mortalité.
L'objectif d'un traitement est de diminuer de manière cliniquement significative (soit de 5% à 10% du poids initial) et durable le poids, les facteurs de risque associés s'en trouvant améliorés.
Actuellement, il n'existe cependant aucune étude démontrant un bénéfice direct des traitements de l'obésité en terme de morbidité/mortalité.

Les experts estiment que les traitements court terme ne sont pas justifiés dans une prise en charge globale de l'obésité. Dans ces conditions, les études disponibles montrent une perte pondérale modeste d'en moyenne de 3 à 4 kg seulement. A l'arrêt du traitement, le retour du poids initial se fait rapidement. Les rapporteurs estiment que cette demande n'initie jamais, comme un "starter", une perte de poids prolongée. Seul un traitement prolongé, s'il était possible, pourrait avoir un bénéfice à long terme.

Les anorexigènes "amphétamine-like"

Les experts ont analysé les études fournies par les laboratoires commercialisant les anorexigènes amphétamine-like. Elles objectivent une perte pondérale de 3 à 4 kg lors de durée d'utilisation de 3 mois en moyenne. Aucune étude suivant une méthodologie rigoureuse (contrôlée, en double aveugle) et avec un nombre suffisant de patients n'est disponible.

Les anorexigènes sérotoninergiques

Les experts ont étudiés l'analyse en terme de répondeurs et non-répondeurs de l'étude INDEX (étude internationale contrôlée en double aveugle de 1 an) fournie par les laboratoires commercialisant les fenfluramines. Le nombre de répondeurs définis par une perte de poids supérieure à 10 % du poids initial est 2 fois plus élevé chez les patients traités par dexfenfluramine que chez les patients recevant un placebo.

Les experts ont étudiés les réponses thérapeutiques enregistrées au cours du deuxième mois de traitement (perte de 1.8 kg en moyenne) qui permettraient de prévoir en partie les répondeurs (patients qui perdront 10 % de leur poids initial au court du traitement). L'importance de la perte pondérale notée au quatrième mois permettrait de recruter avec une plus grande précision l'ensemble des patients répondeurs : parmi les patients qui présentent une perte de poids d'au moins 10 % du poids initial, plus de 80 % le maintiendront à 12 mois.

2) le risque

Les experts pneumologues de l'hôpital Antoine-Béclère ont communiqué officiellement un bilan global de l'expérience de leur établissement concernant les hypertensions artérielles pulmonaires (HTAP) suivies entre 1984 et 1995 : 326 HTAP ont ainsi été répertoriées dont 67 associées à la prise d'un anorexigène.

Le Président de la Commission Nationale de Pharmacovigilance a fait état de plusieurs courriers adressés à l'Agence du Médicament par les pharmaciens responsables de plusieurs firmes. Certaines demandent que les observations françaises des anorexigènes amphétamine-like soient à nouveau revues sur le plan de l'imputation avec le CRPV de Besançon responsable de l'enquête nationale, d'autres soulèvent des questions quant aux modalités de l'analyse de l'étude IPPHS.

Les dossiers français pourront être revus avec le CRPV de Besançon si les laboratoires en font la demande.

Les questions relatives à l'étude IPPHS ont été examinées, en présence de plusieurs membres du Comité Scientifiques de l'étude mais en l'absence du Pr Abenhaim, coordinateur de l'étude, excusé.

3) Gestion du rapport bénéfice/risque

L'obésité est une pathologie chronique dont la prise en charge doit être globale et prolongée. Les traitements brefs dits "starter" ne sont pas efficaces.
Pour ce qui concerne la prise en compte du risque, la pratique d'un échodoppler ne garantit pas la détection précoce d'une HTAP, de plus l'arrêt du traitement en cas de d'HTAP modérée n'entraîne pas systématiquement la réversibilité de la symptomatologie.

4) Audition des firmes

4-1 les anorexigènes "amphétamine-like"

Les firmes commercialisant les anorexigènes amphétamine-like ont reformulé des questions à propos de l'étude IPPHS. Elle seront transmises au Pr Abenhaim. L'administration s'engage à fournir les réponses aux laboratoires concernés.

Les firmes proposent de mener une étude court terme (3 mois) pour démontrer l'efficacité de leurs produits prescrits en seconde intention en soutien d'un régime hygiéno-diététique.

4-2 les anorexigènes sérotoninergiques

Les laboratoires commercialisant les fenfluramines ont présenté les résultats de l'étude Index en terme de répondeurs . Le niveau d'efficacité était fixé à une perte de 10% du poids initial. Une réponse au cours des premiers mois serait prédictive d'une perte de poids de 10% sous traitement.

La firme propose une prescription de ces produits par des spécialistes, associée aux mesures diététiques, chez des patients répondeurs définis dès les premiers mois de traitement, avec analyse de la morbi-mortalité à long terme chez les patients traités.

5) Conclusion

Après cette audition des firmes pharmaceutiques, la Commission Nationale de Pharmacovigilance a proposé la suspension des anorexigènes amphétamine-like. Leur potentiel de pharmacodépendance ne permet pas d'en envisager la prescription pour des périodes longues et ce d'autant qu'aucune étude à long-terme sur un nombre suffisant de patients n'a été conduite.
Les fenfluramines pourraient être prescrite dans le cadre d'une prise en charge globale de l'obésité, après échec du traitement hygiéno-diététique en milieu hospitalier spécialisé :

- à long terme chez des patients répondeurs présentant un BMI $\geq$ 30 caractérisés comme répondeurs, au terme d'un traitement de 1 ou 2 mois ;
- ayant donné leur consentement éclairé.

Les Résumés des Caractéristiques devront comporter des mises en garde sur le risque de survenue accru d'hypertension artérielle pulmonaire lors des traitements prolongés (plus de 3 mois).

Ces mesures devront s'accompagner d'une étude d'efficacité en terme de morbi-mortalité de phase IV, menée avec les fenfluramines.

Les membres de la Commission ont demandé qu'un comité de pilotage soit créé pour cette étude et que les futurs prescripteurs soient sensibilisés à la notification des effets indésirables aux Centres Régionaux de Pharmacovigilance.

Pour ce qui concerne les préparations magistrales, la Commission Nationale de Pharmacovigilance souhaite étendre l'interdiction des préparations magistrales du 10 Mai 1995 à l'ensemble des principes actifs figurant dans la liste 3 de la loi Talon (Décret n° 82-253 du 16 Mars 1982 donné en annexe).

Annexe 1-60

II – ENQUETE OFFICIELLE SUR L'HEPATOTOXICITE DES FORMES ORALES DES SPECIALITES CONTENANT DU NAFTIDROFURYL

Dans le cadre de la réévaluation du rapport bénéfice/risque du naftidrofuryl, une enquête officielle de pharmacovigilance sur les effets indésirables hépatiques, lors de l'administration par voie orale des spécialités PRAXILENE® 200 mg, PRAXILENE® 100 mg, GEVATRAN® 200 mg LP, DI-ACTANE® 200 mg LP, NAFTILUX® 200 mg LP, a été confiée au Centre Régional de Pharmacovigilance de Lyon.

1. Données de pharmacovigilance :

De 1985 à fin 1994, parmi les 44 observations d'atteinte hépatique retenues, une seule décrit une réadministration positive chez une femme de 67 ans, probablement atteinte de la maladie de Gilbert. Le type d'atteinte paraît homogène (cytolyse hépatique dans 70% des cas) et d'évolution généralement favorable. La majorité des observations comporte des médicaments associés et l'incidence de l'ensemble des cas est très faible.

2. Données complémentaires :

Au niveau international, le laboratoire LIPHA rapporte 9 observations d'atteintes hépatiques, peu documentées dont une d'évolution fatale, chez des patients ayant reçu du naftidrofuryl.

La tolérance du naftidrofuryl (sous sa forme fumarate) a été évaluée dans le cadre d'un essai clinique comparativement à celle d'un placebo, lors d'un traitement de 180 jours, et aucune différence significative n'a été mise en évidence entre les deux groupes de traitement.

Lors de l'administration par voie injectable, la responsabilité du naftidrofuryl peut être évoquée dans 3 cas (avec un traitement associé de même imputabilité) recueillis par le système national de pharmacovigilance.
Dans la littérature, deux observations d'atteinte hépatique cytolytique aiguë ont été décrites.

3. Conclusions :

Au vu de ces données, les arguments en faveur de l'hépatotoxicité du naftidrofuryl ne paraissent pas décisifs. La Commission nationale de pharmacovigilance propose donc de ne pas mentionner les atteintes hépatiques dans les effets indésirables du naftidrofuryl par voie orale.

III - ACICLOVIR ET GROSSESSE

La Commission nationale de pharmacovigilance a pris connaissance des résultats de l'enquête officielle sur l'évaluation du risque éventuel d'exposition à l'aciclovir pendant la grossesse et l'attitude à adopter face à une prise d'aciclovir chez une femme enceinte.

Menée par le centre régional de pharmacovigilance de Lyon en collaboration avec les centres de Paris Saint-Vincent-de-Paul et Paris La Pitié-Salpêtrière prenant en compte les données des CRPV ainsi que celles du centre de renseignement sur les agents tératogènes (CRAT) et des laboratoires Wellcome, cette étude s'étend de 1985 à fin 1992 et distingue les cas dits "prospectifs" (suivi systématique de l'évolution de la grossesse après prise d'aciclovir) des cas rétrospectifs (notification enregistrée alors que l'évolution de la grossesse est connue chez des femmes ayant été traitées par aciclovir).

1/ Bilan de l'enquête :

L'analyse des 188 dossiers, d'évolution connue, n'a pas montré d'augmentation :
- du nombre d'interruption volontaire ou thérapeutique de grossesse (par rapport aux données DGS-INSERM),
- du nombre de fausses couches spontanées (par rapport au groupe témoin d'une étude sur la fluoxétine)
- ni du taux de malformation de 3,9% (par rapport au taux de base de la population générale estimé à 3%). Les quelques malformations observées, dans les dossiers prospectifs et rétrospectifs, touchent des appareils différents et n'évoquent donc pas un syndrome malformatif homogène et spécifique.

Le nombre de cas est trop faible pour mettre en évidence un effet délétère des formes topiques, à très faible passage systémique, utilisées au cours de la grossesse.

2/ Registre international :

Les données issues du registre international des laboratoires Wellcome concernant le suivi "prospectif" de 1117 grossesses exposées à un traitement par aciclovir sont comparables aux résultats de l'enquête.

3/ Conclusions :

L'ensemble des données n'a pas mis en évidence d'augmentation du risque malformatif ou foetotoxique, notamment après une exposition lors du premier trimestre ou en fin de grossesse. Il paraît donc possible d'être rassurant face à une prise accidentelle d'aciclovir au cours de la grossesse.

Cependant les effectifs sont trop limités pour qu'une augmentation faible du risque de malformation soit détectable ; d'autre part, les données n'ont pas été comparées à un groupe témoin issu de la même population, mais à celles observées dans la population générale. Enfin, cette enquête n'a pas évalué les éventuels effets délétères à long terme, notamment une altération potentielle de la fonction immunitaire suggérée par des études chez l'animal. Il apparait donc important de rappeler que seul l'herpès systémique grave justifie la mise en place d'un traitement par l'aciclovir chez la femme enceinte.
La Commission nationale de pharmacovigilance propose une rédaction plus informative et plus rassurante du libellé de la rubrique "grossesse et allaitement" du résumé des caractéristiques du produit.

Annexe 1-60

IV – RELEVE D'AVIS

La procédure des relevés d'avis, suite au Comité Technique, est entérinée par la Commission nationale de pharmacovigilance. Les dossiers de demande de modification de l'information médicale seront dorénavant présentés aux membres de la Commission nationale de pharmacovigilance sous forme de relevé d'avis suite au Comité technique. Ces avis, avec le rapport technique, seront adressés aux membres avant la Commission nationale. Ils seront validés ou modifiés lors de la réunion de la Commission.

A – DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE TRIATEC® FAIBLE 1,25mg, TRIATEC® 2,5mg, TRIATEC® 5mg (ramipril) (Laboratoires HOECHST)

Considérant :

- les notifications d'effets indésirables au système national de pharmacovigilance, les déclarations obligatoires de la firme et les données de la littérature,
- la rareté de survenue d'érythème polymorphe et de purpura vasculaire sous ramipril,

la Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis suite au Comité technique du 18/05/95, soit :

Ajouter

– à la rubrique "Précautions d'Emploi" : hémodialyse : des réactions anaphylactoïdes (oedème de la langue et des lèvres avec dyspnée et baisse tensionnelle) ont été observées au cours de l'hémodialyse utilisant des membranes de haute perméabilité (polyacrylonitrile) chez des patients traités par inhibiteurs de l'enzyme de conversion. Il est prudent d'éviter cette association. *"Des réactions similaires ont été observées au cours de LDL aphérèses sur sulfate de dextran".*

– à la rubrique "Effets indésirables" :
Effets digestifs *"une augmentation des enzymes hépatiques a été notée dans des cas isolés, associée exceptionnellement à une hépatite cholestatique ou mixte, nécessitant l'arrêt du traitement".*
Effets respiratoires : toux, *"et plus rarement bronchospasme".*
Effets allergiques et cutanés : prurit, *"éruption cutanée maculopapuleuse ou urticarienne, flush, et exceptionnellement : dermatose lichénoïde ou psoriasiforme".*

B – DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE CEPOREXINE® 125 mg granulés en sachet, CEPOREXINE® 250 mg granulés en sachet, CEPOREXINE® 250 mg granulés pour suspension buvable, CEPOREXINE® 500 mg gélules, CEPOREXINE® 1000 mg comprimés enrobés sécables (cefalexine) (Laboratoires GLAXO)

Considérant :

- la possibilité de survenue de colites pseudo-membraneuses lors de traitement par cefalexine,
- que l'innocuité de la cefalexine n'a pas été établie durant la grossesse,
- les effets indésirables collectés par le système national de pharmacovigilance et le laboratoire,
- la dialysance de ce médicament,

La Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis suite au Comité technique du 02/03/95, sous réserve d'une modification de forme :

Remplacer de la phrase "il a été convenu qu'un paragraphe mentionnant la dialysance de la cefalexine soit ajouté à la rubrique Pharmacocinétique." par

"il a été convenu que le paragraphe mentionnant la dialysance de la céfalexine soit déplacé à la rubrique Pharmacocinétique."

C - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE SPORANOX® (itraconazole) (Laboratoires JANSSEN)

Au vu des données de pharmacovigilance et des résultats des études pharmacocinétiques, expérimentales ou sur volontaires sains, la Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis du Comité technique du 18/05/95, il est nécessaire d'inclure les effets indésirables de type oedème de Quincke, syndrome de Stevens-Johnson, ainsi que la possibilité de survenue d'oedème, hépatites et neuropathies périphériques lors de traitements prolongés. Une surveillance du bilan hépatique est préconisée lors des traitements de plus d'un mois.

Suite à des études pharmacocinétiques et de pharmacologie clinique, de nouvelles associations contre-indiquées sont à mentionner : avec l'astémizole, le cisapride et le triazolam.
L'association avec le midazolam est à déconseiller.

Une mise en garde concernant l'hépatotoxicité apparaît nécessaire ainsi que des précautions d'emploi, lors d'associations avec la didanosine, les anti-acides, les antagonistes calciques de la famille des dihydropyridines, les quinidiniques dont hydroquinidine, les anticoagulants oraux.

D - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE PRESTOLE® (triamtérène, hydrochlorothiazide) (Laboratoires SMITHKLINE BEECHAM)

Considérant :

- qu'afin d'éviter une hyperkaliémie, une précaution d'emploi est nécessaire lors d'association avec les inhibiteurs de l'enzyme de conversion,
- qu'il n'est pas établi qu'une association de type PRESTOLE® présente des risques de troubles du rythme,
- que la survenue de calculs riches en triamtérène est un argument en faveur d'un potentiel lithogène,
- que la survenue d'effets indésirables à type de modification de la formule sanguine et de thrombopénie est rapportée dans la littérature,
- qu'aucune étude n'a établi la sécurité d'emploi chez l'enfant,

La Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis suite au Comité technique du 18/05/95, sous réserve des modifications suivantes :

- dans le libellé des associations nécessitant des précautions d'emploi : remplacer la phrase *"lorsqu'un traitement diurétique préalable peut avoir entraîné une déplétion..."* par "lorsqu'un traitement diurétique a entraîné une déplétion ..."

- remplacer "*médicaments donnant des torsades de pointes...*" par "médicaments pouvant entraîner des torsades de pointes..." et inclure ce libellé dans la rubrique "associations nécessitant des précautions d'emploi" et non "associations déconseillées".

E - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE Spécialités injectables contenant de la noramidopyrine (Laboratoires HOECHST, LAFON, RIOM CERM, THERABEL LUCIEN PHARMA)

Considérant le risque de formation d'un précipité lors de l'association au cours de la même injection ou perfusion de phloroglucinol et de noramidopyrine (risque d'apparition de phlébothrombose), la Commission nationale de pharmacovigilance du 19/06/95 approuve le relevé d'avis suite au Comité technique du 30/03/95, sous réserve de la suppression du terme "connue" à la fin du libellé, soit : "Il est contre-indiqué de mélanger dans la même seringue [nom de la spécialité contenant de la noramidopyrine] et le SPASFON® (Phloroglucinol), en raison d'une incompatibilité physico-chimique."

F - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE VOLTARENE® collyre (diclofenac) (Laboratoires CIBA VISION)

Considérant :

- que le laboratoire a retiré sa demande sur les effets du collyre sur l'aptitude à conduire des véhicules,
- qu'il n'y a pratiquement aucun risque d'effet toxique en cas d'ingestion accidentelle ou volontaire d'un flacon,
- que la kératite ponctuée est l'effet indésirable le plus fréquemment notifié,

la Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis suite au Comité technique du 30/03/95

G - DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE ANSATIPINE® (rifabutine)

Considérant :

- qu'une diminution de la dose d'ANSATIPINE® doit être préconisée en cas d'insuffisance hépatique sévère,
- qu'une actualisation de la rubrique "interactions médicamenteuses" est nécessaire,
- que la survenue d'effets indésirables à type d'uvéites, notamment lors d'une augmentation des doses et de certaines associations médicamenteuses, a été rapportée au niveau du système national de pharmacovigilance, au laboratoire et dans la littérature,
- et que parmi les signes cliniques d'uvéite, la diminution de l'acuité visuelle mérite d'être signalée dans l'annexe II,

la Commission nationale de pharmacovigilance du 19/06/95 a approuvé le relevé d'avis suite au Comité technique du 20/04/95.

Annexe 1-60

SOMMAIRE

I – LES ANOREXIGENES ET HYPERTENSION ARTERIELLE PULMONAIRE PRIMITIVE 3

II – ENQUETE OFFICIELLE SUR L'HEPATOTOXICITE DES FORMES ORALES DES SPECIALITES CONTENANT DU NAFTIDROFURYL 6

le 16/07/95

Urgent

Note sur les annexigènes
à l'intention
de Mr TABUTEAU, Dir. Général de
l'Agence du Médicament

Objet = situation après le Comité des Spécialités Pharmaceutiques des 11-12 et 13 Juillet 95.

1) Position du CSP de Juillet

La procédure selon l'article 12 est prolongée de 60 jours, pour permettre d'obtenir des informations complémentaires des firmes pharmaceutiques, en terme de

- bénéfice(s) thérapeutique(s) selon les modes (continus ou discontinus) et durées de traitement
- profil global de sécurité, incluant d'autres effets indésirables que l'hypertension pulmonaire

L'annexe I correspond aux questions

qui seront adressées aux firmes
et au calendrier=

- réponses des détenteurs d'AMM 31 Août
- rapports d'évaluations et du rapporteur (FR) du co-rapporteur (SWE) pour le profil de sécurité 30 Oct
- avis du C.S.P 17 Oct

Ce délai permettra au C.S.P d'affiner sa position

2 Rappel des éléments du dossier

2.1) Une enquête de pharmacovigilance a recensé 78 cas d'hypertension artérielle pulmonaire primitive (PP) associés à la prise d'anorexigènes, survenus en France depuis 1985

Une étude épidémiologique cas-témoin (IPPH) menée, en 92-93, dans 4 pays, par le Pr Abenhaim, a confirmé le lien

suite

contre la survenue d'une HSA
la prise d'anorexigènes (fenfluramine(F)/dex fenfluramine(DF)/amfépramone/clobenzorex/fenproporex, phenmétrazine), les anorexigènes étant considérés comme une classe. L'analyse "rétrospective" par sous-groupe fait apparaître une association significative avec F/DFenfl; mais, par manque de puissance, l'association n'atteint pas le seuil de significativité pour les autres anorexigènes (amphétaminiques); cependant, il existe une forte tendance...

2.2) Les 2 Commissions Nationales de PV des 28 Avril et 03 Mai ont permis (annexes 2 et 3) dans l'attente de l'évaluation de données complémentaires d'efficacité, de prendre un ~~premier train de mesures~~:
- restriction des indications (2e intention, obésité avec IMC supérieur à 30
- limitation de la durée d'hospitalisation à 3 mois
- contre-indication des associations

Une large information a été diffusée visant le public et les professions de santé

à la suite d'une réunion du
Groupe de Travail Pharmacovigilance du C.S.P
(11 Mai) et du Comité lui-même (16-17 Mai)
l'Allemagne (Pr H. Polenbrandt) a saisi
le Comité, sur ce sujet d'intérêt communautaire
selon l'article 12 (17 Mai 95)

2.4) Un groupe d'experts sur l'obésité
(23 Mai) réuni à l'Agence du Médicament
a permis de faire le point sur l'efficacité
des anorexigènes. Les firmes ont été entendues, le 30.

Un rapport d'évaluation a été adressé
par le D.E.V. au C.S.P et à son groupe
de Travail de Pharmacovigilance, sur efficacité & sécurité

2.5) le groupe de Travail Pharmacovigilance
du CSP, au vu du rapport d'évaluation
français, a conclu (annexe 4), le 02/06, à :
- l'absence d'intérêt des dérivés amphétaminiques
qui n'ont pas de place dans le traitement
de l'obésité (absence de bénéfice long terme;
risque dépassant le bénéfice)
- la possibilité de maintenir F/DF

adré:
- avec les indications limitées ...
- et une prescription pour les spécialités

2.6 la Commission Nationale de Pharmacovigilance du 19/06 a émis les mêmes recommandations (cf compte-rendu personnel en annexe 5)
Lire =
- suspension des amphétaminiques
- maintien dans les conditions précitées de F/DF, notamment avec prescription (initiale) hospitalière.

2.7 le C.S.P des 11-12-13 Juillet

après 3 auditions de firmes a décidé de prolonger la procédure [M^me le Pr^e Abenhaim, amenée par la délégation française, a pu répondre aux questions des fabricants]

Au plan scientifique, le Comité a retenu les faits décrits par un document FRE "position statement" (annexe 6)

Annexe 1-61

La discussion a fait apparaître que :

a) - les représentants n'étaient pas prêts à répondre oui en Juillet 95

b) - cependant, ils n'étaient pas satisfaits (du tout) de laisser en le marché

c) - ils redoutaient de ne pas avoir des bases suffisamment solides pour un avis négatif (tenaient, par ailleurs, exclusivement aux empêchements que :

- pour F/D.F. la preuve d'un lien avec l'HPL est faite, mais que l'évitité est bien prouvé (à un an)
- pour les annexistes : il n'existe qu'une "suspicion" mais, fin en revanche, seul un effet contre terme est affiché, dont on peut douter de l'intérêt dans le cadre d'une prise en charge long terme de l'obésité et que les empêchements sont décriés depuis 20 ans pour leurs multiples effets indésirables (dépendance, effets

cerveaux, effets cardio-vasculaires...)

d) ils n'étaient pas convaincus de pouvoir faire une différence entre F/DF et amphétaminiques

Deux solutions ont été évoquées :

(A) suspension des amphétaminiques → [pré-vote 7/15 favorables à la suspension malgré la volonté de ne pas conclure en Juillet

(B) maintien de F/DF et amphétaminiques

un milieu spécialisé. Les cliniciens feraient la différence.

Cette position de compromis heurte SUE, DK, NL qui n'ont pas des amphétaminiques sur leur marché ... et qui, à la suite d'un article 12 favorable, pourraient être obligés de les adopter !!

Annexe 1-61

[illegible] que dans le pré-vote, [illegible] et DK n'devraient pas, pour autant, être le volonté de suspendre (immédiatement).

Il n'est pas impossible qu'en Octobre, l'avis soit négatif, mais, cela n'est pas certain.

De plus, en cas d'avis négatif (pour les amphétaminiques / ou l'ensemble des anorexigènes), il y aurait forcément des recours

Il paraît difficile d'entendre (cf lettre de Durand) les FR, comme souligné par PL en C.S

Je serais favorable à un passage en prescription hospitalière (initiale) [illegible]

DIRECTION GENERALE DE LA SANTE

Sous-Direction de la Pharmacie

Dossier suivi par
Mme H. SAINTE MARIE, chargé de mission

N O T E
pour Monsieur le Directeur général de
l'Agence du médicament

OBJET : anorexigènes.

Par lettre du 12 octobre 1995, l'Agence du médicament a demandé l'interdiction de l'utilisation dans les préparations magistrales des principes actifs qui, ajoutés à ceux déjà interdits par l'arrêté du 10 mai 1995, sont en cours d'évaluation au niveau européen.

Par ailleurs, j'observe que la commission de pharmacovigilance, au cours de sa réunion du 19 juin 1995, avait souhaité voir cette interdiction étendue à l'ensemble des principes actifs figurant dans la liste 3 annexée au décret du 16 mars 1982.

L'Agence du médicament avait d'ailleurs sensibilisé mon service sur les risques de transfert en direction des principes actifs autres que ceux concernés par l'étude européenne, dans un courrier du 5 octobre 1995.

Dans ces conditions, et comme suite à votre conversation téléphonique de ce jour avec Mme MOREL, je vous serais obligée de bien vouloir me préciser le plus rapidement possible :

– d'une part, quelles sont les bases scientifiques sur lesquelles l'Agence du médicament s'est fondée pour demander l'interdiction des principes actifs étudiés au niveau européen et non interdits par l'arrêté du 10 mai 1995 ; à cet égard, je souhaiterais obtenir communication du rapport que l'Agence a fourni, en tant que rapporteur, au comité des spécialités pharmaceutiques ;

– d'autre part, pour quelles raisons l'Agence a limité cette demande aux seuls principes actifs précités, sans englober les autres principes actifs figurant dans le groupe III de l'annexe au décret de 1982 précité.

Le Chargé de Mission
auprès du Sous-Directeur de la Pharmacie

Hélène SAINTE MARIE

AGENCE DU MEDICAMENT

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis, le 20 OCT. 1995

NOTE
pour Monsieur le Directeur Général
de la Santé

Objet : anorexigènes

En réponse à votre note du 19 Octobre 1995, Je vous prie de bien vouloir trouver ci-joint les précisions demandées :

Les substances anorexigènes inclues dans l'article 12 sont les seules à avoir fait l'objet d'une évaluation au niveau européen et correspondent aux spécialités pharmaceutiques commercialisées dans divers Etats membres de la Communauté Européenne. Il semble donc pertinent d'en interdire l'utilisation dans les préparations magistrales.

Toutefois, en raison du risque de reports de prescription sur les principes actifs figurant dans le groupe 3 du Décret n° 82-200 du 25 Février 1982, la Commission Nationale de Pharmacovigilance lors de sa séance du 19 Juin 1995 a souhaité que l'arrêté du 10 Mai 1995 soit étendu à ce groupe. Ces produits, à l'exception de ceux inclus dans l'enquête européenne n'ont pas fait l'objet d'une évaluation spécifique ; leur interdiction dans des préparations magistrales vise à empêcher un report de prescription vers des principes actifs ayant les mêmes particularités que les anorexigènes inclus dans l'article 12.

Vous trouverez joint à ce courrier les rapports communiqués aux états de la Communauté Européenne, ainsi que la liste des principes actifs du groupe 3 du Décret pré-cité.

Le Directeur Général

D. TABUTEAU

Arrêté du 25 octobre 1995 portant interdiction d'exécution et de délivrance de certaines préparations magistrales

NOR : *SANP9503231A*

Le ministre de la santé publique et de l'assurance maladie,

Vu le code de la santé publique, et notamment les articles R. 5144-9 et R. 5179 ;

Vu l'avis de la Commission nationale de pharmacovigilance du 19 juin 1995 ;

Vu l'avis de la commission d'autorisation de mise sur le marché n° 208 du 15 septembre 1995 ;

Considérant qu'une étude épidémiologique internationale a mis en évidence une relation entre la survenue d'une maladie vasculaire pulmonaire grave et souvent mortelle et la prise prolongée de médicaments anorexigènes à base de certains principes actifs ;

Considérant que la législation et la réglementation spécifiques aux médicaments, et notamment celles relatives à leur mise sur le marché et à leurs conditions de prescription et de délivrance, permet de prendre les mesures nécessaires à la sécurité de ces produits ;

Considérant que les préparations magistrales ou autres préparations à base de ces principes actifs sont commercialisées sans autorisation de mise sur le marché et qu'il n'est pas possible d'assurer le même encadrement de leur prescription et de leur délivrance ;

Considérant que ces préparations présentent les mêmes risques graves pour la santé publique,

Arrête :

Art. 1er. – Sont interdites à compter de la publication du présent arrêté l'exécution et la délivrance de préparations magistrales ou autres préparations à base de principes actifs suivants :

Acridorex, amfécloral, amfépentorex, aminorex, amphétamine, benflurorex, benzphétamine, chlorphentermine, cloforex, clominorex, clotermine, dexamphétamine, difémétorex, étilamfétamine, étolorex, fénétylline, fénisorex, fénosolone, flucétorex, fludorex, fluminorex, formétorex, furfénorex, indanorex, levamphétamine, mazindol, métamfépramone, métamphétamine, morforex, norpseudoéphédrine, ortétamine, oxifentorex, pentorex, phenbutrazine (fenbutrazate), phendimétrazine, phenmétrazine, phentermine, picilorex, propylhexedrine, triflorex.

Art. 2. – Le directeur général de la santé est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 25 octobre 1995.

Pour le ministre et par délégation :
Le directeur général de la santé,
J.-F. GIRARD

MINISTÈRE DE L'AGRICULTURE, DE LA PÊCHE ET DE L'ALIMENTATION

Arrêtés du 29 juin 1995 relatifs à des groupements de producteurs

NOR : *AGRP9501972A*

Reconnaissances

Par arrêtés du ministre de l'agriculture, de la pêche et de l'alimentation en date du 29 juin 1995, les organismes ci-dessous sont reconnus en qualité de groupement de producteurs.

La coopérative Société coopérative agricole Ovins 27, agréée le 6 février 1995 sous le numéro 27/95/001, dont le siège social est établi au Neubourg (Eure), est reconnue en qualité de groupement de producteurs à compter du 1er janvier 1995 et jusqu'au 31 octobre 1996 pour les agneaux et les ovins de réforme sur la circonscription territoriale suivante :

Le département de l'Eure ;
L'arrondissement de Lisieux (Calvados).

La coopérative Société coopérative agricole Terres de Gascogne, Gers porcs, dont le siège social est établi à Condom (Gers), est reconnue en qualité de groupement de producteurs jusqu'au 31 octobre 1996 pour les porcelets et les porcs charcutiers sur la circonscription territoriale suivante :

Canton d'Astafort (Lot-et-Garonne) ;
Canton de Boulogne-sur-Gesse (Haute-Garonne) ;
Canton de Cadours (Haute-Garonne) ;
Canton de Léguevin (Haute-Garonne) ;
Arrondissement d'Auch (Gers) ;
Canton de Condom (Gers) ;
Canton d'Eauze (Gers) ;
Canton de Fleurance (Gers) ;
Canton de Lectoure (Gers) ;
Canton de Mauvezin (Gers) ;
Canton de Miradoux (Gers) ;
Canton de Montréal (Gers) ;
Canton de Saint-Clar (Gers) ;
Canton de Valence-sur-Baïse (Gers) ;
Canton d'Aignan (Gers) ;
Canton de Marciac (Gers) ;

AGENCE DU MEDICAMENT
DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

20 DEC. 1996

Copie

Note
Pour Mr Philippe BAS, Directeur de Cabinet
du Ministre du Travail et des Affaires Sociales
et Mr Benoît PARLOS, Directeur de Cabinet
du Secrétaire d'Etat à la Santé et à la Sécurité Sociale
(A l'attention de Mr Pierre BIVAS, Conseiller Technique)

Objet : Synthèse du dossier anorexigènes

L'hypertension artérielle pulmonaire primitive est une maladie rare (deux cas pour un million d'habitants), mais d'évolution sévère et le plus souvent mortelle. Les ressources thérapeutiques sont limitées à des perfusions continues de prostacycline à visée vasodilatatrice et aux greffes pulmonaires ou cardiopulmonaires.

I anorexigènes et hypertension artérielle

En 1991, des cas d'hypertesion artérielle pulmonaire associés à la prise de fenfluramine ont été publiés. En France, plusieurs cas de notifications spontanées liées à l'utilisation d'anorexigènes, notamment defenfluramine et dexfenfluramine ont justifié la mise en place d'une enquête nationale de pharmacovigilance. Cette enquête conduite par le Centre de Pharmacovigilance de Besançon a permis de relever 78 cas d'hypertension artérielle pulmonaire primitive notifiés au système français de pharmacovigilance et associés à la prise d'anorexigènes entre 1985 et 1994.

Parallèlement une étude internationale prospective cas-témoin (étude IPPHS) dont les resultats définitifs ont été connus au printemps 1995, conduite en Europe entre 1992 et 1994 et coordonné par le Pr L.Abenhaim (Université Mc Gill, Montréal), a établi l'existence d'un lien significatif entre la prise d'anorexigènes et la survenue d'une hypertension artérielle pulmonaire primitive. Le risque augmente avec la durée du traitement ; il est significativement augmenté pour des durées supérieures à trois mois.

II Mesures prises en France

La relation établie entre la survenue d'hypertensions artérielles pulmonaires primitives et la prise de médicaments anorexigènes a conduit la Commission Nationale de Pharmacovigilance et la Commission d'Autorisation de Mise sur le Marché à proposer, dès le mois de Mai 1995, des mesures restrictives visà vis de l'utilisation de ces produits. L'Agence a donc pris les décisions suivantes :

- Harmonisation du Résumé des Caractéristiques des produits (RCP) de l'ensemble des spécialités avec restriction de l'indication au traitement de seconde intention, après échec d'un traitement diététique adapté, des obésités majeures (indice de masse corporelle supérieure à 30 kg/m2) représentant un facteur de risque grave :

- limitation de la durée totale de traitement à trois mois,
- identification claire d'un risque potentiellement mortel.

Parallèllement, un arrêté du Ministre de la Santé a interdit l'exécution et la délivrance des préparations magistrales à base de substances anorexigènes.

Ces mesures ont été portées à la connaissance des professionnels de santé et du public le 16 mai 1995 (Cf. Avis aux prescripteurs joint)

Parallèllement, un groupe d'experts spécialistes de diabétologie-endocrinologie-nutrition était chargé, à partir de l'ensemble des données fournies par les firmes pharmaceutiques concernées, de réévaluer l'intérêt thérapeutique des anorexigènes et leur place dans la prise en charge globale de l'obésité. Les conclusions ont été :

- Pour les amphétamines et apparentés : il n'est pas possible de prescrire ces produits à long terme en raison de leur potentiel de dépendance ; on ne peut donc attendre une perte de poids prolongée, d'autant que leur effet cesse dès l'arrêt du traitement. Le bénéfice thérapeutique, s'il existe, est donc insuffisant au regard du risque potentiel d'hypertension artérielle pulmonaire.

- Pour les fenfluramines : il existe une étude long terme (un an) menée avec la dexfenfluramine. Le nombre de patients répondeurs au traitement (perte prolongée de 10 % du poids initial) double par rapport à un placebo. Ce produit pourrait être utile dans le cadre d'une prescription à long terme, après une stricte sélection des patients, dans le cadre d'une prise en charge globale par des spécialistes. Il convient de vérifier par une étude épidémiologique l'impact réel d'un traitement long terme sur la morbidité et la mortalité.

La Commission Nationale de Pharmacovigilance du 19 juin 1995 a validé ces conclusions, après audition des firmes pharmaceutiques commercialisant des anorexigènes en France et envisagé la suspension des anorexigènes amphétaminiques et le maintien de la fenfluramine et desfenfluramine en milieu hospitalier sous le contrôle de spécialistes (cf. annexes). Ces propositions ne pouvaient être appliquées qu'après les conclusions du Comité des Spécialités Pharmaceutiques.

Toutefois, les délais règlementaires de réponse ainsi que la processus décisionnel européen ne permettaient pas d'espérer la mise en oeuvre de mesures concrètes avant la fin du premier trimestre 1996, en cas d'appel des firmes. La France étant le pays Européen qui compte le plus grand nombre de cas d'hypertension artérielle primitive, était confrontée à un problème de Santé publique majeur. Aussi, l'Agence du Médicament a t'elle saisi à nouveau la Commission d'Autorisation de Mise sur le Marché sur la nécessité de prendre des mesures à titre conservatoire dans l'attente de la décision européenne.

La Commission d'AMM du 15 septembre 1995 a estimé que :

- l'obésité était une maladie chronique nécessitant un traitement prolongé et une prise en charge globale pluridisciplinaire ;

- les anorexigènes, prescrits à long terme, pouvaient avoir une place dans cette prise en charge globale ;

- compte tenu du risque inhérent à la prescription des anorexigènes, la décision de prescription devait être soigneusement pesée et ne concerner que des obésités majeures de type androïde, représentant un réel facteur de risque de morbidité et mortalité cardio-vasculaires.

Dans ces conditions, la Commission a proposé une prescription restreinte avec prescription initiale hospitalière par des services spécialisés en diabétologie, endocrinologie, nutrition, médecine interne et/ou par des spécialistes d'endocrinologie et maladies métaboliques. Le relais de la prescription pouvant se faire en ville. La validité de la prescription initiale proposée était de un an. La réglementation ne permet en effet pas de réserver la prescription initiale à des spécialistes hospitaliers et libéraux assurant une prise en charge globale de l'obésité avec renouvellement possible par tout médecin.

Il a en outre, été rappelé que la durée cumulative de prescription des amphétaminiques ne devait pas excéder trois mois par cure de 4 à 6 semaines, en raison du risque de dépendance. Pour les fenfluramines, un traitement plus prolongé était autorisé pour les patients ayant atteint une perte de poids d'au moins 5 % de leur poids initial après 2 à 3 mois de traitement.

Ces mesures restrictives répondaient au double objectif :

- d'éliminer les risques de prescription à visée esthétique des anorexigènes ;

- de conserver la possibilité pour les spécialistes de disposer d'un moyen pharmacologique dans le cadre d'une prise en charge globale de l'obésité.

Ainsi, les patients pour lesquels une diminution possible du risque de mortalité cardio-vasculaire compensait l'éventualité rare de survenue d'une hypertension artérielle pulmonaire ont pu bénéficier du traitement.

Ces mesures ont été prises par l'Agence du Médicament dès l'approbation de l'avis de la Commission d'Autorisation de Mise sur le Marché et portées à la connaissance du public et des professionnels de santé (Cf communiqué de presse du 30 octobre 1995)

III Procédure Européenne

L'ensemble des données de tolérance ont été transmises au Comité des Spécialités Pharmaceutiques. L'Allemagne a saisi le Comité au cours de sa séance du mois de Mai 1995 en vertu de l'article 12 de la directive 75/319/EEC. La France a été nommée rapporteur du dossier.

Depuis cette date le dossier des anorexigènes a donc été évalué en parallèle en France et au niveau Européen .

Trois rapports ont ainsi été examinés au niveau du Comité des Spécialités pharmaceutiques au cours de l'année 1995 et les titulaires d'autorisation de mise sur le marché ont été entendus à deux reprises en juillet 1995 et en octobre 1995.

Un premier avis rendu par le Comités des Spécialités Pharmaceutiques le 15 février 1996, a fait l'objet d'un appel de certaines firmes pharmaceutiques. Aussi un avis final de ce Comité n'a été donné qu'au mois de juillet 1996.

- les anorexigènes représentent un traitement adjuvant du régime alimentaire chez des patients atteints d'obésité dont l'index de masse corporelle (IMC) est de 30 kg/m2 ou plus, qui n'ont pas répondu au régime amaigrissant adopté seul ;

- il est recommandé que ce traitement soit mené sous la surveillance d'un médecin expérimenté dans le traitement de l'obésité ;

- il est de plus indiqué pour les fenfluramines que le traitement ne pourra être prolongé au delà de 3 mois que chez les patients qui présentent , dans les 3 mois suivant le début du traitement , une perte de poids égale ou supérieure à 10 % du poids initial ;

- toute association médicamenteuse à un autre anorexigène à action centrale est contre-indiquée en raison du risque accru d'hypertension artérielle pulmonaire potentiellement fatale.

- Une mise en garde indique clairement que :

"Des cas d'hypertension artérielle pulmonaire sévère, souvent fatale, ont été rapportés chez des patients ayant reçu des anorexigènes.

Une étude épidémiologique a montré que la prise d'anorexigènes est un facteur de risque impliqué dans le développement de l'hypertension artérielle pulmonaire et que la prise d'anorexigène est fortement liée à un risque accru de survenue de cet effet indésirable.

Compte tenu de ce risque rare mais grave, il faut souligner :

- que l'indication thérapeutique et la durée de traitement doivent être soigneusement respectées ;

- qu'une durée de traitement supérieure à trois mois ainsi qu'un Index de Masse Corporelle ≥ 30 kg/m2, augmentent le risque d'hypertension artérielle pulmonaire ;

- que l'apparition ou l'aggravation d'une dyspnée d'effort doit faire suspecter la survenue d'une hypertension artérielle pulmonaire. Dans ces circonstances, le traitement doit être arrêté immédiatement et le patient orienté en milieu spécialisé pour investigations".

IV Position française

La décision de la Commission Européenne sur les conditions d'utilisation des médicaments anoexigènes ne remet pas en cause les mesures actuellement en vigueur en France.

En effet, depuis le mois d'octobre 1995, les autorisations de mise sur le marché de ces médicaments comportaient déjà les informations proposées par le Comité des Spécialités Pharmaceutiques :

- les anorexigènes étaient reservés au traitement de seconde intention, après échec d'un traitement hygiéno-diététique adapté , des obésités patentes de type androïde chez des patients ayant un indice de masse corporelle égal ou supérieur à 30 kg/m2 ;

- les anorexigènes étaient reservés au traitement de seconde intention, après échec d'un traitement hygiéno-diététique adapté , des obésités patentes de type androïde chez des patients ayant un indice de masse corporelle égal ou supérieur à 30 kg/m2 ;

- pour les fenfluramines, la prolongation du traitement au delà de 3 mois n'était envisagée qu'en cas de réponse clinique attestée par une perte de poids d'au moins 5 % du poids initial. (la décision de la Commission Européenne restreint encore l'indication en fixant à 10 % la perte de poids nécessaire pour justifier la poursuite du traitement).

- l'association à d'autres médicaments anorexigènes était contre-indiquée ;

- une mise en garde indiquait que :

"Des observations d'hypertensions artérielles pulmonaires graves,souvent mortelles, ont été rapportées chez des patients ayant reçu un traitement par anorexigènes.

Une relation avec la prise de ces médicaments a été établie. Compe tenu de ce risque rare mais grave :

- l'indication doit être respectée ;

- le traitement ne doit être poursuivi qu'en cas de réponse clinique dans les 3 premier mois (pour les fenfluramines) ;

- toute apparition ou augmentation d'une dyspnée d'effort doit faire évoquer la possibilité d'hypertension artérielle pulmonaire et faire arrêter le traitement .

Il est alors nécessaire d'adresser le patient en milieu spécialisé afin de pratiquer des examens respiratoires."

Ces traitements étaient reservés aux médecins ayant une parfaite expérience de la prise en charge de l'obésité et ayant les moyens d'appréhender complètement les risques liés à l'obésité elle même. La prescription initiale peut ainsi reposer sur une évaluation précise et individuelle de la balance bénéfice /risque de ces traitements.

Il apparait ainsi clairement que la position européenne est en accord avec les mesures prises à titre conservatoire en France en 1995. Les libellés des autorisations de mise sur le marché feront donc simplement l'objet d'une rectification pour reprendre les termes exacts de la décision européenne.

Cette position a été rendue publique par un communiqué de presse diffusé le 19 décembre 1996 après accord du cabinet du Ministre.(pièce jointe)

Un recours administratif a été formé devant l'Agence et sera examiné par la commission d'AMM notamment à la lumière de la nouvelle réglementation qui doit prochainement compléter le dispositif sur la prescription restreinte (articles R5143-5-1 et suivants du code de la santé publique).

Il convient de souligner que les décisions européenne et française permettent de maintenir ces médicaments à la disposition des patients pour lesquels le risque de morbidité et de mortalité cardiovasculaires dû à une forte obésité, justifie la prise de risque lié au traitement par des produits anorexigènes.

En revanche, il importe d'écarter tout risque d'une prise d'anorexigène en dehors des strictes indications de l'autorisation de mise sur le marché. Tel est l'objet des décisions arrêtées l'an dernier.

Dans ces conditions, le maintien des mesures prises par la France dès 1995 est une nécessité de santé publique.

Didier TABUTEAU

AGENCE DU MEDICAMENT

Saint-Denis, le 12 Mai 1995

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Cher Confrère,

Une étude internationale, cas/témoin, visant à préciser les facteurs de risque des hypertensions artérielles pulmonaires d'allure primitive, vient de montrer l'existence d'une association entre **la survenue d'hypertension artérielle pulmonaire et la prise d'anorexigènes**.

Le risque de survenue de cet effet indésirable, dont vous connaissez la gravité du fait de son évolution le plus souvent fatale, augmente lorsque la durée du traitement dépasse trois mois ou lorsque les anorexigènes sont prescrits en association.

L'Agence du Médicament a donc décidé, sur proposition de la Commission Nationale de Pharmacovigilance et en accord avec les firmes commercialisant des spécialités contenant ces principes actifs* de :

- limiter l'indication de ces produits au traitement des obésités patentes des patients dont l'indice de masse corporelle est supérieur à 30, constituant un facteur de risque cardiovasculaire grave,
- limiter à 3 mois les durées cumulatives de traitement,
- contre-indiquer leur association.

Le rapport bénéfice/risque de ces traitements, dans la prise en charge thérapeutique globale de l'obésité, est en cours de réévaluation par l'Agence du Médicament qui prendra si nécessaire d'autres mesures complémentaires. Parallèlement, le Ministère chargé de la santé engage la procédure nécessaire pour interdire l'utilisation des substances anorexigènes dans les préparations magistrales.

Dès à présent, nous vous demandons d'assurer le strict respect de ces nouvelles règles, tant à l'occasion de la prescription que de la délivrance, en les expliquant aux patients afin d'en empêcher toute utilisation en dehors des modalités pré-citées.

Veuillez agréer, Cher Confrère, l'expression de ma considération distinguée.

Pr J.M. ALEXANDRE
Directeur de l'Evaluation

AGENCE DU MEDICAMENT

AVIS AUX PRESCRIPTEURS

La Commission Nationale de Pharmacovigilance réunie le 03/05/95 a pris connaissance des résultats d'une étude épidémiologique internationale sur l'Hypertension Artérielle Pulmonaire Primitive.

Cette étude montre qu'il existe une association entre la survenue de ces Hypertensions Pulmonaires et la prise de tout anorexigène* pour une durée de traitement supérieure à 3 mois.

Les résultats sont confirmés par la notification spontanée des Hypertensions Pulmonaires au système national de Pharmacovigilance.
Cette pathologie est de fréquence très faible mais de gravité extrême compte tenu de son évolution fatale. En conséquence, sur proposition de la Commission Nationale de Pharmacovigilance, l'Agence du Médicament a décidé de :

- restreindre l'indication au traitement de seconde intention, après échec d'un traitement diététique adapté, d'obésité patente avec indice de masse corporelle supérieur à 30.

- limiter la durée d'utilisation à 3 mois.

- de contre-indiquer leur association.

Parallèlement, un arrêté du ministre chargé de la santé interdit l'exécution et la délivrance de préparations magistrales et autres préparations à base de substances anorexigènes.

Un nouvel examen du rapport bénéfice/risque par la Commission Nationale de Pharmacovigilance aura lieu en Juin sur la base d'études complémentaires en cours.

Le Comité des Spécialités Pharmaceutiques de l'Agence Européenne (E.M.E.A.) a été saisi du problème.

Annexe 1-64

Arrêté du 10 mai 1995 portant interdiction de l'exécution et de la délivrance de préparations magistrales ou autres préparations à base de certains principes actifs

NOR : *SANP9501560A*

Le ministre délégué à la santé, porte-parole du Gouvernement,

Vu le code de la santé publique, et notamment ses articles L. 605 (10°), R. 5144-9 et R. 5179 ;

Considérant qu'une étude épidémiologique internationale a mis en évidence une relation entre la survenue d'une maladie vasculaire pulmonaire grave et souvent mortelle et la prise prolongée de médicaments anorexigènes ;

Considérant l'avis de la Commission nationale de pharmacovigilance du 3 mai 1995,

Arrête :

Art. 1er. – Sont interdites, à compter de la date de publication du présent arrêté, l'exécution et la délivrance de préparations magistrales ou autres préparations à base des principes actifs suivants :

- dexfenfluramine ;
- fenfluramine ;
- amfépramone ;
- fenproporex ;
- clobenzorex ;
- mefenorex.

Art. 2. – Le directeur général de la santé est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 10 mai 1995.

Pour le ministre et par délégation :
Le directeur général de la santé,
J.-F. GIRARD

JO 16 mai 95

Arrêté du 25 octobre 1995 portant interdiction d'exécution et de délivrance de certaines préparations magistrales

NOR : *SANP9503231A*

Le ministre de la santé publique et de l'assurance maladie,

Vu le code de la santé publique, et notamment les articles R. 5144-9 et R. 5179 ;

Vu l'avis de la Commission nationale de pharmacovigilance du 19 juin 1995 ;

Vu l'avis de la commission d'autorisation de mise sur le marché n° 208 du 15 septembre 1995 ;

Considérant qu'une étude épidémiologique internationale a mis en évidence une relation entre la survenue d'une maladie vasculaire pulmonaire grave et souvent mortelle et la prise prolongée de médicaments anorexigènes à base de certains principes actifs ;

Considérant que la législation et la réglementation spécifiques aux médicaments, et notamment celles relatives à leur mise sur le marché et à leurs conditions de prescription et de délivrance, permet de prendre les mesures nécessaires à la sécurité de ces produits ;

Considérant que les préparations magistrales ou autres préparations à base de ces principes actifs sont commercialisées sans autorisation de mise sur le marché et qu'il n'est pas possible d'assurer le même encadrement de leur prescription et de leur délivrance ;

Considérant que ces préparations présentent les mêmes risques graves pour la santé publique,

Arrête :

Art. 1er. – Sont interdites à compter de la publication du présent arrêté l'exécution et la délivrance de préparations magistrales ou autres préparations à base de principes actifs suivants :

Acridorex, amfécloral, amfépentorex, aminorex, amphétamine, benfluorex, benzphétamine, chlorphentermine, cloforex, clominorex, clotermine, dexamphétamine, diféméthorex, diflamfétamine, étolorex, fénétylline, fénisorex, fénocolone, fluféthorex, fludorex, fluminorex, formétorex, furféthorex, isadorex, levamphétamine, mazindol, métamfépramone, métamphétamine, morforex, norpseudoéphédrine, ortétamine, oxifentorex, pentorex, phenbutrazine (fenbutrazate), phendimétrazine, phenmétrazine, phentermine, picilorex, propylhexedrine, triflorex.

Art. 2. – Le directeur général de la santé est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 25 octobre 1995.

Pour le ministre et par délégation :
Le directeur général de la santé,
J.-F. GIRARD

JO du 31 octobre 95

RÉPUBLIQUE FRANÇAISE

25 OCT. 1995

AGENCE DU MEDICAMENT

Le Directeur de l'Evaluation du Médicament

DIRECTION GENERALE DE LA SANTE

Le Directeur Général

Cher Confrère,

Comme vous le savez, au mois de Mai 1995, l'Agence du Médicament a pris une première série de mesures restreignant les conditions de prescription des anorexigènes, en raison du risque de survenue d'hypertension pulmonaire primitive, maladie rare mais d'évolution souvent mortelle associé à la prise de ces médicaments.

Dans l'attente d'une réévaluation du rapport bénéfice/risque, l'utilisation de cette classe a donc été restreinte aux patients présentant une obésité majeure avec des durées de traitement n'excédant pas 3 mois.

Les évaluations complémentaires conduites depuis cette date par les instances scientifiques de l'Agence ont établi que pour le traitement de l'obésité, et dans le cadre d' une prise en charge globale et prolongée, d'une part les fenfluramines* pouvaient être utiles, le cas échéant en prescription long terme, et que d'autre part les amphétaminiques* et apparentés induisaient une perte de poids significative mais que la durée de prescription devait être brève en raison du potentiel de pharmacodépendance.

En conséquence, et dans l'attente de l'avis du Comité des Spécialités Pharmaceutiques de l'Agence européenne pour l'évaluation des médicaments qui a été saisi du dossier, le Directeur Général de l'Agence du Médicament a décidé à titre conservatoire et conformément à l'avis de la commission d'AMM, de modifier les conditions de prescription des anorexigènes.

Ces nouvelles conditions de prescriptions qui visent à assurer une prise en charge globale de l'obésité en unités de soins spécialisées, consistent en :

une "prescription initiale hospitalière annuelle réservée aux services spécialisés en diabétologie/endocrinologie et maladies métaboliques /médecine interne et/ou aux spécialistes en endocrinologie et maladies métaboliques ou médecine interne".

La validité de cette prescription initiale est de un an.

Le renouvellement est possible en médecine de ville sur présentation de l'ordonnance hospitalière.

Annexe 1-64

Le pharmacien d'officine ne peut délivrer ces spécialités que sur présentation des 2 ordonnances : la première ordonnance hospitalière et l'ordonnance de renouvellement.

La prescription des Fenfluramines ne peut être maintenue que chez les patients "répondeurs" identifiés après une période de traitement de 3 mois.
En revanche, pour les amphétaminiques et apparentés, la durée de prescription reste limitée à 3 mois, par cure de 4 à 6 semaines, en raison du risque de dépendance.

En ce qui concerne les préparations magistrales, nous vous rappelons qu'un arrêté du ministre chargé de la santé du 10 mai 1995 a interdit l'exécution et la délivrance des préparations magistrales à base de principes actifs correspondant aux spécialités précitées. Un nouvel arrêté étend cette interdiction à l'ensemble des principes actifs qui figurent dans le groupe III du Décret n° 82-200 du 25 février 1982 et à des principes actifs qui sont inclus dans des spécialités faisant l'objet d'une évaluation par l'Agence européenne.

Nous vous prions d'agréer, Cher Confrère, l'assurance de notre considération distinguée.

Pr Jean-Michel ALEXANDRE

Pr Jean-François GIRARD

RÉPUBLIQUE FRANÇAISE

AGENCE DU MÉDICAMENT

DIRECTION GÉNÉRALE DE LA SANTÉ

COMMUNIQUÉ DE PRESSE

En raison de la survenue de quelques cas de maladie vasculaire pulmonaire grave et souvent mortelle associés à la prise de médicaments anorexigènes (coupe-faim), l'Agence du Médicament a restreint, au mois de mai 1995, les conditions d'utilisation de ces produits aux seules obésités majeures et uniquement après échec d'un traitement diététique adapté, pour des durées de traitement n'excédant pas 3 mois.

A la suite des évaluations complémentaires conduites depuis cette date par l'Agence du Médicament et dans l'attente de l'avis du Comité de Spécialités Pharmaceutiques de l'Agence européenne pour l'évaluation des médicaments qui a été saisi du dossier, le Directeur Général de l'Agence du Médicament a décidé à titre conservatoire et conformément à l'avis de la commission d'AMM, de modifier les conditions de prescription des anorexigènes.

En effet, ces évaluations ont montré que ces spécialités devaient être utilisées au sein d'unités permettant d'assurer une prise en charge globale de l'obésité, respectant des règles hygiénodiététiques et bénéficiant d'un encadrement psychothérapeutique.

Désormais pour ces médicaments, la prescription initiale est donc limitée aux services hospitaliers spécialisés en endocrinologie et maladies métaboliques, médecine interne, diabétologie et aux spécialistes hospitaliers : endocrinologues, diabétologues et médecins internistes.

La durée de validité de l'ordonnance initiale hospitalière est fixée à 1 an. Le renouvellement peut être réalisé par des médecins spécialistes ou généralistes de ville pour les patients qui présentent une ordonnance initiale hospitalière. Le pharmacien, ne peut délivrer ces spécialités que sur présentation des 2 ordonnances : la première ordonnance hospitalière et l'ordonnance de renouvellement.

En ce qui concerne les préparations magistrales, un arrêté du ministre chargé de la santé du 10 mai 1995 a interdit l'exécution et la délivrance des préparations à base de principes actifs correspondant aux spécialités précitées. Un nouvel arrêté complète la liste des substances interdites.

Pour toute information complémentaire, un service de renseignement téléphonique est assuré par l'Agence du Médicament de 9 h 00 à 18 h 00 au 48 13 22 82.

RÉPUBLIQUE FRANÇAISE

AGENCE DU MEDICAMENT

Saint-Denis, le

19 DEC. 1996

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Communiqué de presse

La décision de la Commission Européenne sur les conditions d'utilisation des médicaments anorexigènes vient d'être portée à la connaissance des états membres de l'Union Européenne. Cette décision ne remet pas en cause les mesures actuellement en vigueur en France.

En effet, suite à la survenue de cas d'hypertension artérielle pulmonaire primitive, maladie rare mais d'évolution souvent mortelle associés à la prise des médicaments anorexigènes, l'Agence du Médicament a modifié, à titre conservatoire et dans l'attente de l'avis du Comité des spécialités Pharmaceutiques, les conditions de prescription des anorexigènes, au mois de mai et d'octobre 1995.

Le 17 juillet 1996, le Comité des Spécialités Pharmaceutiques après avoir examiné au cours de la procédure communautaire les données disponibles a proposé une mise en garde indiquant clairement :

> *"des cas d'hypertension artérielle pulmonaire sévère, souvent fatale, ont été rapportés chez des patients ayant reçu des anorexigènes.*
> *Une étude épidémiologique a montré que la prise d'anorexigènes est un facteur de risque impliqué dans le développement de l'hypertension artérielle pulmonaire et que la prise d'anorexigène est fortement liée à un risque accru de survenue de cet effet indésirable. Compte tenu de ce risque rare mais grave, il faut souligner :*
> *- que l'indication thérapeutique et la durée de traitement doivent être soigneusement respectées ;*
> *- qu'une durée de traitement supérieure à trois mois ainsi qu'un Index de Masse Corporelle ≥ 30 kg/m2, augmentent le risque d'hypertension artérielle pulmonaire ;*
> *- que l'apparition ou l'aggravation d'une dyspnée d'effort doit faire suspecter la survenue d'une hypertension artérielle pulmonaire ; dans ces circonstances, le traitement doit être arrêté immédiatement et le patient orienté en milieu spécialisé pour investigations".*

En outre, le Comité des Specialités Pharmaceutiques a recommandé que ce traitement soit mené sous la surveillance d'un médecin expérimenté dans le traitement de l'obésité. En France, afin de répondre à cet objectif et d'assurer une prise en charge globale de l'obésité, la prescription initiale de ces médicaments a été restreinte aux services spécialisés en diabétologie/endocrinologie et maladie métabolique/médecine interne, la durée de validité de l'ordonnance hospitalière étant fixée à un an.

La Commission Européenne a entériné les propositions du Comité le 9 décembre 1996. La décision est en accord avec les mesures adoptées en France depuis 1995 et les autorisations de mise sur le marché seront rectifiées pour reprendre les termes précis de la décision européenne.

Liste des anorexigènes concernés :

Anorexigènes fenfluramines :

ISOMERIDE® (dexfenfluramiue)
PONDERAL® (fenfluramine)

Anorexigènes amphétaminiques :

VOLUME 337 AUGUST 28, 1997 NUMBER 9

VALVULAR HEART DISEASE ASSOCIATED WITH FENFLURAMINE–PHENTERMINE

HEIDI M. CONNOLLY, M.D., JACK L. CRARY, M.D., MICHAEL D. MCGOON, M.D., DONALD D. HENSRUD, M.D., M.P.H., BROOKS S. EDWARDS, M.D., WILLIAM D. EDWARDS, M.D., AND HARTZELL V. SCHAFF, M.D.

ABSTRACT

Background Fenfluramine and phentermine have been individually approved as anorectic agents by the Food and Drug Administration (FDA). When used in combination the drugs may be just as effective as either drug alone, with the added advantages of the need for lower doses of each agent and perhaps fewer side effects. Although the combination has not been approved by the FDA, in 1996 the total number of prescriptions in the United States for fenfluramine and phentermine exceeded 18 million.

Methods We identified valvular heart disease in 24 women treated with fenfluramine–phentermine who had no history of cardiac disease. The women presented with cardiovascular symptoms or a heart murmur. As increasing numbers of these patients with similar clinical features were identified, there appeared to be an association between these features and fenfluramine–phentermine therapy.

Results Twenty-four women (mean [±SD] age, 44±8 years) were evaluated 12.3±7.1 months after the initiation of fenfluramine–phentermine therapy. Echocardiography demonstrated unusual valvular morphology and regurgitation in all patients. Both right-sided and left-sided heart valves were involved. Eight women also had newly documented pulmonary hypertension. To date, cardiac surgical intervention has been required in five patients. The heart valves had a glistening white appearance. Histopathological findings included plaque-like encasement of the leaflets and chordal structures with intact valve architecture. The histopathological features were identical to those seen in carcinoid or ergotamine-induced valve disease.

Conclusions These cases arouse concern that fenfluramine–phentermine therapy may be associated with valvular heart disease. Candidates for fenfluramine–phentermine therapy should be informed about serious potential adverse effects, including pulmonary hypertension and valvular heart disease. (N Engl J Med 1997;337:581-8.)

FENFLURAMINE and phentermine are prescription medications that have been individually approved by the Food and Drug Administration (FDA) as appetite suppressants for the treatment of obesity. When used in combination they may be just as effective as either drug alone, with the added advantages of the need for lower doses of each agent, fewer side effects, and improved patient tolerance.[1] Even though the FDA has not approved the use of the combination, in 1996 the total number of prescriptions for fenfluramine and phentermine in the United States exceeded 18 million.[2]

Pulmonary hypertension has been reported in association with treatment with fenfluramine[3,4] or phentermine[5] alone. The *d*-isomer of fenfluramine, dexfenfluramine, also increases the risk of pulmonary hypertension,[6] particularly when patients receive high doses for more than three months. These drugs may cause pulmonary hypertension through the vasoconstrictor action of serotonin or by altering the depolarization of pulmonary vascular smooth-muscle membrane.[7]

Valvular disease has been reported after exposure to serotonin-like drugs such as ergotamine and methysergide[8] and with increased serotonin levels associated with carcinoid disease.[9,10] Valvular heart disease has not been reported in patients taking anorectic agents. We report 24 cases of unusual valvular disease in patients taking fenfluramine–phentermine.

METHODS

All the patients (Table 1) were identified during the course of routine evaluation for various clinical problems. No attempt was

Murmur, edema, dyspnea	Severe MR; moderate AR and TR; RVSP, 93 mm Hg	Not done			
Murmur	Moderate AR; mild MR; EF, 75%	Not done			
Murmur, edema	Moderate AR, TR, and MR; EF, 65%	Not done			
Palpitations	Moderate AR; mild MR; EF, 70%	Not done			
Murmur	Moderate AR, mild MR and TR	Not done			
Supraventricular tachycardia	Mild MR and TR, normal left ventricle	Not done			
Dyspnea	Moderate AR; EF, 66%	Not done			
Murmur	Mild MR, AR, and TR	Not done			
Chest pain	Mild MR, TR, and AR; normal EF	Not done			
Murmur, dyspnea, edema	Severe AR and MR; RVSP, 45 mm Hg	Not done			
Palpitations, chest pain	Mild AR	Not done			

*MR denotes mitral regurgitation, MV mitral valve, NA not available, CHF congestive heart failure, AR aortic regurgitation, TR tricuspid regurgitation, EF ejection fraction, PAP pulmonary-artery pressure, AVR aortic-valve replacement, MVR mitral-valve replacement, RVSP right ventricular systolic pressure, and SEM systolic ejection murmur.

†Body-mass index is the weight in kilograms divided by the square of the height in meters.

‡"Stuck-on" refers to the fact that the valve architecture was intact.

made to identify patients by reviewing data bases, conducting cross-index searches of patient files, or soliciting reports of suspected cases from clinical practices. As increasing numbers of patients were identified with similar clinical features, a perceived association between these features and previous or current use of fenfluramine–phentermine evolved. The serendipitous connection between these individual cases was identified as a result of communication among several physicians beginning in May 1996.

May 1996

In May 1996, Patient 1 underwent mitral-valve repair at the Mayo Clinic for the treatment of severe mitral regurgitation. Intraoperatively, the valve was noted to have a glistening white appearance, suggesting ergotamine-induced valvular injury as observed in previous patients,[8] but the patient had no history of ergotamine ingestion.

July 1996

In July 1996, Patient 1 was evaluated by another physician for severe symptomatic tricuspid regurgitation. Echocardiography confirmed severe tricuspid regurgitation and thickening of the valve leaflets. These findings were similar to those seen in patients with carcinoid or ergotamine-induced valve disease. A history was obtained indicating fenfluramine–phentermine use for 25 months until 1 month before mitral-valve surgery. A 24-hour urinary 5-hydroxyindoleacetic acid value was normal.

January 1997

In January 1997, a woman (Patient 7) with pulmonary hypertension was evaluated at the Mayo Clinic, and echocardiography demonstrated thickened aortic-valve leaflets and aortic regurgitation. An echocardiogram obtained two years previously revealed no abnormalities. The patient had taken fenfluramine–phentermine for one year before the more recent echocardiographic examination.

Also in January 1997, a physician from MeritCare Medical Center (Fargo, N.D.) contacted the Mayo Clinic and inquired whether there was a recognized association between diet medications and valvular heart disease. The inquiry was precipitated by the physician's awareness that his echocardiographic sonographers had identified a cohort of 12 patients (Patients 2, 3, 6, and 10 through 18) with valvular heart disease who had a peculiar valvular morphology. A further review of the patients' records revealed that all 12 patients had taken fenfluramine–phentermine. The patients' records and echocardiograms were sent to the Mayo Clinic. The echocardiograms disclosed valve lesions very similar to those noted in Patients 1 and 7. Excised valve tissue was obtained from two patients (Patients 2 and 3), and slides prepared with elastic–van Gieson stain were reviewed by a cardiac pathologist. Histopathological examination revealed features identical to those of ergotamine-induced and carcinoid valve disease.

March 1997

In March 1997, a surgeon at the Mayo Clinic was contacted by one of his patients (Patient 4) who had undergone mitral-valve repair in 1996. The patient informed him that she had aortic regurgitation and pulmonary hypertension. A review of the surgical records showed that the appearance of the valve was distinctly unusual and not consistent with a history of rheumatic heart disease. Further inquiry revealed that the patient had taken fenfluramine–phentermine for 12 months before mitral-valve surgery.

Also in March 1997, valve tissue from a cardiac surgical patient (Patient 5) operated on at another institution was received by the Mayo Clinic for a pathological opinion. The morphologic features of the explanted valve (Fig. 1) were identical to those of valves from Patients 1 and 4 at the time of surgical inspection. Gross pathological features included thickening of the leaflets and chordae and a glistening white appearance. The histopathological features were identical to those in Patients 2 and 3. Patient 5 had been treated with fenfluramine–phentermine for 11 months.

April 1997

In April 1997, a patient (Patient 8) with a six-month history of fenfluramine–phentermine use was evaluated for dyspnea by a Mayo Clinic cardiologist consulting in another city. Multivalvular heart disease and pulmonary hypertension were identified. The cardiologist, unaware of the previous cases, asked a colleague whether he knew of an association between fenfluramine–phentermine therapy and valvular heart disease. Echocardiography revealed valvular morphology similar to that noted in the other patients.

Seven other patients (Patients 9 and 19 through 24) with similar clinical histories and echocardiographic findings were identified during clinical evaluations at MeritCare Medical Center from January through April 1997.

CASE REPORTS

Patient 1

Patient 1 was a 41-year-old woman (body-mass index [the weight in kilograms divided by the square of the height in meters] before treatment with appetite suppressants, 39.7) who was referred to the Mayo Clinic for mitral-valve surgery three months after a systolic murmur was first noted. She had taken fenfluramine–phentermine (fenfluramine, 40 mg three times per day, and phentermine hydrochloride, 16 mg three times per day) for 25 months. Therapy had been discontinued one month before cardiac surgery because of the reported potentially catastrophic catecholamine-depleting effect of fenfluramine.[11] Echocardiography and cardiac catheterization confirmed the presence of severe mitral regurgitation.

During mitral-valve repair, unusual morphologic features were noted: the posterior and anterior leaflets were tethered, and the chordae were shortened. The valve was glistening white, had no rheumatic calcification or yellowish discoloration, and resembled valves affected by ergot alkaloid derivatives.[8] The patient had not used ergot preparations. Intraoperative transesophageal echocardiography demonstrated severe mitral regurgitation (Fig. 2) and mild tricuspid regurgitation.

After hospital discharge, symptomatic tricuspid valve regurgitation developed. Echocardiography demonstrated that the mitral-valve repair was intact without regurgitation. The tricuspid valve was thickened and failed to coapt; tricuspid regurgitation was severe. With medical management, symptoms of right ventricular failure improved despite the persistence of severe tricuspid regurgitation.

Patient 2

Patient 2 was a 44-year-old woman (pretreatment body-mass index, 35.5) who was treated with fenfluramine–phentermine (fenfluramine, 20 mg three times daily, and phentermine, 30 mg per day) for one year before dyspnea and a heart murmur were noted. Echocardiography demonstrated thickened aortic, mitral, and tricuspid valves with regurgitation. Because of progressive symptoms, mitral-valve and aortic-valve replacement and tricuspid-valve repair were performed at MeritCare Medical Center six months after fenfluramine–phentermine therapy was stopped. Histopathological examination of the resected mitral valve demonstrated intact valve architecture, with a plaque-like process that extended along the leaflet surfaces and encased the chordae tendineae (Fig. 3). Lesions on the aortic valve were similar but less extensive.

Patient 3

Patient 3 was a 48-year-old woman (pretreatment body-mass index, 34.5) with no previous cardiac disease who was treated with fenfluramine–phentermine (fenfluramine, 20 mg three times daily, and phentermine, 30 mg per day) for nine months. Therapy was discontinued when a murmur was noted, and symptoms of edema and breathlessness were reported. At echocardiography, the mitral valve was thickened and severely regurgitant. Three months later, the patient underwent mitral-valve replacement at MeritCare Medical Center for symptomatic mitral regurgitation. Histopathological examination demonstrated intact valve architecture and plaque-like lesions of apparent myofibroblasts in an abundant extracellular matrix of glycosaminoglycans and collagen (Fig. 4).

Patient 6

Patient 6 was a 51-year-old woman (pretreatment body-mass index, 56.8) with normal findings on cardiac examination who was treated with fenfluramine–phentermine (fenfluramine, 20 mg three times daily, and phentermine, 30 mg per day in divided doses). Seven months after this treatment was initiated, dyspnea and edema developed and a new murmur was noted. Transthoracic and transesophageal echocardiography at MeritCare Medical Center demonstrated thickened valves with severe mitral regurgitation and moderate aortic-valve and tricuspid-valve regurgitation. Fenfluramine–phentermine therapy was discontinued, and medical therapy for heart failure was instituted. Echocardiography performed three months later demonstrated minimal improvement in the valvular disease. The patient continues to be observed medically and has persistent symptoms of dyspnea.

Patient 7

Patient 7 was a 44-year-old woman who began receiving fenfluramine–phentermine for a pretreatment body-mass index of 30.5. Two years earlier, echocardiography had revealed normal valves. The initial dose was 60 mg of fenfluramine per day in divided doses and 30 mg of phentermine per day. Under medical

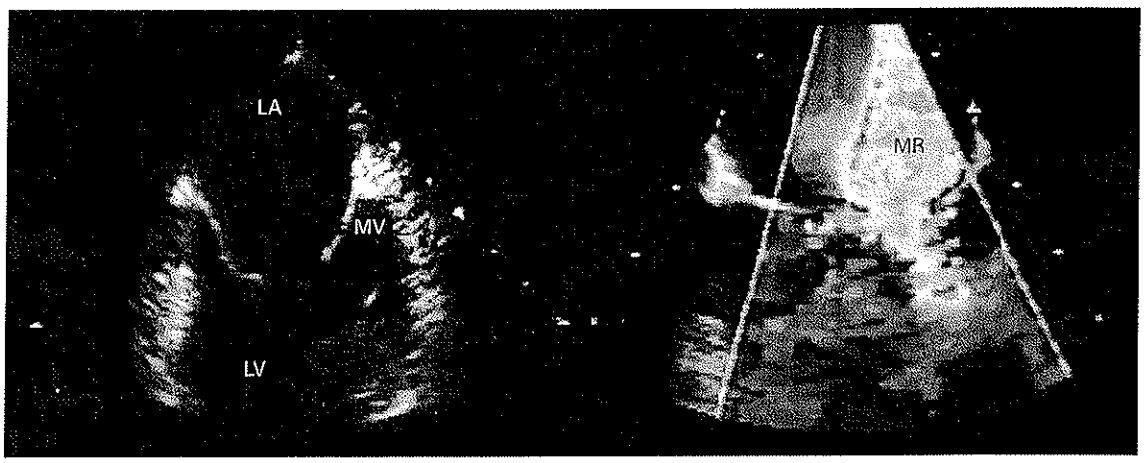

Figure 2. Intraoperative Transesophageal Echocardiograms in Patient 1.
The image on the left shows a thickened mitral valve (MV) during diastole. With the addition of color flow, the image on the right demonstrates severe mitral regurgitation (MR) during systole. LA denotes left atrium, and LV left ventricle.

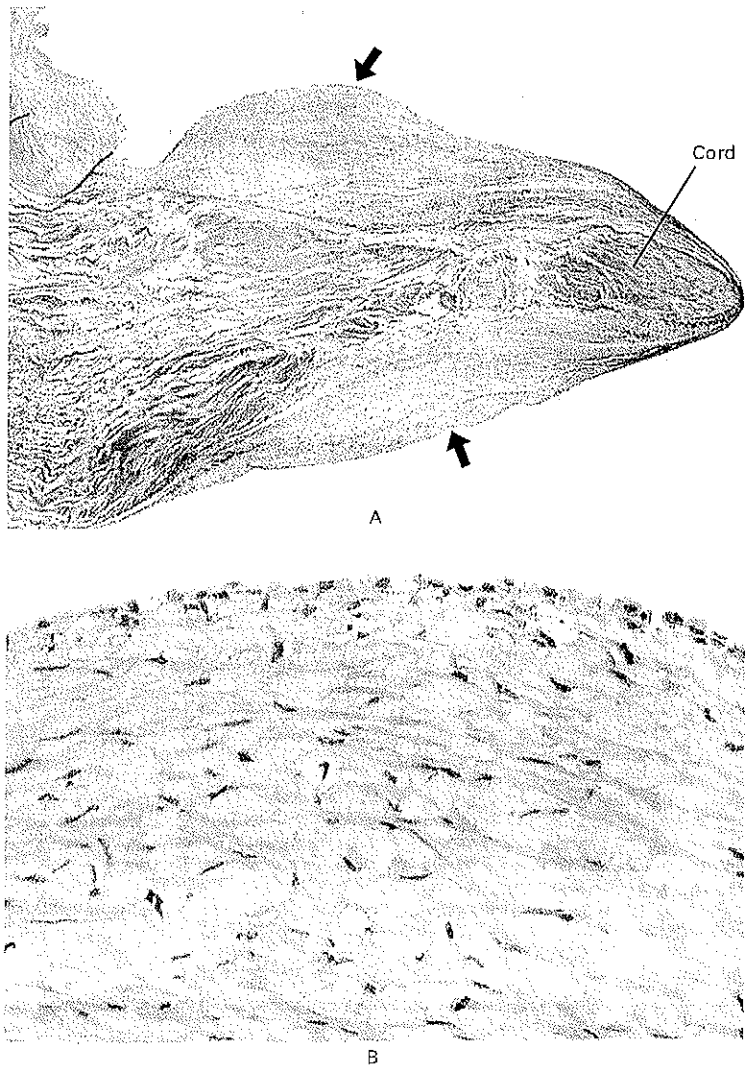

Figure 3. Photomicrographs of Resected Mitral Valve from Patient 2.

In Panel A, a low-power view (elastic–van Gieson stain, ×36) shows intact valve architecture with "stuck-on" plaques (arrows). In Panel B, a high-power view (hematoxylin and eosin, ×360) shows proliferative myofibroblasts in an abundant extracellular matrix.

direction, the daily doses were gradually increased to 220 mg of fenfluramine and 60 mg of phentermine.

Twelve months after fenfluramine–phentermine treatment was initiated, dyspnea developed on exertion. Echocardiography demonstrated a thickened trileaflet aortic valve with moderate regurgitation. Pulmonary-artery systolic pressure measured by cardiac catheterization was 75 mm Hg. Treatment with fenfluramine–phentermine was discontinued.

RESULTS

Table 1 summarizes the clinical features of the patients. Except for systemic hypertension, all of the patients were thought to be free of cardiovascular disease at the onset of weight-reduction therapy. The physicians who prescribed the anorectic agents for the patients were not the ones who evaluated the cardiovascular changes. The patients were evaluated a mean (±SD) of 12.3±7.1 months after the initiation of fenfluramine–phentermine treatment. The actual durations of drug therapy are shown in Table 1. Twenty patients presented with cardiovascular symptoms, and four patients had only a new murmur.

All patients underwent comprehensive two-dimen-

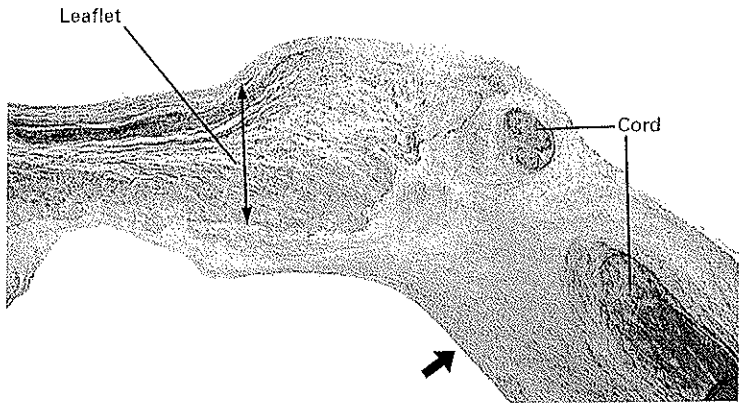

Figure 4. Photomicrograph of Resected Mitral Valve from Patient 3.
A low-power view (elastic–van Gieson stain, ×36) shows intact leaflet and tendinous cord, with encasement by proliferative plaque (arrow).

sional echocardiography, pulsed- and continuous-wave Doppler imaging, and color-flow examination according to previously described techniques.[12,13] Valve morphology was noted by two examiners to be atypical for rheumatic, congenital, or degenerative lesions. The mitral and aortic valves exhibited echocardiographic features similar to those seen in patients with chronic rheumatic involvement; however, there was no evidence of valve obstruction. Thickening and diastolic doming of the anterior mitral leaflet, with preserved mobility and thickening, and immobility of the posterior leaflet were typical findings (Fig. 2). Subvalvular involvement was characterized by thickening and shortening of the chordae tendineae, causing tethering of the posterior leaflet. The combination of abnormalities resulted in malcoaptation and central regurgitation. The aortic valve was characterized by thickening and mild retraction of the leaflets. With tricuspid-valve involvement, the septal leaflet was thickened and variably fixed to the septum. The anterior leaflet appeared thickened and exhibited decreased mobility, diastolic doming, and loss of coaptation visible on two-dimensional imaging. Color-flow imaging demonstrated variable degrees of regurgitation in all patients. The echocardiographic appearance of the valves was similar in the medically treated and the surgically treated patients.

Eight patients had Doppler echocardiographic or catheter evidence of pulmonary hypertension (right ventricular systolic pressure, >50 mm Hg; range, 52 to 93) that had not been documented previously. Tricuspid regurgitation of moderate or greater severity was present in five of the eight patients with pulmonary hypertension.

DISCUSSION

Fenfluramine is a sympathomimetic amine that has an anorectic action mediated through the activation of serotonergic pathways in the brain. Fenfluramine promotes the rapid release of serotonin, inhibits its reuptake, and may have receptor-agonist activity,[14] thus making serotonin more susceptible to metabolism and breakdown. The *d*-isomer of fenfluramine, dexfenfluramine, appears to be relatively selective for the central serotonergic system. Phentermine is a noradrenergic agent. Commonly used doses of these medications are 20 to 120 mg of fenfluramine per day and 18.75 to 37.5 mg of phentermine resin per day or 15 to 30 mg of phentermine hydrochloride per day.

Patients with malignant carcinoid syndrome have high levels of circulating serotonin. Associated cardiac disease is characterized by fibroplasia that involves primarily the valvular endocardium on the right side of the heart.[10,15] The mechanism of valve injury in patients with carcinoid syndrome has not been determined but is believed to be serotonin-mediated, because such patients have higher circulating levels of serotonin than do their counterparts without cardiac involvement.[10] The predilection for right-sided valve disease in carcinoid syndrome is most likely related to the serotonin-rich blood that enters the right atrium directly from the liver and the subsequent partial pulmonary degradation of serotonin. In our patients both left-sided and right-sided valvular lesions were seen, and multiple valves were often involved in individual patients.

The pathophysiologic mechanism in patients with ergot-alkaloid–induced valve disease has not been established, but the similar chemical structures of se-

rotonin, methysergide, and ergotamine may provide a clue.[16] Ergotamine-induced and carcinoid valve disease are microscopically identical, with fibrotic endocardial changes.[8] The pathological, surgical, and echocardiographic features of carcinoid and ergotamine-induced valve disease are indistinguishable from the features noted in our patients.

Fenfluramine alters serotonin metabolism in the brain.[14] Phentermine interferes with the pulmonary clearance of serotonin, which may explain its association with primary pulmonary hypertension.[17] Although serotonin levels were not measured in our patients, we postulate that the combination of fenfluramine and phentermine may potentiate the effect or concentration of circulating serotonin and result in valvular injury similar to that seen in patients with carcinoid syndrome or in those taking ergot preparations. However, the precise process by which this might occur is not known. No studies examining the effect of the combination of fenfluramine and phentermine in animals have been reported. Five of the 24 patients included in this series were taking either sertraline or fluoxetine while receiving fenfluramine–phentermine.

This description of patients is limited by the absence of pathological confirmation in the majority of cases. Many of the patients continue to be treated medically and have not undergone invasive or interventional procedures. Consequently, neither direct inspection nor histopathological evaluation has been carried out in most of the patients. Because no patient had symptomatic or clinical evidence of cardiovascular disease before the initiation of therapy with appetite suppressants, no routine pretreatment echocardiographic base-line studies were obtained. Only one patient had had an incidental echocardiographic study two years before treatment, and it showed no abnormalities. In the aggregate, however, these patients and those who underwent operative intervention had similar clinical and echocardiographic features. The mean age at the initiation of treatment, body-mass index, and duration of treatment before symptoms developed were similar in the medically and surgically treated groups.

In the absence of a control group or a case–control study, definitive statements about a true association of valvular disease with fenfluramine–phentermine therapy cannot be made. However, the appearance of clinically significant left-sided regurgitant valvular heart disease in a population less than 50 years old is rare.[18] Thus, the association of valvular regurgitation with fenfluramine–phentermine treatment is not likely to be due to chance. Moreover, the unusual echocardiographic morphology of the lesions further diminishes the likelihood of a coincidental observation.

These cases should arouse concern that this combination of appetite suppressants has important implications regarding valvular heart disease. Prospective studies of this association will be required to validate the possibility that this combination of medications may cause valvular heart disease. The mechanism of valve injury and the frequency of the association have yet to be determined. Candidates for fenfluramine–phentermine therapy should be informed about serious potential adverse effects, including pulmonary hypertension and valvular heart disease.

We are indebted to Pam Ruff, B.S., R.D.C.S., for identification of the patients, to Jeanne Beare, R.N., for data acquisition, and to Julie Klemmensen and Ann McCullough, M.D., for assistance in the preparation of the manuscript.

Brief Report

Fatal Pulmonary Hypertension Associated with Short-Term Use of Fenfluramine and Phentermine

Eugene J. Mark, M.D., Eva D. Patalas, M.D., Howard T. Chang, M.D., Ph.D., Richard J. Evans, M.D., and Stanton C. Kessler, M.D.

THE dangers inherent in marked obesity have prompted physicians to advocate more aggressive strategies for weight reduction. One current strategy is the prescription of fenfluramine,[1,2] either alone or in combination with phentermine, with the knowledge that the risks of the drugs must be balanced against the risks of continued obesity.

Pulmonary hypertension in adults has several causes that can be identified pathologically. In the case of pulmonary hypertension that develops with hypoxia during the course of chronic obstructive or interstitial fibrosing disease of the lung, the pulmonary vessels are characterized by intimal and medial hyperplasia and luminal stenosis. Thromboembolic pulmonary hypertension results from the occlusion of large and small vessels by organizing blood clot with ingrowth of fibroblasts. Pulmonary venous hypertension due to cardiac failure or pulmonary veno-occlusive disease leads to secondary arterial hypertension as well as hemosiderosis. Collagen vascular disease, particularly scleroderma, can cause exuberant intimal proliferation described as onionskin change. Finally, plexogenic arteriopathy, a pathologically distinctive form of arterial remodeling, typically develops in patients with primary pulmonary hypertension.

Most patients with primary pulmonary hypertension are young women with a relatively rapid progression of disease.[3,4] Although most cases have no apparent cause, some can be traced to specific medical conditions or drugs. Particularly well established causes are cirrhosis[5,6] and human immunodeficiency virus infection.[7,8] Drugs used to suppress appetite can also cause pulmonary hypertension.

A small epidemic of pulmonary hypertension with fatalities in Switzerland, Germany, and Austria in the late 1960s and early 1970s was due to the use of aminorex for weight reduction.[9-13] Plexogenic arteriopathy characterized the pulmonary abnormalities.[10,14,15] Fenfluramine and dexfenfluramine, anorectic drugs currently in use, are also known to cause pulmonary hypertension.[16,17] We document on the basis of autopsy findings that plexogenic pulmonary hypertension was the cause of death in a woman who took fenfluramine and phentermine to lose weight. She died approximately 8 months after taking this off-label combination of drugs for only 23 days.

CASE REPORT

Clinical Findings

A 29-year-old woman sought medical help for obesity. She was otherwise healthy and did not smoke cigarettes. There was no family history of pulmonary hypertension. She weighed 88 kg (193 lb) and was 1.65 m (65 in.) tall. Her body-mass index (the weight in kilograms divided by the square of the height in meters) was 32. Combination therapy with fenfluramine (Pondimin) at a dose of 10 mg taken orally three times per day and phentermine (Ionamin) at a dose of 15 mg taken orally every morning was prescribed. The medications were discontinued after 23 days. The patient lost 4.5 kg (10 lb) during treatment. The patient subsequently reported an increased heart rate and shortness of breath with moderate exercise. These symptoms resolved over the next several weeks.

She felt well until five months later, when she noticed shortness of breath and pedal edema during an upper respiratory tract infection. Soon thereafter she had two episodes of syncope. Laboratory investigation showed mild polycythemia and respiratory alkalosis. Chest radiographs showed mild prominence of the right ventricular outflow tract and the left pulmonary artery. An electrocardiogram showed right-axis deviation and right ventricular hypertrophy. Cardiac catheterization showed severe pulmonary hypertension and markedly elevated pulmonary vascular resistance. The right ventricular pressure was 100/20 mm Hg; the pulmonary-artery pressure was 100/45 mm Hg, with a mean of 60 mm Hg; the pulmonary-capillary wedge pressure was 6 to 8 mm Hg; and the pulmonary vascular resistance was 20 to 24 Wood units (normal, <2). Ventilation–perfusion scanning showed a very low probability of acute pulmonary embolism, with no segmental perfusion defects. Pulmonary angiography showed vascular pruning and low flow consistent with the presence of high pulmonary vascular resistance and low cardiac output.

Other studies were performed to rule out various causes of pulmonary hypertension. Liver-function studies showed a mild elevation of alanine aminotransferase and lactate dehydrogenase in the serum. Abdominal ultrasonography revealed no liver abnormalities. Tests for antinuclear antibodies were negative. Administration of oxygen improved the patient's condition, but treatment with nitric oxide did not. A continuous intravenous infusion of epoprostenol was administered through an indwelling catheter two months after her syncopal episodes. The initial dose was 2 μg per kilogram of body weight per minute and was subsequently increased to 4 μg per kilogram per minute and then to 5 μg per kilogram per minute.

The patient was in stable condition and reasonably functional at home for six weeks before a fever developed and she was hospitalized. Cultures for bacteria were negative. Her condition improved with antibiotics, and she was discharged, only to be re-

From the Department of Pathology, Massachusetts General Hospital, and Harvard Medical School (E.J.M., H.T.C.), and the Office of the Chief Medical Examiner, Commonwealth of Massachusetts (E.J.M., E.D.P., R.J.E., S.C.K.) — all in Boston. Address reprint requests to Dr. Mark at the Department of Pathology, Massachusetts General Hospital, 55 Fruit St., Warren Bldg. 219, Boston, MA 02114-2696.

admitted two days later with more fever and pleuritic chest pain. An additional antibiotic was given, and she was again sent home. Two days later she died suddenly and unexpectedly in cardiac arrest.

Pathological Findings

An autopsy was performed at the Massachusetts General Hospital under the auspices of the Office of the Chief Medical Examiner of the Commonwealth of Massachusetts. There were no restrictions to the autopsy. A standard dissection protocol was followed. The lungs were inflated with formalin and cut 24 hours later into slabs 1 cm thick. Ten blocks of tissue were examined from each lung. The sections were stained with hematoxylin and eosin, Prussian blue for iron, elastic–van Gieson for elastic tissue, Mallory's trichrome for collagen, and Wilder's stain for reticulin.

At autopsy the body weighed 91 kg (200 lb). The right lung weighed 777 g and the left lung 630 g, approximately twice the normal weights. The lungs were congested but otherwise macroscopically unremarkable. The heart weighed 399 g, which is slightly heavier than normal. There was marked right ventricular hypertrophy. The lateral wall of the right ventricle was 0.6 cm thick (normal, 0.3 cm or less) when measured 1 cm below the tricuspid valve. The circumference of the pulmonary trunk was 6 cm, and the ascending aorta was 5 cm in circumference (Fig. 1), whereas normally the circumference of the ascending aorta is greater than that of the pulmonary trunk in an adult. Neither the aorta nor the main pulmonary arteries had atherosclerosis.

Histopathological examination of the lungs revealed congestion, extensive alveolar and interstitial edema, and evidence of marked pulmonary hypertension. Medial and intimal proliferation (Fig. 2) involved the majority of the muscular pulmonary arteries and arterioles. These findings correspond to a pathological grade of 3 on a 5-point scale in which 0 represents normal findings, 1 medial hypertrophy, 2 intimal hyperplasia, 3 occlusive intimal fibroelastosis, and 4 plexogenic arteriopathy.[18] Plexiform arteriopathy[14,15,18] (Fig. 3) was present in every slide and involved an average of three arteries per slide. Lesions manifested by dilatation, which are typically found distal to plexogenic lesions, were numerous as well (Fig. 4). Necrotizing arteritis (Fig. 5) with fibrinoid necrosis of the vascular wall, nuclear dust, and regional acute hemorrhage was present in a few slides. The findings are characteristic of plexogenic pulmonary hypertension and correspond to a pathological grade of 4.[18] The pulmonary veins were normal. A few aggregates of clear oval cells representing neuroendocrine cells were present in the basal layer of bronchiolar epithelium. There was no bronchiolitis, bronchopneumonia, or hemosiderosis. No acute or organizing thromboemboli were present. Polarization microscopy showed no birefringent material in blood vessels.

All other organs, including the brain, were macroscopically and microscopically normal. There was no coronary artery disease, hepatic fibrosis, or venous thrombosis.

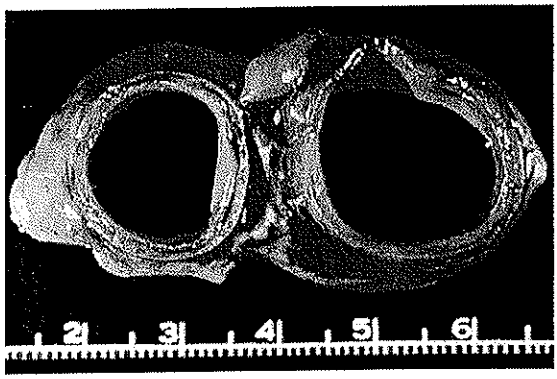

Figure 1. Cross Section of the Ascending Aorta (on the Left) and the Pulmonary Trunk (on the Right).
The pulmonary trunk is larger than the aorta, which is an abnormal finding indicative of pulmonary hypertension.

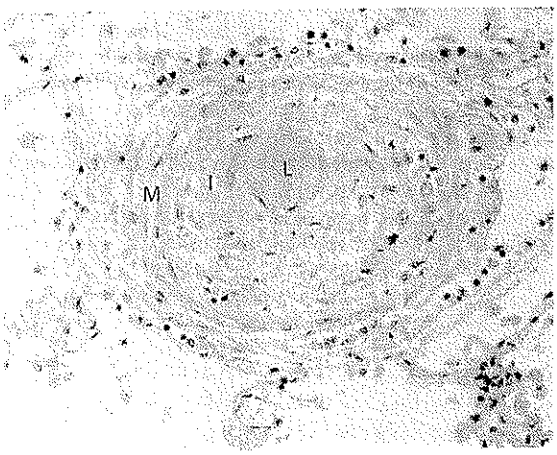

Figure 2. Pulmonary Hypertension with Marked Intimal (I) and Medial (M) Hyperplasia in a Muscular Pulmonary Artery (Hematoxylin and Eosin, ×20).
The lumen (L) is one fourth the normal diameter.

DISCUSSION

Plexogenic arteriopathy is the usual and most distinctive anatomical finding in primary pulmonary hypertension[14,15] and was present in European patients who had taken aminorex as an appetite suppressant in the 1960s and 1970s.[10] The morphology of plexogenic and angiomatoid lesions in these patients distinguished their form of the disease from common forms of pulmonary hypertension. Plexogenic lesions are preceded by exuberant proliferation of medial and intimal cells, which constitute lesser degrees of pulmonary hypertension. Necrosis of the arterial wall with repair and local vascular remodeling culminates in a racemose collection of abnormal channels outside the original artery. The proliferating cells are myofibroblasts[19] and endothelial cells with increased expression of endothelin-1.[20] Shunts develop between the pulmonary and bronchial arterial systems.[21,22] Vascular scarring leads to post-stenotically dilated blood vessels with thinned walls. All phases of plexogenic arteriopathy were observed in patients who took aminorex and in our patient, who took fenfluramine and phentermine.

The risk of pulmonary hypertension after treatment with aminorex was estimated to be only 2 in 1000,[11] but this figure was still 20 times the risk in the general population.[14] The latent period between drug therapy with aminorex and the development of the disease may have been related to the dose, but

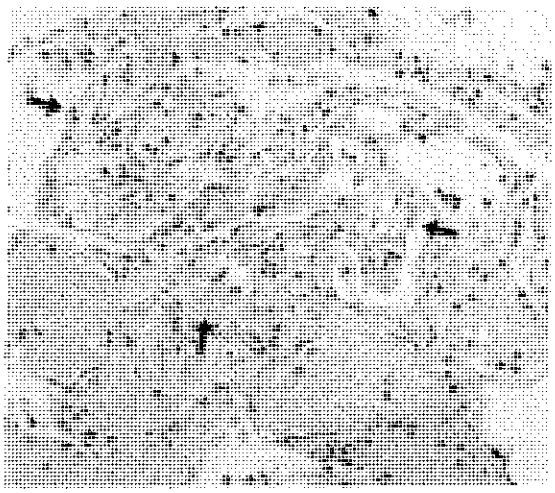

Figure 3. Plexogenic Arteriopathy (Hematoxylin and Eosin, ×20).
Interwoven vessels, which have the diameter of capillaries, form a plexus (arrows).

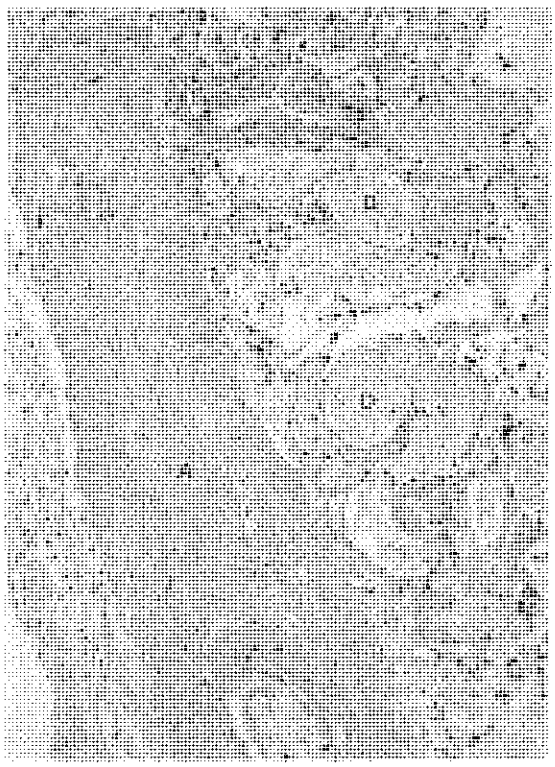

Figure 4. Dilated Blood Vessels with Thin Walls ("Dilatation Lesions," D) (Hematoxylin and Eosin, ×10).
Abnormal ectatic blood-filled vessels with thin walls lie adjacent to an artery occluded by intimal fibrosis (A).

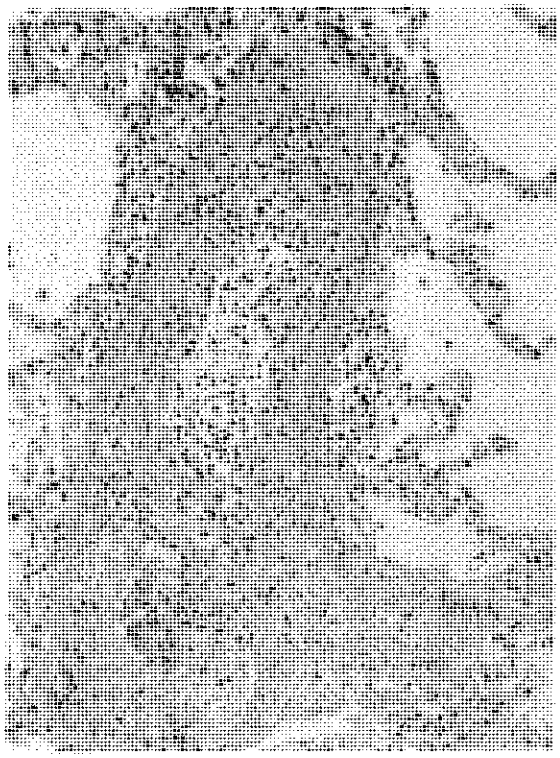

Figure 5. Necrotizing Arteritis (Hematoxylin and Eosin, ×10).
Neutrophils and nuclear dust (asterisks) infiltrate all layers of small elastic artery. Fibrinoid necrosis (F) is present. A glomeruloid (G) proliferation of endothelial cells protrudes into a curious aneurysmal structure.

the dose was sometimes small and often bore little relation to the degree of elevation in pressure.[14] Primary pulmonary hypertension has a familial basis in some instances.[23] In one case during the aminorex epidemic, pulmonary hypertension developed in a mother and daughter who were both taking the drug.[12] In one study of 32 patients in Switzerland in whom pulmonary hypertension developed during or after therapy with aminorex, 1 patient took the drug for only three weeks, another 3 took it for one month, and 23 took it for three months or longer.[12] Disease developed in 18 patients during treatment, in 4 within three months after therapy, in 2 between three and six months after therapy, and in 1 more than a year after therapy.[12] Since our patient took fenfluramine and phentermine for 23 days and died of pulmonary hypertension 8 months later, the time course of her disease falls within previously documented time frames for aminorex-associated pulmonary hypertension. The relative risk of pulmonary hypertension after treatment with dexfenfluramine for more than three months is approximately 30,[17] which is similar to that associated with aminorex.

How reversible is the pulmonary hypertension due to anorectic agents? Intimal and medial proliferations are believed to be potentially reversible. The necrotizing arteritis and ensuing plexogenic arteriopathy are probably permanent, but only a minority of the arteries generally show this change. In adults with idiopathic forms of plexogenic arteriopathy and in children in whom plexogenic arteriopathy develops as a result of congenital heart disease with left-to-right shunts, plexogenic lesions are believed to be irreversible and a bad prognostic sign.[13,15,24] However, the pulmonary hypertension caused by aminorex was sometimes reversible. The drug was sold in Europe from 1965 to 1968 and then withdrawn from the market. The epidemic of pulmonary hypertension had subsided by 1972. Ten years later, half the patients who had had signs and symptoms of pulmonary hypertension had died, the majority of right-sided heart failure. The average survival of those who died was 3½ years after the initial clinical diagnosis. Pulmonary vascular obstruction regressed in half the survivors.[13]

Fenfluramine and phentermine are chemical congeners of amphetamine[1] and are structurally similar to aminorex (Fig. 6). Fenfluramine differs from most derivatives of amphetamine by depressing rather than stimulating the central nervous system. It may suppress appetite by stimulating the ventromedial nucleus of the hypothalamus, possibly by promoting the release of serotonin and blocking its neuronal reuptake.[1] Since fenfluramine affects the cellular processing of serotonin and since intimal proliferation and fibrosis may develop in the veins and endocardium of patients with carcinoid syndrome and circulating serotonin or its metabolites,[25,26] drug-related hyperplasia of vascular myofibroblasts and endothelial cells is not entirely a surprise. The numbers of pulmonary endocrine cells, especially those containing gastrin-releasing peptide, are increased in plexogenic arteriopathy and not in other varieties of pulmonary hypertension.[27]

The histopathological findings related to pulmonary hypertension in our patient had four attributes with clinical correlates: it was partly irreversible, because there were plexogenic lesions in addition to intimal and medial proliferation; it was severe, present in every slide of lung tissue, whereas in some cases of idiopathic pulmonary hypertension the pathologist finds a plexogenic lesion in only every 5th or even every 10th block of tissue; it was in part established and ongoing, correlating with an onset months previously; and it was in part acute and necrotizing, correlating with rapid clinical deterioration terminally. The right ventricular hypertrophy and cor pulmonale attest to the severity of the pulmonary hypertension.

In summary, classic and severe plexogenic pulmonary arteriopathy developed in a patient who had taken anorectic agents for only 23 days. Although we cannot rule out preexisting disease, the histologic age of the lesions was consistent with the time elapsed since ingestion of the drugs. The patient died abruptly with cor pulmonale and necrotizing arteritis in the lungs. Pulmonary edema was a terminal event.

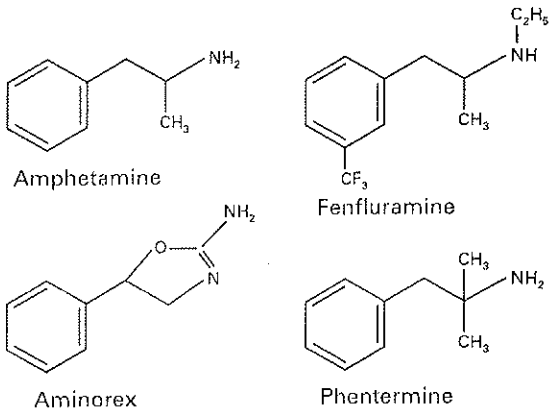

Figure 6. Chemical Structures of Amphetamine, Fenfluramine, Aminorex, and Phentermine.

LES LABORATOIRES SERVIER

RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

Neuilly, le 29 Novembre 1973

Monsieur le Ministre
de la Santé Publique et
de la Sécurité Sociale
Service Central de la Pharmacie
et des Médicaments
9, avenue Lowendal
75007 PARIS

A l'attention du 6ème Bureau

Monsieur le Ministre,

Conformément au décret n° 72-1062 du 21 Novembre 1972, nous avons l'honneur de solliciter une Autorisation de Mise sur le Marché pour notre médicament

MEDIATOR
comprimés dragéifiés

qui a été expérimenté sous le n° 780 SE.

Fabricant demandeur :	Les Laboratoires SERVIER 45 - GIDY-ORLEANS
Pharmacien signataire :	Docteur Jacques SERVIER 45 - GIDY-ORLEANS Président Directeur Général Inscrit à la Section B de l'Ordre des Pharmaciens sous le n° 21 921
Dénomination spéciale :	MEDIATOR
Forme pharmaceutique :	Comprimés dragéifiés
Contenances des modèles-vente:	10, 20, 24, 30, 60 et 100

.../...

22, rue Garnier 758 12-60
XXXXXXXXXXXXXX
17, Avenue Charles de Gaulle - 92 201 - Neuilly-sur-Seine • B.P. 110 • Tél. XXXXXXX + • Télex 62642 NLLSN
Siège Social : 45 - Gidy - France • Société anonyme au capital de 2.220.000 F • R.C .Orléans 54 B 79 • I.N.S.E.E. 359.45.154.0001

LES LABORATOIRES SERVIER

Composition intégrale :

Principe actif :

Benzoate de {[méthyl-1 (trifluorométhyl-3 phényl)-2 éthyl] amino}-2 éthyle, chlorhydrate(*) ..... 0,150 g

Excipients :

Amidon de maïs,
Carboxyméthylcellulose sodique,
Cire blanche,
Ethylcellulose,
Magnésium (stéarate de),
Monooléate de glycérol,
Polysorbate,
Polyvidone excipient,
Silice colloïdale,
Sucre blanc officinal,
Talc,
Titane (oxyde de)

q. s. pour un comprimé dragéifié terminé à ..... 0,700 g

Formule de préparation pour un lot de 150 000 comprimés dragéifiés :

Benzoate de {[méthyl-1 (trifluorométhyl-3 phényl)-2 éthyl] amino}-2 éthyle, chlorhydrate		22,500 kg
Amidon de maïs	environ(+)	9,000 kg
Carboxyméthylcellulose sodique	"	0,105 kg
Ethylcellulose	"	0,125 kg
Magnésium (stéarate de)	"	0,750 kg
Monooléate de glycérol	"	0,062 kg
Polysorbate	"	0,038 kg
Polyvidone excipient	"	3,120 kg
Silice colloïdale	"	0,075 kg
Sucre blanc officinal	"	60,015 kg
Talc	"	8,760 kg
Titane (oxyde de)	"	0,450 kg
		105,000 kg

Cire blanche	q. s.	pour cirer
Eau purifiée		q. s.
Alcool éthylique industriel pharmaceutique :	environ	2 litres
Trichlorofluorométhane	"	1 litre

(+) Le terme "environ" couvre les variations quantitatives éventuelles à tolérer par rapport à la quantité théorique d'excipient indiquée, pour permettre un déroulement régulier de la fabrication tout en respectant le poids final désiré.

(*) Dénomination chimique selon les normes de nomenclature de la Pharmacopée Française

LES LABORATOIRES SERVIER

Nature du récipient :	Pilulier aluminium
Voie d'administration :	Orale
Indications thérapeutiques :	Troubles métaboliques glucido-lipidiques athérogènes. Troubles du métabolisme des lipides. Troubles du métabolisme des glucides.
Contre-indications :	Aucune contre-indication n'a été signalée au cours des essais.
Effets secondaires :	Aucun effet secondaire n'a été signalé au cours des essais.
Posologie usuelle :	1 à 4 comprimés dragéifiés par jour
Durée de conservation proposée :	4 ans
Tableau des substances vénéneuses :	C
Lieux de fabrication et de contrôle :	25, rue Eugène Vignat 45 - ORLEANS
Lieu de conditionnement :	326, rue Marcellin Berthelot 45 - FLEURY-les-AUBRAIS
Date prévue pour le début d'exploitation de la spécialité :	Octobre 1974
Exploitation prévue à l'étranger :	Dans tous les pays où un brevet a été délivré
Expérimentation à l'étranger :	Australie - Belgique - Brésil - Canada - Etats Unis - Grande Bretagne - Italie - République d'Afrique du Sud.
Brevets délivrés :	Allemagne - Angleterre - Australie - Autriche - Belgique - Canada - Danemark - Espagne - Etats Unis - Finlande - Grèce - Hollande - Irlande - Japon - Mexique - Norvège - Nouvelle Zélande - Philippines - Portugal - République Africaine Malgache - Suède - Suisse - Union Sud Africaine - U. R. S. S.

Texte du projet d'étiquetage : Joint en annexe

Projet de fiche signalétique : Joint en annexe

Nous joignons à la présente demande :

- en quatre exemplaires, les documents suivants :

1/ un dossier réunissant

. la description du mode et des conditions de fabrication du médicament

. la description des techniques de contrôle des matières premières et de la spécialité prête à l'emploi
ainsi que l'indication des résultats obtenus par application de ces techniques

. le brevet

2/ l'expertise analytique de M. Christian EGNELL, Expert Analyste, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 2. 7. 72)

- en deux exemplaires, les documents suivants :

1/ l'expertise pharmacologique de M. le Docteur J. CHARPENTIER, Expert Pharmacologue-Toxicologue agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

2/ l'expertise toxicologique de M. le Docteur J. CHARPENTIER

3/ l'expertise tératologique de M. le Docteur J. CHARPENTIER

4/ les expertises cliniques suivantes :

- Démonstration de l'activité du Médiator dans le traitement des hyperlipoprotéinémies primitives

. Expertise de

M. le Professeur J. LOEPER, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70).

. Expertise de

M. le Professeur J. ROUFFY, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 15. 11. 72).

.../...

- Etude en double aveugle de l'activité du Médiator sur la mobilisation des acides gras libres plasmatiques, sur la balance azotée et sur les dépenses énergétiques basale et post-prandiale

. Expertise de

M. le Professeur Agrégé M. APFELBAUM, Expert Clinicien en Endocrinologie-Nutrition, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 2. 7. 72).

- Etude de l'activité du Médiator dans les troubles métaboliques athérogènes glucido-lipidiques observés au cours du diabète clinique ou latent, avec notamment une étude en double aveugle

. Expertise de

M. le Docteur R. DEUIL, Expert Clinicien en Endocrinologie-Nutrition, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

M. le Professeur M. PLAUCHU, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

et de M. le Professeur H. WAREMBOURG, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70).

- Etude comparative en double aveugle contre phenformine de l'activité du Médiator dans les troubles métaboliques athérogènes glucido-lipidiques au cours du diabète chimique ou clinique

. Expertise de

M. le Professeur J. MIROUZE, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

- Etude d'activité et d'acceptabilité du Médiator dans l'athérosclérose avec notamment une étude en double aveugle

. Expertise de

M. le Professeur P. Y. HATT, Expert Clinicien en Cardiologie, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 30. 3. 71)

M. le Docteur C. ELBAZ, Expert Clinicien en Chirurgie, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 30. 3. 71)

et M. le Docteur J. FREYRIA, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70).

. . . /. . .

LES LABORATOIRES SERVIER

- Etude de l'acceptabilité clinique et biologique du Mediator lors de traitements à moyen terme

. Expertise de

M. le Professeur G. CABANEL, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

M. le Docteur A. CREFF, Expert Clinicien en Endocrinologie-Nutrition, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 2. 7. 72)

M. le Professeur M. PLAUCHU, Expert Clinicien en Médecine Interne, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70)

et M. le Docteur M. ZARA, Expert Clinicien en Endocrinologie-Nutrition, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 30. 3. 71).

- Etude de l'acceptabilité clinique et biologique du Mediator lors de traitements au long cours

. Expertise de

M. le Professeur Agrégé J. GUYOTAT, Expert Clinicien en Neuro-Psychiatrie, agréé par le Ministère de la Santé Publique et de la Sécurité Sociale (J. O. du 10. 5. 70).

Enfin, nous joignons un chèque bancaire de 2 500 F. - (deux mille cinq cents francs) établi à l'ordre du Trésor Public.

Nous vous prions de croire, Monsieur le Ministre, à l'assurance de notre très haute considération.

Docteur Jacques SERVIER

Synthèse de la réglementation applicable à l'autorisation de mise sur le marché d'un médicament, selon une procédure nationale, de 1970 à 2010

Sommaire :

- **Préambule : p. 1 à 2**

Annexe 2-2

Synthèse de la réglementation applicable à l'autorisation de mise sur le marché d'un médicament, selon une procédure nationale, de 1970 à 2010

Directive 75/319/CEE concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques	Procédure de validation des spécialités pharmaceutiques : **article 39 (point 2) de la directive 75/319CEE** Les Etats membres doivent dans un délai de 15 ans appliquer les dispositions de la directive 75/319 **Aux termes des notes de la DPhM des 30 janvier et 22 mai 1985 :** Les industriels doivent mettre à jour les dossiers de fabrication et du contrôle de qualité des produits ainsi que procéder à une réévaluation en fonction de la progression des connaissances toxicologiques, pharmacologiques et cliniques des différents médicaments et de l'apport de connaissances médicales nouvelles. Un médicament sera maintenu sur le marché si son efficacité est démontrée ou suffisamment justifiée, et lorsque son rapport bénéfice/risque est positif. La validation pourra conduire au retrait du marché lorsque notamment la sécurité ne sera pas assurée au regard des connaissances actuelles (...). L'efficacité et la sécurité, dans les conditions normales d'emploi et dans les indications revendiquées seront appréciées indication par indication compte tenu : - des données et connaissances disponibles sur la base des travaux expérimentaux : dans ce cadre, la présentation des éléments bibliographiques est importante ; - et/ou de l'expérience acquise à leur sujet. Dans cette optique, les travaux de réflexion et de révision de la Commission de Révision des dictionnaires de spécialités pharmaceutiques seront très largement pris en compte. **Aux termes des avis aux fabricants de spécialités pharmaceutiques, relatif à l'application de l'article 39 précité, publiés aux JO du 20 décembre 1984, du 4 juin 1985 et du 5 juillet 1985.** L'opération dite « de validation » ou de réévaluation des spécialités pharmaceutiques impose aux titulaires d'autorisation (visa ou AMM délivrées antérieurement au 1er décembre 1976) d'effectuer auprès de la DPhM une demande de transformation de visa en AMM ou une demande de validation d'AMM ou à indiquer qu'ils ne souhaitent pas cette transformation ou cette validation. Les dossiers doivent être soumis en 1985 selon un calendrier par tranche défini par la classe pharmacothérapeutique dont relève la spécialité pharmaceutique. Le dossier de demande de validation comporte notamment un document de synthèse dans lequel doivent figurer en particulier : - le résumé des caractéristiques du produit ; - le niveau des ventes ; - les pays dans lesquels l'AMM a été donnée ; - le bilan des effets indésirables signalés à la firme après mise sur le marché ; données de pharmacovigilance et de consommation globale du produit ; utilisation dans d'autres pays.

NUMÉRO DU DOSSIER :

NL 10008

DOSSIER DE PRÉSENTATION

Nom du produit : MEDIATOR

Forme : Comprimés Dragéifiés

Nom du Laboratoire : LABO. SERVIER

Rapporteur : M.r le Professeur Guignard

Désigné le 20 DEC 1973

Délai : 15 Jours

Signature :

RAPPORT TOXICO-PHARMACO-CLINIQUE

La présente demande concerne des comprimés dragéifiés appelés MEDIATOR renfermant par unité de prise 150 mg de benzoate de ((méthyl-1 (trifluorométhyl-3 phényl)- 2 éthyl) amino)- 2 éthyle, chlorhydrate.

A raison de 1 à 4 comprimés par jour le produit est indiqué dans les troubles métaboliques glucido-lipidiques athérogène.

L'expertise toxico-pharmacologique est due au Dr J. CHAUPENTIER. L'expert a étudié : - 1°) la toxicité aigüe du principe actif chez la souris (per os, I.P.) et le rat (idem), - 2) la toxicité sub-chronique pendant deux mois chez la souris, - 3) la toxicité chronique chez le rat durant 3 mois et 6 mois, - 4) un essai d'innocuité chez la souris, - 4) la toxicité chronique (essai complémentaire) chez le chien durant 6 mois, - 5) l'action sur le métabolisme lipidique (action sur les acides gras libres, le glycérol et les triglycérides chez le rat ; activité sur les lipides plasmatiques, les acides gras libres, le glycogène et les lipides hépatiques du rat avec un régime normal et avec un régime hyperlipidique ; activité sur la lipase pancréatique et sur la phosphatidate phosphohydrolase), - 6) l'action sur le métabolisme glucidique (rat) : activité sur le glycogène hépatique au cours du jeune ; glycémie et glycogène hépatique

Annexe 2-3

lors de traitements répétés, - 7) l'effet sédatif et anxiolytique chez le rat, - 8) l'action sur l'appareil cardio-vasculaire chez le chien et le rat, - 9) les effets latéraux sur les appareils gastro-intestinal, respiratoire et nerveux autonome.

L'expert conclut notamment que le MEDIATOR s'oppose à la déplétion glycogénique au cours du jeune, diminue l'activité de la lipase pancréatique favorisant la consommation des triglycérides plutôt que leur stokage dans les adipocytes, s'oppose à la surcharge lipidique lors des régimes hyperlipidiques par action directe sur la phosphatidate phosphohydrolase, inhibe, à des concentrations très faibles, la réponse pressive à la noradrénaline d'un vaisseau isolé, présente une action sédative et anxiolytique.

L'expert a en outre recherché l'éventuel effet tératogène du MEDIATOR chez le rat, la souris et le lapin.

L'expertise clinique a été réalisée par les Prs LOEPER, ROUFFY, APFELBAUM, le Dr DEUIL, les Prs PLAUCHU, WAREMBOURG MIROUZE, HATT, ELBAZ, FREYRIA, CABANEL, GUYOTAT, les Drs CREFF et ZARA.

(expertise pharmaco-clinique)

Le Pr APFELDBAUM a étudié en double aveugle : 1) chez 10 patients la libération des acides gras plasmatiques après l'administration d'une dose unique de MEDIATOR, - 2) chez 30 autres sujets l'action sur la balance azotée et les dépenses énergétiques basales et post-prandiales, montrant que le MEDIATOR ne détériore pas le capital protidique de l'organisme et entraine une diminution significative de la dépense d'énergie post-prandiale, énergie perdue qui ne pourra être utilisée ni pour un travail mécanique, ni pour un travail de synthèse chimique.

Les Prs LOEPER et ROUFFY ont étudié le MEDIATOR dans le traitement des hyperlipoprotéinémies primitives chez 56 malades ; le Pr LOEPER a observé une baisse du cholestérol de 13 % (15 % dans les formes II) et une baisse plus modérée de 10 à 15 % des triglycérides ; le Pr ROUFFY a pour sa part noté une baisse de 6,4 % de la cholestérolémie dans le groupe II et de 8 % dans les hyperlipidémies mixtes.

Annexe 2-3

Les Prs PLAUCHU et WAREMBOURG ont étudié le MEDIATOR dans les corrections des troubles glucido-lipidiques observés au cours du diabete (54 malades dont 16 en double aveugle), et le Dr DEUIL dans les anomalies lipidiques du diabète clinique (55 observations). Les experts observent une amélioration de la tolérance hydrocarbonée, une diminution du poids ainsi qu'un abaissement des constituants lipidique sériques (réduction du cholestérol de 13,6 à 21,4 % et des triglycérides de 32,2 % à 37,9 %.

Le Pr MIROUZE a étudié comparativement en double aveugle le MEDIATOR et le PHENFORMINE chez 32 diabètiques, le premier produit se montrant statistiquement plus efficace (par exemple amélioration de la tolérance glucidique dans 1 cas sur 2 contre 1 cas sur 5 avec la PHENFORMINE.

Les Prs HATT, ELBAZ et RREYRIA rapportent 52 observation dont 11 conduites en double aveugle chez des malades atteints d'athéroscléroze. En particulier, sur 41 patients ayant un excés de poids,34 ont maigri sous traitement.

Les Prs CABANEL et PLAUCHU ainsique les Drs CREFF et ZARA ont étudié plus spécialement l'acceptabilité clinique et biologique du MEDIATOR lors de traitement à moyen terme (1 à 5 mois) chez 79 malades dont 34 surcharges pondérales, et le Pr GUYOTAT lors du traitement à long terme (6 à 15 mois) chez 45 malades atteints de troubles psychiatriques variés et présentant des anomalies lipidiques. Aucune action fâcheuse sur le foie, les reins ou les éléments figurés du sang, n'a été observée ; aucune interférence facheuse avec les médicaments associés n'est apparue.

En ce qui concerne les effets secondaires ces deux dernières expertises recoupent les observations des autres experts : bonne tolérance marquée surtout par quelques incidents digestifs (nausées, diarrhées, douleurs épigastriques. 29 cas rapportés par les Prs LOEPER, ROUFFY, PLAUCHU et HATT, - des vertiges (5 cas rapportés par les Prs LOEPER et PLAUCHU, - des prurits (4 observations dues au Pr PLAUCHU), - de la somnolence (4 cas mentionnés par les Prs PLAUCHU et HATT. Les arrêts de traitement ont été exceptionnels (Pr PLAUCHU, 4 arrêts, Pr ROUFFY deux arrêts)

Annexe 2-3

Au total le MEDIATOR apparait comme un médicament actif et bien toléré.

EN CONCLUSION la présente demande relative à un nouveau médicament de la famille de la fenfluramine ayant des propriétés métaboliques anti-athéromateuses ne parait recevable en ce qui concerne le plan toxico-pharmaco-clinique.

PARIS, le 30 janvier 1974

-5 FEV. 1974 SAISINE DE LA COMMISSION

22 mars 1974

Avis de la Commission

Mesure d'instruction

Le dossier de demande d'Autorisation de Mise sur le Marché devra être complété :

1°) par une étude métabolique de la molécule étant donné ses liens de parenté chimique avec la fenfluramine.

2°) par une exploration plus approfondie de la tolérance biologique et clinique à long terme, cette spécialité étant en effet réservé à des traitements au long cours.

9-4-74

NOTIFICATION DE LA DECISION AU FABRICANT

1) L'étude métabolique réalisée par le Dr Jean CHARPENTIER chez le chien et chez l'homme permet de conclure que : - 1, le MEDIATOR est rapidement et totalement absorbé par le tractus digestif. Son élimination s'effectue exclusivement par les reins. Cette élimination est rapide évitant le risque d'une accumulation, - 2 la voie principale du métabolisme passe par la débenzoylation puis la sulfo- et la glycuroconjugaison - 3 que la voie secondaire est plus complexe : une séquence de débenzoylation, désalkylation, désamination oxydative et conjugaison à la glycine conduit à l'acide m-trifluorométhylhippurique, terme ultime du métabolisme hépatique.

Le métabolisme du MEDIATOR ne passe donc pas par le stade fenfluramine.

2) Une synthèse avec évaluation statistique, portant sur l'acceptabilité clinique et biologique, a été réalisé sur 151

NUMÉRO DU DOSSIER :

NL 10008

650

Annexe 2-3

DOSSIER DE PRÉSENTATION

patients traités durant 3 à 18 mois et dont les observations figurent dans le dossier d'Autorisation de Mise sur le Marché. Cette synthèse, confirmant notre rapport, montre que l'acceptabilité du Médiator s'avère satisfaisante : 1) sur le plan clinique, seules six observations font état de troubles mineurs, qui n'ont en aucun cas fait envisager la nécessité d'interrompre le traitement, - 2) sur le plan biologique, même aux plus fortes doses totales de MEDIATOR reçues par chaque patient, les contrôles portant sur le foie, le rein et le sang n'ont montré aucune modification, - 3) il n'est apparu aucune interaction de quelque sorte que ce soit au cours des 94 associations réalisées entre MEDIATOR et d'autres médicaments.

En conséquence, j'estime les compléments versés au dossier par le fabricant recevables

PARIS, le 1 AVRIL 1974

Dossier n° : NL 10006 C 557

Monsieur,

Vous m'avez adressé une demande tendant à obtenir l'autorisation de mise sur le marché pour la spécialité dénommée :

MEDIATOR, comprimés dragéifiés.

Il ressort de l'examen du dossier :

que compte-tenu des liens de parenté chimique de la molécule avec la fenfluramine il devra être procédé à une étude métabolique.

En outre il s'avère nécessaire d'approfondir l'exploration de la tolérance clinique et biologique de ce produit destiné à des traitements au long cours.

En conséquence, j'ai l'honneur de vous faire connaître qu'une mesure d'instruction a été décidé (e) à l'encontre de votre demande et qu'un délai de 3 mois vous est accordé pour me fournir vos justifications.

Veuillez agréer, Monsieur, l'assurance de ma considération distinguée.

Vu le livre V du Code de la Santé Publique (partie législative et partie réglementaire et notamment l'article L 601)

DÉCIDE :

ARTICLE 1er - L'autorisation de mise sur le marché prévue à l'article L 601 du Code de la Santé Publique est accordée en vue de son débit à titre gratuit ou onéreux à la spécialité :
MEDIATOR, comprimés dragéifiés.
des Laboratoires

SERVIER, 45 - GIDY-ORLEANS

ARTICLE 2 - Ladite spécialité répond à la composition suivante :

Principe actif :

Benzoate de {[méthyl-1 (trifluorométhyl-3 phényl)-2 éthyl] amino}-2 éthyle, chlorhydrate ..... 0,150 g

Excipients :

Amidon de maïs,
Carboxyméthylcellulose sodique,
Cire blanche,
Ethylcellulose,
Magnésium (stéarate de),
Monooléate de glycérol,
Polysorbate,
Polyvidone excipient,
Silice colloïdale,
Sucre blanc officinal,
Talc,
Titane (oxyde de)
q.s. pour un comprimé dragéifié terminé à ..... 0,700 g

AUTORISATION DE MISE SUR LE MARCHÉ :

- 317 225.3 : 10 comprimés dragéifiés.
- 317 226.6 : 20 comprimés dragéifiés.
- 317 227.2 : 24 comprimés dragéifiés.
- 317 227.9 : 30 comprimés dragéifiés.
- 317 228.5 : 60 comprimés dragéifiés.
- 317 229.1 : 100 comprimés dragéifiés.

Annexe 2-5

ARTICLE 3 - Le fabricant devra respecter les conditions prévues dans sa demande d'autorisation de mise sur le marché en ce qui concerne la fabrication et le contrôle de ce produit.

ARTICLE 4 - La durée de conservation prévisible dans l'état actuel du dossier est de... 4 ans.

ARTICLE 5 - La validité de cette autorisation est limitée à cinq ans à partir de la date de la présente décision.

ARTICLE 6 - Les indications thérapeutiques sont limitées à :

. Troubles métaboliques glucido-lipidiques athérogènes.
. Troubles du métabolisme des lipides.
. Troubles du métabolisme des glucides.

ARTICLE 7 - Dans la publicité auprès du corps médical et auprès du public, le fabricant mentionnera :

. Qu'en fonction de susceptibilités individuelles et plus particulièrement aux posologies supérieures à 3 comprimés par jour, les effets secondaires suivants ont été observés :

- digestifs (nausées, vomissements, gastralgies, diarrhée),
- asthénie,
- somnolence ou état vertigineux.

ARTICLE 8 - Le Chef du Service Central de la Pharmacie et des Médicaments est chargé de notifier cette décision aux intéressés.

Monsieur le Professeur,

J'ai l'honneur de vous faire connaître qu'une Autorisation de Mise sur le Marché vient d'être accordée à la spécialité :

- MEDIATOR, comprimés dragéifiés -

présentée par les Laboratoires SERVIER.

S'agissant d'une molécule nouvelle, dont vous trouverez ci-joint une notice de renseignements, il m'a paru nécessaire de vous demander si vous ne jugez pas opportun que ce produit fasse l'objet d'une surveillance au titre de la Pharmaco-vigilanc

Avec mes remerciements anticipés, Veuillez agréer, Monsieur le Professeur, l'assurance de ma considération distinguée.

Tél. : 567.55.44

Madame, Monsieur le Pharmacien Responsable
des Laboratoires
SERVIER
22 rue Garnier
92201 NEUILLY SUR SEINE CEDEX BP 110

Madame, Monsieur,

La monographie de votre spécialité :

M E D I A T O R

a fait l'objet d'une étude approfondie par la Commission de Contrôle des Dictionnaires de Spécialités Pharmaceutiques, en application du décret du 24 août 1976.

A l'issu du travail commun entre les experts de la Commission et les spécialistes au sein de votre Etablissement Pharmaceutique, un texte a été rédigé, que vous avez approuvé par lettre adressée le 25 OCTOBRE 1979 au Président de la Commission. La copie de ce texte est jointe à la présente lettre.

Je donne mon accord à cette rédaction, qui sera désormais la seule à pouvoir paraître dans les prochaines éditions du dictionnaire VIDAL, et des recueils de même nature. Cet accord, bien entendu, est donné dans l'état actuel des connaissances.

Je vous engage à rendre l'information que porte la Fiche Signalétique remise par le visiteur médical, conforme au présent texte dès sa prochaine édition.

Je me félicite du résultat de cet effort commun, qui a permis de contribuer à l'amélioration de l'information médicale et pharmaceutique.

Veuillez agréer, Madame, Monsieur, l'assurance de ma considération distinguée.

Pour le Ministre et par délégation

Le Pharmacien Inspecteur
Divisionnaire de la Santé

Jacques CORDONNIER

RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

Direction de Recherche et Développement

MONOGRAPHIE DESTINEE AUX DICTIONNAIRES DES SPECIALITES PHARMACEUTIQUES

M E D I A T O R

DENOMINATION SPECIALE : MEDIATOR

FORME PHARMACEUTIQUE : Comprimés dragéifiés

PRESENTATION ET COMPOSITION :

Présentation : Pilulier de 30 comprimés dragéifiés

Composition :

	dose par unité de prise	dose par conditionnement
Benzoate de {[méthyl-1 (trifluoro-méthyl-3 phényl)-2 éthyl] amino}-2 éthyle, chlorhydrate ou benfluorex chlorhydrate	0,150 g	4,5 g

Excipients :

Amidon de maïs, carboxyméthylcellulose sodique, cire blanche, éthylcellulose, stéarate de magnésium, mono-oléate de glycérol, polysorbate, polyvidone - excipient, silice colloïdale, sucre blanc officinal, talc, oxyde de titane.

q.s. pour un comprimé dragéifié terminé à 0,700 g

SORT DU MEDICAMENT :

- Absorption gastro-intestinale rapide et totale avec un pic maximal survenant entre 1 et 2 heures après l'administration.
- Elimination rapide et totale par voie urinaire : en 8 heures, une excrétion moyenne d'environ 74 % de la dose administrée est constatée.

L'élimination se fait en 2 phases :

- une première phase rapide (60 % en 3 ou 4 heures)
- une deuxième phase lente, se terminant en 36 heures environ.

.../...

PROPRIETES :

Hypolipémiant

Il agit ainsi sur plusieurs facteurs fondamentaux liés au risque athérogène.

1. Actions de MEDIATOR sur le métabolisme lipidique

   - MEDIATOR diminue l'absorption intestinale des triglycérides (rat) Cet effet, confirmé chez l'homme en pharmacologie clinique, repose sur la diminution d'activité de la lipase pancréatique
   - Il réduit la synthèse hépatique des triglycérides et du cholestérol in vitro et in vivo (rat)
   - Il diminue la stéatose hépatique induite par des régimes riches en lipides, en glucides chez le rat obèse et au cours du diabète expérimental (ra
   - Il limite l'incorporation du cholestérol dans la paroi artérielle (lapin).

   Ce mode d'action est susceptible d'expliquer la diminution du cholestérol et des triglycérides chez l'homme.

2. Actions de MEDIATOR sur le métabolisme glucidique :

   - Il facilite la pénétration et l'utilisation cellulaire du glucose (rat)
   - Il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'H.P.O. chez le lapin
   - Dans le diabète asymptomatique chez les patients obèses, il entraîne une baisse de la glycémie post-prandiale et une amélioration de la courbe d'H.P.O. supérieure à celle qu'on obtient avec un régime identique associé à un placébo.

   MEDIATOR n'ayant pas d'action sur l'insulinosécrétion ne peut pas provoquer d'hypoglycémie.

3. Effet complémentaire de MEDIATOR :

   Chez des patients obèses traités par MEDIATOR et régime, une baisse de l'uricémie d'environ 14 % a été observée.

   hyperuricémiant.

Aucune interférence indésirable de MEDIATOR avec les traitements associés au cours des études n'a été constatée.

MEDIATOR :
- ne potentialise pas les anticoagulants,
- ne provoque pas d'hypoglycémie,
- n'interfère pas avec la fonction thyroïdienne.

.../...

INDICATIONS :

Proposé dans le traitement des :

1. Hypercholestérolémies et hypertriglycéridémies endogènes de l'adulte, isolées ou associées,
   - lorsqu'un REGIME ADAPTE ET ASSIDU s'est avéré insuffisant,
   - lorsque la cholestérolémie après régime reste élevée et/ou qu'il existe des facteurs de risque associés.
     La poursuite du régime est toujours indispensable.
2. Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Remarque :
L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

CONTRE-INDICATIONS :

- les pancréatites chroniques avérées,
- la grossesse, par mesure de prudence.

MISE EN GARDE :

Les troubles métaboliques relevant d'un traitement par MEDIATOR sont essentiellement observés chez l'adulte. La prescription de MEDIATOR n'est donc pas justifiée chez l'enfant.

PRECAUTIONS D'EMPLOI :

Si après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

EFFETS INDESIRABLES :

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.

En raison de la nouveauté de ce produit, les effets indésirables à long terme n'ont pu encore être appréciés par des études contrôlées.

MODE D'EMPLOI ET POSOLOGIE :

- 3 comprimés dragéifiés par jour.

Coût de traitement journalier : 0,98 à 2,94 F.
Cette posologie peut être prescrite d'emblée ou atteinte progressivement :

- 1 comprimé la première semaine au dîner,
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner,
- 3 comprimés à partir de la troisième semaine, 1 au petit-déjeuner, 1 au déjeuner, 1 au dîner.

.../...

Par la suite, la posologie peut être ramenée à 2 parfois 1 comprimé par jour, en fonction des résultats biologiques.

Durée du traitement :

En association avec le régime, MEDIATOR constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

SURDOSAGE :

Conduite à tenir en cas d'absorption massive :

Le traitement sera purement symptomatique : lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la tension artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

MENTION IMPOSEE :

Durée de conservation : 4 ans.

CLASSEMENT DES SPECIALITES AU REGARD DU REGIME DES SUBSTANCES VENENEUSES

Tableau A.

RENSEIGNEMENTS ADMINISTRATIFS :

A.M.M. n° 317.557.9 du 16 juillet 1974.

Année de la première mise sur le marché : 1976.

PRIX DE VENTE AU PUBLIC :

Pilulier de 30 comprimés dragéifiés : 29,05 F. + 0,35 SHP.

Remboursement de la Sécurité Sociale : 70 %.

Admis aux Collectivités : 70 %.

RESPONSABLE DE LA MISE SUR LE MARCHE :

Saint-Denis, le 27 DEC. 2010

Note

à l'attention de
la mission de l'Inspection Générale des Affaires Sociales sur le retrait du benfluorex

Objet : Procédure de validation des spécialités autorisées avant le 1 décembre 1976
Réf. : Message électronique de M. Etienne Marie du 24 décembre 2010

Dans le cadre de l'enquête en cours relative au retrait du benfluorex, vous avez souhaité disposer des références juridiques et les modalités de mise en application de la procédure dite de « validation » des spécialités pharmaceutiques autorisées avant le 1er décembre 1976 et de celle de l'AMM de la spécialité MEDIATOR en particulier.

A cet égard, je vous prie de trouver ci-après les éléments de réponse que je suis en mesure de vous apporter à ce jour.

1. sur les textes de référence de la procédure dite « de validation »

La directive 65/65/CEE du Conseil du 26 janvier 1965 concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques indiquait que ses dispositions seraient progressivement appliquées aux spécialités autorisées en vertu des dispositions antérieures, dans le délai de cinq ans à compter de sa notification. L'ordonnance n° 67-827 du 23 septembre 1967, qui transpose la directive 65/65/CEE, a donc prévu en son article 5 que la nouvelle législation relative à l'AMM serait progressivement appliquée aux spécialités autorisées avant le 28 septembre 1967. En application de cet article, le décret n° 68-964 du 4 novembre 1968 a organisé une procédure de validation.

Est ensuite intervenue la directive 75/319/CEE du Conseil du 20 mai 1975 concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques (J.O. n° L 47 du 09/06/1975) (P.J. n°1), qui a de nouveau modifié la réglementation et a par conséquent enjoint les Etats-membres à procéder à la mise en conformité des AMM délivrées avant le 1er décembre 1976 et ce, dans un délai de 15 ans à compter de sa notification, soit avant juin 1990 (article 39, point 2).

A cette fin, en France, plusieurs avis aux fabricants de spécialités pharmaceutiques, relatifs à l'application de l'article 39 précité, ont été publiés au J.O. ou au B.O.S.P, et des notes de la Direction de la pharmacie et du médicament (DPhM) du Ministère chargé de la santé ont été diffusées.

Annexe 2-10

2. sur les modalités générales de mise en œuvre de la procédure de validation

L'avis aux demandeurs publié au J.O. du 20 décembre 1984 (P.J. n°2) précisait aux titulaires d'autorisation (visa ou AMM délivrées antérieurement au 1er décembre 1976) d'effectuer auprès de la DPhM :

- soit une demande de transformation de visa en AMM ;
- soit une demande de validation d'AMM ;
- soit une déclaration indiquant qu'ils ne souhaitaient pas cette transformation ou validation des autorisations précédemment délivrées.

Le contenu du dossier de demande était précisé. Ce dossier devait inclure :

- une lettre de demande comportant certaines informations définies ;
- une proposition de résumé des caractéristiques du produit (RCP) ;
- une proposition de libellé de l'information pour le public ;
- un dossier incluant notamment un document de synthèse comprenant des renseignements pharmaceutiques, toxicologiques, pharmacologiques et cliniques. Ce document devait mentionner les éléments du dossier primitif et des informations complémentaires, dont « les noms des experts, le lieu et la date des études effectuées et toutes les informations permettant d'apprécier, pour le médicament dont il s'agit, son niveau d'efficacité et de sécurité dans des conditions normales d'emploi pour les indications revendiquées, compte tenu des données et des connaissances disponibles sur la base des travaux expérimentaux et/ou de l'expérience acquise à leur sujet (notamment données de pharmacovigilance, de consommation globale du produit, utilisation dans d'autres pays,...) » ;
- un dossier pharmaceutique actualisé.

L'opération générale de validation devait s'effectuer par classes pharmacothérapeutiques, réparties en 9 tranches. Le contenu de chaque tranche et le calendrier de dépôt des dossiers afférents étaient précisés dans l'avis aux demandeurs du 20 décembre 1984 précité et dans les avis aux demandeurs publiés aux J. O. du 4 juin 1985 (P.J. n°3) et du 5 juillet 1985 (P.J. n°4).
Le calendrier global prévisionnel s'étalait de 1985 à 1990.
Il était notamment indiqué que la validation portait sur les indications thérapeutiques et qu'en conséquence, les spécialités revendiquant plusieurs indications appartenant à différentes classes pharmacothérapeutiques seraient étudiées avec chacune des classes concernées (et donc selon le calendrier envisagé pour chacune des classes concernées).

Le contenu de chaque « tranche » et les dates de dépôt correspondantes étaient les suivants (voir les avis aux demandeurs précités pour le détail sur les groupes de médicaments concernés dans chaque classe pharmacothérapeutique) :

- 1ère tranche : les premiers dossiers, appartenant aux classes suivantes, devaient être déposés entre le 1er janvier 1985 et le 30 juin 1985 : antivitamines K, héparines injectables, antiangoreux, antiarythmiques, antihypertenseurs, bêta-bloquants, hypolipémiants, glucosides, cardiotoniques, diurétiques, sédatifs cardiaques, cardio-accélérateurs (antibradycardisants), analeptiques cardiovasculaires ; médicaments ophtalmologiques antiglaucomateux et mydriatiques.

- 2ème tranche : les dossiers appartenant aux classes pharmacothérapeutiques suivantes devaient être déposés entre le 1er juillet 1985 et le 31 décembre 1985 : médicaments de neurologie et de psychiatrie.

- 3ème tranche : janvier à juin 1986 : médicaments utilisés en médecine cardio-vasculaire et non appelés au cours de la 1ère tranche, potassium et antihyperkaliémiques, hémostase, anorexigènes.

- 4ème tranche : juillet à décembre 1986 : gastro-entérologie, hépatologie.

- 5ème tranche : janvier à juin 1987 : ophtalmologie, glucorticoïdes oraux et injectables et ACTH, infections.

Annexe 2-10

- 6ème tranche : sauf exception, jusqu'au 30 juin 1988: gastro-entérologie (laxatifs), pneumologie, rhinologie, ophtalmologie, otologie, stomatologie, allergologie, produits dentaires.

- 7ème tranche : mars 1989 : pneumologie, dermatologie, spécialités à base de principes actifs d'origine végétale revendiquant une indication thérapeutique liée à leur utilisation traditionnelle.

- 8ème tranche : décembre 1989 : rhumatologie, douleurs, anesthésiologie, antipyrétiques, gynécologie, endocrinologie, uronéphrologie.

- 9ème tranche : 10 juin 1990 : parasitologie, hématologie, cancérologie, ophtalmologie, métabolisme-nutrition-vitamines, alimentation parentérale, toxicologie, produits de diagnostic, diététique pharmaceutique, produits dentaires.

Les principes généraux et la procédure de validation ont été détaillés par une note de la DPhM du 30 janvier 1985 (P.J. n°5). Il s'agissait d'une « mise à jour des dossiers de fabrication et du contrôle de la qualité des produits ainsi que d'une réévaluation en fonction de la progression des connaissances toxicologiques, pharmacologiques, cliniques des différents médicaments et de l'apport de connaissances médicales nouvelles ». L'issue de cette réévaluation devait aboutir au maintien sur le marché des médicaments « à efficacité démontrée » ou « suffisamment justifiée » **et « ayant un rapport bénéfice/risque positif »**. A cette fin, il est à noter que des modifications qualitatives ou quantitatives de formule pouvaient être demandées et acceptées.

Les modalités précises d'examen des dossiers par la DPhM n'étaient pas décrites dans les textes précités. Concernant l'examen du dossier clinique (efficacité, intérêt thérapeutique), il était toutefois précisé dans la note précitée que « les travaux de réflexion et de révision de la Commission de révision des Dictionnaires de Spécialités Pharmaceutiques » seraient « très largement pris en compte ». En outre, la Commission d'AMM ayant été créée en 1978, il est probable que son avis ait été sollicité pour l'examen de ces demandes.

L'examen des dossiers débutait par les données cliniques qui correspondaient au « critère premier déterminant de la validation ou de la non validation ». Il était effectué par le Ministère de la Santé (DPhM) dans un délai de 6 mois et conduisait à la validation, au refus, à une demande de compléments préalables ou à un accord pour une modification de formule (et sur le dossier complémentaire à fournir) :

- après accord sur le dossier clinique, l'examen des données pharmaceutiques et toxicologiques pouvait s'effectuer dans un second temps ;

- dans les cas de demande de compléments préalables ou d'accord pour une modification de formule, les demandeurs disposaient de 18 mois pour apporter les compléments ; la DPhM statuait ensuite dans les 3 mois en validant ou refusant la spécialité ;

- enfin, pour les médicaments non validés, « un délai de 18 mois à compter de l'issue de la période du 1er examen du groupe de médicaments appelés » était « accordé pour permettre aux fabricants une éventuelle reconversion (par exemple modification de formule) » ; à l'issue de cette période, le retrait devait être le cas échéant prononcé. Pendant cette période intermédiaire, les conditions dans lesquelles les médicaments non validés pouvaient rester sur le marché étaient « déterminées pour chaque cas particulier ». L'information des utilisateurs de cette absence de validation était prévue « afin de faciliter les changements d'habitude ».

Par note de la DPhM du 22 mai 1985 (lettre au SNIP) (P.J. n°6), les modalités de constitution du dossier pharmaceutique ont été précisées.

Annexe 2-10

Dans un nouvel avis aux fabricants publié le 3 juin 1986 (B.O.S.P. 86/19) (P.J. n°7), le format et le contenu du dossier complet de demande de validation étaient reprécisés et davantage détaillés. Ces nouvelles dispositions étaient applicables aux dossiers correspondants à la 3ème tranche et aux tranches suivantes. Deux types de dossiers étaient décrits : ceux correspondant à un « premier dépôt » et ceux correspondants à un « dépôt ultérieur » (pour les produits ayant déjà fait l'objet d'un dépôt antérieur pour d'autres indications dans une tranche précédemment appelée).

3. sur l'achèvement de la procédure générale de validation

La procédure de validation n'a pas été finalisée à la date initialement annoncée et imposée par la directive 75/319/CEE (1990). Il semble que la DPhM a notamment rencontré au début des années 90 d'importantes difficultés à traiter tant les demandes de validation que les nouvelles demandes d'AMM. Des retards importants se sont donc accumulés à cette période.

A partir de 1993, la procédure de validation s'est naturellement poursuivie et achevée sous la responsabilité de l'Agence du Médicament (ADM) ; une cellule spécifique a été chargée de cette mission au sein de la Direction de l'évaluation (DEV).
Des avis aux demandeurs ont repoussé certains délais correspondants aux tranches non finalisés, jusqu'au 31 janvier 1996 au plus tard.
Il est à noter que l'ADM a soumis tous les dossiers de validation à l'avis de la Commission d'AMM.

Mi-1996, un nouvel objectif d'achèvement complet de la procédure fin 1996 a été sollicité par le Ministère. L'Afssaps a alors alloué des moyens et du personnel supplémentaires pour cette activité.

Selon une note de D. Tabuteau, directeur général de l'ADM, à P. Bas, directeur de cabinet du Ministre du travail et des affaires sociales, du 31 décembre 1996, la procédure de validation aurait concerné au total près de 6000 dossiers. A la création de l'ADM en 1993, 4500 dossiers étaient encore à traiter.

L'évaluation de l'ensemble des dossiers a pu être achevée fin 1996 ; toutefois, les notifications des AMM correspondantes, des réponses aux firmes ayant sollicité des délais supplémentaires ou le traitement des recours déposés par les firmes ont été achevés à la fin de l'année 1997.

4. sur le processus de validation de l'AMM de MEDIATOR

Vous trouverez ci-aprés l'historique de la validation de la spécialité MEDIATOR, tiré des documents archivés dans les feuilles de garde de cette spécialité :

- 16 juillet 1974 : octroi de l'AMM dans les indications :
  - troubles métaboliques glucido-lipidiques athérogènes ;
  - troubles du métabolisme des lipides ;
  - troubles du métabolisme des glucides ;

- 29 octobre 1979 : accord sur la monographie étoilée par la Commission de Contrôle des Dictionnaires de Spécialités Pharmaceutiques. Les indications retenues sont :
  - Hypercholestérolémies et hypertriglycéridémies endogènes de l'adulte, isolées ou associées, lorsqu' régime adapté et assidu s'est avéré insuffisant ; lorsque la cholestérolémie aprés régime reste élevée et/ou qu'il existe des facteurs de risque associés. La poursuite du régime est toujours indispensable.
  - Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

- 26 juin 1985 : demande de Servier de validation de l'AMM (correspondant à la 1ère tranche de validation, classe « hypolipémiants »)

Annexe 2-10

- 22 avril 1987 : validation de l'AMM (1ère tranche / hypolipémiants). La seule indication retenue est : « adjuvant du régime adapté dans les hypertriglycéridémies » ; à noter toutefois le maintien de l'action sur le métabolisme glucidique dans la rubrique « propriétés pharmacologiques » du RCP.

- 29 juillet 1987 : lettre de Servier sollicitant le maintien de l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » dans les annexes de l'AMM validée, dans l'attente de la validation de cette indication lors de l'appel de la 8ème tranche prévu en 1989 (classe « endocrinologie ») ;

- 1er septembre 1987 : lettre de réponse de la DPhM précisant que l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » a été examinée mais n'a pas été retenue, et donc n'a donc pas été reprise dans les annexes de l'AMM. Il est proposé au laboratoire de déposer une demande pour cette indication lors de l'appel de la 8ème tranche (classe « endocrinologie ») ;

- 19 janvier 1990 : demande de Servier de validation de l'indication relative à la 8ème tranche (« endocrinologie ») ;

- 26 juillet 1994 : demande de modification de la rubrique « propriétés pharmacologiques » du RCP afin de renforcer les propriétés sur le métabolisme glucidique ;

- 16 mars 1995 : avis défavorable de l'ADM à cette demande de modification du libellé pour les raisons suivantes : « L'indication soumise à la validation n'est pas justifiée par les données fournies » ; « aucune mention de propriétés pharmacologiques en relation avec cette indication ne peut être acceptée » ;

- 22 septembre 1995 : réunion de concertation relative à l'indication non validée « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » dont les conclusions sont : « Le benfluorex pourrait avoir une place dans la stratégie thérapeutique du diabète (ie. intolérance à la metformine) mais celle-ci reste entièrement à démontrer. Dans l'intervalle, l'indication chez le diabétique n'est pas maintenue. » ;

- 5 décembre 1995 : examen de l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » par le groupe de travail interne (GTI) n°53. Avis du GTI : projet de rejet de la validation de cette indication (« (...) L'insuffisance de données d'efficacité ne permet donc pas de définir un bénéfice clinique pertinent chez les patients diabétiques en surcharge pondérale. ») ;

- 16 avril 1997 : décision de modification de l'AMM confirmant la validation de l'indication « hypertriglycéridémies » ; en revanche, démonstration d'efficacité insuffisante pour l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale ». Par ailleurs, suppression des propriétés sur le métabolisme glucidique de la rubrique « propriétés pharmacologiques » ;

- 28 avril 1997 : observations de l'Agence du médicament sur le projet de notice/étiquetage déposé en janvier 1997 dans le cadre général de la mise en conformité des textes relatifs à la notice et à l'étiquetage des spécialités[1] : suppression de toute mention relative à l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » ;

- 4 août 1997 : lettre de l'ADM à Servier indiquant que suite à un « entretien » de Servier avec Arielle North (responsable de la « Coordination des Affaires réglementaires » de la DEV), les mentions concernant l'indication « adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale » peuvent être maintenues. Les nouvelles observations de l'ADM sur le projet de notice/étiquetage sont jointes au courrier ; l'indication précitée n'y est plus supprimée ;

---

[1] *Directive 92/27/CEE du 31 mars 1992 concernant l'étiquetage et la notice des médicaments à usage humain (transposée par le décret 94-19 du 5 janvier 1994)*

Annexe 2-10

- 29 mai 1998 : demande de Servier d'extension de l'AMM dans l'indication « Diabète de type II, en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique » ;

- Avis de la Commission d'AMM n° 273 du 2 octobre 1998 : sursis à statuer « en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis à vis de la metformine » ;

- Avis de la Commission d'AMM n° 289 du 8 juillet 1999 : sursis à statuer « en l'attente des conclusions de l'inspection sur la qualité de l'essai ; de l'évaluation des données disponibles de pharmacovigilance ; de l'avis de l'expert méthodologiste » ;

- Avis de la Commission d'AMM n° 296 du 9 décembre 1999 : avis défavorable à l'indication proposée ;

- 25 avril 2000 : décision de refus de modification de l'AMM.

- 29 juin 2000 : demande de recours gracieux de Servier à l'encontre du projet de rejet de sa demande

- Avis du GT « endocrinologie, gynécologie, rhumatologie, antalgie, pneumologie, ORL et ophtalmologie » (PTC2) n°1 du 20 septembre 2000, validé par la Commission d'AMM n° 311 du 16 novembre 2000 : « Maintien de l'avis défavorable à l'indication proposée par la firme. (...). En conséquence, le libellé de l'indication thérapeutique retenu est le suivant : « adjuvant du régime adapté dans les hypertriglycéridémies ; adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale (...)» ;

- 12 juin 2001 : décision de modification de l'AMM intégrant notamment ce libellé d'indications au sein des annexes de l'AMM.

Au vu de ce qui précède, l'indication du traitement adjuvant du diabète n'a pas été retenue dans le cadre de la validation, tant lors de son examen dans le cadre de la 1ère tranche que lors d'un nouvel examen dans le cadre de la 8ème tranche.
En revanche, pour des raisons non précisées dans les échanges, cette indication a été acceptée en 1997 dans le cadre de la procédure de mise en conformité des textes relatifs à la notice à l'étiquetage.
Elle a ensuite été reprise telle que validée en 1997 dans la notice à l'occasion de la notification d'une modification de l'AMM initialement demandée par Servier pour l'ajout du traitement du diabète de type II.

Mes services se tiennent à votre disposition pour toute précision que vous jugeriez utile.

Le Directeur Général

Jean MARIMBERT

31975L0319

Deuxième directive 75/319/CEE du Conseil, du 20 mai 1975, concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques

Journal officiel n° L 147 du 09/06/1975 p. 0013 - 0022
édition spéciale finnoise: chapitre 13 tome 4 p. 0098
édition spéciale grecque: chapitre 13 tome 3 p. 0066
édition spéciale suédoise: chapitre 13 tome 4 p. 0098
édition spéciale espagnole: chapitre 13 tome 4 p. 0092
édition spéciale portugaise: chapitre 13 tome 4 p. 0092

DEUXIÈME DIRECTIVE DU CONSEIL du 20 mai 1975 concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques (75/319/CEE)

LE CONSEIL DES COMMUNAUTÉS EUROPÉENNES,

vu le traité instituant la Communauté économique européenne, et notamment son article 100,

vu la proposition de la Commission,

vu l'avis de l'Assemblée (1),

vu l'avis du Comité économique et social (2),

considérant qu'il importe, d'une part, de poursuivre le rapprochement amorcé par la directive 65/65/CEE du Conseil, du 26 janvier 1965, concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques (3), et, d'autre part, d'assurer une application des principes posés par cette directive;

considérant que, en vue de réduire les disparités qui subsistent, il importe, d'une part, de déterminer les règles relatives au contrôle des spécialités pharmaceutiques et, d'autre part, de préciser les tâches qui incombent aux autorités compétentes des États membres en vue d'assurer le respect des prescriptions légales;

considérant qu'il convient, en vue de réaliser progressivement la libre circulation des spécialités pharmaceutiques, de faciliter la délivrance d'autorisations de mise sur le marché dans plusieurs États membres pour une même spécialité pharmaceutique;

considérant que, à cette fin, il convient d'instituer un comité des spécialités pharmaceutiques composé des représentants des États membres et de la Commission et chargé d'émettre un avis sur la conformité d'une spécialité pharmaceutique aux conditions prévues par la directive 65/65/CEE;

considérant que la présente directive ne constitue qu'une étape dans la réalisation de l'objectif de la libre circulation des spécialités pharmaceutiques ; que, à cet effet, de nouvelles mesures s'avéreront nécessaires, compte tenu de l'expérience acquise, notamment au sein dudit comité, en vue d'éliminer les obstacles à la libre circulation qui subsistent encore;

considérant que, afin de faciliter la circulation des spécialités pharmaceutiques et d'éviter que les contrôles effectués dans un État membre ne soient refaits dans un autre État membre, il y a lieu de déterminer les conditions minimales de fabrication et d'importation en provenance de pays tiers et l'octroi de l'autorisation y relative;

considérant qu'il importe que, dans les États membres, la surveillance et le contrôle de la fabrication des spécialités pharmaceutiques soient assurés par une personne répondant à des conditions minimales de qualification;

considérant, en outre, que les dispositions de la présente directive et de la directive 65/65/CEE qui concernent les spécialités pharmaceutiques ne sont pas suffisantes, encore qu'appropriées, pour les vaccins, toxines ou sérums, les spécialités à base de sang humain ou

de composants de sang ou d'isotopes radioactifs et les spécialités homéopathiques ; qu'il convient dès lors de ne pas en imposer actuellement l'application à ces spécialités;

considérant que certaines règles de la présente directive rendent nécessaire une adaptation de différentes dispositions de la directive 65/65/CEE,

A ARRÊTÉ LA PRÉSENTE DIRECTIVE:

CHAPITRE Ier Demande d'autorisation de mise sur le marché

Article premier

Les États membres prennent toutes les dispositions utiles pour que les documents et renseignements (1)JO nº 96 du 2.6.1965, p. 1677/65. (2)JO nº 107 du 19.6.1965, p. 1825/65. (3)JO nº 22 du 9.2.1965, p. 369/65.

énumérés à l'article 4 deuxième alinéa points 7 et 8 de la directive 65/65/CEE soient établis par des experts possédant les qualifications techniques ou professionnelles nécessaires, avant d'être présentés aux autorités compétentes. Ces documents et renseignements sont signés par ces experts.

Article 2

Selon leurs qualifications, le rôle des experts est: a) de procéder aux travaux relevant de leur discipline (analyse, pharmacologie et sciences expérimentales analogues, clinique) et de décrire objectivement les résultats obtenus (qualitatifs et quantitatifs);

b) de décrire les constatations qu'ils ont faites conformément à la directive 75/318/CEE du Conseil, du 20 mai 1975, relative au rapprochement des législations des États membres concernant les normes et protocoles analytiques, toxicopharmacologiques et cliniques en matière d'essais des spécialités pharmaceutiques (1), et de dire notamment: - pour l'analyste, si le produit est conforme à la composition déclarée en fournissant toute justification sur les méthodes de contrôle qui seront utilisées par le fabricant,

- pour le pharmacologue ou le spécialiste ayant une compétence expérimentale analogue, quelle est la toxicité du produit et quelles sont les propriétés pharmacologiques constatées,

- pour le clinicien, s'il a pu retrouver sur les personnes traitées avec le produit les effets correspondant aux renseignements donnés par le demandeur en application de l'article 4 de la directive 65/65/CEE, si le produit est bien toléré, quelle posologie il conseille et quels sont les éventuels contre-indications et effets secondaires;

c) de justifier le recours éventuel à la documentation bibliographique visée à l'article 4 deuxième alinéa point 8 sous a) et b) de la directive 65/65/CEE, dans les conditions prévues par la directive 75/318/CEE.

Les rapports détaillés des experts font partie du dossier que le demandeur présente aux autorités compétentes.

Article 3

En cas de non-respect de l'article 2 de la présente directive, l'article 5 deuxième alinéa de la directive 65/65/CEE est applicable.

CHAPITRE II Instruction de la demande d'autorisation de mise sur le marché

Article 4

Pour instruire la demande présentée en vertu de l'article 4 de la directive 65/65/CEE, les autorités compétentes des États membres: a) doivent vérifier la conformité à l'article 4 précité du dossier présenté et examiner si les conditions de délivrance de l'autorisation de mise sur le marché sont remplies;

b) peuvent soumettre la spécialité au contrôle d'un laboratoire d'État ou d'un laboratoire désigné à cet effet, pour s'assurer que les méthodes de contrôle utilisées par le fabricant et décrites dans le dossier, conformément à l'article 4 deuxième alinéa point 7 de la directive 65/65/CEE, sont satisfaisantes;

c) peuvent, le cas échéant, exiger du demandeur qu'il complète le dossier en ce qui concerne les éléments visés à l'article 4 deuxième alinéa de la directive 65/65/CEE. Lorsque les autorités compétentes se prévalent de cette faculté, les délais prévus à l'article 7 de ladite directive sont suspendus jusqu'à ce que les données complémentaires requises aient été fournies. De même, ces délais sont suspendus du temps laissé, le cas échéant, au demandeur pour s'expliquer oralement ou par écrit.

Article 5

Les États membres prennent toutes les dispositions utiles afin que: a) les autorités compétentes vérifient que les fabricants et les importateurs de spécialités pharmaceutiques en provenance de pays tiers sont en mesure de réaliser la fabrication dans le respect des indications fournies en application de l'article 4 deuxième alinéa point 4 de la directive 65/65/CEE et/ou d'effectuer les contrôles suivant les méthodes décrites dans le dossier conformément à l'article 4 deuxième alinéa point 7 de ladite directive; (1)Voir page 1 du présent Journal officiel.

b) les autorités compétentes puissent autoriser les fabricants et les importateurs de spécialités pharmaceutiques en provenance de pays tiers, dans des cas exceptionnels et justifiés, à faire effectuer par des tiers certaines phases de la fabrication et/ou certains des contrôles prévus sous a) ; dans ce cas, les vérifications des autorités compétentes s'effectuent également dans l'établissement désigné.

Article 6

Lorsqu'une notice est jointe au conditionnement d'une spécialité pharmaceutique, les États membres prennent toutes les mesures utiles pour que la notice ne concerne que cette spécialité.

Toutes les indications figurant dans la notice doivent être conformes aux renseignements et documents fournis en vertu de l'article 4 de la directive 65/65/CEE et être approuvées par les autorités compétentes.

La notice doit comporter au moins les indications suivantes: a) nom et domicile ou raison sociale et domicile ou siège social du responsable de la mise sur le marché et, le cas échéant, du fabricant;

b) dénomination et composition qualitative et quantitative de la spécialité pharmaceutique en principes actifs.

Les dénominations communes internationales recommandées par l'Organisation mondiale de la santé doivent être employées chaque fois que ces dénominations existent;

c) sauf décision contraire des autorités compétentes: - indications thérapeutiques,

- contre-indications, effets secondaires et précautions particulières d'emploi.

Les indications et décisions prévues aux premier et deuxième tirets doivent tenir compte des résultats des essais cliniques et pharmacologiques prévus à l'article 4 deuxième alinéa point 8 de la directive 65/65/CEE ainsi que, pour les indications visées au deuxième tiret, de l'expérience acquise lors de l'emploi de la spécialité pharmaceutique après la commercialisation;

d) toute indication relative à l'utilisation de la spécialité pharmaceutique (mode et voie d'administration, durée du traitement lorsqu'elle doit être limitée, posologie usuelle);

e) précautions particulières de conservation s'il y a lieu.

Les autres indications doivent être nettement séparées des indications visées ci-dessus.

Les États membres peuvent exiger qu'une notice soit jointe au conditionnement de la spécialité pharmaceutique.

Article 7

Sans préjudice du chapitre IV et de l'article 21 de la directive 65/65/CEE, les États membres peuvent exiger qu'il soit porté sur le récipient et/ou sur l'emballage extérieur et/ou sur la notice de la spécialité pharmaceutique d'autres mentions essentielles pour la sécurité ou pour la protection de la santé publique, y compris les précautions particulières d'emploi et d'autres avertissements résultant des essais cliniques et pharmacologiques prévus à l'article 4 deuxième alinéa point 8 de la directive 65/65/CEE ou qui, après la commercialisation, résultent de l'expérience acquise lors de l'emploi de la spécialité pharmaceutique.

CHAPITRE III Comité des spécialités pharmaceutiques

Article 8

1. En vue de faciliter l'adoption d'une attitude commune par les États membres relative aux autorisations de mise sur le marché, il est institué un comité des spécialités pharmaceutiques, ci-après dénommé «comité», qui est composé de représentants des États membres et de la Commission.

2. Le comité, sur saisine d'un État membre, est chargé d'examiner, conformément aux articles 9 à 14, les questions relatives à l'application des articles 5, 11 ou 20 de la directive

65/65/CEE.

3. Le comité établit son règlement intérieur.

Article 9

1. Lorsqu'un État membre a accordé une autorisation de mise sur le marché, il transmet au comité un dossier comprenant une copie de cette autorisation ainsi que les renseignements et documents énumérés à l'article 4 deuxième alinéa de la directive 65/65/ CEE si le responsable de la mise sur le marché a demandé cette transmission à cinq autres États membres au moins.

2. Le comité transmet sans délai ce dossier aux autorités compétentes des États membres désignés.

3. Cette transmission vaut introduction, au sens de l'article 4 de la directive 65/65/CEE, d'une demande d'autorisation de mise sur le marché auprès desdites autorités.

Article 10

1. Si, dans un délai de 120 jours à compter de la date de transmission visée à l'article 9 paragraphe 2, aucune opposition n'a été formulée auprès du comité par les autorités compétentes des États membres désignés, ce comité, après constat, en informe immédiatement les États membres concernés.

2. Lorsqu'un État membre estime ne pas pouvoir envisager d'accorder l'autorisation de mise sur le marché, il transmet, dans ce délai de 120 jours, son opposition motivée sur la base de l'article 5 de la directive 65/65/CEE.

Article 11

1. Dans les cas visés à l'article 10 paragraphe 2, le comité délibère et émet un avis motivé dans un délai de 60 jours à compter de l'expiration du délai visé à l'article 10.

2. L'avis du comité porte sur la conformité de la spécialité pharmaceutique aux conditions prévues à l'article 5 de la directive 65/65/CEE.

Le comité informe immédiatement les États membres concernés de son avis, ou de ceux de ses membres en cas d'avis divergents.

3. Les États membres concernés se prononcent sur la demande d'autorisation de mise sur le marché dans un délai n'excédant pas 30 jours à compter de l'information visée à l'article 10 paragraphe 1 ou au paragraphe 2 du présent article. Ils informent immédiatement le comité de leur décision.

Article 12

1. Lorsqu'une même spécialité pharmaceutique à fait l'objet de plusieurs demandes d'autorisation de mise sur le marché, introduites conformément à l'article 4 de la directive 65/65/CEE et qu'un ou plusieurs États membres ont accordé l'autorisation alors qu'un ou plusieurs autres États membres l'ont refusée, un des États membres concernés peut saisir le comité.

Il en est de même lorsqu'un ou plusieurs États membres ont suspendu ou retiré une autorisation de mise sur le marché, alors qu'un ou plusieurs États membres n'ont pas procédé à cette suspension ou à ce retrait.

2. Le comité délibère et émet un avis motivé dans un délai maximal de 120 jours.

3. L'avis du comité ne porte que sur les motifs pour lesquels l'autorisation a été refusée, suspendue ou retirée.

Le comité informe immédiatement les États membres concernés de son avis, ou de ceux de ses membres en cas d'avis divergents.

4. Les États membres concernés font connaître, dans un délai de 30 jours, la suite qu'ils donnent à l'avis du comité.

Article 13

Le comité peut se fixer un délai pour un nouvel examen sur la base des données relatives aux conditions prévues aux articles 5, 11 ou 20 de la directive 65/65/CEE recueillies entre-temps par les États membres, notamment ceux qui autorisent la spécialité.

Article 14

Les autorités compétentes des États membres peuvent, dans des cas particuliers présentant un intérêt communautaire, saisir le comité avant qu'elles décident, sur une demande, une

suspension ou un retrait d'autorisation de mise sur le marché.

Article 15

1. La Commission fait rapport au Conseil, chaque année, sur le fonctionnement de la procédure prévue au présent chapitre et ses effets sur l'évolution des échanges intracommunautaires, et pour la première fois 2 ans après l'entrée en application de la présente directive.

2. En fonction de l'expérience acquise, et au plus tard 4 ans après l'entrée en application de la présente directive, la Commission soumet au Conseil une proposition comportant toutes mesures appropriées tendant à éliminer les obstacles à la libre circulation des spécialités pharmaceutiques qui subsistent encore. Le Conseil se prononce sur la proposition de la Commission au plus tard un an après en avoir été saisi.

CHAPITRE IV Fabrication et importation en provenance de pays tiers

Article 16

1. Les États membres prennent toutes les dispositions utiles pour que la fabrication des spécialités pharmaceutiques soit soumise à la possession d'une autorisation.

2. L'autorisation visée au paragraphe 1 est exigée tant pour la fabrication totale ou partielle que pour les opérations de division, de conditionnement ou de présentation.

Toutefois, cette autorisation n'est pas exigée pour les préparations, divisions, changements de conditionnement ou présentation, dans la mesure où ces opérations sont exécutées, uniquement en vue de la dispensation au détail, par des pharmaciens dans une officine ou par d'autres personnes légalement autorisées dans les États membres à effectuer lesdites opérations.

3. L'autorisation visée au paragraphe 1 est exigée également pour les importations en provenance de pays tiers dans un État membre ; à cette fin, le présent chapitre et l'article 29 s'appliquent à de telles importations de la même manière qu'ils s'appliquent à la fabrication.

Article 17

Pour obtenir l'autorisation visée à l'article 16, le demandeur doit satisfaire au moins aux exigences suivantes: a) spécifier les spécialités et les formes pharmaceutiques à fabriquer ou à importer ainsi que l'endroit de leur fabrication et/ou de leur contrôle;

b) disposer, pour leur fabrication ou leur importation, des locaux, de l'équipement technique et des possibilités de contrôle appropriés et suffisants répondant aux exigences légales que l'État membre concerné prévoit, tant du point de vue de la fabrication et du contrôle que de la conservation des produits, dans le respect des dispositions de l'article 5 sous a);

c) disposer d'au moins une personne qualifiée au sens de l'article 21.

Le demandeur doit fournir, dans sa demande, les renseignements justificatifs.

Article 18

1. L'autorité compétente de l'État membre ne délivre l'autorisation visée à l'article 16 qu'après s'être assurée, par une enquête réalisée par ses agents, que les renseignements fournis en application de l'article 17 sont exacts.

2. L'autorisation peut être assortie, pour garantir le respect des conditions prévues à l'article 17, de certaines obligations imposées soit à l'occasion de son octroi, soit postérieurement à sa délivrance.

3. L'autorisation ne s'applique qu'aux locaux indiqués dans la demande ainsi qu'aux spécialités et aux formes pharmaceutiques indiquées dans cette même demande.

Article 19

Le titulaire de l'autorisation visée à l'article 16 est tenu au moins: a) de disposer du personnel répondant aux exigences légales prévues par l'État membre concerné tant du point de vue de la fabrication que des contrôles;

b) de ne céder les spécialités autorisées qu'en conformité avec la législation des États membres concernés;

c) d'informer préalablement l'autorité compétente de toute modification qu'il désirerait apporter à l'un des renseignements fournis en application de l'article 17 ; toutefois, l'autorité compétente est informée sans délai en cas de remplacement imprévu de la personne qualifiée visée à l'article 21;

d) de rendre ses locaux, en tout temps, accessibles aux agents de l'autorité compétente de

l'État membre concerné;

e) de mettre la personne qualifiée visée à l'article 21 en mesure d'accomplir sa mission, notamment en mettant à sa disposition tous les moyens nécessaires.

Article 20

1. Les États membres prennent toutes les dispositions utiles pour que la durée de la procédure pour l'octroi de l'autorisation visée à l'article 16 n'excède pas un délai de 90 jours à compter de la date de la réception de la demande par l'autorité compétente.

2. En cas de demande de modification par le titulaire de l'autorisation de l'un des éléments visés à l'article 17 sous a) et b), la durée de la procédure concernant cette demande ne dépasse pas 30 jours. Dans les cas exceptionnels, ce délai peut être prorogé jusqu'à 90 jours.

3. Les États membres peuvent exiger du demandeur des compléments d'information en ce qui concerne les renseignements fournis en application de l'article 17 ainsi qu'en ce qui concerne la personne qualifiée visée à l'article 21 ; lorsque l'autorité compétente se prévaut de cette faculté, les délais prévus aux paragraphes 1 et 2 sont suspendus jusqu'à ce que les données complémentaires requises aient été fournies.

Article 21

1. Les États membres prennent toutes les dispositions utiles pour que le titulaire de l'autorisation visée à l'article 16 dispose d'une façon permanente et continue d'au moins une personne qualifiée répondant aux conditions prévues à l'article 23, responsable notamment de l'exécution des obligations spécifiées à l'article 22.

2. S'il répond personnellement aux conditions prévues à l'article 23, le titulaire de l'autorisation peut assumer lui-même la responsabilité visée au paragraphe 1.

Article 22

1. Les États membres prennent toutes les dispositions utiles pour que la personne qualifiée visée à l'article 21, sans préjudice de ses relations avec le titulaire de l'autorisation visée à l'article 16, ait la responsabilité, dans le cadre des procédures visées à l'article 25, de veiller que: a) dans le cas de spécialités fabriquées dans l'État membre concerné, chaque lot de spécialités pharmaceutiques a été fabriqué et contrôlé conformément à la législation en vigueur dans cet État membre et dans le respect des exigences retenues pour l'autorisation de mise sur le marché;

b) dans le cas de spécialités en provenance de pays tiers, chaque lot de fabrication importé a fait l'objet, dans le pays importateur, d'une analyse qualitative complète, d'une analyse quantitative d'au moins tous les principes actifs et de tous les autres essais ou vérifications nécessaires pour assurer la qualité des spécialités pharmaceutiques dans le respect des exigences retenues pour l'autorisation de mise sur le marché.

Les lots de spécialités ainsi contrôlés dans un État membre sont dispensés des contrôles précités lorsqu'ils sont importés dans un autre État membre, accompagnés des comptes rendus de contrôle signés par la personne qualifiée.

Un État membre peut exempter la personne qualifiée de la responsabilité des contrôles prévus sous b) pour les spécialités importées et destinées à rester dans cet État membre lorsque des arrangements appropriés sont intervenus avec le pays exportateur assurant que ces contrôles ont été effectués dans ce pays. Lorsque ces spécialités sont importées conditionnées pour la vente au détail, les États membres peuvent prévoir des exceptions aux exigences prévues à l'article 17.

2. Dans tous les cas, et notamment lorsque les spécialités pharmaceutiques sont livrées à la vente, la personne qualifiée doit attester que chaque lot de fabrication répond aux dispositions du présent article, sur un registre ou document équivalent prévu à cet effet ; ledit registre ou document équivalent doit être tenu à jour au fur et à mesure des opérations effectuées et mis à la disposition des agents de l'autorité compétente pendant une période respectant les dispositions de l'État membre concerné et au moins pendant une période de 5 ans.

Article 23

Les États membres assurent que la personne qualifiée visée à l'article 21 répond aux conditions minimales de qualification suivantes: a) Possession d'un diplôme, certificat ou autre titre sanctionnant un cycle de formation universitaire - ou un cycle de formation reconnu équivalent par l'État membre intéressé - s'étendant sur une durée minimale de 4 années d'enseignement théorique et pratique dans l'une des disciplines scientifiques suivantes :

pharmacie, médecine, médecine vétérinaire, chimie, chimie et technologie pharmaceutiques, biologie. Toutefois: - la durée minimale du cycle de formation universitaire peut être de 3 ans et demi lorsque le cycle de formation est suivi d'une période de formation théorique et pratique d'une durée minimale d'un an et comportant un stage d'au moins six mois dans une officine ouverte au public, sanctionnée par un examen de niveau universitaire;

- lorsque, dans un État membre, coexistent deux cycles de formation universitaire ou reconnus équivalents par cet État dont l'un s'étend sur 4 années et l'autre sur 3 années, le diplôme, certificat ou autre titre sanctionnant le cycle de formation universitaire - ou reconnu équivalent - de trois ans est considéré comme remplissant la condition de durée visée sous a) pour autant que les diplômes, certificats ou autres titres sanctionnant les deux cycles de formation soient reconnus équivalents par cet État.

Le cycle de formation comporte un enseignement théorique et pratique portant au moins sur les matières de base suivantes: - physique expérimentale,

- chimie générale et inorganique,

- chimie organique,

- chimie analytique,

- chimie pharmaceutique, y compris l'analyse des médicaments,

- biochimie générale et appliquée (médicale),

- physiologie,

- microbiologie,

- pharmacologie,

- technologie pharmaceutique,

- toxicologie,

- pharmacognosie (matière médicale) (étude de la composition et des effets des principes actifs de substances naturelles d'origine végétale ou animale).

L'enseignement de ces matières doit être dosé de façon à permettre à l'intéressé d'assumer les obligations spécifiées à l'article 22.

Dans la mesure où certains diplômes, certificats ou autres titres énumérés sous a) ne respectent pas les critères fixés ci-dessus, l'autorité compétente de l'État membre s'assure que l'intéressé fait la preuve de connaissances satisfaisantes dans les matières en cause.

b) Exercice pendant au moins 2 ans, dans une ou plusieurs entreprises ayant obtenu une autorisation de fabrication, des activités d'analyse qualitative des médicaments, d'analyse quantitative des principes actifs ainsi que d'essais et vérifications nécessaires pour assurer la qualité des spécialités.

La durée de l'expérience pratique peut être diminuée d'une année lorsque le cycle de formation universitaire s'étend sur une durée d'au moins 5 ans et d'un an et demi lorsque ce cycle de formation s'étend sur une durée d'au moins 6 ans.

Article 24

1. Une personne exerçant dans un État membre les activités de la personne visée à l'article 21 au moment de la mise en application de la présente directive dans cet État, sans répondre aux dispositions de l'article 23, est qualifiée pour continuer à exercer ces activités dans cet État.

2. Le titulaire d'un diplôme, certificat ou autre titre, sanctionnant un cycle de formation universitaire - ou un cycle de formation reconnu équivalent par l'État membre intéressé - dans une discipline scientifique qui l'habilite à exercer les activités de la personne visée à l'article 21, conformément à la législation de cet État, peut - lorsqu'il a commencé sa formation avant la notification de la présente directive - être considéré comme qualifié pour assumer dans cet État la charge de la personne visée à l'article 21 à condition d'avoir au préalable exercé, avant la fin de la dixième année suivant la notification de la présente directive, pendant au moins 2 ans, dans une ou plusieurs entreprises ayant obtenu une autorisation visée à l'article 16, des activités de surveillance de production et/ou des activités d'analyse qualitative, d'analyse quantitative des principes actifs ainsi que d'essais et vérifications nécessaires pour assurer la qualité des spécialités sous l'autorité directe d'une personne visée à l'article 21.

Lorsque l'intéressé a acquis l'expérience pratique visée au premier alinéa plus de 10 ans avant la notification de la présente directive, il est exigé une année supplémentaire d'expérience

pratique répondant aux conditions visées au premier alinéa et effectuée immédiatement avant l'exercice de ces activités.

3. Une personne qui, au moment de la mise en application de la présente directive, exerce en collaboration directe avec une personne visée à l'article 21, des activités de surveillance de production et/ou des activités d'analyse qualitative, d'analyse quantitative des principes actifs ainsi que d'essais et vérifications nécessaires pour assurer la qualité des spécialités, peut - pendant une période de cinq ans après la mise en application de la présente directive - être considérée comme qualifiée pour assumer dans cet État la charge de la personne visée à l'article 21, à condition que l'État membre s'assure que la personne fait la preuve de connaissances théoriques et pratiques satisfaisantes et qu'elle a exercé lesdites activités pendant 5 ans au moins.

Article 25

Les États membres assurent le respect des obligations de la personne qualifiée visée à l'article 21 par des mesures administratives appropriées, ou par la soumission à une discipline professionnelle.

Les États membres peuvent prévoir la suspension temporaire de cette personne dès l'ouverture d'une procédure administrative ou disciplinaire à son encontre pour manquement à ses obligations.

CHAPITRE V Surveillance et sanctions

Article 26

L'autorité compétente de l'État membre concerné s'assure, par des inspections, que les prescriptions légales concernant les spécialités pharmaceutiques sont respectées.

Ces inspections sont effectuées par des agents de l'autorité compétente qui doivent être habilités à: a) procéder à des inspections des établissements de fabrication et de commerce ainsi que des laboratoires chargés, par le titulaire de l'autorisation visée à l'article 16, d'effectuer des contrôles en vertu de l'article 5 sous b);

b) prélever des échantillons;

c) prendre connaissance de tous les documents se rapportant à l'objet des inspections, sous réserve des dispositions en vigueur dans les États membres au moment de la notification de la présente directive, qui limitent cette faculté en ce qui concerne la description du mode de préparation.

Article 27

Les États membres prennent toutes les dispositions utiles pour que le responsable de la mise sur le marché et, le cas échéant, le titulaire de l'autorisation visée à l'article 16 justifient de l'exécution des contrôles pratiqués sur le produit fini et/ou sur les composants et les produits intermédiaires de la fabrication, selon les méthodes retenues pour l'autorisation de mise sur le marché.

Article 28

1. Sans préjudice des mesures prévues à l'article 11 de la directive 65/65/CEE, les États membres prennent toutes les dispositions utiles pour que la délivrance de la spécialité pharmaceutique soit interdite et que cette spécialité soit retirée du marché lorsque: a) il apparaît que la spécialité est nocive dans les conditions normales d'emploi;

b) l'effet thérapeutique de la spécialité fait défaut;

c) la spécialité n'a pas la composition qualitative et quantitative déclarée;

d) les contrôles sur le produit fini et/ou sur les composants et les produits intermédiaires de la fabrication n'ont pas été effectués ou lorsqu'une autre exigence ou obligation relative à l'octroi de l'autorisation prévue à l'article 16 n'a pas été respectée.

2. L'autorité compétente peut limiter l'interdiction de délivrance et le retrait du marché aux seuls lots de fabrication faisant l'objet d'une contestation.

Article 29

1. L'autorité compétente d'un État membre suspend ou retire l'autorisation visée à l'article 16 pour une catégorie de préparations ou pour l'ensemble de celles-ci lorsqu'une des exigences prévues à l'article 17 n'est plus respectée.

2. L'autorité compétente d'un État membre, outre les mesures prévues à l'article 28, peut soit suspendre la fabrication ou l'importation de spécialités pharmaceutiques en provenance de

pays tiers, soit suspendre ou retirer l'autorisation visée à l'article 16 pour une catégorie de préparations ou pour l'ensemble de celles-ci en cas de non-respect des articles 18, 19, 22 et 27.

CHAPITRE VI Dispositions diverses

Article 30

Les États membres prennent toutes les dispositions utiles pour que les autorités compétentes concernées se communiquent mutuellement les informations appropriées pour garantir le respect des exigences retenues pour l'autorisation visée à l'article 16 ou pour l'autorisation de mise sur le marché.

Article 31

Toute décision prise en vertu des articles 18, 28 et 29, ainsi que toute décision négative prise en application de l'article 5 sous b) et de l'article 11 paragraphe 3 doivent être motivées de façon précise. Elles sont notifiées à l'intéressé avec l'indication des moyens de recours prévus par la législation en vigueur et du délai dans lequel le recours peut être présenté.

Article 32

Toute décision de suspension de fabrication ou d'importation de spécialités pharmaceutiques en provenance de pays tiers, d'interdiction de délivrance et de retrait du marché d'une spécialité ne peut être prise que pour des raisons énumérées aux articles 28 et 29.

Article 33

Chaque État membre prend toutes les dispositions utiles pour que les décisions d'autorisation, de mise sur le marché, de refus ou de retrait d'autorisation de mise sur le marché, d'annulation de décision de refus ou de retrait d'autorisation de mise sur le marché, d'interdiction de délivrance, de retrait du marché et leurs motifs soient immédiatement portés à la connaissance du comité.

Article 34

La présente directive ne s'applique qu'aux spécialités pharmaceutiques à usage humain.

Les chapitres II à V de la directive 65/65/CEE et la présente directive ne sont pas applicables aux spécialités pharmaceutiques consistant en vaccins, toxines ou sérums, ni aux spécialités pharmaceutiques à base de sang humain ou de composants de sang ou d'isotopes radioactifs, ni aux spécialités homéopathiques. Une énumération indicative de ces vaccins, toxines ou sérums, figure en annexe.

Article 35

Le texte de l'article 4 deuxième alinéa point 7 de la directive 65/65/CEE est remplacé par le texte suivant:

«Description des méthodes de contrôle utilisées par le fabricant (analyse qualitative et quantitative des composants et du produit fini, essais particuliers, par exemple, essais de stérilité, essais pour la recherche des substances pyrogènes, recherche des métaux lourds, essais de stabilité, essais biologiques et de toxicité, contrôles sur les produits intermédiaires de la fabrication).»

Article 36

Le texte de l'article 11 deuxième alinéa de la directive 65/65/CEE est remplacé par le texte suivant:

«L'autorisation sera également suspendue ou retirée lorsqu'il sera reconnu que les renseignements figurant dans le dossier, en vertu de l'article 4, sont erronés ou lorsque les contrôles visés à l'article 8 de la présente directive ou à l'article 27 de la deuxième directive 75/319/CEE du Conseil, du 20 mai 1795, concernant le rapprochement des dispositions législatives, réglementaires et administratives relatives aux spécialités pharmaceutiques (1), (La note suivante est ajoutée) : n'ont pas été effectués.»

Article 37

Le texte de l'article 24 de la directive 65/65/CEE est remplacé par le texte suivant:

«La réglementation prévue par la présente directive sera progressivement appliquée aux spécialités ayant reçu l'autorisation de mise sur le marché en vertu des dispositions antérieures, dans les délais et les conditions prévus à l'article 39 paragraphes 2 et 3 de la deuxième directive 75/319/CEE.»

CHAPITRE VII Dispositions d'application et mesures transitoires

Article 38

Les États membres mettent en vigueur les dispositions législatives, réglementaires et administratives nécessaires pour se conformer à la présente directive dans un délai de dix-huit mois à compter de sa notification et en informent immédiatement la Commission.

Les États membres communiquent à la Commission le texte des dispositions essentielles de droit interne qu'ils adoptent dans le domaine régi par la présente directive.

Article 39

1. Pour ce qui est des autorisations visées à l'article 16 et délivrées avant l'expiration du délai fixé à l'article 38, les États membres peuvent accorder aux entreprises intéressées un délai supplémentaire d'un an pour se conformer aux dispositions du chapitre IV.

2. Les autres dispositions de la présente directive sont progressivement appliquées aux spécialités pharmaceutiques mises sur le marché, en vertu des dispositions antérieures, dans un délai de 15 ans à compter de la notification visée à l'article 38.

3. Les États membres communiquent à la Commission, dans les 3 ans à compter de la notification de la présente directive, le nombre des spécialités pharmaceutiques qui relèvent du paragraphe 2 et, chaque année qui suit, le nombre de ces spécialités pour lesquelles l'autorisation de mise sur le marché visée à l'article 3 de la directive 65/65/CEE n'a pas encore été délivrée.

Article 40

Les États membres sont destinataires de la présente directive.

Fait à Bruxelles, le 20 mai 1975.

Par le Conseil

Le président

R. RYAN (1) JO nº L 147 du 9.6.1975, p. 13.»

ANNEXE

Les termes «vaccins, toxines ou sérums» figurant à l'article 34 recouvrent notamment: - les agents utilisés en vue de provoquer une immunité active

(tels que le vaccin anticholérique, le BCG, le vaccin antipoliomyélitique, le vaccin antivariolique),

- les agents utilisés en vue de diagnostiquer l'état d'immunité,

comprenant notamment la tuberculine ainsi que la tuberculine PPD, les toxines utilisées pour les tests de Schick et de Dick, la brucelline,

- les agents utilisés en vue de provoquer une immunité passive

(tels que l'antitoxine diphtérique, la globuline antivariolique, la globuline antilymphocytique).

R.J. n°2
(J.O. du 20/12/1984)

Annexe 2-10 2.

MINISTÈRE DES AFFAIRES SOCIALES ET DE LA SOLIDARITÉ NATIONALE

Avis aux fabricants de spécialités pharmaceutiques relatif à l'application de l'article 39 (point 2) de la directive 75-319 C.E.E.

VALIDATION DES SPECIALITES PHARMACEUTIQUES

Cet avis remplace l'avis n° 22 690 publié au *Bulletin officiel* du ministère de la solidarité nationale SN-S 82-13.

Les titulaires d'autorisation (visa ou A.M.M. délivrés antérieurement au 1er décembre 1976) doivent effectuer la validation de leurs spécialités conformément à l'article 39 (point 2) de la directive 75-319 C.E.E. du 20 mai 1975 ; ils ont à fournir, auprès de la direction de la pharmacie et du médicament (secrétariat d'Etat chargé de la santé), 1, place Fontenoy, 75700 Paris, soit une demande de transformation de visa en A.M.M., soit une demande de validation d'A.M.M., selon le schéma défini ci-dessous, ou à indiquer qu'ils ne souhaitent pas cette transformation ou cette validation.

L'opération générale de validation des spécialités pharmaceutiques s'effectuera par classe pharmacothérapeutique à partir du 1er janvier 1985. Les délais de dépôt de dossier devront être expressément respectés, sous peine de forclusion.

Les premiers dossiers, appartenant aux classes suivantes, doivent être déposés entre le 1er janvier 1985 et le 30 juin 1985 :

- antivitamines K, héparines injectables, antiangoreux, antiarythmiques, antihypertenseurs, bétabloquants, hypolipémiants, glucosides cardiotoniques, diurétiques, sédatifs cardiaques, cardio-accélérateurs (antibradycardisants), analeptiques cardiovasculaires ;
- médicaments ophtalmologiques antiglaucomateux et mydriatiques.

Liste des documents à fournir

1. Lettre de demande

Elle devra indiquer notamment :

- numéro de dossier ;
- date d'octroi du visa et de ses rectificatifs ; date et numéro d'enregistrement définitif de la demande de transformation en autorisation de mise sur le marché,

ou,

- date d'octroi de l'autorisation de mise sur le marché, de ses rectificatifs et de ses renouvellements quinquennaux ;
- lieu de fabrication (1), de conditionnement, de contrôle ;
- composition intégrale qualitative et quantitative en principes actifs et en constituants de l'excipient.

2. Résumé des caractéristiques du produit

Il doit comprendre les informations suivantes :

- dénomination de la spécialité et forme pharmaceutique ; (s'il y a lieu, la dénomination commune internationale lorsqu'elle existe, ou celle de la pharmacopée française ou européenne ;
- nom ou raison sociale et domicile ou siège social du titulaire de l'autorisation de mise sur le marché ;
- composition qualitative et quantitative en principes actifs et en constituants de l'excipient dont la connaissance est nécessaire à une bonne administration du médicament ;
- nature et contenance du (des) récipient(s) destiné(s) à la vente (préciser le numéro attribué par le C.I.P.) ;
- condition de délivrance au public, réserve à l'usage hospitalier, à l'usage professionnel ;
- durée de stabilité, si nécessaire après reconstitution du produit, ou lorsque le récipient est ouvert pour la première fois ;
- précautions particulières de conservation ;
- incompatibilités majeures chimiques ou physiques ;
- propriétés pharmacologiques et, dans la mesure où ces renseignements sont utiles pour l'utilisation thérapeutique, éléments de pharmacocinétique ;
- indications thérapeutiques ;
- effets indésirables (fréquence et gravité) ;
- mises en garde spéciales ;
- contre-indications ;
- précautions particulières d'emploi, notamment en cas de grossesse et d'allaitement, d'utilisation par des enfants, des personnes âgées, et dans des circonstances pathologiques particulières et effets sur la capacité de conduire et l'usage des machines ;
- interactions médicamenteuses et autres ;
- posologie et mode d'administration ;
- surdosage (symptômes, conduite d'urgence, antidotes) ;
- date d'établissement du résumé des caractéristiques du produit.

3. Proposition du libellé de l'information au public

4. Dossier présenté à l'appui de la demande

Il doit comprendre :

- un chèque de 1 000 francs ;
- la photocopie des pièces administratives ;
- un document de synthèse en 20 exemplaires comprenant des renseignements pharmaceutiques, toxicologiques, pharmacologiques et cliniques. Ce document mentionne les éléments du dossier primitif et les informations complémentaires (2) dont dispose l'industriel pour chaque partie du dossier ; sont précisés les noms des experts, le lieu et la date des études effectuées et toutes les informations permettant d'apprécier, pour le médicament dont il s'agit, son niveau d'efficacité et de sécurité dans des conditions normales d'emploi pour les indications revendiquées, compte tenu des données et des connaissances disponibles sur la base des travaux expérimentaux et/ou de l'expérience acquise à leur sujet (notamment données de pharmacovigilance, de consommation globale du produit, utilisation dans d'autres pays...) ;
- un dossier pharmaceutique actualisé (3).

(1) Préciser le nom et l'adresse du fabricant si le titulaire ne fabrique pas la spécialité.

(2) Adresser comme il est prévu pour les dossiers d'autorisation de mise sur le marché à la direction de la pharmacie et du médicament deux exemplaires des éléments bibliographiques pertinents et des travaux expérimentaux.

(3) Le dossier pourra être remplacé :

a) En cas de mise à jour récente ayant reçu l'aval de la direction de la pharmacie et du médicament, par une note y faisant référence.

b) En cas de demande de modification de formule, par une demande de dispense motivée conforme à l'article R. 5133 *a* du code de la santé publique.

Dans les autres cas, adresser le dossier pharmaceutique comme il est prévu pour les dossiers d'autorisation de mise sur le marché :

- deux exemplaires à la direction de la pharmacie et du médicament ;
- un exemplaire au Laboratoire national de la santé, 25, boulevard Saint-Jacques, 75014 Paris ;
- un exemplaire au Laboratoire national de la santé, 14, rue de l'Ecole-de-la-Pharmacie, 34000 Montpellier ;
- un exemplaire à l'inspection régionale de la pharmacie du lieu de fabrication.

- **AVIS** aux fabricants de spécialités pharmaceutiques relatif à l'application de l'article 39 (point 2) de la directive 75/319/CEE - Validation des spécialités pharmaceutiques (J.O. du 4 juin 1985).

Cet avis fait suite à l'avis paru au
Journal Officiel du 20 décembre 1984.

Les titulaires d'autorisation (visa ou autorisation de mise sur le marché délivrés antérieurement au 1er décembre 1976) doivent effectuer la validation de leurs spécialités conformément à l'article 39 (point 2) de la directive 75/319/CEE du 20 mai 1975 ; ils ont à fournir, auprès de la direction de la pharmacie et du médicament (secrétariat d'Etat chargé de la santé), 1, place Fontenoy, 75007 Paris, soit une demande de transformation de visa en autorisation de mise sur le marché, soit une demande de validation d'autorisation de mise sur le marché, selon le schéma défini dans l'avis du 20 décembre 1984, ou à indiquer qu'ils ne souhaitent pas cette transformation ou cette validation.

Les dossiers appartenant aux classes pharmacothérapeutiques suivantes doivent être déposés entre le 1er juillet et le 31 décembre 1985 :

Les médicaments de neurologie et de psychiatrie

Avec en particulier : les antimigraineux, les antiparkinsoniens, les antiépileptiques, les antimyasthéniques, les sédatifs (barbituriques et autres), les hypnotiques (barbituriques et autres), les neuroleptiques, les anxiolytiques, les psycho-stimulants, les antidépresseurs et les normothymiques.

Sont exclus :

- les anesthésiques locaux et généraux ;
- les antalgiques ;
- parmi les psychostimulants : les médicaments à visée antiasthénique ;
- les médicaments vasodilatateurs et anti-ischémiques.

VALIDATION DES SPECIALITES PHARMACEUTIQUES

La validation des spécialités pharmaceutiques se fera selon le calendrier qui suit.

Il est rappelé que la validation porte sur les indications thérapeutiques ; donc une spécialité revendiquant plusieurs indications, appartenant à différentes classes pharmacothérapeutiques, sera étudiée avec chacune des classes concernées au plan des indications.

Troisième tranche : janvier à juin 1986

Les médicaments utilisés en médecine cardio-vasculaire (ceux non appelés au cours de la 1ère tranche), les médicaments de l'hémostase et les anorexigènes.

Cardiovasculaires :

Vasodilatateurs et antiischémiques, vasculoprotecteurs et veinotoniques, topiques en phlébologie et sclérosants veineux.

Potassium et antihyperkaliémiques.

Hémostase :

Hémostatiques généraux et locaux, thrombolytiques, antifibrinolytiques, antiagrégants plaquettaires, vitamines K et divers.

Anorexigènes.

Quatrième tranche : juillet à décembre 1986

Gastro-entérologie :

Antihistaminiques H_1, antiacides et protecteurs gastriques, antireflux gastro-oesophagien, antiulcéreux divers, anesthésiques de contact, adsorbants, antiflatulents et protecteurs intestinaux, antimétéoriques divers, antispasmodiques, antisécrétoires, épaississants antiémétisants, enzymes digestives, acidifiants gastriques et stimulants sécrétoires, péristaltigènes intestinaux, antidiarrhéiques, topiques en proctologie, divers.

Hépatologie :

Cholagogues et cholérétiques seuls ou associés, hépatotropes, antilithiasiques, divers.

Cinquième tranche : janvier à juin 1987

Ophtalmologie :

Anti-infectieux locaux seuls ou associés et corticoïdes locaux.
Antiseptiques (seuls ou associés) en ophtalmologie.

Glucocorticoïdes oraux et injectables et ACTH.

Infections :

Substances antibactériennes à usage général, anti-infectieux urinaires, antiseptiques (seuls ou associés) intestinaux et urinaires, antibiotiques et anticandidosiques intestinaux, associations d'antibiotiques, sulfamides généraux, antibactériens divers, antifongiques systémiques, anti-tuberculeux, antilépreux, antiviraux.

Sixième tranche : sauf exception, jusqu'au 30 juin 1988

Gastro-entérologie :

Laxatifs (reportée au 30 mars 1988).

Pneumologie :

Bronchodilatateurs et antiasthmatiques, analeptiques respiratoires, produits bronchopulmonaires, mucomodificateurs bronchiques, divers produits pour inhalations, produits à usage externe, immunothérapie.

Rhinologie :

Anticoryza par voie générale, produits locaux, immunothérapie, divers.

Ophtalmologie :

Anesthésiques locaux, produits pour le cristallin.

Otologie :

Céruménolytiques, autres produits locaux, produits généraux, antiémétiques, antinauséeux, antinaupathiques et antivertigineux.

Stomatologie :

Produits locaux gingivodentaires et buccopharyngés, produits bismuthés (angines), divers.

Allergologie :

- **AVIS aux fabricants** de spécialités pharmaceutiques relatif à l'application de l'article 39 (point 2) de la directive 75/319/CEE (J.O. du 5 juillet 1985)
  modifié par :
  - Avis aux fabricants (J.O. du 29 janvier 1986)
  - Avis aux fabricants (J.O. du 31 mai 1986)
  - Avis aux fabricants (J.O. du 20 novembre 1986)
  - Avis aux fabricants J.O. du 21 mars 1987)
  - Avis aux fabricants (J.O. du 22 mai 1987)
  - Avis aux fabricants (J.O. du 8 novembre 1987)
  - Avis aux fabricants (J.O. du 15 mars 1988)
  - Avis aux fabricants (J.O. du 3 août 1988)
  - Avis aux fabricants (J.O. du 22 décembre 1988)
  - Avis aux farications (J.O. du 2 mai 1989)
  - Avis aux fabricants (J.O. du10 août 1989).

Antihistaminiques, divers.

Produits dentaires : (reporté avec la 9e tranche - décembre 1989)

Septième tranche : mars 1989

Pneumologie :

Antitussifs.

Dermatologie :

Corticoïdes seuls ou associés, antibiotiques seuls ou associés, antifongiques seuls ou associés, antiherpétiques, antiviraux, antiséborrhéiques, antiacnéiques, antialopéciques, trophiques des ongles, antisénescents cutanés, réducteurs, kératolytiques, antiverrues, antimétabolites locaux, antihistaminiques, anesthésiques de surface seuls ou associés, antiprurigineux, anhidrotiques, enzymes protéolytiques, cicatrisants, antisclérodermiques, photosensibilisants, dépigmentant, antidyschromique, caroténoïdes, radioprotecteurs, antiérythrose, anticouperose, topiques divers, .

Spécialités à base de principes actifs d'origine végétale revendiquant une indication thérapeutique liée à leur utilisation traditionnelle.

Huitième tranche : décembre 1989

Rhumatologie :

Corticoïdes injectables intra-articulaires, anti-inflammatoires non stéroïdiens, antirhumatismaux divers, calcitonine, antipagétiques, vitamine D, myorelaxants, médications phospho-calciques, analgésiques et antirhumatismaux externes, enzymes anti-inflammatoires et antioedémateuses, antigoutteux, divers.

Douleurs :

Analgésiques généraux, analgésiques du tableau B et inhibiteurs.

Anesthésiologie :

Anesthésiques généraux, anesthésiques locaux et vaginaux, anesthésiques locaux à usage dentaire, analgésiques pour anesthésie, curarisants, divers.

Antipyrétiques.

Gynécologie :

Contraceptifs locaux, anti-infectieux locaux (non encore appelés) et généraux, antiseptiques (seuls ou associés), ocytociques et hémostatiques utérins, utérorelaxants, divers.

Endocrinologie :

Antidiabétiques et hyperglycémiants, anabolisants stéroïdiens, hormones hypothalamiques et hypophysaires, inducteurs de l'ovulation, modérateurs hypophysaires, antigonadotropes, antiprolactines, androgènes, antiandrogènes, oestrogènes, antioestrogènes, contraceptifs oraux, oestroprogestatifs, progestatifs, associations d'hormones sexuelles, minéralo-corticoïdes, anticortisolique, hormones thyroïdiennes, extraits thyroïdiens et produits iodés, antithyroïdiens, opothérapie.

Uronéphrologie :

Epuration extrarénale, acidifiants urinaires, alcalinisants urinaires, diurétiques osmotiques, diurétiques divers (non encore appelés), sédatifs urinaires pelviens, produits proposés dans l'adénome prostatique antiénurétiques, vasodilatateurs génitaux, divers.

Neuvième tranche : 10 juin 1990

Parasitologie :

Antiamibiens, antihelminthiques, antipaludéens, antileshmaniens, antitrypanosomes, antiparasitaires externes.

Hématologie :

Antianémiques, antileucopéniques.

Cancérologie :

Cytostatiques, immunostimulants, immunodépresseurs.

Ophtalmologie :

Larmes artificielles, produits locaux divers, produits généraux divers et tout autre produit d'ophtalmologie.

Métabolisme - nutrition - vitamines :

Psychostimulant à visée antiasthénique, antiobésité, et désinfiltrants, orexigènes, vitamines A, B1, B2, B5, B6, B12, B associées, C, E, H, H', PP, polyvitamines, associations diverses de vitamines, produits d'apports énergétiques, plastiques, minéraux, vitaminiques (sauf ceux concernant le métabolisme phosphocalcique).

Alimentation parentérale :

Solutés divers pour perfusions et succédanés du plasma.

Toxicologie :

Emétique, chélateurs et antidotes (sauf inhibiteurs de la morphine et de l'héparine), désintoxication alcoolique, désintoxication tabagique.

Produits de diagnostic :

Opacifiants iodés, opacifiants barytés, produits divers.

Diététique pharmaceutique :

Substituts du sucre et du sel, laits, divers.

Produits dentaires :

Produits pour la chirurgie orale et la parodontie, produits de prophylaxie des affections bucco-dentaires, produits pour l'endodontie et produits divers, anesthésiques locaux à usage dentaire.

Des précisions complémentaires seront apportées si besoin est au moment de l'appel de chaque tranche.

P.J. n°5

- **NOTE de la Direction de la Pharmacie et du Médicament**, du 30 janvier 1985.

Annexe 2-10

VALIDATION
PRINCIPES GENERAUX
ETABLISSEMENT DE LA PROCEDURE

L'opération dite "de validation" ou de réévaluation des spécialités pharmaceutiques mises sur le marché antérieurement aux directives européennes doit être effectuée.

C'est une obligation réglementaire prise en application de (point 2) nos engagements internationaux dans le cadre du Traité de Rome (Article 39 de la directive 75/319/CEE du 20 mai 1975).

I - L'OBJECTIF

L'obligation juridique rejoint celle qui s'impose à nous sur le plan de la santé publique : une mise à jour des dossiers de fabrication et du contrôle de qualité des produits ainsi que d'une réévaluation en fonction de la progression des connaissances toxicologiques, pharmacologiques, cliniques des différents médicaments et de l'apport de connaissances médicales nouvelles.

La validation apparaît comme une opération nationale de santé publique et de qualité du médicament français basée sur une réflexion et des arguments objectifs.

La validation ne doit pas être l'occasion d'une remise en cause du niveau scientifique et technique d'évaluation sur lequel est fondé l'octroi des nouvelles autorisations de mise sur le marché.

Elle doit au contraire être l'occasion d'un approfondissement de la réflexion sur les niveaux d'exigences requis, en fonction de chaque type de médicament.

Elle aura des conséquences sur la politique du médicament et la régularisation du marché.

Il sera maintenu sur le marché des médicaments :

- à efficacité démontrée ;
- à efficacité suffisamment justifiée (1) ;

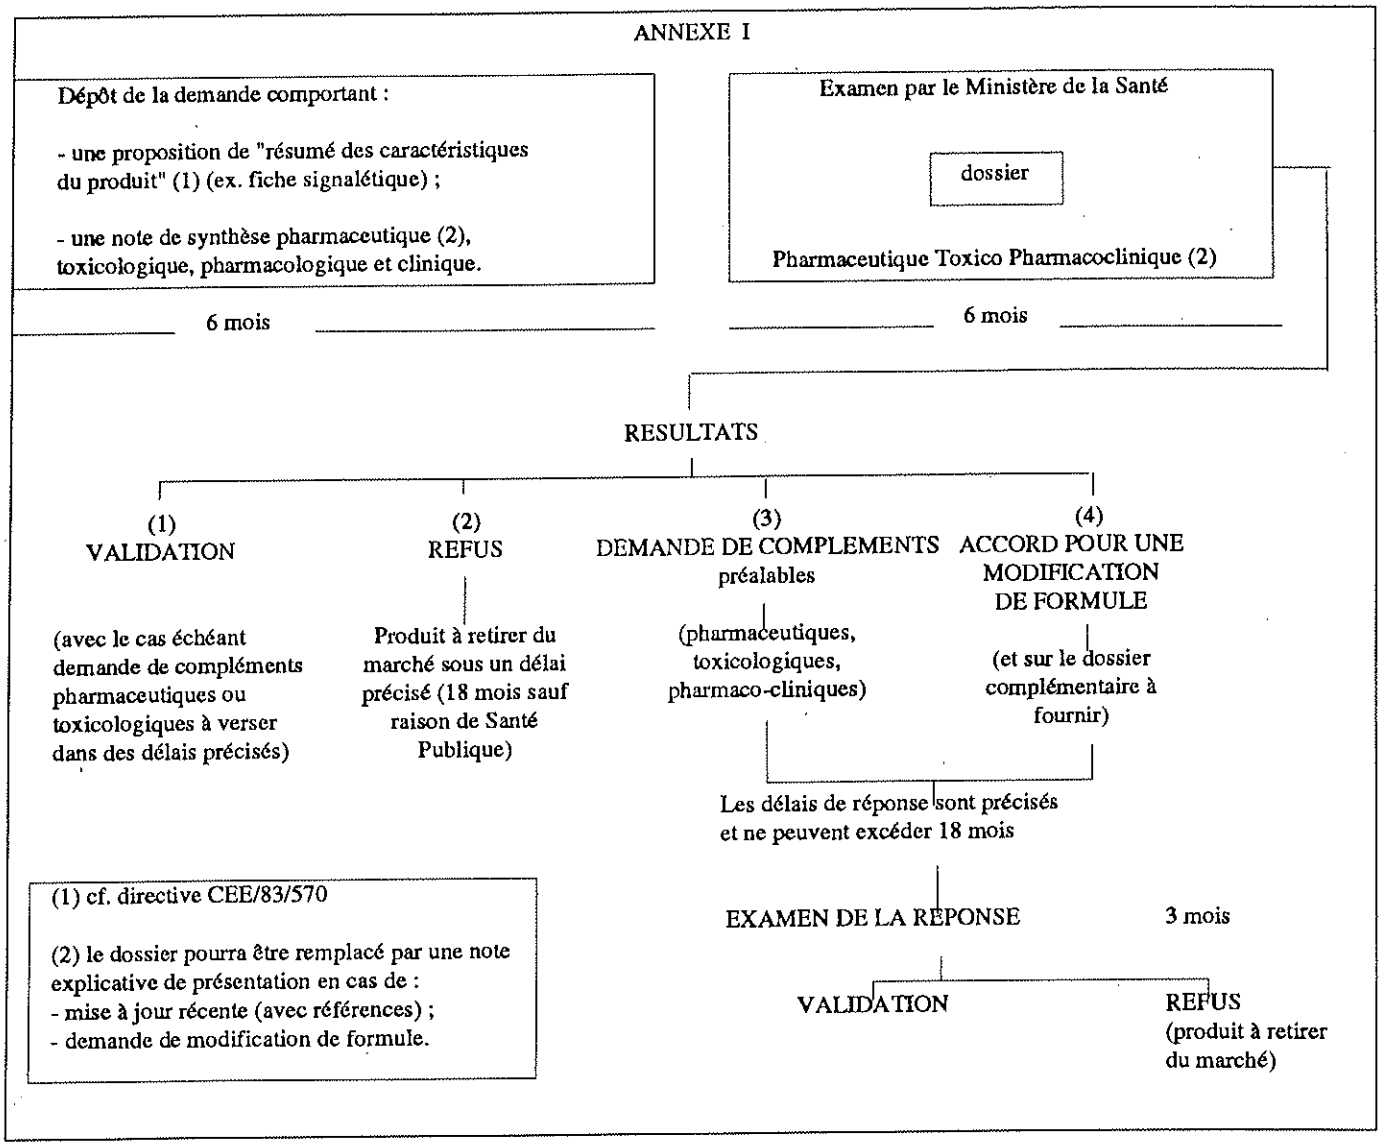
et ayant un rapport bénéfice/risque positif (2).

En conséquence, trois niveaux d'indications thérapeutiques seront acceptés (voir plus loin).

---

(1) Voir article 5 de la directive CEE/65/65 qui prévoit que l'autorisation de mise sur le marché est refusée ... "lorsque l'effet thérapeutique fait défaut ou est insuffisamment justifié".

(2) Voir directive CEE/75/318, 3e partie, chapitre III-I, modifié par la directive CEE/83/570.



Il sera aussi accepté ou demandé des modifications (qualitatives et quantitatives) de formules de certaines spécialités pour leur permettre de correspondre à la définition ci-dessus.

2 - LA VALIDATION DOIT ETRE REALISTE

Elle doit permettre d'offrir aux utilisateurs, les médicaments les mieux adaptés à leur intérêt et à leurs besoins, ceci sans coût indu pour les fabricants et pour la Communauté nationale.

Ceci conduit à estimer que des médicaments actuellement sur le marché seront validés sous réserve dans certains cas :

- d'une mise à jour si besoin du dossier pharmaceutique ;
- que les indications thérapeutiques et la posologie soient éventuellement précisées.

L'appréciation de l'innocuité sera effectuée en prenant en compte les éléments de toxicologie expérimentale prévus par les directives que la firme pharmaceutique aura apportés, ainsi que des observations de pharmacovigilance rendues disponibles.

Toutefois, certains médicaments actuellement sur le marché devront être retirés (sécurité non assurée au regard des connaissances actuelles, principes actifs mal définis, associations illogiques, dosages mal adaptés à la posologie ...) ; cependant dans certains des cas évoqués ci-dessus, des modifications de formule ou de présentation pourront être envisagées.

Les firmes seront donc appelées à déposer une note de synthèse pharmaceutique, toxicologique, pharmacologique et clinique constituant une sorte de carte d'identité de leurs produits (cf. avis aux fabricants de spécialités pharmaceutiques relatif à l'application de l'article 39 (point 2) de la directive 75-319/CEE publié au J.O. du 20 décembre 1984).

3 - LE CRITERE PREMIER DETERMINANT DE LA VALIDATION OU DE LA NON-VALIDATION SERA CLINIQUE

Pour éviter un gaspillage de temps et d'argent, notamment pour les spécialités dont la formule devra être modifiée, l'examen des dossiers complets pourra être effectué en étapes successives (voir schéma en annexe I) :

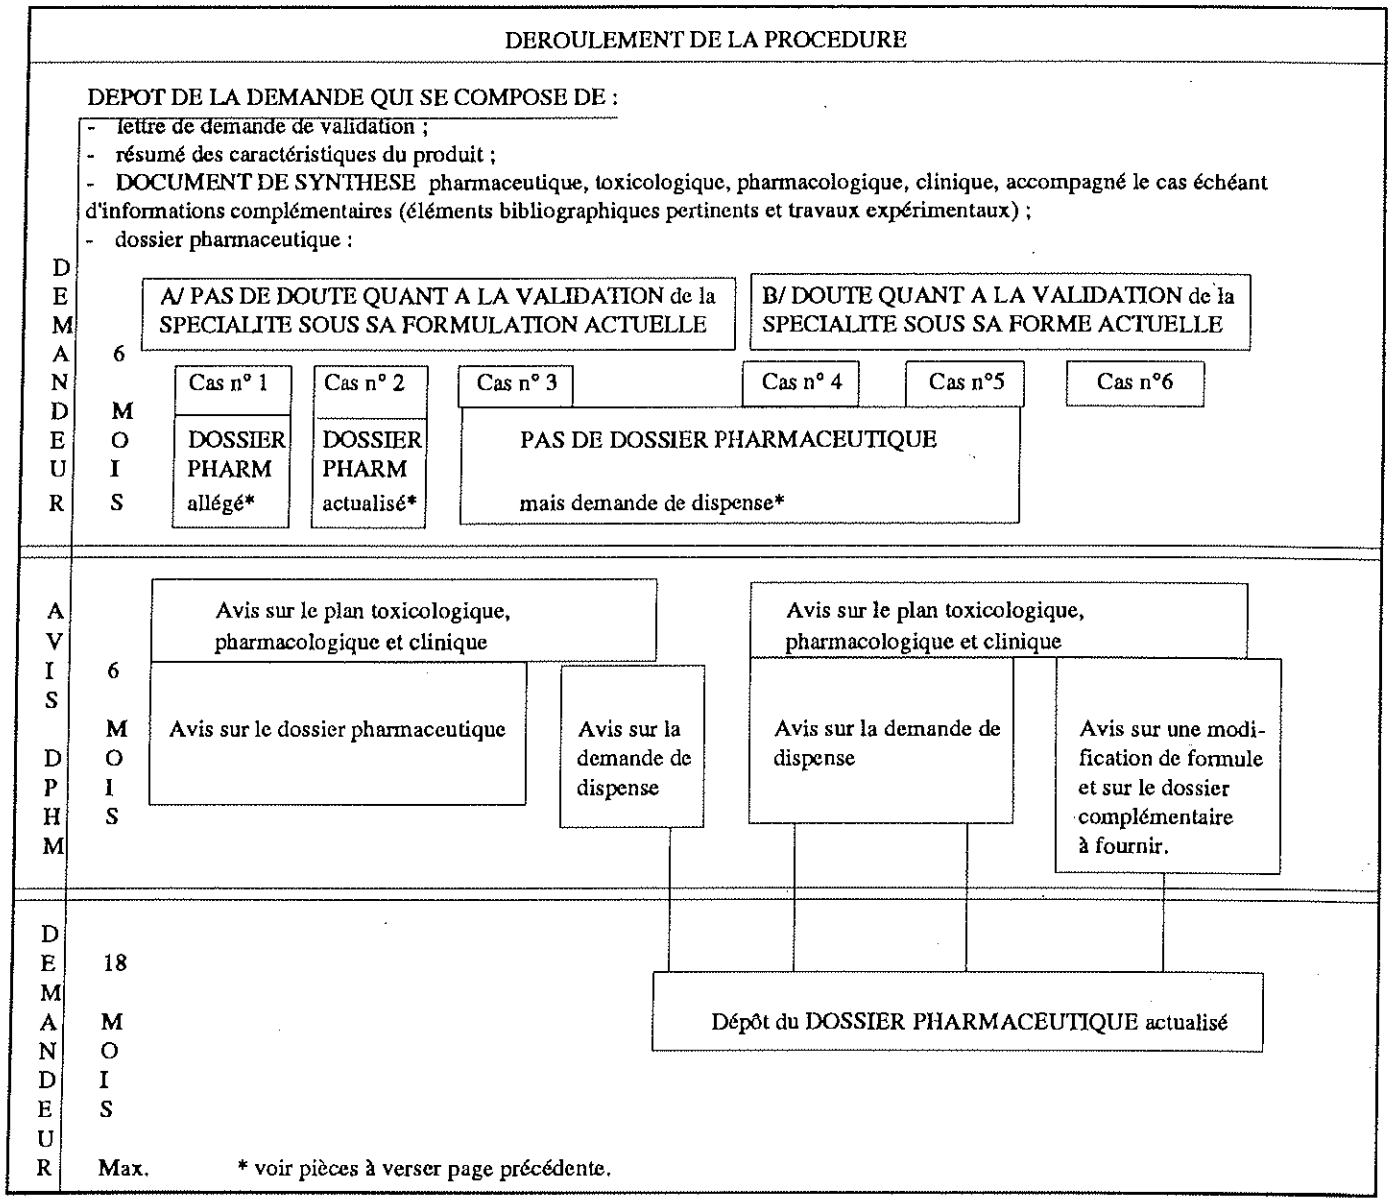
3.1. Prise de position sur le dossier clinique (efficacité, intérêt thérapeutique)

3.1.1. - Bases de travail

L'efficacité et la sécurité, dans les conditions normales d'emploi et dans les indications revendiquées seront appréciées indication par indication compte tenu :

- des données et connaissances disponibles sur la base des travaux expérimentaux : dans ce cadre, la présentation des éléments bilbliographiques est importante ;
- et/ou de l'expérience acquise à leur sujet.

Dans cette optique, les travaux de réflexion et de révision de la



Commission de Révision des Dictionnaires de Spécialités Pharmaceutiques seront très largement pris en compte.

Toutefois, ils ont été menés dans un but différent de celui d'une validation et quelques aménagements devront être envisagés, dans des cas ponctuels, au coup par coup ; en outre, certaines mises à jour des monographies étoilées pourront s'avérer nécessaires en fonction de connaissances nouvelles et dans des cas particuliers, lorsque cela sera utile, certaines études pharmacocinétiques ou cliniques pourront être demandées.

3.1.2. Types d'indications accessibles

Les indications se situeront aux niveaux suivants :

- indications pleinement reconnues : elles sont portées directement lorsque l'efficacité est démontrée par une méthodologie approuvée ;
- indications suffisamment justifiées : lorsque le médicament a une utilité thérapeutique et que la démonstration de l'efficacité ne peut être apportée de façon plus probante en l'état actuel de la science :
  - elles sont précédées de la mention "proposé dans" lorsque le dossier montre un rapport efficacité/tolérance favorable ;
  - elles sont précédées de la mention "appartient à la classe des ... traditionnellement utilisé dans ..." pour les classes ainsi identifiées comme, par exemple, certains médicaments de phytothérapie (voir 4-3).

Il faut remarqner que les rubriques "proposé dans ..." et "utilisé comme" se retrouvent dans les monographies actuelles des dictionnaires de spécialités, et correspondent à des situations qui peuvent mériter un réexamen pouvant entraîner dans certains cas une modification de formule et/ou un changement de niveau d'indications.

3.1.3. Règles de la validation clinique

Dans une même classe pharmacothérapeutique et pour une même indication, et en tenant compte de la nature et de la gravité de la pathologie traitée, seul le niveau d'indication le plus élevé déjà atteint sera retenu.

3.2. Prise de position sur le dossier toxicologique et le dossier pharmaceutique

Elle pourra s'effectuer dans un second temps (voir schéma) après accord sur le dossier clinique et éventuellement adaptation de la formule ; un délai de 6 mois à 18 mois sera donné si besoin, pour fournir les éléments complémentaires.

3.2.1. Sur le plan toxicologique

Une note bibliographique, accompagnée le cas échéant d'études complémentaires effectuées par le laboratoire et non déposées au Ministère, devra être établie pour chaque principe actif et/ou spécialité. Elle devra comprendre une analyse critique situant notamment le dossier par rapport aux directives européennes.

Compte tenu des connaissances actuelles apportées par l'utilisation prolongée dans l'espèce humaine de ces médicaments anciens, il est observé qu'une garantie supplémentaire dans la sécurité d'emploi peut être en particulier apportée par les études de reproduction (notamment segment II) et par les études de mutagénèse. Ces études relativement aisées à conduire sont sources d'informations que l'on ne peut pas retirer d'une utilisation prolongée chez l'homme.

3.2.2. Sur le plan galénique et analytique

Un dossier établi sur la formule finalement retenue devra être garant du haut niveau de qualité de la fabrication (conforme aux B.P.F.) et du contrôle ; l'attention sera portée sur l'adéquation des conditionnements aux usages et posologies prévues.

4 - LES CONSEQUENCES DE LA VALIDATION

4.1. - Les produits qui ne seront pas validés : quand devront-ils être retirés du marché ?

Un délai de 18 mois (à compter de l'issue de la période du premier examen du groupe *de médicaments appelés) sera accordé pour permettre aux fabricants* une éventuelle reconversion (par exemple modification de formule) ; à l'issue de cette période de retrait sera, s'il y a lieu, prononcé (voir annexe I).

Pendant cette période intermédiaire, les conditions dans lesquelles les médicaments qui ne seront pas validés pourront rester sur le marché, seront déterminées pour chaque cas particulier. L'information que le produit ne sera pas validé sera portée à la connaissance des utilisateurs afin de faciliter les changements d'habitude.

4.2. - Les produits dont l'autorisation de mise sur le marché a été octroyée postérieurement au 30 Novembre 1976,

date à laquelle la directive 75/319/CEE a été théoriquement mise en application.

Leur information devrait être révisée si besoin est, et alignée sur celle de la classe pharmacothérapeutique à laquelle ils appartiennent, lorsque cette dernière fera l'objet d'une validation.

4.3. - Les octrois de nouvelles autorisations de mise sur le marché

Différents niveaux d'indications pourront-ils être envisagés pour de nouvelles autorisations de mise sur le marché ? A ce jour, la Commission d'Autorisation des Médicaments reconnaît l'intérêt que peuvent présenter certains produits "traditionnellement utilisés dans" ; ainsi a été actuellement reconnue la classe des médicaments de phytothérapie présentés sous forme de mélanges de plantes pour tisanes ; d'autres travaux sont en cours.

En ce qui concerne le niveau "proposé dans", une difficulté existe à accepter ce niveau d'indication pour de nouveaux médicaments ; en effet cette reconnaissance risquerait d'avoir un effet négatif sur l'effort de recherche et de conduire à une attitude trop souvent laxiste.

Toutefois, la Commission d'Autorisation des Médicaments pourra discuter cette éventualité, classe par classe, à l'occasion des travaux de validation.

Cette éventualité ne paraît cependant acceptable :

1/ qu'en l'absence de produits à activité démontrée dans cette indication, et aussi longtemps qu'il n'en apparaît pas avec une activité très nettement supérieure, en tenant compte de la nature et de la gravité de la pathologie traitée ;

2/ que si les dossiers comportent des études établies sur la base des critères scientifiques actuellement en vigueur.

Ces dossiers devront faire l'objet d'actualisations régulières en fonction de l'évolution scientifique.

L'étude de tels médicaments s'adressant à des pathologies majeures doit obligatoirement se poursuivre afin d'apporter à la collectivité scientifique d'une part, nationale voire internationale d'autre part, la réponse aux problèmes de santé posés. Les firmes bénéficiaires de telles autorisations devront donc s'engager à continuer leurs études et à en soumettre périodiquement les résultats au Ministère de la Santé.

---

* Sont également concernées les autorisations de mise sur le marché résultant d'une transformation de visa octroyé antérieurement au 1er décembre 1976.

P.J. n° 6

Annexe 2-10

- **NOTE de la Direction de la Pharmacie et du Médicament du 22 mai 1985 (Lettre au S.N.I.P.).**

L'avis aux fabricants de spécialités pharmaceutiques, publié au Journal Officiel du 20 décembre 1984, a annoncé la mise en place de l'opération de validation des spécialités pour lesquelles une autorisation (visa ou A.M.M.*) a été délivrée antérieurement au 1er décembre 1976, en application de l'article 39 (point 2) de la directive 75/319/CEE.

Les principes généraux ainsi que la procédure de cette opération de validation ont été définis dans le document du 30 janvier 1985.

Le présent document a pour objet de préciser les modalités de constitution du dossier pharmaceutique.

Afin de faciliter le travail des demandeurs et de l'administration, et compte tenu du fait que le critère premier déterminant la validation ou la non validation sera d'ordre clinique, il convient d'envisager à quel moment devra être déposé le dossier pharmaceutique.

Pour être validée, une spécialité doit répondre simultanément aux conditions suivantes :

- le médicament a une efficacité démontrée ou une efficacité suffisamment justifiée, et le rapport bénéfice/risque est jugé positif ;
- pour une association fixe, l'intérêt est démontré au regard des critères actuels et/ou la composition repose sur des bases rationnelles.

Sur cette base de réflexion, il appartient au demandeur de situer sa spécialité dans un des six cas définis ci-après.

A - Le demandeur n'a pas de doute quant à la validation de la spécialité sous sa formulation actuelle.

Trois cas sont possibles :

- Cas 1 : le dossier pharmaceutique (fabrication - contrôle - étude de stabilité) a fait l'objet d'une actualisation récente qui a reçu l'aval de la Direction de la Pharmacie et du Médicament ;
- Cas 2 : le dossier pharmaceutique nécessite une actualisation **;
- Cas 3 : le demandeur envisage une modification de la formule portant exclusivement sur les excipients.

B - Le demandeur désire la validation et a un doute quant à la possibilité de validation de la spécialité sous sa formulation actuelle, - et/ou il souhaite une modification de la formulation (principe actif et/ou excipient) de la spécialité ou de la forme galénique.

Trois cas sont possibles :

- Cas 4 : le demandeur envisage une modification de la formule portant exclusivement sur les excipients ;

** Si le titulaire de l'autorisation de mise sur le marché estime que son dossier ancien ne nécessite pas une actualisation, ce qui devrait correspondre à une situation exceptionnelle étant donnée la rapide obsolescence des dossiers pharmaceutiques, il fera parvenir un dossier complet avalisé par un expert agréé.

- Cas 5 : le demandeur envisage une modification de la formule portant sur le(s) principe(s) actif(s) (et éventuellement les excipients) et/ou sur la forme galénique :
- Cas 6 : le demandeur n'envisage pas de modification et souhaite connaître la position de la Direction de la Pharmacie et du Médicament.

Selon le cas dans lequel se situe la spécialité, les tableaux suivants résument :
- les pièces versées au moment de l'appel de la classe ;
- le déroulement de la procédure.

Dans tous les cas de demande de validation, un document de synthèse comportant des renseignements pharmaceutiques, toxicologiques, pharmacologiques et cliniques doit être déposé : la teneur du document de synthèse sur le plan pharmaceutique est évoquée plus loin.

La teneur du dossier pharmaceutique (fabrication - contrôle - étude de stabilité) est précisée plus loin.

PIECES A VERSER SUR LE PLAN PHARMACEUTIQUE AU MOMENT DE L'APPEL DE LA CLASSE
(en même temps que les éléments toxicologique, pharmacologique et clinique)

Cas n° 1 :
Dossier pharmaceutique récemment actualisé :
- dossier pharmaceutique allégé constitué de :
  - référence aux mises à jour récentes avalisées par la D.P.H.M. (photocopie de la lettre d'accord)
  - contrôle des principes actifs (cf. § C.1 - C.2)

Cas n° 2 :
Nécessité d'une actualisation du dossier :
- dossier pharmaceutique actualisé, avalisé par un expert agréé (1).

Cas n° 3 et cas n° 4 :
- Modification de formule portant exclusivement sur les excipients envisagée par le demandeur :
- demande de dispense selon l'article R. 5133 a du code de la santé publique avec proposition de dossier complémentaire:
  - dans tous les cas dossier pharmaceutique actualisé, avalisé par un expert agréé (1) ;
  - éventuellement étude de dissolution comparée, étude de biodisponibilité, étude de tolérance, etc.

Cas n° 5 :
- Modification de formule portant sur le(s) principe(s) actif(s) (et éventuellement les excipients) et/ou la forme galénique envisagée par le demandeur :
- demande de dispense selon l'article R. 5133 a du code de la santé publique avec proposition de dossier complémentaire:
  - dans tous les cas dossier pharmaceutique actualisé, avalisé par un expert agréé (1) ;
  - éventuellement étude de biodisponibilité, étude de tolérance, d'efficacité, etc.

Cas n° 6 :
- Pas de modification de formule envisagée par le demandeur qui attend les observations de l'administration:
  - le demandeur précise sa position dans la lettre de demande.

DOCUMENT DE SYNTHESE
prévu par l'avis aux fabricants publié au Journal Officiel du 20 décembre 1984

Le document de synthèse doit être rédigé par des experts répondant à la définition de la Directive 75/319/CEE du 20 Mai 1975 article premier, c'est-à-dire possédant les qualifications techniques ou professionnelles nécessaires dans le domaine considéré.

Il doit permettre au demandeur de dégager sous une forme synthétique et précise les éléments essentiels du dossier de validation.

Il doit être accompagné du résumé des caractéristiques du produit (cf. avis aux fabricants - J.O. du 20 décembre 1984).

Le numéro du dossier doit être porté sur la page de garde de chacun des exemplaires.

En première page, devront être indiquées la date d'octroi du visa ou de l'autorisation de mise sur le marché ainsi que la durée de commercialisation effective (mention des arrêts éventuels) de la spécialité sous ses diverses formulations.

En ce qui concerne les renseignements pharmaceutiques, ce document de synthèse doit préciser la composition qualitative et quantitative complète de la formule existante, son adéquation au but thérapeutique visé, les caractéristiques principales des principes actifs (notamment physico-chimiques), de la forme pharmaceutique, de sa fabrication (notamment du schéma du mode de préparation), de son contrôle et de sa conservation.

S'il est envisagé une modification de formule
- sur le plan des excipients,
- et/ou sur le plan des principes actifs,

il convient d'expliciter les raisons des modifications apportées : allègement envisagé pour améliorer la stabilité, ou faciliter le contrôle ; suppression de produits mal définis, ou présentant des difficultés d'approvisionnement ; opportunité d'ajouter ou de supprimer des conservateurs ...

COMPOSITION DU DOSSIER PHARMACEUTIQUE DE VALIDATION DES SPECIALITES PHARMACEUTIQUES

I. - Généralités

Le dossier pharmaceutique de validation sera élaboré en prenant pour guide l'arrêté du 10 août 1976 fixant le protocole applicable aux essais analytiques.

Afin de faciliter son élaboration, il ne comportera qu'un volume dans lequel on retrouvera l'esprit du dossier scientifique défini par l'avis n° 24 100 (publié au Bulletin Officiel du Ministère des Affaires Sociales le 12 janvier 1984).

Le niveau des exigences doit être adapté à chaque cas en faisant preuve de bon sens et de mesure ; deux aspects nécessitent cependant d'être soulignés :

a) l'actualisation des protocoles de contrôle des matières premières, des produits intermédiaires de fabrication et du produit fini, devra prendre en compte les méthodes modernes d'analyse.

Il convient toutefois de ne pas apporter systématiquement des modifications impliquant des travaux de mise au point ou de recherche, à partir du moment où les procédés donnent satisfaction et offrent les garanties requises ;

b) la vérification de la stabilité sera conduite selon des méthodes validées notamment par la mise en oeuvre d'études de dégradation forcée.

Le dossier pourra prendre en compte largement la mise en place des PRATIQUES DE BONNE FABRICATION, notamment leurs répercussions sur l'organisation générale de la fabrication et sur le système d'assurance de qualité (allègement de certains contrôles de routine par exemple).

II - Contenu du dossier pharmaceutique

Les différents chapitres du dossier pharmaceutique sont les suivants :

A. Description de la composition qualitative et quantitative.

(1) Le lieu de l'expertise, la provenance des données, la date et le nom du (des) expert(s) sont mentionnés.

Les demandes d'agrément d'expert doivent être adressées au bureau Ph 11 (curriculum vitae - moyens techniques disponibles).

B. Description du mode de préparation.
C. Contrôle des matières premières.
D. Contrôle sur les produits intermédiaires de la fabrication.
E. Contrôle du produit fini.
F. Essais de stabilité.

Selon que la spécialité concernée sera reformulée ou non, il est rappelé ici CERTAINES des données importantes qui devront être précisées au niveau des chapitres signalés.

1. Spécialité non reformulée :

A. Composition quantitative et qualitative.
En raison de l'ancienneté de la préparation il n'y a pas lieu de présenter une justification de la formulation.

B. Mode de préparation.
En cas de modification (s) du mode de préparation de la spécialité, il y a lieu de spécifier et le cas échéant de justifier les changements apportés.

C. Contrôle des matières premières
(les principes actifs et dans certains cas les excipients susceptibles d'influencer la qualité du médicament).
1. Dans tous les cas :
- Seront communiqués le nom du fournisseur ainsi que son engagement à faire connaître :
  - tout changement dans la synthèse ou la purification susceptible d'influer sur la qualité de la matière première;
  - le changement de fabricant lorsqu'il n'assure pas lui-même la fabrication des principes actifs.
- En cas d'impossibilité d'obtenir cet engagement du fournisseur, le titulaire de l'A.M.M. doit fournir lui-même, à tout le moins, l'engagement de n'utiliser que des matières premières préparées selon une méthode non susceptible de laisser des impuretés non mentionnées dans la monographie.
- Ces documents peuvent être annexés à la lettre de demande de validation.

2. Pour les matières premières,
- non inscrites à la Pharmacopée française ou européenne,
- inscrites à la Pharmacopée française ou européenne mais préparées selon une méthode susceptible de laisser des impuretés non mentionnées dans la monographie (cf. Protocole analytique - Arrêté du 10.VIII.76 - Chap. C1) :
  - Le schéma d'obtention ou d'extraction est indiqué.
  - Les méthodes actualisées d'analyse (mise au point et routine) sont détaillées avec justification de leur choix et précision des limites d'acceptation.
  - Les essais de pureté sont décrits en fonction de l'ensemble des impuretés prévisibles.

D.E. Contrôle des produits intermédiaires et/ou du produit fini.
- Les essais et les méthodes doivent correspondre à l'état d'avancement du progrès scientifique (exemple : essai de vitesse de dissolution sur les formes orales solides ...) et le dossier comporter les éléments qui expliquent leur choix.
- Les écarts maximaux tolérables doivent être fixés : ainsi, la teneur unitaire en principe actif est fixé à ± 5 pour cent au moment de la fabrication, sauf justification.

F. Essais de stabilité.
- La durée de validité proposée est fondée sur des essais de stabilité conduits dans les conditions normales de conservation, dans le récipient destiné à la vente ou équivalent (sauf justification) en utilisant des méthodes validées.
- En cas de modification du mode de préparation de la spécialité se reporter au paragraphe 2 suivant.

2. Spécialité reformulée.

Les points spécifiques précédemment énoncés en B, C, D, E sont valables également en cas de reformulation.
De plus, les chapitres A et F devront être complétés de façon suivante :

A. Composition quantitative et qualitative :
Donner la justification scientifique et/ou la raison de la modification de formule.

F. Essais de stabilité :
Proposer une nouvelle durée de conservation :
- la durée de conservation pourra être accordée à partir de :
  - études de stabilité en temps réel d'au moins 6 mois ;
  - données accumulées sur stabilité de l'ancienne formule et extrapolables à la nouvelle formule (exemple : connaissance de l'altérabilité du ou des principe (s) actif (s) ;
  - résultats d'études de dégradation forcée sur le principe actif et sur le produit terminé sous la nouvelle formulation, comparativement avec les résultats obtenus avec l'ancienne formulation.

Dans ces conditions, une durée de conservation au moins égale à 24 mois sera accordée.
- dans tous les cas, les études de conservation en temps réel devront être poursuivies et les résultats obtenus communiqués périodiquement.

PJ. 407

Annexe 2-10

- **AVIS aux fabricants** de spécialités pharmaceutiques relatif à l'application de l'article 39 (point 2) de la directive 75-319 C.E.E. Présentation des dossiers de validation (B.O.S.P. 86/19 du 3 juin 1986).

Cet avis concerne la présentation des dossiers de demande de validation.

Les dossiers devront être présentés selon le plan décrit dans les annexes I et II ci-jointes.

L'imprimé intitulé "Examen de recevabilité des dossiers de validation" figurant à la suite des annexes I et II devra être rempli par le demandeur et joint à tout dossier lors de son dépôt.

L'application de cette nouvelle présentation est effective pour le dépôt de la troisième tranche et des tranches suivantes.

ANNEXE I

Présentation d'une demande de validation
(premier dépôt)

Les pièces devront être présentées et numérotées dans l'ordre indiqué.

	Nombre d'exemplaires (chemises cartonnées bleues à élastique)	
	Dossier A	Dossier B
1. Bordereau de transmission de la redevance	1	-
- chèque et accusé de réception rempli ;		
- enveloppe timbrée		
2. Lettre de demande de validation	1	1+4 (*)
- date et signature ;		
- numéro du dossier ;		
- date d'octroi du visa ou de l'A.M.M. ;		
- lieu de fabrication, conditionnement, contrôle ;		
- composition intégrale ;		
- indication pour laquelle la validation est sollicitée avec n° de la tranche correspondante ;		
- autres indications qui ont fait ou qui feront également l'objet d'une demande de validation avec n° des tranches correspondantes ;		
- situation de la spécialité par rapport à la procédure de validation du dossier pharmaceutique. Indiquer le cas choisi (**).		
3. Engagement du fournisseur ou du titulaire de l'autorisation de mise sur le marché sur les matières premières (**)	1	1
4. Photocopie des pièces administratives (groupées dans une sous-chemise)	1	1
- visa ou A.M.M. ;		
- dernier renouvellement quinquennal ;		
- autorisations d'ouverture de ou des établissements pharmaceutiques (fabrication) ;		
- rectificatifs ;		
- monographie du Vidal étoilée.		
5. Résumé des caractéristiques du produit	1	1+4 (*)
6. Proposition du libellé de l'information destinée au public (à mettre dans le dossier clinique du dossier B)	1	1
7. Représentation du conditionnement	1	1
8. Pièces qui ont trait au dossier pharmaceutique : dossier ou lettre selon le cas choisi (**) dans une chemise ou une reliure jaune (***)	1	2
9. Document de synthèse (bleu) (***)	1	2

	Nombre d'exemplaires (chemises cartonnées bleues à élastique)	
	Dossier A	Dossier B
10. Documents complémentaires (éventuellement) (***)	1	1
- toxicologie et pharmacologie expérimentale (vert) ;		
- pharmacologie clinique, pharmacocinétique, et clinique (rouge), individualisés chacun dans une chemise de la couleur indiquée ou reliés séparément avec une couverture de la couleur indiquée.	☐	☐

11. Documents de synthèse : 15 exemplaires supplémentaires groupés à part.
Dans le document de synthèse doivent figurer en particulier :
- le résumé des caractéristiques du produit ;
- le niveau des ventes ;
- les pays dans lesquels l'autorisation de mise sur le marché a été donnée ;
- le bilan des effets indésirables signalés à la firme après mise sur le marché ; donnée de pharmacovigilance et de consommation globale du produit ; utilisation dans d'autres pays.

12. Résumé des caractéristiques du produit : 30 exemplaires supplémentaires groupés à part.
13. Cinq étiquettes autocollantes comportant le nom et l'adresse du laboratoire.

(*) Ventiler un exemplaire dans chacun des volumes constituant le dossier B : pharmaceutique (2), toxicologique (1), clinique (1).

(**) cf. Note de la Direction de la Pharmacie et du Médicament du 22 mai 1985

(***) Les chemises colorées devront être individualisées et comporter chacune le nom de la spécialité, le nom du laboratoire et le numéro du dossier.

ANNEXE II

Présentation d'une demande de validation
(dépôt ultérieur)

Concerne les dépôts de demande pour les produits ayant déjà fait l'objet d'un dépôt antérieur pour d'autres indications dans une tranche précédemment appelée.

	Nombre d'exemplaires (chemises cartonnées bleues à élastique)	
	Dossier A	Dossier B
1. Lettre de demande	1	1
- date et signataire ;		
- numéro de dossier ;		
- date d'octroi du visa ou de l'A.M.M. ;		
- composition intégrale ;		
- indication revendiquée et rappel des autres indications qui ont fait ou qui feront également l'objet d'une demande de validation avec n° des tranches correspondantes.		
2. Résumé des caractéristiques du produit	1	1
3. Proposition du libellé de l'information destinée au public ...	1	1
4. Document de synthèse (bleu) ..	1	1
5. Documents complémentaires (concernant la nouvelle indication) (*)	1	1
- toxicologie et pharmacologie expérimentale (vert) ;		
- pharmacologie clinique, clinique et pharmacocinétique (rouge),		
individualisés chacun dans une chemise de la couleur indiquée ou reliés séparément avec une couverture de la couleur indiquée.		

6. Documents de synthèse : 15 exemplaires supplémentaires groupés à part.
7. Résumé des caractéristiques du produit : 30 exemplaires supplémentaires groupés à part.
8. Cinq étiquettes autocollantes comportant le nom et l'adresse du laboratoire.

(*) Les chemises colorées devront être individualisées et comporter chacune le nom de la spécialité, le nom du laboratoire et le numéro du dossier.

Paris, le 22 AVR. 1987

Monsieur le titulaire de
l'autorisation de mise sur le marché
Laboratoires SERVIER
45400 GIDY

AUTORISATION DE MISE SUR LE MARCHE

Monsieur,

J'ai l'honneur de vous faire connaître que la validation de l'autorisation de mise sur le marché est accordée à la spécialité pharmaceutique :

M E D I A T O R 150 mg, comprimés enrobés

- Les conditions de fabrication et de contrôle de cette spécialité, prévues au dossier, devront être respectées ; toutefois, les méthodes de contrôle devront être modifiées en fonction des progrès de la science et de l'évolution des techniques.

- Les caractéristiques techniques dont vous ferez état, notamment dans le domaine de l'information destinée au corps médical (dictionnaire des spécialités, fiche signalétique, etc) et au public, devront être conformes à celles précisées respectivement dans les annexes I et II. Toutefois, l'indication de la composition de l'excipient pourra être omise ou indiquée de façon qualitative, dans la mesure où sa connaissance n'est pas nécessaire à une bonne administration du médicament.

- La validité de cette autorisation de mise sur le marché est limitée à cinq ans à compter de la date de la présente correspondance.

- L'autorisation de mise sur le marché octroyée le **16 Juillet 1974** pour la spécialité **MEDIATOR, comprimés dragéifiés** est abrogée par la présente décision.

Je vous prie d'agréer, Monsieur, l'assurance de ma considération distinguée.

ANNEXE I — DATE

RESUME DES CARACTERISTIQUES DU PRODUIT

MEDIATOR 150 mg

Comprimés enrobés

- **COMPOSITION**

CHLORHYDRATE DE BENFLUOREX.....	150,0 mg
Amidon de maïs.....	60,0 mg
Polyvidone excipient.....	20,0 mg
Saccharose.....	245,0 mg
Stéarate de magnésium.....	5,0 mg
Talc.....	20,0 mg

pour un noyau de 500 mg

Saccharose.....	172,914 mg
Talc.....	17,651 mg
Polyvidone excipient.....	1,349 mg
Bicarbonate de sodium.....	0,480 mg
Carboxyméthylcellulose sodique.....	0,944 mg
Silice colloïdale.....	0,674 mg
Polysorbate 80.....	0,850 mg
Ethylcellulose.....	0,555 mg
Oléate de glycérol.....	0,278 mg
Dioxyde de titane.....	4,305 mg
Cire d'abeille blanche.....	q.s.

pour un comprimé enrobé de 700 mg

- **PROPRIETES PHARMACOLOGIQUES** : HYPOLIPEMIANT

Il agit sur plusieurs facteurs liés au risque athérogène.

Actions de MEDIATOR sur le métabolisme lipidique :

- MEDIATOR diminue l'absorption intestinale des triglycérides (rat).
- Cet effet confirmé chez l'homme en pharmacologie clinique repose sur la diminution d'activité de la lipase pancréatique.
- Il réduit la synthèse hépatique des triglycérides et du cholestérol in vitro et in vivo (rat).
- Il diminue la stéatose hépatique induite par des régimes riches en lipides, en glucides chez le rat obèse et au cours du diabète expérimental (rat).
- Il limite l'incorporation du cholestérol dans la paroi artérielle (lapin).

Ce mode d'action est susceptible d'expliquer la diminution du cholestérol et des triglycérides chez l'homme.

Actions de MEDIATOR sur le métabolisme glucidique :

. Il facilite la pénétration et l'utilisation cellulaires du glucose (rat).
. Il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'H.P.O. chez le lapin.
. Dans le diabète asymptomatique chez les patients obèses il entraîne une baisse de la glycémie post prandiale et une amélioration de la courbe d'H.P.O. supérieure à celle qu'on obtient avec un régime identique associé à un placebo.

MEDIATOR n'ayant pas d'action sur l'insulino-sécrétion, ne peut pas provoquer d'hypoglycémie.

Effet complémentaire de MEDIATOR :

Chez des patients obèses hyperuricémiques traités par MEDIATOR et régime, une baisse de l'uricémie d'environ 14 % a été observée.
Aucune interférence indésirable de MEDIATOR avec les traitements associés au cours des études n'a été constatée. MEDIATOR :

. ne potentialise pas les anticoagulants.
. ne provoque pas d'hypoglycémie
. n'interfère pas avec la fonction thyroïdienne.

- **ELEMENTS DE PHARMACOCINETIQUE**

. Absorption gastro-intestinale rapide et totale avec un pic maximal survenant entre 1 à 2 heures après l'administration.
. Elimination rapide et totale par voie urinaire : en 8 heures, une excrétion moyenne d'environ 74 % de la dose administrée est constatée.

L'élimination se fait en 2 phases :

. une première phase rapide (60 % en 3 ou 4 heures).
. une deuxième phase lente, se terminant en 36 heures environ.

- **INDICATIONS THERAPEUTIQUES**

Adjuvant du régime adapté dans les hypertriglicéridémies.
La poursuite du régime est toujours indispensable.

Remarque :
L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

- **CONTRE-INDICATIONS**

Les pancréatites chroniques avérées.

- **MISE EN GARDE**

Les troubles métaboliques relevant d'un traitement par MEDIATOR sont essentiellement observés chez l'adulte. La prescription de MEDIATOR n'est donc pas justifiée chez l'enfant.

- PRECAUTIONS D'EMPLOI

Si, après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

Grossesse : les résultats des études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène, en l'absence de données chez l'Homme, ces résultats expérimentaux ne permettent pas de préjuger un effet malformatif dans l'espèce humaine, par conséquent par mesure de prudence ne pas prescrire pendant la grossesse.

Allaitement : en l'absence de données sur le passage dans le lait maternel l'allaitement est déconseillé pendant la durée du traitement.

- EFFETS SUR LA CAPACITE DE CONDUIRE DES VEHICULES OU D'UTILISER DES MACHINES

- INTERACTIONS MEDICAMENTEUSES ET AUTRES INTERACTIONS

- INCOMPATIBILITES MAJEURES

- EFFETS INDESIRABLES

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou état vertigineux. Toutefois, ils s'observent plus particulièrement aux posologies supérieures à 3 comprimés par jour et varient en fonction des susceptibilités individuelles.

- POSOLOGIE ET MODE D'ADMINISTRATION

3 comprimés dragéifiés par jour.
Cette posologie peut être prescrite d'emblée ou atteinte progressivement :

. 1 comprimé la première semaine au dîner.
. 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner.
. 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

Par la suite, la posologie peut être ramenée à 2, parfois à 1 comprimé par jour, en fonction des résultats biologiques.
En association avec le régime, MEDIATOR constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

- SURDOSAGE

Conduite à tenir en cas d'absorption massive : le traitement sera purement symptomatique : lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

A N N E X E II

INFORMATION DESTINEE AU PUBLIC

INDICATIONS THERAPEUTIQUES

Ce médicament est un hypolipémiant (il réduit le taux de lipides sanguins).

Il est préconisé en complément du régime alimentaire dans les hyperlipidémies (surcharge de lipides dans le sang).
Un taux élevé de lipides dans le sang est un facteur majeur d'athérome (dépôt de plaques graisseuses sur la paroi des artères).

CONTRE-INDICATIONS

Ce médicament NE DOIT PAS ETRE UTILISE dans les cas suivants :

En cas de pancréatite chronique (insuffisance du pancréas).

MISE EN GARDE

Dans le traitement des hyperlipidémies, le respect scrupuleux du régime alimentaire prescrit par le médecin est **INDISPENSABLE**. (Eviter de manger des aliments riches en graisses saturées, en sucre, en cholestérol).

EN CAS DE DOUTE NE PAS HESITER A DEMANDER L'AVIS DE VOTRE MEDECIN OU DE VOTRE PHARMACIEN.

PRECAUTIONS D'EMPLOI

AFIN D'EVITER D'EVENTUELLES INTERACTIONS ENTRE PLUSIEURS MEDICAMENTS IL FAUT SIGNALER SYSTEMATIQUEMENT TOUT AUTRE TRAITEMENT EN COURS A VOTRE MEDECIN OU A VOTRE PHARMACIEN.
NE JAMAIS LAISSER A LA PORTEE DES ENFANTS.
PREVENIR LE MEDECIN EN CAS DE GROSSESSE.

EFFETS SUR LA CAPACITE DE CONDUIRE DES VEHICULES OU D'UTILISER DES MACHINES

AUTRES EFFETS POSSIBLES DU MEDICAMENT

COMME TOUT PRODUIT ACTIF, CE MEDICAMENT PEUT, CHEZ CERTAINES PERSONNES, ENTRAINER DES EFFETS PLUS OU MOINS GENANTS :

Troubles digestifs (nausées, gastralgies)
Asthénie, sensation de fatigue, voire somnolence. (Ces effets s'observent particulièrement aux posologies supérieures à 3 comprimés par jour).

POSOLOGIE ET MODE D'ADMINISTRATION

3 comprimés drageifiés par jour.
Cette posologie peut être prescrite d'emblée ou atteinte progressivement :

- 1 comprimé la première semaine au dîner.
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner.
- 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au diner.

Par la suite, la posologie peut être ramenée à 2, parfois à 1 comprimé par jour, en fonction des résultats biologiques.
En association avec le régime, MEDIATOR constitue un traitement symptomatique devant être très prolongé et régulièrement surveillé.

Pour une bonne utilisation de ce médicament il est indispensable de vous soumettre à une surveillance médicale régulière. Celle-ci peut comporter : un dosage des lipides.

DANS TOUS LES CAS SE CONFORMER STRICTEMENT A L'ORDONNANCE DE VOTRE MEDECIN.

CONDITION DE DELIVRANCE

CE MEDICAMENT EST INSCRIT AU TABLEAU A.
VOTRE PHARMACIEN NE POURRA VOUS EN DELIVRER QUE SUR UNE NOUVELLE ORDONNANCE DE VOTRE MEDECIN.

Monsieur le Pharmacien Responsable
des Laboratoires SERVIER
45400 GIDY

VNL 100 08

Monsieur,

Le Médiator 150 mg a fait l'objet d'un passage en validation à la suite duquel l'indication "adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale" a été examinée mais n'a pas été retenue. Elle n'a donc pas été reprise dans l'annexe I de l'autorisation de mise sur le marché validée comme le sont les indications non encore examinées. Si vous souhaitez conserver cette indication, vous pourrez déposer un dossier complet lors de l'appel de la 6ème tranche (endocrinologie).

Je vous prie d'agréer, Monsieur, l'assurance de ma considération distinguée.

Le Directeur de la Pharmacie
et du Médicament

Professeur P. AMBROISE-THOMAS

Gidy, le 7 juillet 1987

Objet : **N/spécialité MEDIATOR**
Dossier V NL 10 008

Monsieur le Directeur,

Nous avons reçu de vos Services, le 22 avril 1987, la validation de l'Autorisation de Mise sur le Marché de notre spécialité pharmaceutique

MEDIATOR 150 mg, comprimés enrobés,

et le résumé des caractéristiques du produit qui l'accompagne. La lecture de ce dernier nous surprend.

En effet, les indications thérapeutiques figurant page 3 (Cf. annexe 1 ci-jointe) sont réduites à :

"Adjuvant du régime adapté dans les hypertriglycéridémies.
La poursuite du régime est toujours indispensable.

Remarque :
L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée".

Ceci correspond à une très importante réduction des indications thérapeutiques telles qu'elles figurent dans la monographie validée par la Commission de contrôle des Dictionnaires des Spécialités Pharmaceutiques (Cf. annexe 2 ci-jointe) puisque l'indication :

"Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale"

a disparu du texte de l'A.M.M. (Annexe I) validée le 22 avril 1987.

.../...

Annexe 2-13

499/HML/al

En revanche, les autres chapîtres, aussi bien de la validation de l'Autorisation de Mise sur le Marché de 1987, que de la monographie agréée précédemment par la Commission de Contrôle des Dictionnaires des Spécialités Pharmaceutiques sont strictement superposables. En particulier, nous attirons votre attention sur le fait que dans les propriétés du médicament, l'action de MEDIATOR sur le métabolisme lipidique et sur le métabolisme glucidique a été reprise intégralement dans le résumé de la validation.

Ne voyant pas ce qui aurait pû justifier entre temps une telle réduction, nous pensons qu'il s'agit là d'une erreur, et qu'ont été omises les indications concernant le diabète asymptomatique avec surcharge pondérale. Pour cette indication, des travaux sont en cours pour être soumis à la Commission lors de la Validation des hypoglycémiants oraux en juin 1989.

Par conséquent, nous vous serions reconnaissants de bien vouloir attirer l'attention de vos Services de manière à apporter les corrections souhaitables (Cf. annexe 3 ci-jointe).

Restant à votre entière disposition pour toute information complémentaire, nous vous prions d'agréer, Monsieur le Directeur, l'expression de notre considération distinguée et de nos sentiments très dévoués.

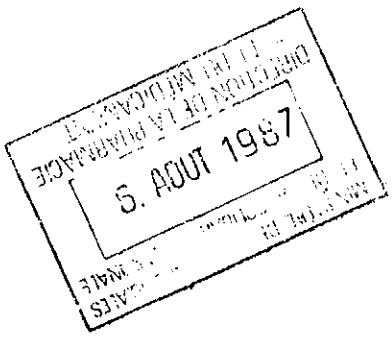
RECHERCHE MÉDICALE ET CRÉATION DE MÉDICAMENTS

N / Réf. *ALR/MCMdS/71/87*

SG
11.8.87



Neuilly, le 29 juillet 1987

Monsieur le Professeur AMBROISE-THOMAS
Directeur de la Pharmacie et du Médicament
MINISTERE DES AFFAIRES SOCIALES ET DE L'EMPLOI
1, place Fontenoy
75700 PARIS CEDEX 7

Monsieur le Directeur,

L'examen de l'Autorisation de Mise sur le Marché de MEDIATOR 150 mg, dans le cadre de la validation des spécialités pharmaceutiques de la classe des hypolipémiants, a donné lieu à l'élaboration d'une nouvelle monographie en date du 22 avril 1987. Or, ce document ne comporte plus dans ses indications :

> "adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale".

Après entretien avec le Professeur ALEXANDRE, le 3 juillet 1987, il me confirme que conformément à l'article 39.2 de la Directive 75/319/CEE, la validation porte sur les indications thérapeutiques, et donc que des spécialités revendiquant plusieurs indications appartenant à différentes classes pharmaco-thérapeutiques devront faire l'objet d'une demande de validation pour chaque classe concernée au plan des indications.

L'indication "adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale" sera à valider lors de l'examen de la classe thérapeutique des antidiabétiques en 1989.

La monographie actuelle de MEDIATOR 150 mg doit donc logiquement conserver l'ancienne indication concernant le diabète.

Div. 01

Par conséquent, nous vous serions reconnaissants de bien vouloir attirer l'attention de vos services de manière à apporter les corrections souhaitables, et de nous adresser un résumé des caractéristiques du produit, modifié de telle façon que nous puissions l'envoyer au dictionnaire Vidal dans les meilleurs délais.

Restant à votre entière disposition pour toute information complémentaire, nous vous prions d'agréer, Monsieur le Directeur, l'expression de notre considération distinguée et de nos sentiments très dévoués.

Monsieur,

Par lettre du 7 MARS 1989 vous avez sollicité le renouvellement de l'autorisation de mise sur le marché de la spécialité :

- MEDIATOR 150 mg, comprimés enrobés

J'ai l'honneur de vous faire connaître que, conformément aux dispositions de l'article R. 5137, 4ème alinéa, du code de la santé publique, cette autorisation de mise sur le marché doit être considérée comme renouvelée à compter du

- 16 JUILLET 1989 -

Toutefois, je vous rappelle que, selon les dispositions de l'article 39 (point 2) de la Directive 75-319 C.E.E. du 20 Mai 1975, les autorisations de mise sur le marché délivrées antérieurement au 1er Décembre 1976 doivent faire l'objet d'une validation dont le présent renouvellement ne saurait tenir lieu.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Situation de la spécialité par rapport à la procédure de validation du dossier pharmaceutique : dossier pharmaceutique actualisé, avalisé par un expert agréé.

A l'appui de cette demande, nous vous adressons :

I. Le dossier A, composé des documents suivants :

1. la proposition du résumé des caractéristiques du produit,
2. le libellé de l'information destinée au public,
3. le document de synthèse,
4. les documents complémentaires :
   * clinique.

II. Le dossier B, composé des mêmes documents que le dossier A.

III.
- 15 exemplaires du document de synthèse,
- 30 exemplaires du résumé des caractéristiques du produit,
- 5 étiquettes autocollantes avec le nom et l'adresse du laboratoire.

Nous vous informons que, par ailleurs, nous envoyons ce jour au Laboratoire National de la Santé (Paris et Montpellier) ainsi qu'à l'Inspection Régionale de la Santé (Orléans), les dossiers C, D et E comprenant les éléments suivants :

- la lettre de demande,
- la proposition du résumé des caractéristiques,
- la proposition du libellé de l'information destinée au public,
- le document de synthèse,

Nous vous prions d'agréer, Monsieur le Ministre, l'expression de nos sentiments distingués.

REMARQUE CONCERNANT LES SULFAMIDES HYPOGLYCEMIANTS ET LES BIGUANIDES :

Ces principes actifs ne constituent pas le traitement du diabète insulino-dépendant.
Cependant, ils peuvent être utilisés en association avec l'insuline.
Des études sont en cours sur l'intérêt clinique de cette association.
En conséquence, le diabète insulino-dépendant fera l'objet d'une contre-indication ainsi libellée :

CONTRE-INDICATIONS

Diabète de type I (insulino-dépendant)
Cependant cette spécialité peut être associée chez certains patients insulino traités.

Mme MAURICE de LORRIS

Objet : **Modification rubrique "Propriétés"**
N/spécialité : MEDIATOR 150 mg
Dossier VL 10008
Validation : Tranche n° 8

Dossier suivi par Madame REVEILLAUD

Monsieur le Directeur Général,

Notre spécialité qui a déjà fait l'objet d'un dossier de Validation comme **hypolipémiant** en avril 1987, à la suite de l'appel de la 1ère tranche en 1985, est toujours en cours d'examen pour la 8ème tranche en **diabétologie**.

Pour ce faire, en diabétologie, nous avions procédé au dépôt :

* d'un dossier initial en janvier 1990,
* puis d'un dossier complémentaire en mai 1992, dans le but de soutenir et rendre homogène le texte des "propriétés" avec celui de l'indication revendiquée.

A l'appui de cette demande, nous vous avions alors adressé :

- **3** rapports de pharmacologie animale
  - Pr B. PORTHA - FRANCE (réf. P.0992.01.043),
  - Dr L.H. STORLIEN - AUSTRALIE (réf. P.0992.01.044),
  - Dr J. DUHAULT - FRANCE (réf. P.0992.01.045).

- **2** études cliniques randomisées en double aveugle contre placebo
  - Pr G.B. BOLLI et P. BRUNETTI - ITALIE (réf. C.0780.31.067),
  - Pr D.W. ERKELENS - PAYS-BAS (réf. C.0780.31.068).

Nous vous transmettons, ce jour :

- **3 nouveaux rapports d'étude,** en deux exemplaires, de pharmacologie clinique qui démontrent l'action de MEDIATOR sur le contrôle métabolique glycémique (HbA1c) :
  - étude du Dr VELUSSI (3 volumes),
  - étude du Pr PONTIROLI (3 volumes),
  - étude du Pr ERKELENS (3 volumes),

- accompagnés en 50 exemplaires du **rapport d'expert** du Pr del PRATO qui reprend l'ensemble des études remises.

Veuillez agréer, Monsieur le Directeur Général, l'expression de nos salutations distinguées.

B. PAPILLAUD
Pharmacien Responsable inscrit à la Section B de l'Ordre National des Pharmaciens sous le n° 61.067

P.S. : la traduction française du rapport d'expert vous sera transmise, en 50 exemplaires, au plus tard le 26.01.95.

PROCEDURE NATIONALE

- MEDIATOR

dossier n° NL 10008

Laboratoires SERVIER

Demande déposée le 26 Juillet 1994

Principe actif :		chlorhydrate de benfluorex
Caractère d'originalité :		modification du RCP "propriétés pharmacologiques"
Classe ATC :		appareil digestif et métabolisme
Réf. Stat. :	VIDAL LIBRA	Antidiabétique

La modification des propriétés pharmacologiques demandée doit permettre d'obtenir une confirmation de l'indication suivante :

- "en association au régime dans le diabète non insulinodépendant avec surcharge pondérale et/ou pour hyperinsulinisme".

La firme revendique la modification suivante au chapitre "PROPRIETES PHARMACOLOGIQUES :

abroger :

Actions de Médiator sur le métabolisme glucidique :

- il facilite la pénétration et l'utilisation cellulaires du glucose (rat) ;
- il diminue l'hyperglycémie du rat diabétique (insulinoprive ou non) et l'aire d'HPO chez le lapin ;
- dans le diabète asymptomatique chez les patients obèses, il entraine une baisse de la glycémie post-prandiale et une amélioration de la courbe d'HPO supérieure à celle qu'on obtient avec un régime identique associé à un placebo.

Médiator n'ayant pas d'action sur l'insulinosécrétion, ne peut pas provoquer d'hypoglycémie.

Remplacer par :

Actions de Médiator sur le métabolisme glucidique :

* Chez l'animal :

- il diminue l'hyperglycémie et améliore la tolérance au glucose (rat diabétique et/ou insulinorésistant) ;
- il facilite la pénétration et l'utilisation cellulaires du glucose (rat), améliore l'action périphérique de l'insuline chez le rat diabétique insulinorésistant, et normalise la production hépatique de glucose (études de clamp) ;

Annexe 2-21

- il diminue l'insulinémie du rat diabétique hyperinsulinémique ;
- chez le rat, il ne modifie pas la glycémie ni l'insulinémie.

* Chez le diabétique non insulinodépendant en surpoids :

- il diminue la glycémie à jeûn et post-prandiale ;
- il diminue l'insulinorésistance : les études du clamp montrent que le benfluorex augmente l'utilisation périphérique du glucose et freine la production hépatique de glucose.

Médiator ne stimulant pas l'insulinosécrétion, ne peut pas provoquer d'hypoglycémie.

AVIS DE LA COMMISSION N° 199 DU 3 FEVRIER : AVIS DEFAVORABLE, à l'indication et aux propriétés pharmacologiques revendiquées.

Le bénéfice thérapeutique n'est pas établi dans l'indication concernée :
- les essais ne sont pas contrôlés,
- le bénéfice observé (sur la glycémie et l'hémoglobine glycosylée) est incomplet,
- le bénéfice ne concerne qu'une faible partie des patients traités.

Note Interne :

En clinique, les études non contrôlées, compilant des résultats sur un nombre important de patients mais traités pendant une durée trop courte de 90 jours, montrent une amélioration incomplète de la glycémie à jeûn qui reste à 9 mmoles et de l'hémoglobine glycosylée qui reste élevée (8,4%).

REPUBLIQUE FRANCAISE

16 MARS 1990

SAINT DENIS, le

143-145, boulevard Anatole France
93200 SAINT DENIS
Tél : 48.13.20.00

Monsieur le Titulaire de
l'Autorisation de Mise sur le Marché
des Laboratoires SERVIER
GIDY
45400 FLEURY LES AUBRAIS

Dossier suivi par : **Madame M.T. REVEILLAUD**

Réf. à rappeler : VNL 10 008
COM 199
MTR/LC

Monsieur,

Vous m'avez adressé une demande de rectificatif d'Autorisation de Mise sur le Marché pour la spécialité : **MEDIATOR 150 mg**
dans le but de soutenir et rendre homogène le texte des "propriétés pharmacologiques" avec celui de l'indication revendiquée pour la 8ème tranche de validation en diabétologie.

Après avis de la commission prévu à l'article R. 5140 du code de la santé publique, je vous informe que **je ne suis pas en mesure de réserver une suite favorable** à cette modification du libellé des propriétés pharmacologiques et par conséquent, à l'indication qui s'y rapporte, pour les raisons suivantes :

1 - l'indication soumise à la validation n'est pas justifiée par les données fournies :

- les essais ne sont pas contrôlés ;
- le bénéfice observé sur la glycémie et l'hémoglobine glycosylée est incomplet ;
- le bénéfice ne concerne qu'une faible partie des patients traités.

2 - En conséquence, aucune mention de propriétés pharmacologiques en relation avec cette indication ne peut être acceptée.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

LE DIRECTEUR DE L'EVALUATION

Pr. Jean-Michel ALEXANDRE

Annexe 2-24

RÉPUBLIQUE FRANÇAISE

AGENCE DU MEDICAMENT

DIRECTION DE L'EVALUATION Saint-Denis le 9 octobre 1995

Dossier suivi par : A. SAINT RAYMOND

COMPTE-RENDU DE LA REUNION DE CONCERTATION MEDIATOR du 22 Septembre 1995 A L'AGENCE DU MEDICAMENT

Etaient présents :

SERVIER / IRIS
Pr de Jong
Dr Desché
Dr Bessac

EXPERTS POUR SERVIER
Pr del Prato (Italie)
Pr Rekelens (Pays-Bas)
Dr Brun

EXPERTS POUR L'AGENCE
Pr Vexiau,
Dr Simon

Agence du Médicament
Pr Alexandre
Dr Abadie
Dr Saint Raymond.

L'objectif de cette réunion est d'entendre la firme sur l'indication non validée de Mediator (benfluorex) : "adjuvant du régime dans le diabète avec surcharge pondérale".

Rappel : Mediator a fait l'objet d'une validation (8ème tranche), et une seule indication a été maintenue :
-adjuvant du régime dans les hypertriglycéridémies.

La deuxième indication (adjuvant du régime dans le diabètte asymptomatique avec surcharge pondérale) ne semble plus justifiée ni adaptée à la prise en charge du diabète en 1995 ; elle ne repose que sur des études anciennes, non contrôlées pour la plupart et incluant un très petit effectif (67 au total dans les études en aveugle). La firme, ayant demandé le 26/7/94 une modification des propriétés pharmacologiques afin de confirmer cette indication, s'est vue notifier un avis défavorable (COM 199 du 3/2/95).

La firme désire présenter, en complément d'un rappel des essais cliniques disponibles, le programme d'études cliniques en cours dans cette indication, afin de justifier le maintien de l'indication.

Le Pr del Prato fait une présentation des mécanismes de l'insulinosécrétion et de l'insulinorésistance.
L'insulinorésistance est caractérisée par une augmentation de la production hépatique de glucose et une diminution de son utilisation périphérique. Le benfluorex agirait essentiellement en diminuant la production hépatique du glucose et à un moindre degré en favorisant l'utilisation périphérique. Il est sans effet sur l'insulinosécrétion.

Le Pr Rekelens présente les techniques qui permettent de mesurer l'insulinorésistance (clamp, etc) et d'étudier la place du benfluorex.

Le Dr Brun précise qu'il existe une place, dans la pratique, pour la prescription de benfluorex chez le diabétique obèse intolérant aux biguanides car les sulfonylurées majorent la prise de poids. De même, il y aurait, selon lui, une indication chez le diabétique âgé à fonction rénale altérée ou dans les "petits diabètes" ou le syndrome X (hypertriglycéridémie, obésité et hyperinsulinisme). Enfin, il pense que chez le diabétique (type 2) insulino-traité, le benfluorex aurait la même efficacité que les 2 autres types de traitement.

Le Pr Vexiau rappelle que ce sont les résultats des essais chez l'Homme qui doivent être les éléments de jugement en démontrant des effets sur le poids, la glycémie et les facteurs de risque (et non les études de pharmacologie).
Compte-tenu des effets d'autres variables, en particulier des variations de poids dans cette pathologie, les études ouvertes et non contrôlées menées avec le benfluorex n'ont pas de valeur.
Les résultats des études contre placebo fournies ont seulement fait l'objet d'analyse intra-groupe et non de comparaison versus placebo. De plus, il n'y a pas d'études versus molécule de référence.
En revanche, la baisse observée de l'hémoglobine glycosylée (de l'ordre de 2%) pourrait être un bénéfice intéressant si elle est confirmée dans des essais rigoureux.

Il semble donc que le benfluorex puisse avoir une place dans les intolérances aux autres molécules si une démonstration d'efficacité est apportée.

La firme présente le programme d'études qui démarre et qui devrait pouvoir répondre de manière plus rigoureuse aux questions en suspens actuellement (études en double aveugle contre placebo et produit de référence).

NB : bien qu'apparenté aux amphétamines, le benfluorex n'a jamais été associé à la survenue d'hypertension artérielle pulmonaire primitive.

En conclusion, le benfluorex pourrait avoir une place dans la stratégie thérapeutique du diabète (ie, intolérance à la metformine) mais celle-ci reste entièrement à démontrer. Dans l'intervalle, l'indication chez le diabétique n'est pas maintenue.

PROCEDURE NATIONALE

- **MEDIATOR 150 mg**, comprimé

dossier N° V NL 10008

Laboratoires SERVIER

Demande déposée le 21 MAI 1995

Principe actif : chlorhydrate de benfluorex

Caractère d'originalité : VALIDATION 8ÈME TRANCHE
ENDOCRINOLOGIE

Classe A.T.C. : ANTIDIABETIQUES HYPOGLYCEMIANTS ORAUX
(A: appareil digestif et métabolisme)

Réf.Stat.: VIDAL
LIBRA

L'indication : "Adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale" devait faire l'objet d'une validation 8ème tranche. La firme a demandé une modification de cette indication et des propriétés pharmacologiques. Cette demande de modification a fait l'objet d'un avis défavorable de la Commission (199, 3/2/95).
La firme a demandé une réunion de concertation dont les conclusions sont que cette première indication n'est plus adaptée car non soutenue par les études appropriées. La firme met en place un programme d'études destiné à soutenir cette indication.
Actuellement, la firme dispose toujours de l'AMM dans cette indication.

AVIS DU GTI N° 53 DU 5 DECEMBRE 1995 : PROJET DE REJET de la validation de l'indication de Mediator : "adjuvant du régime dans le diabète avec surcharge pondérale", pour insuffisance de données d'efficacité.

Le dossier clinique transmis ne permet pas d'établir l'efficacité du benfluorex dans l'indication revendiquée. Les résultats des études contrôlées contre placebo qui, seules, pourraient être retenues, n'ont pas fait l'objet de comparaison statistique entre le groupe traité et le groupe placebo mais uniquement intra-groupe. Il n'y a pas d'études menées versus produit de référence. L'insuffisance de données d'efficacité ne permet donc pas de définir un bénéfice clinique pertinent chez les patients diabétiques en surcharge pondérale.

Demande de renouvellement d'A.M.M.
MEDIATOR® 150 mg

Composition intégrale dn médicament :

Chlorhydrate de benfluorex	150,0 mg
Amidon de maïs	60,0 mg
Polyvidone excipient	20,0 mg
Saccharose	245,0 mg
Stéarate de magnésium	5,0 mg
Talc	20,0 mg

pour un noyau de 500 mg

Saccharose	172,914 mg
Talc	17,651 mg
Polyvidone excipient	1,349 mg
Bicarbonate de sodium	0,480 mg
Carboxyméthylcellulose sodique	0,944 mg
Silice colloïdale	0,674 mg
Polysorbate 80	0,850 mg
Ethylcellulose	0,555 mg
Oléate de glycérol	0,278 mg
Dioxyde de titane	4,305 mg
Cire d'abeille blanche	q.s.

pour un comprimé enrobé de 700 mg

Nous vous prions de bien vouloir trouver ci-joint, en deux exemplaires, les documents suivants :

- une photocopie de l'A.M.M. validée en tant qu'hypolipémiant le 22 avril 1987 [l'indication "adjuvant du régime dans le diabète insulino-dépendant avec surcharge pondérale"- validation tranche n°8 endocrinologie - étant en attente], accompagnée des rectificatifs du 29 mai 1987, 14 février 1996 et du renouvellement du 11 mai 1992.
- une copie du texte de l'annexe I (R.C.P.) conforme au dernier avis aux fabricants et des textes de l'Annexe II (notice) et de l'Annexe III (étiquetage) mis en conformité avec les dispositions des articles R 5143 et R 5143-5 du code de la Santé Publique, selon le Décret 94-19 du 5 janvier 1994 ;
- une attestation de non-modification des éléments produits à l'appui de la demande d'A.M.M.

Par ailleurs, nous vous informons que nous adressons, ce jour, copie de ce courrier à la Direction des Laboratoires et des Contrôles (Saint-Denis et Montpellier) et à l'Inspection Régionale de la Santé (Orléans).

Nous vous remettons, enfin, un bordereau de transmission de la redevance accompagné d'un chèque bancaire d'un montant de 4.000 Frs (quatre mille francs) établi à l'ordre de Monsieur l'Agent Comptable de l'Agence du Médicament.

En espérant que vous voudrez bien réserver une suite favorable à notre demande, nous vous prions de croire, Monsieur le Directeur, à l'expression de notre considération distinguée.

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

16

1. DENOMINATION

MEDIATOR 150 mg, comprimé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex	150,0 mg
Amidon de maïs	60,0 mg
Povidone	20,0 mg
Saccharose	245,0 mg
Stéarate de magnésium	5,0 mg
Talc	20,0 mg

pour un comprimé nu de 500 mg

Saccharose	172,914 mg
Talc	17,651 mg
Povidone	1,349 mg
Bicarbonate de sodium	0,480 mg
Carmellose sodique	0,944 mg
Silice colloïdale	0,674 mg
Polysorbate 80	0,850 mg
Ethylcellulose	0,550 mg
Oléate de glycérol	0,278 mg
Dioxyde de titane	4,305 mg
Cire d'abeille blanche	q.s.

pour un comprimé enrobé de 700 mg

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

Adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable

Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée

4.2 Posologie et mode d'administration

Réservé à l'adulte.
La posologie habituelle est de 3 comprimés par jour.

Cette posologie peut être prescrite d'emblée ou atteinte progressivement :
- 1 comprimé la première semaine au dîner,
- 2 comprimés la deuxième semaine : 1 au déjeuner, 1 au dîner,
- 3 comprimés à partir de la troisième semaine : 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

Par la suite, la posologie peut être ramenée à 2, parfois à 1 comprimé par jour, en fonction des résultats biologiques.
Le traitement par le benfluorex est un traitement symptomatique qui doit être régulièrement surveillé.

4.3 Contre-indications

Pancréatites chroniques.

4.4 Mises en garde et précautions particulières d'emploi

Si, après une période d'administration de quelques mois (3 à 6 mois), une réduction satisfaisante des concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

4.5 Interactions avec d'autres médicaments et autres formes d'interactions

4.6 Grossesse et allaitement

Grossesse : les résultats des études réalisées chez l'animal n'ont pas mis en évidence d'effet tératogène du benfluorex. En clinique, le nombre de grossesses exposées est insuffisant pour pouvoir exclure tout risque malformatif ou foetotoxique. En conséquence, il est préférable de ne pas utiliser le benfluorex pendant la grossesse, et ce d'autant que les hyperlipoprotéinémies de la femme enceinte ne représentent pas une indication de ce produit.

Allaitement : en l'absence de données sur le passage dans le lait maternel, l'allaitement est déconseillé pendant la durée du traitement.

4.7 Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

Le prescripteur doit attirer l'attention des conducteurs ou utilisateurs de machines sur le risque de somnolence ou de vertiges.

4.8 Effets indésirables

Les effets secondaires suivants ont été observés : digestifs (nausées, vomissements, gastralgies, diarrhée), asthénie, somnolence ou état vertigineux.

4.9 Surdosage

Conduite à tenir en cas d'absorption massive :

Le traitement sera purement symptomatique, lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience, des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

HYPOLIPIDEMIANT
(B : Sang, organes hématopoïétiques)

Chez le rat, le benfluorex diminue l'absorption intestinale des triglycérides. Cet effet, confirmé chez l'homme en pharmacologie clinique, repose sur la diminution d'activité de la lipase pancréatique.

5.2 Propriétés pharmacocinétiques

5.3 Données de sécurité précliniques

Monsieur,

Par courrier reçu en date du 27 janvier 1997, vous avez déposé un projet de notice et d'étiquetage de vos spécialités :

HYPERIUM 1 mg, comprimés
MEDIATOR 150 mg, comprimé enrobé

A cet égard, je vous informe que ces projets de notice et d'étiquetage appellent de ma part les observations ci jointes.

Aussi, je vous demande de bien vouloir mettre en oeuvre les modifications demandées afin de vous mettre en conformité avec les dispositions des articles R.5143 et R.5143-5 du code de la santé publique.

Je vous rappelle que conformément aux dispositions du troisième alinea de l'article R.5139 du code de la santé publique, l'autorisation de mise sur le marché est suspendue ou retirée par le Directeur Général de l'Agence du médicament, lorsque l'étiquetage ou la notice ne sont pas conformes aux dispositions réglementaires en vigueur.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Monsieur,

Par lettre du 24 JANVIER 1997, vous avez sollicité le renouvellement de l'autorisation de mise sur le marché de la spécialité :

MEDIATOR 150 mg, comprimés enrobés

J'ai l'honneur de vous faire connaître que cette autorisation de mise sur le marché doit être conformément aux dispositions de l'article R.5137, 4ème alinéa du Code de la Santé publique, considérée comme renouvelée à compter du 22 AVRIL 1997.

Toutefois, je vous rappelle que les spécialités dont les autorisations de mise sur le marché ont été délivrées antérieurement au 1er décembre 1976 sont soumises à une validation dont le présent renouvellement ne saurait tenir lieu.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Monsieur,

Suite à votre entretien avec Madame Arielle NORTH, vous avez souhaité modifier les corrections notifiées par l'Agence du Médicament du 28 avril 1997, concernant un projet de notice et d'étiquetage de votre spécialité :

MEDIATOR 150mg, comprimé enrobé

A cet égard, je vous informe que vous pouvez maintenir les mentions concernant l'indication thérapeutique du diabète. Par conséquent, vous trouverez ci-joint votre projet de notice et d'étiquetage revu et corrigé.

Aussi, je vous demande de bien vouloir mettre en oeuvre les modifications demandées afin de vous mettre en conformité avec les dispositions des articles R.5143 et R.5143-5 du code de la santé publique.

Je vous rappelle que conformément aux dispositions du troisième alinea de l'article R.5139 du code de la santé publique, l'autorisation de mise sur le marché est suspendue ou retirée par le Directeur Général de l'Agence du médicament, lorsque l'étiquetage ou la notice ne sont pas conformes aux dispositions réglementaires en vigueur.

Historique de la spécialité MEDIATOR VNL10008

de l'AMM à Année 2000

AMM 16/07/1974
indication : - troubles métaboliques glucido-lipidiques athérogènes
- troubles du métabolisme des lipides
- troubles du métabolisme des glucides

juin 1985 : demande de validation

22 mai 1987 : validation partielle dans l'indication :
"adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

janvier 1990 : demande de validation à l'appel de la 8ème tranche "endocrinologie" pour l'indication :
"en association au régime dans le diabète non insulinodépendant avec surcharge pondérale et/ou hyperinsulinisme."

22 septembre 1995 : réunion de concertation (ASR) dont l'objectif était d'entendre la firme sur l'indication non validée de Médiator "adjuvant de régime dans le diabète avec surcharge pondérale"

GTI 53 du 5/12/95 : projet de rejet de la validation de cette indication

27 janvier 1997 : dépôt d'un projet de notice-étiquetage pour mise en conformité -décret 94.

➤**16 avril 1997** : notification du rectificatif achevant la validation dans la seule indication
" Adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du régime est toujours indispensable
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas pronvée"

Le courrier d'accompagnement précisait :
la démonstration d'efficacité dans l'indication "adjuvant de régime dans le diabète avec surcharge pondérale" est insuffisante
En effet, le dossier clinique transmis ne permet pas d'établir l'efficacité du benfluorex dans l'indication revendiquée. Les résultats des études contrôlées contre placebo qui, seules, pourraient être retenues, n'ont pas fait l'objet de comparaison statistique entre le groupe traité et le groupe placebo mais uniquement intra-groupe. Il n'y a pas d'études menées contre produit de référence. L'insuffisance de données d'efficacité ne permet donc pas de définir un bénéfice clinique pertinent chez les patients diabétiques en surcharge pondérale.

28 avril 1997 : notification du projet de notice corrigé, supprimant l'indication diabète

Mai-juin 1997 : la firme rapporte à l'agence l'original de la notification du 28 avril. Après accord avec AN et JMA (cf note manuscrite d'AN) : ⚠ C Rey Quinior ne retrouve pas ce document.

4 août 1997 : courrier de l'Agence autorisant la firme à maintenir l'indication diabète

29 mai 1998 : demande de modification du RCP : extension d'indication au "diabète de type II(non insulino-dépendant, en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique" (courrier absent en feuille de garde)

Avis de la COM 289 du 8/07/99 : sursis à statuer, notifié le 10/09/99

Vidal 2000 : l'information mentionne toujours les 2 indications.

Monsieur le Directeur Général,

En réponse au courrier du Professeur ALEXANDRE en date du 16 mars 1995, et en concertation étroite avec l'Agence du Médicament (lettre du Docteur ABADIE du 26 janvier 1996), nous avons réalisé une étude coordonnée par les Professeurs LEUTENEGGER, DEL PRATO et ERKELENS :

"Efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul.
Etude de phase III randomisée à double insu durant 6 mois versus placebo et versus chlorhydrate de metformine (850 mg à 2550 mg/j)",

en vue de soutenir l'indication thérapeutique suivante :

"Diabète de type II (non insulino-dépendant) en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".

Nous vous avions adressé, le 30 décembre 1997, la **première analyse** de cette étude.

Nous vous transmettons, ce jour, en 3 exemplaires, **l'analyse finale** confirmant les résultats de l'analyse principale relative à l'efficacité de Benfluorex versus placebo et démontrant la non infériorité de Benfluorex par rapport à la Metformine.

Ce document comporte 29 volumes, dont 15 volumes (du 14/29 au 28/29) relatifs aux cahiers d'observation que nous nous engageons, conformément à l'Avis aux demandeurs, à tenir à la disposition de l'Administration.

Nous joignons par ailleurs, en 50 exemplaires, une nouvelle rédaction du R.C.P., avec modification des rubriques 4.1 "Indications thérapeutiques" et 5.1 "Propriétés pharmacodynamiques", ces dernières étant également soutenues par 3 études de pharmacologie clinique des Dr VELUSSI, PONTIROLI et du Pr ERKELENS dont les rapports ont été déposés à l'Agence du Médicament, en janvier 1995.

Nous vous prions de croire, Monsieur le Directeur Général, à l'expression de notre considération distinguée.

Claude SANTINI
Pharmacien Responsable

PJ : *3 exemplaires de l'étude (14 volumes sans les cahiers d'observation),*
50 exemplaires de la nouvelle rédaction du R.C.P.

DEMANDE DU LABORATOIRE SERVIER D'INDICATION DU MEDIATOR 150 mg POUR LE TRAITEMENT DU DIABÈTE DE TYPE II

(Réunion de la Commission d'AMM du vendredi 2 octobre 1998)

Il s'agit, en fait, au-delà de cette demande extension d'indication, de statuer sur la reconnaissance du Médiator comme agent antidiabétique et hypolipémiant. La modification proposée du RCP du Médiator porte en effet la mention suivante : "Antidiabétique oral différent des sulfamides hypoglycémiants et des biguanides, le Médiator diminue la glycémie à jeûn et post-prandiale chez les diabétiques de type II (non insulino-dépendants)...". Or, jusqu'à présent, dans ses indications retenues, le Médiator est considéré comme adjuvant du régime dans le traitement des hypertriglycéridémies et du diabète asymptomatique avec surcharge pondérale.

L'actuelle demande du Laboratoire SERVIER se fonde sur les résultats d'une étude de phase III, randomisée à double insu, d'une durée de 7 mois, versus placebo et versus Metformine, intitulée "Efficacité du Benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type II mal contrôlés par le régime seul". Il s'est agi d'une étude multicentrique co-coordonnée par les Professeurs Leutenegger de Reims, Del Prato de Padoue et Erkelins d'Utrecht. 316 centres ont été impliqués, 294 en France, 20 en Italie et 2 au Pays Bas. L'étude a duré du 1er juillet 1996 au 4 mars 1998. Après une période de pré-inclusion de 2 mois, la période de traitement était de 6 mois après une période de 5 semaines d'adaptation de la posologie. Le critère principal de jugement était l'HbA1c, de dosage centralisé, mesurée à S0, S17 et S29. Les critères secondaires ont comporté glycémie à jeûn (S0, S17 et S29), insulinémie sérique (S0 et S29), bilan lipidique (S0 et S29) ainsi que les arrêts de traitement pour inefficacité, l'évolution du poids et la mesure mensuelle de la glycémie dosée localement. Un protocole d'évaluation de tolérance a été conduit parallèlement.

Des 1210 patients sélectionnés (diabète de type II, âge : 35 - 70 ans, traitement par régime seul, glycémie à jeûn comprise entre 7,8 et 13,9 mmol/l et/ou HbA1c comprise entre 7,5 et 10,0 %), 722 ont été inclus dont 573 ont terminé l'étude. L'analyse fine de la structure de l'étude, de son déroulement et de ses critères de validité a été réalisée par ailleurs par des collègues spécialistes de ces méthodologies. Ce rapport ne vise qu'à évaluer les principaux résultats de l'étude selon les critères de la diabétologie clinique. Les points suivants méritent commentaires :

- dans le goupe Benfluorex, 6,8 % des traitements ont été arrêtés par manque d'effet (glycémie à jeûn > 2,5 g/l), contre 10,4 % dans le groupe placebo mais 1 % dans le groupe Metformine. Cette observation mérite discussion. Ce taux d'échec différencie fortement l'effet thérapeutique du Benfluorex de celui de la Metformine et amène à relativiser la comparaison des groupes Benfluorex versus Metformine ;

- un autre élément concerne la population des diabétiques inclus dans l'étude : bien que l'éventail des valeurs d'HbA1c d'inclusion soit assez large, la valeur moyenne des taux parait singulièrement peu élevée (7,48-7,79 %) ; cet échantillon est-il bien représentatif des diabétiques non insulino-dépendants ? La déviation standard des valeurs d'HbA1c est donnée,

Annexe 2-33

mais la distribution est-elle gaussienne? En d'autres termes, comment évolue l'efficacité du Médiator en fonction du degré du déséquilibre du diabète ?

- la comparaison Benfluorex-placébo fait apparaître une diminution de 0,79-0,86 % (valeurs absolues) de l'HbA1c quelle que soit la population retenue pour le calcul (population "intention de traiter", population "per-protocole"). Mais la comparaison de l'évolution des moyennes des HbA1c des groupes "cas complets" placébo et Benfluorex est difficile compte-tenu des différences des valeurs de départ et du fait que l'on ne sait pas si les comparaisons intra-groupes S17-S29 montrent une différence significative ;

- la comparaison des valeurs d'insulinémie basale des groupes placébo et Benfluorex n'a pas grande signification ; en revanche, il aurait pu être intéressant d'étudier l'évolution par groupe des rapports "glycémie-insulinémie" individuels ;

- pour la comparaison Benfluorex versus Metformine, les modalités de l'analyse statistique ne semblent pas avoir été conduites, ou au moins présentées, comme pour la comparaison précédente ce qui obscurcit la lisibilité des résultats ; en particulier, manque, apparemment, l'équivalent du tableau 17 figurant les valeurs S0, S17 et S29. Compte-tenu de ces difficultés d'interprétation, la lecture des valeurs des HbA1c moyennes suggère une efficacité du Benfluorex moindre que celle de la Metformine. Le commentaire est similaire pour ce qui concerne les glycémies à jeûn et les insulinémies ;

- un autre commentaire concerne l'éventuelle efficacité "antidiabétique" du Benfluorex en fonction du surpoids. Le poids moyen des patients inclus (82,7 ± 14,4 kg ; IMC : 29,8 ± 4,1 kg/m^2), sans doute conforme aux critères de sélection, apparaît singulièrement élevé. Il serait peut-être utile de tenter de stratifier la présentation des résultats en fonction de l'IMC initial.

Au total, cette étude révèle une certaine action, significative et favorable, du Benfluorex sur le contrôle de la glycémie de diabétiques non insulino-dépendants. Cet effet semble moindre que celui de la Metformine. Cependant, l'étude présentée n'apporte pas d'éléments suffisamment convainquants pour extrapoler cet effet à des segments plus larges de la population des patients diabétiques de type II, d'autant plus que, quantitativement, et bien que significatif, l'effet est limité. En conséquence, il n'est pas approprié d'appliquer le qualificatif "d'antidiabétique" au Benfluorex dans l'état des études actuelles. De même, le qualificatif "hypolipémiant" n'est pas justifié à la lecture des résultats de l'étude présentée dans laquelle, toutefois, l'évolution du bilan lipidique n'était qu'un critère secondaire.

Un dernier commentaire concerne les métabolites du Benfluorex. Il est indispensable que la contribution du Benfluorex à la production éventuelle de dérivés de type fenfluramine soit discutée, en particulier dans le contexte des études récentes sur l'impact de ces molécules sur le risque d'anomalies valvulaires cardiaques.

Le 1er octobre 1998
Professeur J. ORGIAZZI

Relevé d'avis

Annexe 2-34

REUNION COMMISSION N°273 DU 2 OCTOBRE 1998

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoires SERVIER

Demande déposée le 29 Mai 1998

Principe actif :	Benfluorex chlorhydrate
Caractère d'originalité :	Extension d'A.M.M. (Modification de l'ANNEXE I).
Classe ATC :	Système cardio-vasculaire/ Hypolipidémiants (C10A : hypocholestérolémiants et hypotriglycéridémiants)

Le benfluorex chlorhydrate a depuis 1987 (date d'A.M.M : 22.04.1987) les indications suivantes :

"- adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours obligatoire.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

Pour information, une **enquête de Pharmacovigilance** concernant le benfluorex a été réalisée et présentée au Comité Technique de Pharmacovigilance le 10 Septembre 1997.
Cette mise au point s'était avérée nécessaire en raison de la nature de l'un des métabolites du benfluorex (norfenfluramine) et en raison de la constatation d'une dérive de prescription comme anorexigène.
Les conclusions ont été les suivantes :

- les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60ng/l).Mais à partir de la fenfluramine, la norfenfluramine produite n'est plus biotransformée et se retrouve dans les urines à 7.4%; à partir du Benfluorex, la norfenfluramine est transformée en un produit désaminé et oxydé et la dose excrétée ne serait que de 2%.
- la réévaluation n'a pas permis d'écarter un passage de la barrière hémato-méningée de la norfenfluramine produite par le benfluorex. Les études pharmacodynamiques n'ont cependant pas mis en évidence d'effet anorexigène du benfluorex.
- le Comité Technique a proposé que la firme fournisse rapidement (avant le 2 Octobre) une analyse précise des prescriptions de MEDIATOR (nouvelles prescriptions, renouvellements de prescriptions) à partir des panels de vente à leur disposition (DOREMA, IMS).

En ce qui concerne le dossier actuel,

1. **TYPE DE DEMANDE :**
   La firme souhaite une extention d'A.M.M dans l'indication suivante :

   "Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".

Cette demande est étayée par une étude clinique de Phase III de *"l'efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul".*

2. PARTICULARITÉS DE CETTE DEMANDE :

L'étude a été réalisée en réponse à la question de l'Agence du Médicament (lettre du 26 Janvier 1996) afin de valider l'efficacité du benfluorex (dépôt d'élément complémentaire, validation tranche N°8 : diabétologie) dans son indication.

Les résultats ont été soumis en deux étapes :

- analyse de l'efficacité du benfluorex versus placebo : 1ère analyse (décembre 97),
- analyse de l'efficacité du benfluorex versus metformine : 2ème analyse (mai 98).

3. ETUDE BENFLUOREX VERSUS PLACEBO ET METFORMINE

Méthodologie :

- Etude de phase III, randomisée en double insu versus placebo et versus chlorhydrate de metformine (850 mg à 2550 mg/j),
- Nombre de patients prévus : 500 (placebo : 100, benfluorex: 200, metformine : 200),
- Nombre de patients analysés :
  - **1ère phase** : analyse intermédiaire à 6 mois de l'efficacité du benfluorex versus placebo 195 patients (placebo : 67 et benfluorex : 128),
  - **2ème phase** : analyse finale de l'efficacité du benfluorex versus metformine Groupe benfluorex: 252 sujets; groupe metformine : 232 sujets,
- Critère principal d'efficacité: **HbA1c** centralisée mesurée à S0, S17 et S29,
- Critères d'efficacité secondaires : glycémie à jeun (S0, S17 et S29), arrêts de traitement pour inefficacité, insulinémie sérique centralisée, bilan lipidique centralisé (cholestérol, HDL-cholestérol, triglycérides), poids (S0,S3,S5,S13,S17 et S29), glycémie locale à jeun (mesurée tous les 3 mois)
- Tolérance : fréquence et nature des événements indésirables, pression artérielle et fréquence cardiaque à toutes les visites, dosage de la créatininémie (S0 et S17).

Résultats :

1. Phase 1 : EFFICACITE benfluorex versus placebo

HbA1c (en %)		**Placebo**		**Benfluorex**	
Analyse en ITT	(n)	Moy+/-ds	(N)	Moy+/-ds	
S0	127	7.43 +/- 1.48	258	7.65 +/- 1.58

Dernière valeur -S0	127	0.50 +/- 1.32	258	- 0.60 +/- 1.42	
Différence des moyennes (se)		**- 0.86 (0.17)**	IC à 95 %	(-1.20, - 0.52)	
Effet traitement (p)		P < 0.001			
Effet temps (p)		< 0.001		< 0.001	

Glycémie à jeun (mmol/L)		**Placebo**		**Benfluorex**	
Analyse en ITT	(n)	Moy+/-ds	(N)	Moy+/-ds	
S0	123	9.74 +/- 2.28	253	10.04 +/- 2.01	
Dernière valeur	124	10.13 +/- 3.11	256	8.80 +/- 2.29	
Dernière valeur -S0	123	0.36 +/- 2.73	253	- 1.24 +/- 2.30	
Différence des moyennes (se)		**- 1.33 (0.28)**	IC à 95 % de la différence	(- 1.89, - 0.77)	
Effet traitement (p)		< 0.001			
Effet temps (p)		0.147		< 0.001	

2. Phase II. EFFICACITE benfluorex versus metformine

HbA1c (en %) Analyse en ITT		**Benfluorex** (n) Moy+/-ds		**Metformine** (N) Moy+/-ds	
S0	258	7.65 +/- 1.58		250	7.79 +/- 1.61
Dernière valeur		259	7.05 +/- 1.46	252	6.77 +/- 1.34
Dernière valeur -S0		258	- 0.60 +/- 1.42	250	- 1.01 +/- 1.38
Différence des moyennes (se)			**0.28 (0.212)**	90 % IC de la différence (0.07 - **0.48)**	
Test de non-infériorité (p)			P = 0.037		

Glycémie à jeun (mmol/L) Analyse en ITT		**Benfluorex** (n) Moy+/-ds		**Metformine** (N) Moy+/-ds	
S0	253	10.04 +/- 2.01		246	10.15 +/- 2.47
Dernière valeur		256	8.80 +/- 2.29	248	8.16 +/- 1.90
Dernière valeur -S0		253	- 1.24 +/- 2.30	246	- 1.97 +/- 2.32
Différence des moyennes (se)			**0.64 (0.19)**		
90 % de l'IC de la différence			(0.33 , 0.95)		

Les résultats de la phase I de cette étude (benfluorex versus placebo) montrent qu'après 6 mois de traitement :
- l'évolution de l'HbA1c est *significativement différente entre les deux groupes de traitement (p<0.001)* avec un effet groupe significatif à S17 et S29 en faveur du benfluorex,
- la différence entre les deux groupes sur la valeur finale de la glycémie à jeun est de -1.32 mmol/l, p=0.007.

3.Tolérance

Au cours de l'étude (phase I + phase II), 28% des patients du groupe placebo et 38 % de ceux du groupe benfluorex ont rapporté au moins un événement indésirable concernant le système gastro-intestinal, des troubles de l'état général et le système respiratoire.
Dans le groupe benfluorex, les événements émergents les plus fréquemment rapportés ont été: asthénie (7), diarrhée (6), vertiges (5) et céphalées (4 patients).

Note interne d'évaluation : L'évaluation de l'étude a soulevé les commentaires suivants:

1. Commentaires concernant la METHODOLOGIE de l'essai (phase I + phase II).

➪ *Rappel de la méthodologie :*

722 patients diabétiques âgés de 35 à 70 ans, traités par régime seul avec une glycémie comprise entre 7.8 et 13.8 mmol/l et/ou une HbA1c entre 7.5 et 10 % ont participé à cette étude.
Les *critères d'efficacité* ont été :
- l'HbA1c à 0, S17 et S29 (critère principal),
- la glycémie à jeun, l'insulinémie, les lipides, le poids (critères secondaires).

La *tolérance* a été évaluée sur l'incidence et la nature des événements indésirables, les chiffres de pression artérielle et de fréquence cardiaque, le taux de créatininémie (S0 et S17).

➪ *Commentaires :*

- le **nombre de sujets inclus** dépasse celui prévu initialement dans le protocole (722 au

lieu
de 500 patients) ce qui entraîne :
* une augmentation de la puissance de l'essai,
* une incidence bénéfique sur les résultats concernant les critères secondaires d'efficacité, (l'analyse des résultats en terme d'efficacité avec seulement 500 patients inclus n'est pas transmise).

- **l'analyse intermédiaire** de l'efficacité du benfluorex versus placebo n'était pas prévue dans
le protocole de l'essai. Par ailleurs, aucun ajustement du seuil de significativité (valeur de p)
n'a été effectué pour l'analyse finale.

- il manque de nombreuses valeurs, en particulier de l'HbA1c. 45.4 % (soit 328 cas) de **déviations majeures** ont été notifiées, ce qui pose un problème de qualité générale de l'essai.

- **Intervalle de confiance (IC)** à 95 % pour l'HbA1c et les critères secondaires dans la partie
I de l'essai (benfluorex versus placebo) alors que l'IC est à 90 % dans la seconde partie (benfluorex versus metformine).

- analyse de l'efficacité benfluorex versus metformine : les résultats montrent une diminution de 0.28 % de l'HbA1c (IC à 90 % : 0.07-0.48). La borne supérieure de cet intervalle est en-dessous de celle de 0.50 %, valeur fixée dans le protocole comme seuil de significativité d'un
antidiabétique oral pour une étude d'équivalence.

- pour les **"cas-complets"**, une analyse de l'évolution des moyennes de l'HbA1c des groupes
placebo et benfluorex à S0, S17 et S29 serait souhaitable.

2. Commentaires concernant les RESULTATS de l'essai **(phase I + phase II).**

⇨ *Rappel des principaux résultats :*

1. Efficacité du **benfluorex versus placebo** (6 mois de traitement par benfluorex)
   - réduction de l'HBA1c de **0.86 % (IC à 95 % : - 1,89 ; - 0.52)**,
   - réduction de la valeur moyenne de la glycémie de **- 1.33 mmol/l (IC à 95 % : -1.98 ;- 0.77)**,
   - pas d'effet sur l'insulinémie, les triglycérides ou le HDL-cholestérol,
   - diminution très modérée mais *significative* du poids sous benfluorex (- 1.96 kg +/- 3.13).

2. Efficacité de **benfluorex versus metformine**.
   - HbA1c :différence de **0.28 %** (IC à 90 % : 0.07; 0.48), soit benfluorex : 7.05 % et metformine : 6.77 %
   - glycémie à jeun : différence de **0.6 mmol/l** (IC à 90 % : 0.66 ; 0.94), soit benfluorex : 8.80
     mmol/L et benfluorex : 8.16 mmol/L

3. En terme de **tolérance** :
   - le nombre total de patients ayant présenté des effets indésirables est réparti de la façon suivante :
   * placebo : 20.8 %

* benfluorex : 24.8 %
* metformine : 26.4 %

- quel que soit le type d'événements indésirables, il n'y a pas de différence significative entre benfluorex
et metformine.

Les effets indésirables les plus fréquents sont de type **gastro-intestinal** (benfluorex : 5.1 % ; metformine : 13.7 %), nausées, douleurs abdominales. Les autres effets sont de type asthénie, vertige, myalgies et lombalgies.

- les effets *indésirables émergents sévères* attribués à benfluorex sont :
  * 1 cas de trouble de l'équilibre,
  * 1 cas de vertige,
  * 2 cas de diarrhées,
  * 1 cas de ballonnement intestinal.

➪ *Commentaires :*

1. La présentation des résultats est ambiguë et les groupes concernés ne sont pas toujours définis.
   Les résultats donnés sont variables selon les tableaux (ex. : données en ITT du groupe Benfluorex versus placebo et versus metformine sur HbA1c).

2. **Concernant l'HbA1c. Bien que l'éventail des valeurs d'HbA1c soit large,** la valeur moyenne des taux **d'HbA1c est peu élevée (7.48-7.79 %),** et n'est pas représentative d'une population de sujets diabétiques. Les patients inclus sont en moyenne peu sévèrement atteints.
   La distribution est-elle Gaussienne? Comment évolue l'efficacité du benfluorex en fonction du déséquilibre du diabète?

3. Les **arrêts de traitements par manque d'efficacité (glycémie > 2.5 g/l)** ont été de 10.4% dans le groupe placebo, 6.8 % dans le groupe benfluorex et de 1 % dans le groupe metformine.

4. La comparaison de l'efficacité du benfluorex versus metformine ne tient pas compte des doses des deux traitements, en particulier **les posologies réelles de metformine utilisées ne sont pas précisées** (posologie minimale, maximale et moyenne).

5. Enfin, il est noté que dans cette étude **aucun effet sur les lipides, en particulier sur les triglycérides n'est mis en évidence** alors que l'A.M.M actuelle précise qu'il s'agit d'un traitement "adjuvant adapté dans les hypertriglycéridémies".

CONCLUSIONS :

Cette étude met en évidence une *action significative et favorable du benfluorex versus placebo sur le contrôle de la glycémie* de sujets diabétiques de type II.

Toutefois, l'évaluation globale de l'efficacité du benfluorex dans l'indication du diabète de type 2 devra tenir compte des réponses aux questions et commentaires soulevées par l'analyse de cette étude, tant sur le plan méthodologique que sur l'interprétation des résultats de l'essai (notamment versus metformine).

Enfin, il serait important de prendre connaissance des données récentes de l'enquête de pharmacovigilance.

AVIS DE LA COMMISSION N° 273 DU 2 OCTOBRE 1998 : SURSIS A STATUER en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis à vis de la metformine.

N.B. :

1) l'efficacité du benfluorex vesus placebo sur la réduction de l'HBA1c paraît établie. Elle est de faible amplitude : 0,9 % et porte sur des patients initialement peu sévèrement atteints (HbA1c de 7,5 à 7,8 %).
2) L'absence d'efficacité du benfluorex sur l'hypertriglycéridémie du diabète est à noter alors que l'hypertriglycéridémie est une des indications actuelles du produit.

Annexe 2-35

Compte-rendu de la réunion interne concernant MEDIATOR (AFSSAPS, 18 mars 1999)

Etaient présents :
Mr. le Dr. Fricker
Mr. le Pr. Berthezene
Mr. le Pr. Halimi
Mr. le Dr. Saltiel

pour l'AFSSAPS :
Dr E. Abadie
Pr. C. Caulin
Dr L.Duranteau
Dr C. Rey-quinio
Dr G. Rostoker

Etaient absents et excusés :
Mr. le Pr. Altman
Mr. le Pr. Orgiazzi
Mr. le Pr. Timsit
Mr. le Pr. Vicaut

Objectif de la réunion :
1) situer l'efficacité du benfluorex vis à vis d'autres thérapeutiques hypoglycémiantes.
2) déterminer la place éventuelle du benfluorex dans la stratégie thérapeutique du diabète de type 2.

Rappel :
avis de la COM du 2 octobre 1998 : SURSIS À STATUER en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis-à-vis de la metformine.
N.B. :
1) l'efficacité du benfluorex versus placebo sur la réduction de l'HBA_{1c} parait établie. Elle est de faible amplitude : 0,9 % et porte sur des patients initialement peu sévèrement atteints (HbA_{1c} de 7,5 % à 7,8 %).
2) L'absence d'efficacité du benfluorex sur l'hypertriglycéridémie du diabète est à noter alors que l'hypertriglycéridémie est une des indications actuelles du produit actuelles du produit.

I. Au plan méthodologique :
1) nous disposons d'un rapport du Pr. E.Vicaut dont les principales conclusions sont les suivantes :

"Concernant l'analyse de non infériorité du benfluorex vs metformine:
1) dans cet essai 2 hypothèses sont testées simultanément :
-supériorité vis à vis du placebo
-non-infériorité vis à vis de la metformine

- Le rapporteur est tout à fait d'accord avec la plupart des remarques méthodologiques telles qu'elles apparaissent dans le rapport de la Commission du 2/10/99. ...dont les plus importantes sont:

-une justification peu claire de la différence entre la taille de l'échantillon prévue et la taille effective. Le problème ne se situe pas à notre avis dans l'augmentation de puissance qu'elle induit, car après tout on ne peut reprocher à un essai d'être trop puissant, mais parce qu'elle introduit un doute sur le maintien de l'aveugle tout au long de l'essai.
(Il faut noter qu'il existe des justifications détaillées des procédures de maintien de l'aveugle après l'analyse intermédiaire du bras vs placebo mais que celles-ci ne répondent pas directement au problème évoqué ci-dessous)

-le nombre de déviations majeures apparaît très important.

- Commentaires concernant le test de non infériorité

Il est noté que l'intervalle de confiance utilisé pour les comparaisons vs placebo étant des intervalles de confiance à 95 %, alors que celui utilisé dans la comparaison vs metformine était un intervalle de confiance à 90 %.
En fait, il y a effectivement un manque de clarté dans la description des procédures utilisées dans cette étude.Il semble que dans le dossier les auteurs ont utilisé un intervalle de confiance BILATERAL à 90 % plutôt que l'intervalle UNILATERAL à 95 %. Si c'est le cas il s'agit d'une erreur formelle mais qui ne modifierait pas leurs conclusions.

En pratique, il me semble nécessaire de leur demander une clarification sur ce point en leur demandant simplement soit de préciser si l'intervalle qu'ils ont considéré est un intervalle BILATERAL, soit (et ce serait plus souhaitable d'un point de vue formel) de fournir le calcul des intervalles de confiance UNILATERAUX à 95 %. (pour ITT et per protocole). Il est intéressant de noter en faveur de l'étude et en rapport avec le problème du grand nombre de déviations que les conclusions basées sur la population per protocole sont similaires (et même plutôt franches) qu'avec la population ITT.
Ce point est important car dans certain cas l'analyse en ITT d'une étude d'équivalence biaise en faveur de la conclusion d'équivalence.

En ce qui concerne les études secondaires : la procédure est très curieuse car aucune borne d'équivalence n'est fixée a priori, même pas en terme de variation relative acceptable. Les auteurs se contentent de comparer les bornes des intervalles de confiance à des variations cliniques pertinentes qui seraient donc déterminées a posteriori. Ceci pourrait être admis dans une phase exploratrice mais n'est pas acceptable dans une procédure à visée démonstratrice.

Annexe 2-35

II. Principaux commentaires des experts cliniciens présents :

-sur la méthodologie :

- les sorties d'étude par manque d'efficacité dans le groupe benfluorex ne sont pas négligeables : 6.8 % vs 1 %; des clarifications sont souhaitables;

- il apparaît dans le groupe metformine que l'ajustement thérapeutique n'ait pas été toujours réalisé dans les conditions prévues de l'essai;

- dans l'essai ont été inclus des patients ayant des HbA_1c dans les limites de la normale et donc non diabétiques ;

-concernant le rapport efficacité/sécurité :

- la non- infériorité vs metformine nécessite d'être réanalysée en tenant compte des manques méthodologiques déjà cités ;

- les résultats mériteraient d'être exprimés :
  . en fonction des quartilles d'HbA_{1c} de départ
  . en fonction du BMI et de la perte de poids en fin de traitement

Il faut remarquer que dans cet essai, les résultats ne montrent aucun effet de diminution du taux des triglycérides dans le groupe benfluorex

III. Commentaires généraux et conclusion :

- l'efficacité du benfluorex dans la réduction de l'HbA_{1c} est faible ;

- la qualité de l'essai parait discutable ;

- l'indication éventuelle se discute si la non-infériorité vs metformine est démontrée :
  - pour un sous-groupe défini de patients diabétiques ; les limites de l'HbA_{1c} seraient à définir :
  - en première intention ;
  - l'efficacité serait à évaluer à 6 mois et le traitement arrêté s'il n'apporte pas de bénéfice (i.e normalisation de l'HbA_{1c})
- manquent des études en association avec d'autres thérapeutiques hypoglycémiantes;
- le benfluorex n'a pas apporté de preuve de diminution de l'incidence des complications à long-terme du diabète.

En conclusion, des clarifications sont nécessaires :

- sur la qualité de l'essai (causes de sortie pour inefficacité, ajustement thérapeutique dans le groupe metformine, qualité des centres investigateurs.): une inspection de l'essai sera discutée (P-H Bertoye)
- sur les résultats d'efficacité dans des sous-groupes :
  . en fonction du quartille d'HbA_{1C}
  . en fonction du poids

- des données manquent :
  . en association avec d'autres thérapeutiques hypoglycémiantes
  . dans le diabète sévère : par ex, lorsque l'HbA_{1c} est supérieur à 8 %)
  . dans les situations où la metformine serait contre-indiquée.

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoires SERVIER

Demande déposée le 29 Mai 1998

Principe actif :	Benfluorex chlorhydrate
Caractère d'originalité :	Extension d'A.M.M. (Modification de l'ANNEXE I).
Classe ATC :	Système cardio-vasculaire/ Hypolipidémiants (C10A : hypocholestérolémiants et hypotriglycéridémiants)

Le benfluorex chlorhydrate a depuis 1987 (date d'A.M.M : 22.04.1987) les indications suivantes :

"- adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours obligatoire.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

Pour information, une **enquête de Pharmacovigilance** concernant le benfluorex a été réalisée et présentée au Comité Technique de Pharmacovigilance le 10 Septembre 1997.
Cette mise au point s'était avérée nécessaire en raison de la nature de l'un des métabolites du benfluorex (norfenfluramine) et en raison de la constatation d'une dérive de prescription comme anorexigène.
Les conclusions ont été les suivantes :

- les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60ng/l).Mais à partir de la fenfluramine, la norfenfluramine produite n'est plus biotransformée et se retrouve dans les urines à 7.4%; à partir du Benfluorex, la norfenfluramine est transformée en un produit désaminé et oxydé et la dose excrétée ne serait que de 2%.
- la réévaluation n'a pas permis d'écarter un passage de la barrière hémato-méningée de la norfenfluramine produite par le benfluorex. Les études pharmacodynamiques n'ont cependant pas mis en évidence d'effet anorexigène du benfluorex.
- le Comité Technique a proposé que la firme fournisse rapidement (avant le 2 Octobre) une analyse précise des prescriptions de MEDIATOR (nouvelles prescriptions, renouvellements de prescriptions) à partir des panels de vente à leur disposition (DOREMA, IMS).

En ce qui concerne le dossier actuel,

1. **TYPE DE DEMANDE :**
La firme souhaite une extention d'A.M.M dans l'indication suivante :

"Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".

Cette demande est étayée par une étude clinique de Phase III de *"l'efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul".*

2. **PARTICULARITÉS DE CETTE DEMANDE :**
L'étude a été réalisée en réponse à la question de l'Agence du Médicament (lettre du 26 Janvier 1996) afin de valider l'efficacité du benfluorex (dépôt d'élément complémentaire, validation tranche N°8 : diabétologie) dans son indication.
Les résultats ont été soumis en deux étapes :
- analyse de l'efficacité du benfluorex versus placebo : 1ère analyse (décembre 97),
- analyse de l'efficacité du benfluorex versus metformine : 2ème analyse (mai 98).

Méthodologie :
- Etude de phase III, randomisée en double insu versus placebo et versus chlorhydrate de metformine (850 mg à 2550 mg/j),
- Nombre de patients prévus : 500 (placebo : 100, benfluorex: 200, metformine : 200),
- Nombre de patients analysés :
  - **1ère phase** : analyse intermédiaire à 6 mois de l'efficacité du benfluorex versus placebo 195 patients (placebo : 67 et benfluorex : 128),
  - **2ème phase** : analyse finale de l'efficacité du benfluorex versus metformine Groupe benfluorex: 252 sujets; groupe metformine : 232 sujets,
- Critère principal d'efficacité: HbA1c centralisée mesurée à S0, S17 et S29,
- Critères d'efficacité secondaires : glycémie à jeun (S0, S17 et S29), arrêts de traitement pour inefficacité, insulinémie sérique centralisée, bilan lipidique centralisé (cholestérol, HDL-cholestérol, triglycérides), poids (S0,S3,S5,S13,S17 et S29), glycémie locale à jeun (mesurée tous les 3 mois)
- Tolérance : fréquence et nature des événements indésirables, pression artérielle et fréquence cardiaque à toutes les visites, dosage de la créatininémie (S0 et S17).

Résultats :

1. Phase 1 : EFFICACITE benfluorex versus placebo

HbA1c (en %)		Placebo		Benfluorex	
Analyse en ITT	(n)	Moy+/-ds	(N)	Moy+/-ds	
S0	127	7.43 +/- 1.48	258	7.65 +/- 1.58	
Dernière valeur		128	7.91 +/- 1.86	259	7.05 +/- 1.46
Dernière valeur -S0		127	0.50 +/- 1.32	258	- 0.60 +/- 1.42
Différence des moyennes (se)		- 0.86 (0.17)	IC à 95 % (-1.20, - 0.52)		
Effet traitement (p)		P < 0.001			
Effet temps (p)		< 0.001		< 0.001	

Annexe 2-36

Glycémie à jeun (mmol/L) Analyse en ITT		Placebo (n) Moy+/-ds		Benfluorex (N) Moy+/-ds	
S0	123	9.74 +/- 2.28		253	10.04 +/- 2.01
Dernière valeur		124	10.13 +/- 3.11	256	8.80 +/- 2.29
Dernière valeur -S0		123	0.3 +/- 2.73	253	- 1.24 +/- 2.30
Différence des moyennes (se)			- 1.33 (0.28)	IC à 95 % de la différence (- 1.89, - 0.77)	
Effet traitement (p)				< 0.001	
Effet temps (p)		0.147		< 0.001	

2. *Phase II. EFFICACITE benfluorex versus metformine*

HbA1c (en %) Analyse en ITT		Benfluorex (n) Moy+/-ds		Metformine (N) Moy+/-ds	
S0	258	7.65 +/- 1.58		250	7.79 +/- 1.61
Dernière valeur		259	7.05 +/- 1.46	252	6.77 +/- 1.34
Dernière valeur -S0		258	- 0.60 +/- 1.42	250	- 1.01 +/- 1.38
Différence des moyennes (se)			0.28 (0.212)	90 % IC de la différence (0.07 - 0.48)	
Test de non-infériorité (p)				P = 0.037	

Glycémie à jeun (mmol/L) Analyse en ITT		Benfluorex (n) Moy+/-ds		Metformine (N) Moy+/-ds	
S0	253	10.04 +/- 2.01		246	10.15 +/- 2.47
Dernière valeur		256	8.80 +/- 2.29	248	8.16 +/- 1.90
Dernière valeur -S0		253	- 1.24 +/- 2.30	246	- 1.97 +/- 2.32
Différence des moyennes (se)			0.64 (0.19)		
90 % de l'IC de la différence			(0.33 , 0.95)		

Les résultats de la phase I de cette étude (benfluorex versus placebo) montrent qu'après 6 mois de traitement :

- l'évolution de l'HbA1c est *significativement différente entre les deux groupes de traitement (p<0.001)* avec un effet groupe significatif à S17 et S29 en faveur du benfluorex,
- la différence entre les deux groupes sur la valeur finale de la glycémie à jeun est de -1.32 mmol/l, p=0.007.

3. *Tolérance*

Au cours de l'étude (phase I + phase II), 28% des patients du groupe placebo et 38 % de ceux du groupe benfluorex ont rapporté au moins un événement indésirable concernant le système gastro-intestinal, des troubles de l'état général et le système respiratoire.
Dans le groupe benfluorex, les événements émergents les plus fréquemment rapportés ont été: asthénie (7), diarrhée (6), vertiges (5) et céphalées (4 patients).

Annexe 2-36

Note interne d'évaluation : L'évaluation de l'étude a soulevé les commentaires suivants:

***1. Commentaires concernant la METHODOLOGIE de l'essai* (phase I + phase II).**

➪ *Rappel de la méthodologie :*

722 patients diabétiques âgés de 35 à 70 ans, traités par régime seul avec une glycémie comprise entre 7.8 et 13.8 mmol/l et/ou une HbA1c entre 7.5 et 10 % ont participé à cette étude.

Les *critères d'efficacité* ont été :

- l'HbA1c à 0, S17 et S29 (critère principal),
- la glycémie à jeun, l'insulinémie, les lipides, le poids (critères secondaires).

La *tolérance* a été évaluée sur l'incidence et la nature des événements indésirables, les chiffres de pression artérielle et de fréquence cardiaque, le taux de créatininémie (S0 et S17).

➪ *Commentaires :*

- le **nombre de sujets inclus** dépasse celui prévu initialement dans le protocole (722 au lieu de 500 patients) ce qui entraîne :
  * une augmentation de la puissance de l'essai,
  * une incidence bénéfique sur les résultats concernant les critères secondaires d'efficacit (l'analyse des résultats en terme d'efficacité avec seulement 500 patients inclus n'est pas transmise).

- **l'analyse intermédiaire** de l'efficacité du benfluorex versus placebo n'était pas prévue dans le protocole de l'essai. Par ailleurs, aucun ajustement du seuil de significativité (valeur de p) n'a été effectué pour l'analyse finale.

- il manque de nombreuses valeurs, en particulier de l'HbA1c. 45.4 % (soit 328 cas) de **déviations majeures** ont été notifiées, ce qui pose un problème de qualité générale de l'essai.

- **Intervalle de confiance (IC)** à 95 % pour l'HbA1c et les critères secondaires dans la partie I de l'essai (benfluorex versus placebo) alors que l'IC est à 90 % dans la seconde partie (benfluorex versus metformine).

- analyse de l'efficacité benfluorex versus metformine : les résultats montrent une diminution de 0.28 % de l'HbA1c (IC à 90 % : 0.07-0.48). La borne supérieure de cet intervalle est en-dessous de celle de 0.50 %, valeur fixée dans le protocole comme seuil de significativité d'u antidiabétique oral pour une étude d'équivalence.

- pour les **"cas-complets"**, une analyse de l'évolution des moyennes de l'HbA1c des groupes placebo et benfluorex à S0, S17 et S29 serait souhaitable.

***2. Commentaires concernant les RESULTATS de l'essai* (phase I + phase II).**

➪ *Rappel des principaux résultats :*

1. Efficacité du **benfluorex versus placebo** (6 mois de traitement par benfluorex)
   - réduction de l'HBA1c de **0.86 % (IC à 95 % : - 1,89 ; - 0.52)**,
   - réduction de la valeur moyenne de la glycémie de - 1.33 mmol/l (IC à 95 % : -1.98 ;-0.77),
   - pas d'effet sur l'insulinémie, les triglycérides ou le HDL-cholestérol,
   - diminution très modérée mais *significative* du poids sous benfluorex (- 1.96 kg +/- 3.13).

2. Efficacité de **benfluorex versus metformine**.
   - HbA1c :différence de **0.28 %** (IC à 90 % : 0.07; 0.48), soit benfluorex : 7.05 % et metformine : 6.77 %

Annexe 2-36

Note interne d'évaluation : L'évaluation de l'étude a soulevé les commentaires suivants:

***1. Commentaires concernant la METHODOLOGIE de l'essai* (phase I + phase II).**

➪ *Rappel de la méthodologie :*

722 patients diabétiques âgés de 35 à 70 ans, traités par régime seul avec une glycémie comprise entre 7.8 et 13.8 mmol/l et/ou une HbA1c entre 7.5 et 10 % ont participé à cette étude.

***2. Commentaires concernant les RESULTATS de l'essai* (phase I + phase II).**

➪ *Rappel des principaux résultats :*

1. Efficacité du **benfluorex versus placebo** (6 mois de traitement par benfluorex)
   - réduction de l'HBA1c de **0.86 % (IC à 95 % : - 1,89 ; - 0.52)**,
   - réduction de la valeur moyenne de la glycémie de - 1.33 mmol/l (IC à 95 % : -1.98 ;-0.77),
   - pas d'effet sur l'insulinémie, les triglycérides ou le HDL-cholestérol,
   - diminution très modérée mais *significative* du poids sous benfluorex (- 1.96 kg +/- 3.13).

2. Efficacité de **benfluorex versus metformine**.
   - HbA1c :différence de **0.28 %** (IC à 90 % : 0.07; 0.48), soit benfluorex : 7.05 % et metformine : 6.77 %

- glycémie à jeun : différence de **0.6 mmol/l** (IC à 90 % : 0.66 ; 0.94), soit benfluorex : 8.80 mmol/L et benfluorex : 8.16 mmol/L

3. En terme de **tolérance** :
   - le nombre total de patients ayant présenté des effets indésirables est réparti de la façon suivante :
   * placebo : 20.8 %
   * benfluorex : 24.8 %
   * metformine : 26.4 %
   - quel que soit le type d'événements indésirables, il n'y a pas de différence significative entre benfluorex et metformine.
   Les effets indésirables les plus fréquents sont de type **gastro-intestinal** (benfluorex : 5.1 % ; metformine : 13.7 %), nausées, douleurs abdominales. Les autres effets sont de type asthénie, vertige, myalgies et lombalgies.
   - les effets *indésirables émergents sévères* attribués à benfluorex sont :
     * 1 cas de trouble de l'équilibre,
     * 1 cas de vertige,
     * 2 cas de diarrhées,
     * 1 cas de ballonnement intestinal.

⇨ *Commentaires :*

1. La présentation des résultats est ambiguë et les groupes concernés ne sont pas toujours définis.
   Les résultats donnés sont variables selon les tableaux (ex. : données en ITT du groupe Benfluorex versus placebo et versus metformine sur HbA1c).

2. **Concernant l'HbA1c. Bien que l'éventail des valeurs d'HbA1c soit large,** la valeur moyenne des taux **d'HbA1c est peu élevée (7.48-7.79 %),** et n'est pas représentative d'une population de sujets diabétiques. Les patients inclus sont en moyenne peu sévèrement atteints.
   La distribution est-elle Gaussienne? Comment évolue l'efficacité du benfluorex en fonction du déséquilibre du diabète?

3. Les **arrêts de traitements par manque d'efficacité (glycémie > 2.5 g/l)** ont été de 10.4% dans le groupe placebo, 6.8 % dans le groupe benfluorex et de 1 % dans le groupe metformine.

4. La comparaison de l'efficacité du benfluorex versus metformine ne tient pas compte des doses des deux traitements, en particulier **les posologies réelles de metformine utilisées ne sont pas précisées** (posologie minimale, maximale et moyenne).

5. Enfin, il est noté que dans cette étude **aucun effet sur les lipides, en particulier sur les triglycérides n'est mis en évidence** alors que l'A.M.M actuelle précise qu'il s'agit d'un traitement "adjuvant adapté dans les hypertriglycéridémies".

CONCLUSIONS :

Cette étude met en évidence une *action significative et favorable du benfluorex versus placebo sur le contrôle de la glycémie* de sujets diabétiques de type II.

Annexe 2-36

Toutefois, l'évaluation globale de l'efficacité du benfluorex dans l'indication du diabète de type 2 devra tenir compte des réponses aux questions et commentaires soulevées par l'analyse de cette étude, tant sur le plan méthodologique que sur l'interprétation des résultats de l'essai (notamment versus metformine).

Enfin, il serait important de prendre connaissance des données récentes de l'enquête de pharmacovigilance.

AVIS DE LA COMMISSION N° 273 DU 2 OCTOBRE 1998 : **SURSIS A STATUER** en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis à vis de la metformine.

N.B. :

1) l'efficacité du benfluorex versus placebo sur la réduction de l'HbA1c paraît établie. Elle est de faible amplitude : 0,9 % et porte sur des patients initialement peu sévèrement atteints (HbA1c de 7,5 à 7,8 %).
2) L'absence d'efficacité du benfluorex sur l'hypertriglycéridémie du diabète est à noter alors que l'hypertriglycéridémie est une des indications actuelles du produit.

Note interne d'évaluation :

Les questions nécessitant des réponses et un avis complémentaire sont :

1/ sur le plan méthodologique et de la qualité de l'essai :
- le choix de l'intervalle de confiance à 95% pour la comparaison versus placebo ; à 90% pour la comparaison versus metformine ;
- le maintien de l'aveugle pendant la durée de l'essai ;
- la qualité des inclusions (certains patients inclus avaient une HbA_{1C} dans les limites de la normale) ; les causes de sortie pour inefficacité : l'ajustement thérapeutique dans le groupe metformine.

2/ concernant l'efficacité
- l'efficacité du benfluorex dans la réduction de l'HbA_{1c} est faible ;
- l'indication éventuelle se discute si la non-infériorité vs metformine est démontrée :
  - pour un sous-groupe défini de patients diabétiques ; les limites de l'HbA_{1c} seraient à définir :
  - en première intention ;
  - l'efficacité serait à évaluer à 6 mois et le traitement est arrêté s'il n'apporte pas de bénéfice (i.e normalisation de l'HbA_{1c})

Enfin, le benfluorex n'a pas apporté de preuve de diminution de l'incidence des complications à long-terme du diabète.

Les données sont insuffisantes pour évaluer l'efficacité du benfluorex :
dans les sous-groupes de patients qui ont un diabète plus sévère,
- en association avec d'autres thérapeutiques hypoglycémiantes
- en fonction du poids
- éventuellement chez les patients ayant une contre indication aux biguanides

enfin, l'absence d'effet sur les triglycérides est souligné

Annexe 2-36

3/ D'autre part, la tolérance du benfluorex est remise en question en raison de la notification récente d'une hypertension artérielle pulmonaire d'allure primitive chez une patiente de 51 ans traitée par benfluorex depuis 4 à 5 ans.

Le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (Italie et France, rapporteurs).

Au total, une mise à jour des données de tolérance, des données de pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines ont été demandées à la firme.

AVIS DE LA COMMISSION N°289 DU 8 JUILLET 1999 : **SURSIS A STATUER** en l'attente

- des conclusions de l'inspection sur la qualité de l'essai ;
- de l'évaluation des données disponibles de pharmacovigilance.
- de l'avis de l'expert méthodologiste.

En tout état de cause le dossier actuel ne permettrait pas de donner l'indication "traitement du diabète de type II" en raison :
- de la faible efficacité hypoglycémiante observée,
- de l'absence de données suffisantes chez les diabétiques ayant une hémoglobine HbA1c élevée (supérieure à celle des patients de l'étude versée, soit en moyenne 7.48 - 7.79 %),
- de l'absence de données en association aux antidiabétiques,
- de l'absence de données à long terme ,
- de la difficulté de positionner le benfluorex dans la stratégie de prise en charge du diabète.

Des études chez les patients chez qui la metformine est contre-indiquée seraient utiles.

Saint-Denis, le 25 AOUT 1999

Note
à l'attention de Monsieur J.M. ALEXANDRE,
Directeur de l'évaluation des médicaments et des produits biologiques

Objet : Mediator - inspection de l'essai CL3-780-144 - note d'étape.

Par note en date du 12 juin 1999, la direction de l'évaluation des médicaments et des produits biologiques a demandé l'inspection de l'essai intitulé "Efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul. Etude de phase III randomisée à double insu durant 6 mois versus placebo et versus chlorhydrate de metformine (850 à 2550 mg/j) (Essai CL3-780-144)", présenté par les laboratoires Servier à l'appui d'une demande d'extension d'indication pour leur spécialité Médiator 150 mg.

L'examen du dossier de cette demande par le département d'inspection des essais cliniques et non cliniques a mis en évidence plusieurs limites et insuffisances concernant le protocole de l'essai et l'analyse des résultats. Par ailleurs, les premières inspections réalisées ont mis en évidence une erreur dans la formule de calcul de l'HbA1c utilisée par le laboratoire centralisé en charge de cette analyse.

*** Limites du protocole et commentaires relatifs aux résultats :**

- Limites du protocole :

Le critère principal d'évaluation de l'efficacité était l'hémoglobine glyquée HbA1c. Les critères d'inclusion dans l'essai étaient une glycémie à jeun ≥ 1,40 g/l (7,8 mmol/l) et ≤ 2,50 g/l (13,9 mmol/l) à la visite d'inclusion (V0) et/ou une HbA1c ≥ 7,5 % et ≤ 10 % à la visite V-1. La présence d'une HbA1c élevée n'était donc pas un critère obligatoire pour l'inclusion. De ce fait, la valeur de base de l'HbA1c de 79 des 722 patients inclus dans l'essai était inférieure ou égale à 5,8 %, valeur de référence du laboratoire ; 281 autres patients avaient une HbA1c inférieure à 7,5 %.

. Limites de l'analyse des résultats :

Ces limites ont été examinées principalement pour l'analyse d'efficacité entre les groupes benfluorex et metformine concernant le critère d'évaluation principal.
L'analyse statistique réalisée pour l'HbA1c a consisté principalement en une comparaison des moyennes des HbA1c à la dernière visite entre les différents groupes.
Le rapport de l'essai et son annexe 16.4. (listing des analyses statistique) ne présentent pas clairement de comparaison statistique des groupes à l'inclusion pour ce paramètre ; les moyennes des HbA1c à l'inclusion dans la population ITT ayant au moins une valeur sous traitement présentent pourtant une différence de 0,14 % entre les groupes metformine (7,79 %) et benfluorex (7,65 %), en faveur du médicament à l'essai, alors que la limite d'équivalence thérapeutique était fixée à 0,50 %.
Pour ce paramètre, la principale analyse statistique mise en évidence dans le rapport de l'essai (tableau 25), dont les résultats ont été repris dans le relevé d'avis de la commission n°273 du 2 octobre 1998, compare les moyennes des HbA1c entre les groupes benfluorex et metformine à la dernière visite. Cette analyse ne tient pas compte des valeurs à l'inclusion. Les résultats de cette analyse concluent à la non-infériorité du benfluorex par rapport à la metformine.
Une deuxième analyse a comporté une analyse de covariance prenant en compte la valeur basale à l'inclusion. Les résultats de cette analyse ne permettent plus de conclure à la non-infériorité du benfluorex (p = 0,059). Enfin, aucune analyse n'a comparé la diminution de l'HbA1c sous traitement entre les deux groupes ; la différence des diminutions (0,41 % en faveur de la metformine, pour une limite d'équivalence fixée à 0,50 %) ne permettrait vraisemblablement pas de conclure en faveur du benfluorex.

. Erreur de calcul de l'HbA1c :

L'HbA1c a été dosée par un laboratoire centralisé, l'Institut Pasteur de Lille, par chromatographie liquide haute performance par échange d'ions. L'inspection de ce laboratoire a montré que la formule de calcul utilisée pour le dosage de l'HbA1c était erronée *(Cf. annexe 1)*. Au vu des résultats des deux séries de dosages examinées au cours de l'inspection, il semble que les résultats d'HbA1c calculés par le laboratoire soient légèrement surestimés pour les valeurs d'HbA1c inférieures à 8 % environ et sous-estimés pour les valeurs supérieures à 8 % environ. Pour ces deux séries, l'écart entre la valeur calculée au cours de l'essai et la valeur réelle est cependant faible et ne dépasse pas 0,1 % d'HbA1c pour chaque patient. Pour chaque patient, l'écart entre l'HbA1c à l'inclusion et à la dernière visite pourrait donc être sous-estimé au maximum de 0,2 %.
Cette erreur peut avoir des conséquences sur plusieurs points :

- inclusion à tort de patients : des patients ont pu être inclus à tort dans l'essai si leur glycémie était inférieure à 1,4 g/l (7,8 mmol/l) et si leur HbA1c a été calculée de manière erronée à 7,5 % au lieu de 7,4 %. Le nombre de patients concernés est cependant vraisemblablement faible ;

L'HbA1c a été dosée par chromatographie liquide haute performance par échange d'ions, avec une calibration en un point. Le calibrant utilisé, fourni par la société Biorad, avait un titre en HbA1c de 8,70 %.

La formule de calcul figurant dans la procédure opératoire standardisée établie par l'Institut Pasteur de Lille préalablement à l'essai est exacte et tient compte du pourcentage de l'aire du pic d'HbA1c par rapport à la somme des aires (HbA1c + HbA0) pour l'échantillon de calibration et pour l'échantillon à analyser ainsi que du titre en HbA1c de l'échantillon de calibration :

% HbA1c patient = (% HbA1c calibrant) x (% aires patient) / (% aires calibrant).

La méthode de calcul réellement utilisée par l'Institut Pasteur de Lille *(voir exemple en pièce jointe)* comporte le calcul de la pente de deux droites de calibration, l'une pour l'HbA1c et l'autre pour l'HbA0, à partir de l'aire du pic de ces fractions d'hémoglobine pour l'échantillon de calibration et de la concentration relative d'HbA1c et d'HbA0 dans cet échantillon, connue uniquement en pourcentage :

pente = aire du pic / "concentration", avec "concentration" = 8,70 % pour HbA1c et 91,30 % pour HbA0.

Ces pentes sont ensuite utilisées pour calculer une "concentration" d'HbA1c et une "concentration" d'HbA0 dans l'échantillon à doser :

"concentration" HbA1c = aire HbA1c patient / pente HbA1c
"concentration" HbA0 = aire HbA0 patient / pente HbA0

On calcule ensuite, à l'aide de ces résultats, un pourcentage d'HbA1c dans l'échantillon :

% HbA1c = "concentration" HbA1c / ("concentration" HbA1c + "concentration" HbA0).

Les "concentrations" d'HbA1c et d'HbA0 dans l'échantillon étant exprimées en %, on calcule donc un pourcentage de pourcentages, et non pas un pourcentage de concentrations.

La formule de calcul utilisée par l'Institut Pasteur de Lille serait acceptable si les concentrations d'HbA1c et d'HbA0 dans l'échantillon de calibration étaient connues de manière indépendante et absolue (exprimées en g/l par exemple). Elle n'est cependant pas exacte dans le cas de l'échantillon de calibration utilisé, pour lequel les concentrations ne sont pas connues de manière absolue mais uniquement en relation l'une avec l'autre.

- comparaison benfluorex - placebo : la sous-estimation de la diminution de l'HbA1c sous benfluorex est en défaveur de ce médicament ;

- comparaison benfluorex - metformine : la diminution de l'HbA1c est plus importante sous metformine que sous benfluorex. La sous-estimation de cette diminution serait donc en faveur du benfluorex. L'erreur maximale réalisée pour chaque patient (0,2 % pour les deux séries de dosages examinées) est à rapprocher de la limite d'équivalence entre les traitements fixée par le protocole de l'essai (0,5 %).

*** Poursuite de l'inspection dans ce contexte :**

Les investigations seront poursuivies pour ce dossier par l'inspection d'investigateurs en France, afin de contrôler les conditions de réalisation de la recherche et l'acceptabilité des données soumises à l'Agence, en fonction de la disponibilité d'inspecteurs médecins habilités et assermentés. En revanche, au vu des éléments présentés dans les paragraphes précédents, l'inspection d'investigateurs aux Pays-Bas et éventuellement en Italie est différée.

Dans ce contexte, je vous remercie de me faire part de vos intentions concernant ce dossier afin que je puisse considérer les actions d'inspection les plus adaptées.

Le Directeur de l'Inspection
et des Etablissements

Philippe LEDENVIC

REUNION COMMISSION N° 296 DU 09 DECEMBRE 1999

PROCEDURE NATIONALE

- MEDIATOR 150, comprimé

Dossier n° VNL 10008

Laboratoires SERVIER

Demande déposée le 29 Mai 1998

Principe actif : Benfluorex chlorhydrate

Caractère d'originalité : Extension d'A.M.M. (Modification de l'ANNEXE I).

Classe ATC : Système cardio-vasculaire/ Hypolipidémiants (C10A : hypocholestérolémiants et hypotriglycéridémiants)

Le benfluorex chlorhydrate a depuis 1987 (date d'A.M.M : 22.04.1987) les indications suivantes :

"- adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours obligatoire.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

Pour information, une **enquête de Pharmacovigilance** concernant le benfluorex a été réalisée et présentée au Comité Technique de Pharmacovigilance le 10 Septembre 1997 (2) 98
Cette mise au point s'était avérée nécessaire en raison de la nature de l'un des métabolites du benfluorex (norfenfluramine) et en raison de la constatation d'une dérive de prescription comme anorexigène.
Les conclusions ont été les suivantes :

- les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60ng/l).Mais à partir de la fenfluramine, la norfenfluramine produite n'est plus biotransformée et se retrouve dans les urines à 7.4%; à partir du Benfluorex, la norfenfluramine est transformée en un produit désaminé et oxydé et la dose excrétée ne serait que de 2%.
- la réévaluation n'a pas permis d'écarter un passage de la barrière hémato-méningée de la norfenfluramine produite par le benfluorex. Les études pharmacodynamiques n'ont cependant pas mis en évidence d'effet anorexigène du benfluorex.
- le Comité Technique a proposé que la firme fournisse rapidement (avant le 2 Octobre) une analyse précise des prescriptions de MEDIATOR (nouvelles prescriptions, renouvellements de prescriptions) à partir des panels de vente à leur disposition (DOREMA, IMS).

En ce qui concerne le dossier actuel,

Annexe 2-38

1. TYPE DE DEMANDE :

La firme souhaite une extention d'A.M.M dans l'indication suivante :

"Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".

Cette demande est étayée par une étude clinique de Phase III de *"l'efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul".*

2. PARTICULARITÉS DE CETTE DEMANDE :

L'étude a été réalisée en réponse à la question de l'Agence du Médicament (lettre du 26 Janvier 1996) afin de valider l'efficacité du benfluorex (dépôt d'élément complémentaire, validation tranche N°8 : diabétologie) dans son indication.
Les résultats ont été soumis en deux étapes :
- analyse de l'efficacité du benfluorex versus placebo : 1ère analyse (décembre 97),
- analyse de l'efficacité du benfluorex versus metformine : 2ème analyse (mai 98).

3. ETUDE BENFLUOREX VERSUS PLACEBO ET METFORMINE

Méthodologie :

- Etude de phase III, randomisée en double insu versus placebo et versus chlorhydrate de metformine (850 mg à 2550 mg/j),
- Nombre de patients prévus : 500 (placebo : 100, benfluorex: 200, metformine : 200),
- Nombre de patients analysés :
  - **1ère phase** : analyse intermédiaire à 6 mois de l'efficacité du benfluorex versus placebo 195 patients (placebo : 67 et benfluorex : 128),
  - **2ème phase** : analyse finale de l'efficacité du benfluorex versus metformine Groupe benfluorex: 252 sujets; groupe metformine : 232 sujets,
- Critère principal d'efficacité: **HbA1c** centralisée mesurée à S0, S17 et S29,
- Critères d'efficacité secondaires : glycémie à jeun (S0, S17 et S29), arrêts de traitement pour inefficacité, insulinémie sérique centralisée, bilan lipidique centralisé (cholestérol, HDL-cholestérol, triglycérides), poids (S0,S3,S5,S13,S17 et S29), glycémie locale à jeun (mesurée tous les 3 mois)
- Tolérance : fréquence et nature des événements indésirables, pression artérielle et fréquence cardiaque à toutes les visites, dosage de la créatininémie (S0 et S17).

Résultats :

1. Phase 1 : EFFICACITE benfluorex versus placebo

HbA1c (en %) Analyse en ITT	Placebo (n)	Moy+/-ds	Benfluorex (N)	Moy+/-ds
S0	127	7.43 +/- 1.48	258	7.65 +/- 1.58
Dernière valeur	128	7.91 +/- 1.86	259	7.05 +/- 1.46
Dernière valeur -S0	127	0.50 +/- 1.32	258	- 0.60 +/- 1.42
Différence des moyennes (se)		**- 0.86 (0.17)**	IC à 95 % (-1.20, - 0.52)	
Effet traitement (p)		P < 0.001		
Effet temps (p)		< 0.001		< 0.001

Glycémie à jeun (mmol/L) Analyse en ITT	Placebo (n)	Moy+/-ds	Benfluorex (N)	Moy+/-ds
S0	123	9.74 +/- 2.28	253	10.04 +/- 2.01
Dernière valeur	124	10.13 +/- 3.11	256	8.80 +/- 2.29
Dernière valeur -S0	123	0.36 +/- 2.73	253	- 1.24 +/- 2.30
Différence des moyennes (se)		**- 1.33 (0.28)**	IC à 95 % de la différence (- 1.89, - 0.77)	
Effet traitement (p)		< 0.001		
Effet temps (p)		0.147		< 0.001

2. Phase II. EFFICACITE benfluorex versus metformine

HbA1c (en %) Analyse en ITT	Benfluorex (n)	Moy+/-ds	Metformine (N)	Moy+/-ds
S0	258	7.65 +/- 1.58	250	7.79 +/- 1.61
Dernière valeur	259	7.05 +/- 1.46	252	6.77 +/- 1.34
Dernière valeur -S0	258	- 0.60 +/- 1.42	250	- 1.01 +/- 1.38
Différence des moyennes (se)		**0.28 (0.212)**	90 % IC de la différence (0.07 - **0.48**)	
Test de non-infériorité (p)		P = 0.037		

Glycémie à jeun (mmol/L) Analyse en ITT	Benfluorex (n)	Moy+/-ds	Metformine (N)	Moy+/-ds
S0	253	10.04 +/- 2.01	246	10.15 +/- 2.47
Dernière valeur	256	8.80 +/- 2.29	248	8.16 +/- 1.90
Dernière valeur -S0	253	- 1.24 +/- 2.30	246	- 1.97 +/- 2.32
Différence des moyennes (se)		**0.64 (0.19)**		
90 % de l'IC de la différence		(0.33 , 0.95)		

Les résultats de la phase I de cette étude (benfluorex versus placebo) montrent qu'après 6 mois de traitement :

- l'évolution de l'HbA1c est *significativement différente entre les deux groupes de traitement (p<0.001)* avec un effet groupe significatif à S17 et S29 en faveur du benfluorex,
- la différence entre les deux groupes sur la valeur finale de la glycémie à jeun est de -1.32 mmol/l, p=0.007.

3.Tolérance

Au cours de l'étude (phase I + phase II), 28% des patients du groupe placebo et 38 % de ceux du groupe benfluorex ont rapporté au moins un événement indésirable concernant le système gastro-intestinal, des troubles de l'état général et le système respiratoire.
Dans le groupe benfluorex, les événements émergents les plus fréquemment rapportés ont été: asthénie (7), diarrhée (6), vertiges (5) et céphalées (4 patients).

Annexe 2-38

Note interne d'évaluation : L'évaluation de l'étude a soulevé les commentaires suivants:

***1. Commentaires concernant la METHODOLOGIE de l'essai* (phase I + phase II).**

⇨ *Rappel de la méthodologie :*

722 patients diabétiques âgés de 35 à 70 ans, traités par régime seul avec une glycémie comprise entre 7.8 et 13.8 mmol/l et/ou une HbA1c entre 7.5 et 10 % ont participé à cette étude.

Les *critères d'efficacité* ont été :

- l'HbA1c à 0, S17 et S29 (critère principal),
- la glycémie à jeun, l'insulinémie, les lipides, le poids (critères secondaires).

La *tolérance* a été évaluée sur l'incidence et la nature des événements indésirables, les chiffres de pression artérielle et de fréquence cardiaque, le taux de créatininémie (S0 et S17).

⇨ *Commentaires :*

- le **nombre de sujets inclus** dépasse celui prévu initialement dans le protocole (722 au lieu de 500 patients) ce qui entraîne :
  * une augmentation de la puissance de l'essai,
  * une incidence bénéfique sur les résultats concernant les critères secondaires d'efficacité, (l'analyse des résultats en terme d'efficacité avec seulement 500 patients inclus n'est pas transmise).

- **l'analyse intermédiaire** de l'efficacité du benfluorex versus placebo n'était pas prévue dans le protocole de l'essai. Par ailleurs, aucun ajustement du seuil de significativité (valeur de p) n'a été effectué pour l'analyse finale.

- il manque de nombreuses valeurs, en particulier de l'HbA1c. 45.4 % (soit 328 cas) de **déviations majeures** ont été notifiées, ce qui pose un problème de qualité générale de l'essai.

- **Intervalle de confiance (IC)** à 95 % pour l'HbA1c et les critères secondaires dans la partie I de l'essai (benfluorex versus placebo) alors que l'IC est à 90 % dans la seconde partie (benfluorex versus metformine).

- analyse de l'efficacité benfluorex versus metformine : les résultats montrent une diminution de 0.28 % de l'HbA1c (IC à 90 % : 0.07-0.48). La borne supérieure de cet intervalle est en-dessous de celle de 0.50 %, valeur fixée dans le protocole comme seuil de significativité d'un antidiabétique oral pour une étude d'équivalence.

- pour les **"cas-complets"**, une analyse de l'évolution des moyennes de l'HbA1c des groupes placebo et benfluorex à S0, S17 et S29 serait souhaitable.

***2. Commentaires concernant les RESULTATS de l'essai* (phase I + phase II).**

⇨ *Rappel des principaux résultats :*

1. Efficacité du **benfluorex versus placebo** (6 mois de traitement par benfluorex)
   - réduction de l'HBA1c de **0.86 % (IC à 95 % : - 1,89 ; - 0.52)**,
   - réduction de la valeur moyenne de la glycémie de **- 1.33 mmol/l (IC à 95 % : -1.98 ;-0.77)**,
   - pas d'effet sur l'insulinémie, les triglycérides ou le HDL-cholestérol,
   - diminution très modérée mais *significative* du poids sous benfluorex (- 1.96 kg +/- 3.13).

2. Efficacité de **benfluorex versus metformine**.
   - HbA1c :différence de **0.28 %** (IC à 90 % : 0.07; 0.48), soit benfluorex : 7.05 % et metformine : 6.77 %
   - glycémie à jeun : différence de **0.6 mmol/l** (IC à 90 % : 0.66 ; 0.94), soit benfluorex : 8.80 mmol/L et benfluorex : 8.16 mmol/L

3. En terme de **tolérance** :
   - le nombre total de patients ayant présenté des effets indésirables est réparti de la façon suivante :

   * placebo : 20.8 %
   * benfluorex : 24.8 %
   * metformine : 26.4 %

   - quel que soit le type d'événements indésirables, il n'y a pas de différence significative entre benfluorex et metformine.

   Les effets indésirables les plus fréquents sont de type **gastro-intestinal** (benfluorex : 5.1 % ; metformine : 13.7 %), nausées, douleurs abdominales. Les autres effets sont de type asthénie, vertige, myalgies et lombalgies.
   - les effets *indésirables émergents sévères* attribués à benfluorex sont :
     * 1 cas de trouble de l'équilibre,
     * 1 cas de vertige,
     * 2 cas de diarrhées,
     * 1 cas de ballonnement intestinal.

➪ *Commentaires :*

1. La présentation des résultats est ambiguë et les groupes concernés ne sont pas toujours définis.
   Les résultats donnés sont variables selon les tableaux (ex. : données en ITT du groupe Benfluorex versus placebo et versus metformine sur HbA1c).

2. **Concernant l'HbA1c. Bien que l'éventail des valeurs d'HbA1c soit large,** la valeur moyenne des taux **d'HbA1c est peu élevée (7.48-7.79 %),** et n'est pas représentative d'une population de sujets diabétiques. Les patients inclus sont en moyenne peu sévèrement atteints.
   La distribution est-elle Gaussienne? Comment évolue l'efficacité du benfluorex en fonction du déséquilibre du diabète?

3. Les **arrêts de traitements par manque d'efficacité (glycémie > 2.5 g/l)** ont été de 10.4% dans le groupe placebo, 6.8 % dans le groupe benfluorex et de 1 % dans le groupe metformine.

4. La comparaison de l'efficacité du benfluorex versus metformine ne tient pas compte des doses des deux traitements, en particulier **les posologies réelles de metformine utilisées ne sont pas précisées** (posologie minimale, maximale et moyenne).

5. Enfin, il est noté que dans cette étude **aucun effet sur les lipides, en particulier sur les triglycérides n'est mis en évidence** alors que l'A.M.M actuelle précise qu'il s'agit d'un traitement "adjuvant adapté dans les hypertriglycéridémies".

CONCLUSIONS :

Cette étude met en évidence une *action significative et favorable du benfluorex versus placebo sur le contrôle de la glycémie* de sujets diabétiques de type II.

Toutefois, l'évaluation globale de l'efficacité du benfluorex dans l'indication du diabète de type 2 devra tenir compte des réponses aux questions et commentaires soulevées par l'analyse de cette étude, tant sur le plan méthodologique que sur l'interprétation des résultats de l'essai (notamment versus metformine).

Enfin, il serait important de prendre connaissance des données récentes de l'enquête de pharmacovigilance.

AVIS DE LA COMMISSION N° 273 DU 2 OCTOBRE 1998 : SURSIS A STATUER en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis à vis de la metformine.

N.B. :

1) l'efficacité du benfluorex versus placebo sur la réduction de l'HbA1c paraît établie. Elle est de faible amplitude : 0,9 % et porte sur des patients initialement peu sévèrement atteints (HbA1c de 7,5 à 7,8 %).
2) L'absence d'efficacité du benfluorex sur l'hypertriglycéridémie du diabète est à noter alors que l'hypertriglycéridémie est une des indications actuelles du produit.

Note interne d'évaluation :

Les questions nécessitant des réponses et un avis complémentaire sont :

1/ sur le plan méthodologique et de la qualité de l'essai :
- le choix de l'intervalle de confiance à 95% pour la comparaison versus placebo ; à 90% pour la comparaison versus metformine ;
- le maintien de l'aveugle pendant la durée de l'essai ;
- la qualité des inclusions (certains patients inclus avaient une HbA_{1C} dans les limites de la normale) ; les causes de sortie pour inefficacité : l'ajustement thérapeutique dans le groupe metformine.

2/ concernant l'efficacité
- l'efficacité du benfluorex dans la réduction de l'HbA_{1c} est faible ;
- l'indication éventuelle se discute si la non-infériorité vs metformine est démontrée :
  - pour un sous-groupe défini de patients diabétiques ; les limites de l'HbA_{1c} seraient à définir :
  - en première intention ;
  - l'efficacité serait à évaluer à 6 mois et le traitement est arrêté s'il n'apporte pas de bénéfice (i.e normalisation de l'HbA_{1c})

Enfin, le benfluorex n'a pas apporté de preuve de diminution de l'incidence des complications à long-terme du diabète.

Annexe 2-38

Les données sont insuffisantes pour évaluer l'efficacité du benfluorex :
- dans les sous-groupes de patients qui ont un diabète plus sévère,
- en association avec d'autres thérapeutiques hypoglycémiantes
- en fonction du poids
- éventuellement chez les patients ayant une contre indication aux biguanides

enfin, l'absence d'effet sur les triglycérides est souligné

3/ D'autre part, la tolérance du benfluorex est remise en question en raison de la notification récente d'une hypertension artérielle pulmonaire d'allure primitive chez une patiente de 51 ans traitée par benfluorex depuis 4 à 5 ans.

Le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (Italie et France, rapporteurs).

Au total, une mise à jour des données de tolérance, des données de pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines ont été demandées à la firme.

AVIS DE LA COMMISSION N°289 DU 8 JUILLET 1999 : SURSIS A STATUER en l'attente

- des conclusions de l'inspection sur la qualité de l'essai ;
- de l'évaluation des données disponibles de pharmacovigilance.
- de l'avis de l'expert méthodologiste.

En tout état de cause le dossier actuel ne permettrait pas de donner l'indication "traitement du diabète de type II" en raison :
- de la faible efficacité hypoglycémiante observée,
- de l'absence de données suffisantes chez les diabétiques ayant une hémoglobine HbA1c élevée (supérieure à celle des patients de l'étude versée, soit en moyenne 7.48 - 7.79 %),
- de l'absence de données en association aux antidiabétiques,
- de l'absence de données à long terme ,
- de la difficulté de positionner le benfluorex dans la stratégie de prise en charge du diabète.

Des études chez les patients chez qui la metformine est contre-indiquée seraient utiles.

NOTE INTERNE D'ÉVALUATION :

• Au plan de la pharmacovigilance :

1 - Les notifications en France ont été de 350 effets indésirables (essentiellement, allergie-anaphylaxie, élévation des transaminases) ;

2 - 1 cas d'hypertension artérielle pulmonaire a été rapporté en France chez un patient traité uniquement par le Médiator ;

3 - Compte-tenu du métabolisme mal connu, des données complémentaires de pharmacocinétiques ont été demandées à la firme par la Commission Nationale de Pharmacovigilance ;

4 - les données à moyen et long terme (>6 mois) sont insuffisantes et nécessiterait également d'être complétées).

Néanmoins, le profil de tolérance est acceptable.

• Données d'inspection :

1 - Limites du protocole :

Le critère principal d'évaluation de l'efficacité était l'hémoglobine glyquée HbA1c. Les critères d'inclusion dans l'essai étaient une glycémie à jeun ≥ 1,40 g/l (7,8 mmol/l) et ≤ 2,50 g/l (13,9 mmol/l) à la visite d'inclusion (V0) *et/ou* une HbA1c ≥ 7,5 % et ≤ 10 % à la visite V-1. La présence d'une HbA1c élevée n'était donc pas un critère obligatoire pour l'inclusion. De ce fait, la valeur de base de l'HbA1c de **79** des 722 patients inclus dans l'essai était **inférieure ou égale** à **5,8 %**, valeur de référence du laboratoire ; **281 avaient une HbA1c inférieure à 7,5 %.**

2 - Résultats :

• *Limites de l'analyse des résultats :*

Ces limites ont été examinées principalement pour l'analyse d'efficacité entre les groupes benfluorex et metformine concernant le critère d'évaluation principal.
L'analyse statistique réalisée pour l'HbA1c a consisté principalement en une comparaison des moyennes des HbA1c à la dernière visite entre les différents groupes. Le rapport de l'essai et son annexe 16.4. (listing des analyses statistique) ne présentent pas clairement de comparaison statistique des groupes à l'inclusion pour ce paramètre ; les moyennes des HbA1c **à l'inclusion** dans la population ITT ayant au moins une valeur sous traitement présentent pourtant une **différence de 0,14 %** entre les groupes metformine (7,79 %) et benfluorex (7,65 %), en faveur du médicament à l'essai, alors que la limite d'équivalence thérapeutique était fixée à 0,50 %.

• *Erreur de calcul de l'HbA1c :*

L'HbA1c a été dosée par un **laboratoire centralisé**, l'Institut Pasteur de Lille, par chromatographie liquide haute performance par échange d'ions. L'inspection de ce laboratoire a montré que la **formule de calcul utilisée pour le dosage de l'HbA1c était erronée**. Au vu des résultats des deux séries de dosages examinées au cours de l'inspection, il semble que les résultats d'HbA1c calculés par le laboratoire soient légèrement surestimés pour les valeurs d'HbA1c inférieures à 8 % environ et sous-estimés pour les valeurs supérieures à 8 % environ.
Pour ces deux séries, l'écart entre la valeur calculée au cours de l'essai et la valeur réelle est cependant faible et ne dépasse pas 0,1 % d'HbA1c pour chaque patient.
Pour chaque patient, l'écart entre l'HbA1c à l'inclusion et à la dernière visite pourrait donc être sous-estimé au maximum de 0,2 %.
Cette erreur peut avoir des conséquences sur plusieurs points :

- inclusion à tort de patients : des patients ont pu être inclus à tort dans l'essai si leur glycémie était inférieure à 1,4 g/l (7,8 mmol/l) et si leur HbA1c a été calculée de manière erronée à 7,5 % au lieu de 7,4 %. Le nombre de patients concernés est cependant vraisemblablement faible ;

- comparaison benfluorex - placebo : la sous-estimation de la diminution de l'HbA1c sous benfluorex est en défaveur de ce médicament ;

Annexe 2-38

- **comparaison benfluorex - metformine** : la diminution de l'HbA1c est plus importante sous metformine que sous benfluorex. La sous-estimation de cette diminution serait donc en faveur du benfluorex. L'erreur maximale réalisée pour chaque patient (0,2 % pour les deux séries de dosages examinées) est à rapprocher de la limite d'équivalence entre les traitements fixée par le protocole de l'essai (0,5 %).

• Au plan méthodologique :

En résumé, l'étude comprenait 3 groupes : placebo, traitement par Benfluàrex, traitement par Metformine.

1) Une première analyse d'efficacité du Benflurorex contre placebo a montré une différence significative en faveur du Benfluorex.

2) analyse d'efficacité Benfluorex contre Metformine

Le type d'analyse choisi a été celui de la **non-infériorité**.
L'analyse en non-infériorité implique :
- le choix d'une zone d'équivalence ;
- la bonne qualité de l'étude (les écarts entrainant des biais vers la non-infériorité)
- une analyse perprotocole et en ITT

• concernant la zone d'équivalence : la borne supérieure choisie est de 50 % ; elle est acceptable mais correspond à la limite supérieure de la borne acceptable ;

• concernant la qualité de la réalisation de l'étude, différents commentaires peuvent être faits :
- inclusion : 722 patients ont été inclus (contre 500 prévus) ; 15,7 % sont des **déviations majeures** ; le dosage d'HbA_{1C} à S_{17} est connu pour 88.5 % des patients ; ce nombre n'est pas connu à S_{29} ni la répartition dans les 2 groupes de cet écart.

Il existe un **déséquilibre dans les taux d'HbA_{1C} à l'inclusion** : 7.5 % dans le groupe Benfluorex ; 7.9 % dans le groupe metformine.

• D'autre part, seuls **68 % des patients ont été inclus dans l'analyse per protocole**.
Résultats :

	Benfluorex	**Metformine**	IC 90 %	IC 95 %
HbA_{1C} (per protocole)	6.89 %	6.81 %		[0.12-0.29]
HbA_{1C} (ITT)	7.5 %	6.77 %	[0.07-0.48]	[0.04-0.52]
si l'analyse est réalisée avec la variation d'HbA_{1C} (ΔHbA_{1C}) :				
ΔHbA_{1C} per protocole			[0.20-0.66]	
ΔHbA_{1C} (ITT)			[0.21-0.61]	

Conclusions :
- l'étude ne conclut pas à la non infériorité du Benfluorex versus metformine ;
- le Benfluorex apparaît inférieur à la metformine.

D'autre part,
• l'analyse des profils de tolérance des deux produits n'a montré aucune différence significative entre les deux produits;
• enfin, aucun effet sur les triglycérides n'a été observé.

Annexe 2-38

AVIS DE LA COMMISSION N° 296 DU 09 DECEMBRE 1999 :

AVIS DEFAVORABLE à l'indication proposée :

1 - au plan de l'efficacité :

➜ il est noté une efficacité du Benfluorex comparé au placebo. Néanmoins, il n'est pas possible d'évaluer sur la taille de l'effet compte tenu des défauts de qualité de l'étude.

➜l'essai clinique fourni ne permet pas de conclure à la non infériorité du Benfluorex comparé à la Metformine.

En effet, la réalisation de l'étude n'est pas satisfaisante au plan méthodologique :
- 79/722 patients avaient une HbA_{1C} inférieure à 5.8 % donc normale, et 281/722 avaient une HbA_{1C} inférieure à 7.5 % ;
- il existe un déséquilibre dans les taux d'HbA_{1C} à l'inclusion : 7.5 % dans le groupe Benfluorex ; 7.9 % dans le groupe Metformine.
- la qualité de l'essai est mauvaise:
  - à l' inclusion : 722 patients ont été inclus (contre 500 prévus) ; 15,7 % sont des déviations majeures ; le dosage d'HbA_{1C} à S_{17} est connu pour 88.5 % des patients ; ce nombre n'est pas connu à S_{29} ni la répartition dans les 2 groupes de cet écart.
  - il existe un déséquilibre des taux d'HbA_{1C} à l'inclusion : 7.5 % en moyenne dans le groupe Benfluorex contre 7.9 % dans le groupe Metformine.
- l'analyse per protocole n'a inclus que 68 % des patients ;
- enfin, les résultats sur l'HbA_{1C} en analyse per protocole et en ITT ne sont pas concordants. En effet en analyse per protocole, l'intervalle de confiance à 95% est de [0.12-0.29] et permettrait de conclure à une non infériorité alors que l'intervalle de confiance à 95% en analyse ITT est de [0.04-0.52], la borne supérieure de l'intervalle de confiance dépassant la limite retenue de 0.50.

2 - au plan de la tolérance, l'analyse des profils de tolérance n'a pas montré pas de différence significative avec la Metformine.

3 - d'autre part, aucune efficacité sur les triglycérides n'a été montrée.

4 - les données cliniques sont insuffisantes pour :
- placer le benfluorex dans la stratégie thérapeutique du diabète de type 2 ;
- évaluer l'efficacité du benfluorex en association avec d'autres antidiabétiques oraux ;
- indiquer le benfluorex chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisant rénale, sujet âgé...).

RÉPUBLIQUE FRANÇAISE

A G E N C E
FRANÇAISE DE SECURITE SANITAIRE DES
PRODUITS DE SANTE

DIRECTION DE L'EVALUATION
DES MEDICAMENTS ET DES
PRODUITS BIOLOGIQUES

Réf. à rappeler : VNL 10008
COM 296
LD/TD

DÉCISION DU DIRECTEUR GÉNÉRAL DE L'AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ

du 25 AVR. 2000
refusant la modification
de l'autorisation de mise sur le marché de

MEDIATOR 150 mg, comprimé enrobé

LE DIRECTEUR GÉNÉRAL DE L'AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ,

Vu le livre V du code de la santé publique, notamment les articles L. 601, L. 605 3è, R. 5128 à R. 5140 ;

Vu la décision d'autorisation de mise sur le marché octroyée le 22 avril 1987 ;

Vu la demande de modification de l'autorisation de mise sur le marché présentée par les laboratoires SERVIER ;

pour **MEDIATOR 150 mg, comprimé enrobé ;**

et concernant la modification d'indication : *"Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique"* ;

Vu l'avis de la Commission prévu à l'article R.5140 du code de la santé publique ;

Considérant que la démonstration de l'efficacité n'a pas été apportée.

En effet :

1 - sur le plan de l'efficacité :

- il est pris acte d'une efficacité du Benfluorex comparé au placebo. Néanmoins, il n'est pas possible d'évaluer la taille de l'effet compte tenu des défauts de qualité de l'étude ;

143/147, Boulevard Anatole France 93285 Saint-Denis Cedex - Tél. 01.55.87.30.00

Annexe 2-39

- l'essai clinique fourni ne permet pas de conclure à la non infériorité du Benfluorex comparé à la Metformine.

En effet, la réalisation de l'étude n'est pas satisfaisante au plan méthodologique :

- 79/722 patients avaient une HbA_{1C} inférieure à 5.8 % donc normale, et 281/722 avaient une HbA_{1C} inférieure à 7.5 % ;
- il existe un déséquilibre dans les taux d'HbA_{1C} à l'inclusion : 7.5 % dans le groupe Benfluorex ; 7.9 % dans le groupe Metformine.
- la qualité de l'essai est mauvaise :
  . à l' inclusion : 722 patients ont été inclus (contre 500 prévus) ; 15,7 % sont des déviations majeures ; le dosage d'HbA_{1C} à S_{17} est connu pour 88.5 % des patients ; ce nombre n'est pas connu à S_{29} ni la répartition dans les 2 groupes de cet écart,
  . il existe un déséquilibre des taux d'HbA_{1C} à l'inclusion : 7.5 % en moyenne dans le groupe Benfluorex contre 7.9 % dans le groupe Metformine.

- l'analyse per protocole n'a inclus que 68 % des patients ;
- enfin, les résultats sur l'HbA_{1C} en analyse per protocole et en ITT ne sont pas concordants. En effet en analyse per protocole, l'intervalle de confiance à 95% est de [0.12-0.29] et permettrait de conclure à une non infériorité alors que l'intervalle de confiance à 95% en analyse ITT, est de [0.04-0.52], la borne supérieure de l'intervalle de confiance dépassant la limite retenue de 0.50.

2 - Les données cliniques sont insuffisantes pour :
- placer le benfluorex dans la stratégie thérapeutique du diabète de type 2 ;
- évaluer l'efficacité du benfluorex en association avec d'autres antidiabétiques oraux ;
- indiquer le benfluorex chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisant rénale, sujet âgé...).

DÉCIDE

Article 1er

La modification de l'autorisation de mise sur le marché est refusée au médicament :

MEDIATOR 150 mg, comprimé enrobé

des laboratoires SERVIER
22, rue Garnier
92200 NEUILLY SUR SEINE Cedex

Article 2

Le Directeur de l'évaluation des médicaments et des produits biologiques est chargé de l'exécution de la présente décision.

Madame,

Nous faisons suite à votre courrier du 9 Février 2000, et vous proposons la date du **24 Mars 2000 à 15 h 00** pour une réunion de concertation concernant la spécialité :

MEDIATOR ®, comprimés enrobés

Nous vous remercions par avance de bien vouloir nous confirmer votre accord.

Dans cette attente, nous vous prions d'agréer, Madame, l'expression de nos salutations distinguées.

Réunion de concertation du 24.03.2000

On ne pourrait différer davantage... François !

Monsieur le Président,

Je souhaite tout d'abord vous remercier de nous avoir reçus vendredi dernier, et de nous avoir permis de nous exprimer sur la taille de l'effet hypoglycémiant observé avec MEDIATOR® versus placebo dans l'étude CL3-780-144-FRA, la méthodologie de cet essai et la place de MEDIATOR® dans la stratégie thérapeutique du diabète.

Nous avons retenu le plan d'action suivant :

- Préparation d'une synthèse de l'ensemble des études cliniques réalisées dans le diabète ainsi que des éléments précliniques et de pharmacologie clinique sur le mode d'action insulinosensibilisateur de MEDIATOR®.
- Proposition d'un nouveau libellé d'indication mentionnant l'association aux autres thérapeutiques antidiabétiques existantes.

Comme convenu, nous nous engageons à vous transmettre ces éléments d'ici un mois et souhaitons qu'ils puissent être pris en considération avant toute décision.

Par ailleurs, nous avons bien compris le souhait de Madame CASTOT de recevoir une proposition de modification de R.C.P. sur la base des informations à notre disposition sans attendre le rapport du Ministère Italien (fax du 17/3 dernier). Cette Demande de Modification de l'Information vous est adressée aujourd'hui même.

Je vous prie d'agréer, Monsieur le Président, l'expression de ma haute considération.

Annexe 2-43

REUNION GT PTC2 N° 1 DU 21 SEPTEMBRE 2000

PROCEDURE NATIONALE

- **MEDIATOR 150**, comprimé

Dossier n° VNL 10008

Laboratoires SERVIER

Demande déposée le 29 Mai 1998

Principe actif :	Benfluorex chlorhydrate
Caractère d'originalité :	Extension d'A.M.M. (Modification de l'Annexe I).
Classe ATC :	Système cardio-vasculaire/ Hypolipidémiants (C10A : hypocholestérolémiants et hypotriglycéridémiants)

Le benfluorex chlorhydrate a depuis 1987 (date d'A.M.M : 22.04.1987) les indications suivantes :
"- adjuvant du régime adapté dans les hypertriglycéridémies. La poursuite du traitement est toujours obligatoire.
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.
Remarque : l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

Pour information, une **enquête de Pharmacovigilance** concernant le benfluorex a été réalisée et présentée au Comité Technique de Pharmacovigilance le 10 Septembre 1997.
Cette mise au point s'était avérée nécessaire en raison de la nature de l'un des métabolites du benfluorex (norfenfluramine) et en raison de la constatation d'une dérive de prescription comme anorexigène.
Les conclusions ont été les suivantes :

- les concentrations sanguines de Norfenfluramine sont identiques pour des doses équivalentes de Fenfluramine et de Benfluorex (60ng/l).Mais à partir de la fenfluramine, la norfenfluramine produite n'est plus biotransformée et se retrouve dans les urines à 7.4%; à partir du Benfluorex, la norfenfluramine est transformée en un produit désaminé et oxydé et la dose excrétée ne serait que de 2%.
- la réévaluation n'a pas permis d'écarter un passage de la barrière hémato-méningée de la norfenfluramine produite par le benfluorex. Les études pharmacodynamiques n'ont cependant pas mis en évidence d'effet anorexigène du benfluorex.
- le Comité Technique a proposé que la firme fournisse rapidement (avant le 2 Octobre) une analyse précise des prescriptions de MEDIATOR (nouvelles prescriptions, renouvellements de prescriptions) à partir des panels de vente à leur disposition (DOREMA, IMS).

Annexe 2-43

En ce qui concerne le dossier actuel,

1. **TYPE DE DEMANDE :**
La firme souhaite une extention d'A.M.M dans l'indication suivante :

"Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".

Cette demande est étayée par une étude clinique de Phase III de *"l'efficacité du benfluorex (150 à 450 mg/j) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul".*

2. **PARTICULARITÉS DE CETTE DEMANDE :**
L'étude a été réalisée en réponse à la question de l'Agence du Médicament (lettre du 26 Janvier 1996) afin de valider l'efficacité du benfluorex (dépôt d'élément complémentaire, validation tranche N°8 : diabétologie) dans son indication.
Les résultats ont été soumis en deux étapes :
- analyse de l'efficacité du benfluorex versus placebo : 1ère analyse (décembre 97),
- analyse de l'efficacité du benfluorex versus metformine : 2ème analyse (mai 98).

3. **ETUDE BENFLUOREX VERSUS PLACEBO ET METFORMINE**
Méthodologie :
- Etude de phase III, randomisée en double insu versus placebo et versus chlorhydrate de metformine (850 mg à 2550 mg/j),
- Nombre de patients prévus : 500 (placebo : 100, benfluorex: 200, metformine : 200),
- Nombre de patients analysés :
  - **1ère phase** : analyse intermédiaire à 6 mois de l'efficacité du benfluorex versus placebo 195 patients (placebo : 67 et benfluorex : 128),
  - **2ème phase** : analyse finale de l'efficacité du benfluorex versus metformine Groupe benfluorex: 252 sujets; groupe metformine : 232 sujets,
- Critère principal d'efficacité: **HbA1c** centralisée mesurée à S0, S17 et S29,
- Critères d'efficacité secondaires : glycémie à jeun (S0, S17 et S29), arrêts de traitement pour inefficacité, insulinémie sérique centralisée, bilan lipidique centralisé (cholestérol, HDL-cholestérol, triglycérides), poids (S0,S3,S5,S13,S17 et S29), glycémie locale à jeun (mesurée tous les 3 mois)
- Tolérance : fréquence et nature des événements indésirables, pression artérielle et fréquence cardiaque à toutes les visites, dosage de la créatininémie (S0 et S17).

Résultats :

Glycémie à jeun (mmol/L) Analyse en ITT	Benfluorex (n)	Moy+/-ds	Metformine (N)	Moy+/-ds
S0	253	10.04 +/- 2.01	246	10.15 +/- 2.47
Dernière valeur	256	8.80 +/- 2.29	248	8.16 +/- 1.90
Dernière valeur -S0	253	- 1.24 +/- 2.30	246	- 1.97 +/- 2.32
Différence des moyennes (se)		**0.64 (0.19)**		
90 % de l'IC de la différence		(0.33 , 0.95)		

Les résultats de la phase I de cette étude (benfluorex versus placebo) montrent qu'après 6 mois de traitement :

- l'évolution de l'HbA1c est *significativement différente entre les deux groupes de traitement (p<0.001)* avec un effet groupe significatif à S17 et S29 en faveur du benfluorex,
- la différence entre les deux groupes sur la valeur finale de la glycémie à jeun est de -1.32 mmol/l, p=0.007.

3.Tolérance

Au cours de l'étude (phase I + phase II), 28% des patients du groupe placebo et 38 % de ceux du groupe benfluorex ont rapporté au moins un événement indésirable concernant le système gastro-intestinal, des troubles de l'état général et le système respiratoire.
Dans le groupe benfluorex, les événements émergents les plus fréquemment rapportés ont été: asthénie (7), diarrhée (6), vertiges (5) et céphalées (4 patients).

Note interne d'évaluation : L'évaluation de l'étude a soulevé les commentaires suivants:

1. Commentaires concernant la METHODOLOGIE de l'essai (phase I + phase II).

Rappel de la méthodologie :

722 patients diabétiques âgés de 35 à 70 ans, traités par régime seul avec une glycémie comprise entre 7.8 et 13.8 mmol/l et/ou une HbA1c entre 7.5 et 10 % ont participé à cette étude.

Les *critères d'efficacité* ont été :
- l'HbA1c à 0, S17 et S29 (critère principal),
- la glycémie à jeun, l'insulinémie, les lipides, le poids (critères secondaires).

La *tolérance* a été évaluée sur l'incidence et la nature des événements indésirables, les chiffres de pression artérielle et de fréquence cardiaque, le taux de créatininémie (S0 et S17).

➪ *Commentaires :*

- le **nombre de sujets inclus** dépasse celui prévu initialement dans le protocole (722 au lieu de 500 patients) ce qui entraîne :
  * une augmentation de la puissance de l'essai,
  * une incidence bénéfique sur les résultats concernant les critères secondaires d'efficacité, (l'analyse des résultats en terme d'efficacité avec seulement 500 patients inclus n'est pas transmise).

- **l'analyse intermédiaire** de l'efficacité du benfluorex versus placebo n'était pas prévue dans le protocole de l'essai. Par ailleurs, aucun ajustement du seuil de significativité (valeur de p) n'a été effectué pour l'analyse finale.

- il manque de nombreuses valeurs, en particulier de l'HbA1c. 45.4 % (soit 328 cas) de **déviations majeures** ont été notifiées, ce qui pose un problème de qualité générale de l'essai.

- **Intervalle de confiance (IC)** à 95 % pour l'HbA1c et les critères secondaires dans la partie I de l'essai (benfluorex versus placebo) alors que l'IC est à 90 % dans la seconde partie (benfluorex versus metformine).

- analyse de l'efficacité benfluorex versus metformine : les résultats montrent une diminution de 0.28 % de l'HbA1c (IC à 90 % : 0.07-0.48). La borne supérieure de cet intervalle est en-dessous de celle de 0.50 %, valeur fixée dans le protocole comme seuil de significativité d'un antidiabétique oral pour une étude d'équivalence.

- pour les **"cas-complets"**, une analyse de l'évolution des moyennes de l'HbA1c des groupes placebo et benfluorex à S0, S17 et S29 serait souhaitable.

***2. Commentaires concernant les RESULTATS de l'essai* (phase I + phase II).**

➪ *Rappel des principaux résultats :*

1. Efficacité du **benfluorex versus placebo** (6 mois de traitement par benfluorex)
   - réduction de l'HBA1c de **0.86 % (IC à 95 % : - 1,89 ; - 0.52)**,
   - réduction de la valeur moyenne de la glycémie de **- 1.33 mmol/l (IC à 95 % : -1.98 ;-0.77)**,
   - pas d'effet sur l'insulinémie, les triglycérides ou le HDL-cholestérol,
   - diminution très modérée mais *significative* du poids sous benfluorex (- 1.96 kg +/- 3.13).

2. Efficacité de **benfluorex versus metformine**.
   - HbA1c :différence de **0.28 %** (IC à 90 % : 0.07; 0.48), soit benfluorex : 7.05 % et metformine : 6.77 %
   - glycémie à jeun : différence de **0.6 mmol/l** (IC à 90 % : 0.66 ; 0.94), soit benfluorex : 8.80 mmol/L et benfluorex : 8.16 mmol/L

3. En terme de **tolérance** :
   - le nombre total de patients ayant présenté des effets indésirables est réparti de la façon suivante :

   * placebo : 20.8 %
   * benfluorex : 24.8 %
   * metformine : 26.4 %

   - quel que soit le type d'événements indésirables, il n'y a pas de différence significative entre benfluorex et metformine.

   Les effets indésirables les plus fréquents sont de type **gastro-intestinal** (benfluorex : 5.1 % ; metformine : 13.7 %), nausées, douleurs abdominales. Les autres effets sont de type asthénie, vertige, myalgies et lombalgies.
   - les effets *indésirables émergents sévères* attribués à benfluorex sont :
     * 1 cas de trouble de l'équilibre,
     * 1 cas de vertige,
     * 2 cas de diarrhées,
     * 1 cas de ballonnement intestinal.

➪ *Commentaires :*

1. La présentation des résultats est ambiguë et les groupes concernés ne sont pas toujours définis.
   Les résultats donnés sont variables selon les tableaux (ex. : données en ITT du groupe Benfluorex versus placebo et versus metformine sur HbA1c).

2. **Concernant l'HbA1c. Bien que l'éventail des valeurs d'HbA1c soit large,** la valeur moyenne des taux **d'HbA1c est peu élevée (7.48-7.79 %),** et n'est pas représentative d'une population de sujets diabétiques. Les patients inclus sont en moyenne peu sévèrement atteints.
   La distribution est-elle Gaussienne? Comment évolue l'efficacité du benfluorex en fonction du déséquilibre du diabète?

3. Les **arrêts de traitements par manque d'efficacité (glycémie > 2.5 g/l)** ont été de 10.4% dans le groupe placebo, 6.8 % dans le groupe benfluorex et de 1 % dans le groupe metformine.

4. La comparaison de l'efficacité du benfluorex versus metformine ne tient pas compte des doses des deux traitements, en particulier **les posologies réelles de metformine utilisées ne sont pas précisées** (posologie minimale, maximale et moyenne).

5. Enfin, il est noté que dans cette étude **aucun effet sur les lipides, en particulier sur les triglycérides n'est mis en évidence** alors que l'A.M.M actuelle précise qu'il s'agit d'un traitement "adjuvant adapté dans les hypertriglycéridémies".

CONCLUSIONS :

Cette étude met en évidence une *action significative et favorable du benfluorex versus placebo sur le contrôle de la glycémie* de sujets diabétiques de type II.

Toutefois, l'évaluation globale de l'efficacité du benfluorex dans l'indication du diabète de type 2 devra tenir compte des réponses aux questions et commentaires soulevées par l'analyse de cette étude, tant sur le plan méthodologique que sur l'interprétation des résultats de l'essai (notamment versus metformine).

Annexe 2-43

Enfin, il serait important de prendre connaissance des données récentes de l'enquête de pharmacovigilance.

AVIS DE LA COMMISSION N° 273 DU 2 OCTOBRE 1998 : SURSIS A STATUER en l'attente d'une réévaluation du dossier au plan méthodologique, notamment afin de situer l'efficacité du benfluorex vis à vis de la metformine.

N.B. :

1) l'efficacité du benfluorex versus placebo sur la réduction de l'HbA1c paraît établie. Elle est de faible amplitude : 0,9 % et porte sur des patients initialement peu sévèrement atteints (HbA1c de 7,5 à 7,8 %).
2) L'absence d'efficacité du benfluorex sur l'hypertriglycéridémie du diabète est à noter alors que l'hypertriglycéridémie est une des indications actuelles du produit.

Note interne d'évaluation :

Les questions nécessitant des réponses et un avis complémentaire sont :

1/ sur le plan méthodologique et de la qualité de l'essai :
- le choix de l'intervalle de confiance à 95% pour la comparaison versus placebo ; à 90% pour la comparaison versus metformine ;
- le maintien de l'aveugle pendant la durée de l'essai ;
- la qualité des inclusions (certains patients inclus avaient une HbA_{1C} dans les limites de la normale) ; les causes de sortie pour inefficacité : l'ajustement thérapeutique dans le groupe metformine.

2/ concernant l'efficacité
- l'efficacité du benfluorex dans la réduction de l'HbA_{1c} est faible ;
- l'indication éventuelle se discute si la non-infériorité vs metformine est démontrée :
  - pour un sous-groupe défini de patients diabétiques ; les limites de l'HbA_{1c} seraient à définir :
  - en première intention ;
  - l'efficacité serait à évaluer à 6 mois et le traitement est arrêté s'il n'apporte pas de bénéfice (i.e normalisation de l'HbA_{1c})

Enfin, le benfluorex n'a pas apporté de preuve de diminution de l'incidence des complications à long-terme du diabète.

Les données sont insuffisantes pour évaluer l'efficacité du benfluorex :
- dans les sous-groupes de patients qui ont un diabète plus sévère,
- en association avec d'autres thérapeutiques hypoglycémiantes
- en fonction du poids
- éventuellement chez les patients ayant une contre indication aux biguanides

enfin, l'absence d'effet sur les triglycérides est souligné.

3/ D'autre part, la tolérance du benfluorex est remise en question en raison de la notification récente d'une hypertension artérielle pulmonaire d'allure primitive chez une patiente de 51 ans traitée par benfluorex depuis 4 à 5 ans.

Le benfluorex fait également l'objet d'une évaluation au niveau du groupe de travail européen de pharmacovigilance (Italie et France, rapporteurs).

Annexe 2-43

Au total, une mise à jour des données de tolérance, des données de pharmacocinétique du benfluorex et de ses métabolites et une étude comparative de ces données avec celles des fenfluramines ont été demandées à la firme.

AVIS DE LA COMMISSION N°289 DU 8 JUILLET 1999 : SURSIS A STATUER en l'attente

- des conclusions de l'inspection sur la qualité de l'essai ;
- de l'évaluation des données disponibles de pharmacovigilance.
- de l'avis de l'expert méthodologiste.

En tout état de cause le dossier actuel ne permettrait pas de donner l'indication "traitement du diabète de type II" en raison :
- de la faible efficacité hypoglycémiante observée,
- de l'absence de données suffisantes chez les diabétiques ayant une hémoglobine HbA1c élevée (supérieure à celle des patients de l'étude versée, soit en moyenne 7.48 - 7.79 %),
- de l'absence de données en association aux antidiabétiques,
- de l'absence de données à long terme ,
- de la difficulté de positionner le benfluorex dans la stratégie de prise en charge du diabète.

Des études chez les patients chez qui la metformine est contre-indiquée seraient utiles.

NOTE INTERNE D'ÉVALUATION :

• Au plan de la pharmacovigilance :

1 - Les notifications en France ont été de 350 effets indésirables (essentiellement, allergie-anaphylaxie, élévation des transaminases) ;

2 - 1 cas d'hypertension artérielle pulmonaire a été rapporté en France chez un patient traité uniquement par le Médiator ;

3 - Compte-tenu du métabolisme mal connu, des données complémentaires de pharmacocinétiques ont été demandées à la firme par la Commission Nationale de Pharmacovigilance ;

4 - les données à moyen et long terme (>6 mois) sont insuffisantes et nécessiterait également d'être complétées).

Néanmoins, le profil de tolérance est acceptable.

• Données d'inspection :

1 - Limites du protocole :

Le critère principal d'évaluation de l'efficacité était l'hémoglobine glyquée HbA1c. Les critères d'inclusion dans l'essai étaient une glycémie à jeun ≥ 1,40 g/l (7,8 mmol/l) et ≤ 2,50 g/l (13,9 mmol/l) à la visite d'inclusion (V0) *et/ou* une HbA1c ≥ 7,5 % et ≤ 10 % à la visite V-1. La présence d'une HbA1c élevée n'était donc pas un critère obligatoire pour l'inclusion. De ce fait, la valeur de base de l'HbA1c de **79** des 722 patients inclus dans l'essai était **inférieure ou égale** à **5,8 %**, valeur de référence du laboratoire ; **281 avaient une HbA1c inférieure à 7,5 %.**

2 - Résultats :

• *Limites de l'analyse des résultats :*

Ces limites ont été examinées principalement pour l'analyse d'efficacité entre les groupes benfluorex et metformine concernant le critère d'évaluation principal.
L'analyse statistique réalisée pour l'HbA1c a consisté principalement en une comparaison des moyennes des HbA1c à la dernière visite entre les différents groupes. Le rapport de l'essai et son annexe 16.4. (listing des analyses statistique) ne présentent pas clairement de comparaison statistique des groupes à l'inclusion pour ce paramètre ; les moyennes des HbA1c **à l'inclusion** dans la population ITT ayant au moins une valeur sous traitement présentent pourtant une **différence de 0,14 %** entre les groupes metformine (7,79 %) et benfluorex (7,65 %), en faveur du médicament à l'essai, alors que la limite d'équivalence thérapeutique était fixée à 0,50 %.

• *Erreur de calcul de l'HbA1c :*

L'HbA1c a été dosée par un **laboratoire centralisé**, l'Institut Pasteur de Lille, par chromatographie liquide haute performance par échange d'ions. L'inspection de ce laboratoire a montré que la **formule de calcul utilisée pour le dosage de l'HbA1c était erronée**. Au vu des résultats des deux séries de dosages examinées au cours de l'inspection, il semble que les résultats d'HbA1c calculés par le laboratoire soient légèrement surestimés pour les valeurs d'HbA1c inférieures à 8 % environ et sous-estimés pour les valeurs supérieures à 8 % environ.
Pour ces deux séries, l'écart entre la valeur calculée au cours de l'essai et la valeur réelle est cependant faible et ne dépasse pas 0,1 % d'HbA1c pour chaque patient.
Pour chaque patient, l'écart entre l'HbA1c à l'inclusion et à la dernière visite pourrait donc être sous-estimé au maximum de 0,2 %.
Cette erreur peut avoir des conséquences sur plusieurs points :

- inclusion à tort de patients : des patients ont pu être inclus à tort dans l'essai si leur glycémie était inférieure à 1,4 g/l (7,8 mmol/l) et si leur HbA1c a été calculée de manière erronée à 7,5 % au lieu de 7,4 %. Le nombre de patients concernés est cependant vraisemblablement faible ;

- comparaison benfluorex - placebo : la sous-estimation de la diminution de l'HbA1c sous benfluorex est en défaveur de ce médicament ;

- **comparaison benfluorex - metformine** : la diminution de l'HbA1c est plus importante sous metformine que sous benfluorex. La sous-estimation de cette diminution serait donc en faveur du benfluorex. L'erreur maximale réalisée pour chaque patient (0,2 % pour les deux séries de dosages examinées) est à rapprocher de la limite d'équivalence entre les traitements fixée par le protocole de l'essai (0,5 %).

• Au plan méthodologique :

En résumé, l'étude comprenait 3 groupes : placebo, traitement par Benfluàrex, traitement par Metformine.

1) Une première analyse d'efficacité du Benflurorex contre placebo a montré une différence significative en faveur du Benfluorex.

Annexe 2-43

2) analyse d'efficacité Benfluorex contre Metformine

Le type d'analyse choisi a été celui de la **non-infériorité**.
L'analyse en non-infériorité implique :
- le choix d'une zone d'équivalence ;
- la bonne qualité de l'étude (les écarts entrainant des biais vers la non-infériorité)
- une analyse perprotocole et en ITT

• concernant la zone d'équivalence : la borne supérieure choisie est de 50 % ; elle est acceptable mais correspond à la limite supérieure de la borne acceptable ;

• concernant la qualité de la réalisation de l'étude, différents commentaires peuvent être faits :
- inclusion : 722 patients ont été inclus (contre 500 prévus) ; 15,7 % sont des **déviations majeures** ; le dosage d'HbA_{1C} à S_{17} est connu pour 88.5 % des patients ; ce nombre n'est pas connu à S_{29} ni la répartition dans les 2 groupes de cet écart.

Il existe un **déséquilibre dans les taux d'HbA_{1C} à l'inclusion** : 7.5 % dans le groupe Benfluorex ; 7.9 % dans le groupe metformine.

• D'autre part, seuls **68 % des patients ont été inclus dans l'analyse per protocole**.
Résultats :

	Benfluorex	**Metformine**	IC 90 %	IC 95 %
HbA_{1C} (per protocole)	6.89 %	6.81 %		[0.12-0.29]
HbA_{1C} (ITT)	7.5 %	6.77 %	[0.07-0.48]	[0.04-0.52]
si l'analyse est réalisée avec la variation d'HbA_{1C} (ΔHbA_{1C}) :				
ΔHbA_{1C} per protocole			[0.20-0.66]	
ΔHbA_{1C} (ITT)			[0.21-0.61]	

Conclusions :
- l'étude ne conclut pas à la non infériorité du Benfluorex versus metformine ;
- le Benfluorex apparaît inférieur à la metformine.

D'autre part,
• l'analyse des profils de tolérance des deux produits n'a montré aucune différence significative entre les deux produits;
•enfin, aucun effet sur les triglycérides n'a été observé.

AVIS DE LA COMMISSION N° 296 DU 09 DECEMBRE 1999 :

AVIS DEFAVORABLE à l'indication proposée :

1 - au plan de l'efficacité :

➜ il est noté une efficacité du Benfluorex comparé au placebo. Néanmoins, il n'est pas possible d'évaluer sur la taille de l'effet compte tenu des défauts de qualité de l'étude.

➜l'essai clinique fourni ne permet pas de conclure à la non infériorité du Benfluorex comparé à la Metformine.

En effet, la réalisation de l'étude n'est pas satisfaisante au plan méthodologique :
- 79/722 patients avaient une HbA_{1C} inférieure à 5.8 % donc normale, et 281/722 avaient une HbA_{1C} inférieure à 7.5 % ;
- il existe un déséquilibre dans les taux d'HbA_{1C} à l'inclusion : 7.5 % dans le groupe Benfluorex ; 7.9 % dans le groupe Metformine.
- la qualité de l'essai est mauvaise:
  - à l' inclusion : 722 patients ont été inclus (contre 500 prévus) ; 15,7 % sont des déviations majeures ; le dosage d'HbA_{1C} à S_{17} est connu pour 88.5 % des patients ; ce nombre n'est pas connu à S_{29} ni la répartition dans les 2 groupes de cet écart.
  - il existe un déséquilibre des taux d'HbA_{1C} à l'inclusion : 7.5 % en moyenne dans le groupe Benfluorex contre 7.9 % dans le groupe Metformine.
- l'analyse per protocole n'a inclus que 68 % des patients ;
- enfin, les résultats sur l'HbA_{1C} en analyse per protocole et en ITT ne sont pas concordants. En effet en analyse per protocole, l'intervalle de confiance à 95% est de [0.12-0.29] et permettrait de conclure à une non infériorité alors que l'intervalle de confiance à 95% en analyse ITT est de [0.04-0.52], la borne supérieure de l'intervalle de confiance dépassant la limite retenue de 0.50.

2 - au plan de la tolérance, l'analyse des profils de tolérance n'a pas montré pas de différence significative avec la Metformine.

3 - d'autre part, aucune efficacité sur les triglycérides n'a été montrée.

4 - les données cliniques sont insuffisantes pour :
- placer le benfluorex dans la stratégie thérapeutique du diabète de type 2 ;
- évaluer l'efficacité du benfluorex en association avec d'autres antidiabétiques oraux ;
- indiquer le benfluorex chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisant rénale, sujet âgé...).

Demande de recours grâcieux:

Suite à l'avis défavorable émis par la Commission d'AMM le 9 décembre 1999 concernant l'indication suivante :

"diabète de type 2 (non-insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique",

la firme dépose les éléments suivants:

1/ des analyses complémentaires en sous-groupes des données de l'étude de phase III de *"l'efficacité du Benfluorex (150 à 450 mg/jour) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul"*. A noter, ces analyses complémentaires ont été présentées lors d'une réunion à l'Agence le 14 mars 2000.

Le dossier comporte par ailleurs:

2/ une revue de la littérature sur les activités pharmacologiques de Médiator chez l'animal.

Annexe 2-43

3/ une revue de l'efficacité de Médiator à différents stades de la maladie.
Un programme d'études a été mis en place pour étudier le mécanisme d'action chez l'homme. Les populations suivantes ont été étudiées :

=> *patients insuffisamment contrôlés par régime seul* (Velussi et col., 196): comparaison de Médiator au placebo en monothérapie.

=> *patients insuffisamment contrôlés par un sulfonylurée en monothérapie* (2 études: Stucci et col., 1996, Louvet, rapport interne, 1995): comparaison de Médiator à un placebo en association à une traitement par sulfonylurée à dose maintenue constante pendant l'étude.

=> *patients insuffisamment contrôlés par une insulinothérapie* (2 études: Bianchi et col., 1996; Pontiroli et col., 1996): comparaison de Médiator à un traitement par placebo en association à l'insuine à dose maximale maintenue constante pendant la durée du traitement en double aveugle. Dans l'étude de Pontiroli, les patients étaient soumis à un régime à très basse calorie (800 Kcal /jour pendant la période de pré-inclusion et 1000 Kcal / jour pendant la période de traitement en double aveugle.

=> *patients insuffisamment contrôlés par metformine en monothérapie* (Pr Roger): comparaison de Médiator à un placebo en association à la metformine à dose maintenue constante pendant l'étude, après une période de pré-inclusion de 2 mois sous metformine seule.

=> *patients insulinorequérants* (Pr Leutenegger): comparaison de Médiator au placebo en association à l'insuline, dont la dose pouvait être modifiée au cours de l'étude.

NB. En parallèle, une demande de modification de l'information médicale concernant les effets cutanés et/ou allergiques (rubriques "*Contre-indications*" et "*Effets indésirables*") est examinée par l'Unité de Pharmacovigilance de l'Agence.

NOTE INTERNE D'ÉVALUATION :

- concernant le **mode d'action** du benfluorex,
  * les études de la sensibilité à l'insuline ne mettent pas toutes en évidence une augmentation de la sensibilité à l'insuline;
  * une augmentation de l'utilisation périphérique de glucose a été montrée dans 3 études utilisant des techniques de clamp euglycémique : R. Binachi, 1993; P. De Feo, 1993; et A. Ricchio, 1993)
  * études relatives à la production hépatique de glucose: les résultats sont contradictoires. Etude de De Feo: diminution de la production hépatique de glucose, non démontrée dans l'étude de Ricchio.
  * étude de la consommation périphérique de glucose sous benfluorex (Bianchi) non démontrée.

- concernant **l'efficacité du benfluorex à différents stades de la maladie**. Ces études ont permis d'explorer l'efficacité anti-diabétiques de Médiator, en monothérapie (Velussi) et en association, respectivement aux sulfonylurées (Stucci et Louvet), à la metformine (Roger), et à l'insuline (Bianchi, Leutenegegr et Pontiroli). L'étude du Pr Roger a été menée chez des médecins généralistes, celle de Leutenegger dans 7 centres hospitaliers français.
A noter, ces études ont toutes été réalisées selon le même schéma: études monocentriques en double aveugle, comparant Médiator à une placebo en groupes parallèles, pour une durée de traitement de trois mois.

Annexe 2-43

Remarques:
* la comparaison entre benfluorex et placebo est en faveur d'un effet positif mais modéré du produit.
* cependant, la taille réduite des effectifs est faible dans chaque étude, soit de 20 à 60 patients.
* dans les études multicentriques (Leutenegger), le dosage des paramètres principaux d'évaluation (glycémie à jeun et HbA1c) n'a pas été centralisé.
* aucune analyse de la perte de poids n'a été réalisée dans ces études. Il serait en effet intéressant de savoir si l'effet du Médiator n'est pas uniquement lié à son effet sur le poids (cf. études de pharmacologie et rapprochement avec les effets anorexigènes).
* l'étude réalisée chez les médecins généralistes (Roger) montre un effet significatif sur la glycémie à jeun; celle réalisée en milieu hospitalier (Leutenegger) ne montre pas d'effet sur l'HbA1c.
Au total, compte-tenu des critiques méthodologiques de ces études (défaut de centralisation des dosages), leur validité pour une demande d'AMM reste insuffisante.

- concernant les **analyses complémentaires en sous-groupes** de l'étude ce *"l'efficacité du Benfluorex (150 à 450 mg/jour) par voie orale chez 500 patients diabétiques de type 2 mal contrôlés par le régime seul"*.
Les principales critiques formulées lors de la 1ère analyse restent identiques:
* analyse effectuée chez 722 patients inclus contre 500 initialement prévus dans le protocole. Aucune présentation des résultats sur les 500 patients prévus n'a été effectuée par la firme.

* déséquilibre du taux d'HbA1c à l'inclusion, plus basse dans le groupe Benfluorex que dans le groupe metformine;
* il apparaît que 25 % des patients étaient des inclus à tort, avec un taux d'HbA1c normal (< 6.5%);
* l'analyse *per-protocol* n'inclut que 68 % des patients. Aucune explication n'est donnée sur les patients exclus de cette analyse;
* les doses maximales de metformine réellement reçues n'ont pas été précisées, les patients pouvant recevoir de 820 mg à 2250 mg. Il est donc pas possible de savoir si le Médiator a été comparé à des doses maximales de metformine et de connaître réellement son efficacité par rapport à ce traitement de référence.
* enfin, les critères utilisés en ITT et en analyse *per protocol* ne sont pas concordants: utilisation d'un IC à 95% dans l'étude versus placebo et à 90% versus metformine.

AVIS DU GT PTC2 N°1 DU 20 SEPTEMBRE 2000:

- Maintien de **l'AVIS DEFAVORABLE** à l 'indication proposée par la firme: 11/12/00 . *"diabète de type 2 (non-insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique"*.
En effet, compte-tenu des défauts méthodologiques de l'essai, aucune conclusion ne peut être formulée sur la taille de l'effet hypoglycémiant :
- du benfluorex comparé au placebo ;
- du benfluorex comparé à la metformine.
De plus le dossier ne permet pas de situer le benfluorex dans la stratégie de prise en charge des patients diabétiques.

En conséquence, le libellé de l'indication thérapeutique (rubrique 4.1. Indications thérapeutiques) retenu est le suivant:
"- adjuvant du régime adapté dans les hypertriglycéridémies;
- adjuvant du régime chez les diabétiques avec surcharge pondérale.
Remarque: l'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée."

L'information de l'ensemble des rubriques du RCP sera revue en fonction du nouveau libellé.

Enfin, en vue de l'obtention d'une indication dans le diabète de type 2, la firme devrait fournir des études évaluant l'efficacité du benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux. L'efficacité devrait également être étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisant rénaux, sujets âgés).

GTPTC2-1
CRQ/MG

Monsieur,

Par courrier du 29 mai 1998, concernant la spécialité :

MEDIATOR 150 mg, comprimé

vous avez sollicité une demande de modification d'indication au *"Diabète de type II (non insulino-dépendant), en association au régime adapté, lorsque ce régime n'est pas suffisant pour rétablir à lui seul l'équilibre glycémique".*

Une décision de refus à cette modification de l'autorisation de mise sur le marché vous a été notifiée le 25 avril 2000 pour insuffisance de données d'efficacité. Cette décision fait suite à l'avis défavorable rendu par la Commission mentionnée à l'article R. 5140 du code de la santé publique, en date du 27 janvier 2000.

Par courrier du 29 juin 2000, vous avez déposé un recours gracieux, suite à la décision défavorable sus-mentionnée, en apportant point par point les réponses aux objections émises par la Commission.

J'ai l'honneur de vous faire connaître qu'après avis de la Commission sus-citée, **je ne suis toujours pas en mesure de réserver une suite favorable** à votre demande d'extension d'indication pour insuffisance de données d'efficacité.

En effet, compte-tenu des défauts méthodologiques de l'essai, aucune conclusion ne peut être formulée sur la taille de l'effet hypoglycémiant :
- du benfluorex comparé au placebo ;
- du benfluorex comparé à la metformine.

Concernant les analyses complémentaires en sous-groupes de l'étude de *phase III "l'efficacité du Benfluorex (150 à 450 mg/jour) par voie orale chez 500 patients*

143/147 Boulevard Anatole France 93285 Saint-Denis Cedex - Tél. 01.55.87.30.00

Annexe 2-44

diabétiques de type 2 mal contrôlés par le régime seul", les principales critiques formulées lors de la première analyse restent identiques :

* l'analyse a été effectuée chez 722 patients inclus contre 500 initialement prévus dans le protocole. Aucune présentation des résultats sur les 500 patients prévus n'a été effectuée ;

* il y a un déséquilibre du taux d'HbA1c à l'inclusion, plus basse dans le groupe benfluorex que dans le groupe metformine ;

* il apparaît que 25 % des patients étaient des inclus à tort, avec un taux d'HbA1c normal (< 6.5%) ;

* l'analyse *per-protocol* n'inclut que 68 % des patients. Aucune explication n'est donnée sur les patients exclus de cette analyse ;

* les doses maximales de metformine réellement reçues n'ont pas été précisées, les patients pouvant recevoir de 820 mg à 2250 mg. Il est donc pas possible de savoir si le MEDIATOR a été comparé à des doses maximales de metformine et de connaître réellement son efficacité par rapport à ce traitement de référence ;

* enfin, les critères utilisés en intention de traiter et en analyse *per protocol* ne sont pas concordants: utilisation d'un intervalle de confiance à 95% dans l'étude versus placebo et à 90% dans l'étude versus metformine.

De plus le dossier ne permet pas de situer le benfluorex dans la stratégie de prise en charge des patients diabétiques.

En vue de l'obtention d'une indication dans le diabète de type 2, des études évaluant l'efficacité du benfluorex en monothérapie et en association avec d'autres antidiabétiques oraux devraient être fournies. L'efficacité devrait également être étudiée chez les patients chez qui d'autres antidiabétiques oraux sont contre-indiqués ou mal tolérés (insuffisant rénaux, sujets âgés).

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Pour le Directeur Général

Monsieur,

J'ai l'honneur de vous faire parvenir, ci-joint, l'ampliation de la décision portant modification de l'autorisation de mise sur le marché du médicament :

- MEDIATOR 150 mg, comprimé enrobé

que vous avez sollicité le 9 juin 1998.

Je vous informe que le pictogramme mentionné à l'avant dernier alinéa de l'article R 5143 du code de la santé publique tel qu'issu du décret N°99-338 du 3 mai 1999 doit être apposé sur le conditionnement extérieur de votre spécialité, celle-ci ayant des effets sur la capacité de conduire des véhicules ou d'utiliser des machines mentionnés dans la rubrique du résumé des caractéristiques du produit prévue à cet effet.

Le modèle de pictogramme devant être utilisé et libre de droit, est disponible sur le site internet de l'Agence Française de Sécurité Sanitaire des Produits de Santé: http://agprod.sante.fr.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Pour le Directeur Général
et par délégation

DÉCISION DU DIRECTEUR GÉNÉRAL DE L'AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ

du .....

portant modification
de l'autorisation de mise sur le marché du médicament

MEDIATOR 150 mg, comprimé enrobé

VU le livre V du code de la santé publique, notamment les articles L.601 et R.5128 à R.5140 et R.5143-5-1 à R.5143-5-5 ;

VU l'autorisation de mise sur le marché validée octroyée le **22 avril 1987** ;

Vu la demande de modification de l'autorisation de mise sur le marché présentée par LES LABORATOIRES SERVIER ;

le 9 juin 1998 ;

pour le médicament :

MEDIATOR 150 mg, comprimé enrobé

et concernant dans :

- les rubriques de l'annexe I (résumé des caractéristiques du produit)
  4.1 Indications thérapeutiques
  4.6. Grossesse et allaitement

Les annexes I (RCP), IIIA (Etyiquetage) et IIIB (Notice) sont modifiées en conséquence ;

Vu la décision de refus de modification notifiée le 25 avril 2000 ;

Vu la demande de recours gracieux en date du 29 juin 2000, suite à l'avis défavorable sus-cité ;

Annexe 2-45

VU l'avis de la commission prévu à l'article R. 5140 du code de la santé publique ;

DÉCIDE

Article 1er

La demande de modification du dossier d'autorisation de mise sur le marché est acceptée et les annexes I, II, III_A, et III_B de la présente décision remplacent les dispositions prévues par les annexes I, II et III de l'Autorisation de Mise sur le Marché susvisée modifiée.

Article 2

Les Laboratoires SERVIER

Pièces Jointes : 4 annexes

Annexe 2-45

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

1. DENOMINATION

12 JUIN 2001

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé de 700 mg

Pour les excipients, voir rubrique 6.1..

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

- Adjuvant du régime adapté dans les hypertriglycéridémies;
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

4.2 Posologie et mode d'administration

Voie orale.

La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:
- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

En association à un régime adapté, Médiator constitue un traitement *adjuvant* : une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3 Contre-indications

- Hypersensibilité au chlorydrate de benfluorex ou à l'un des constituants ;
- Pancréatites chroniques avérées.

4.4 Mises en garde et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante de concentrations sériques de lipides ou de glucose n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5 Interactions avec d'autres médicaments et autres formes d'interactions

4.6 Grossesse et allaitement

Grossesse:
Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.
En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.
En conséquence, par mesure de prudence, il est préférable de ne pas utiliser ce médicament pendant la grossesse. En cas d'exposition fortuite, il conviendra d'interrompre ce traitement.

Allaitement
En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement.

4.7 Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

Annexe 2-45

4.8 Effets indésirables

Les effets secondaires suivants ont été observés :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée) ;
- asthénie ;
- somnolence ;
- état vertigineux.

Toutefois, ces effets s'observent plus particulièrement à des posologies élevées. Une susceptibilité individuelle a également été observée.

4.9 Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

HYPOCHOLESTROLEMIANT ET HYPOTRIGLYCERIDEMIANT
Code ATC : C10AX04

Actions de Médiator sur le métabolisme lipidique:
Chez l'animal (rat), Médiator diminue l'absorption intestinale des triglycérides.
Cet effet a été également observé chez l'homme en pharmacologie clinique et serait dû à une diminution de l'activité de la lipase pancréatique.

Les effets suivants ont été également observés chez l'animal:
- diminution de la synthèse hépatique des triglycérides et du cholestérol, *in vitro* et *in vivo* (rat);
- diminution de la stéatose hépatique induite par des régimes riches en lipides, riches en glucides (rat obèse) ainsi qu'au cours du diabète expérimental (rat);
- limitation de l'incorporation du cholestérol dans la paroi artérielle (lapin).

Ces différents mécanismes pourraient expliquer en partie la diminution du cholestérol et des triglycérides observée chez l'homme.

Actions de Médiator sur le métabolisme glucidique:
Chez l'animal, les effets suivants ont été observés:
- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat);
- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

Médiator n'a pas d'action sur l'insulino-sécrétion; la survenue d'hypoglycémie est peu probable.

Effet complémentaire de Médiator:
Une baisse de l'uricémie d'environ 14 % a été observée chez des patients obèses hyperuricémiques traités par Médiator en association à un régime adapté.

Annexe 2-45

7

5.2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.
Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :
- une première phase rapide (60 % en 3 ou 4 heures);
- une seconde phase lente, de 36 heures environ.

5.3 Données de sécurité précliniques

Sans objet.

6. DONNEES PHARMACEUTIQUES

6.1. Liste des excipients

Amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E 171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

6.2. Incompatibilités

Sans objet.

6.3. Durée de conservation

3 ans

6.4. Précautions particulières de conservation

Pas de précautions particulières de conservation.

6.5. Nature et contenu de l'emballage extérieur

Plaquettes thermoformées (PVC-Aluminium)

6.6. Instructions pour l'utilisation et la manipulation

(Cf. 4.2.Posologie et mode d'administration)

NOTICE

Lisez attentivement l'intégralité de cette notice avant de prendre ce médicament.
Elle contient des informations importantes sur votre traitement.
Si vous avez d'autres questions, si vous avez un doute, demandez plus d'informations à votre médecin ou à votre pharmacien.
Ce médicament vous a été personnellement prescrit. Ne le donnez jamais à quelqu'un d'autre, même en cas de symptômes identiques, car cela pourrait lui être nocif.
Gardez cette notice, vous pourriez avoir besoin de la relire.

MEDIATOR 150 mg, comprimé enrobé

La substance active est :

Chlorhydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé

Les autres composants sont : amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane (E 171), éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

Titulaire/Exploitant :
LES LABORATOIRES SERVIER
22, rue Garnier
92200 NEUILLY SUR SEINE

Fabricant :
LES LABORATOIRES SERVIER INDUSTRIE
905, route de Saran
45520 GIDY

1. QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

MEDIATOR 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.
MEDIATOR 150 mg se présente sous la forme de comprimés enrobés.
Boîtes de 10, 20, 24, 30, 60 et 100 comprimés.

Ce traitement est en préconisé comme adjuvant à un régime adapté :
- dans les hypertriglycéridémies *(taux de lipides élevés dans le sang)* ;
- chez les diabétiques avec surcharge pondérale *(taux de sucre élevé dans le sang)*.

2. INFORMATIONS NÉCESSAIRES AVANT D'UTILISER MEDIATOR 150 mg, comprimé enrobé

MEDIATOR 150 mg, comprimé enrobé NE DOIT JAMAIS ETRE UTILISE dans les cas suivants :
- allergie au chlorhydrate de benfluorex ou à l'un des composants du produit;
- en cas de pancréatite chronique *(insuffisance du pancréas)*.

MISES en GARDE et PRECAUTIONS PARTICULIERES D'EMPLOI avec MEDIATOR 150 mg, comprimé enrobé:

Un régime alimentaire adapté doit être poursuivi pendant toute la durée du traitement.

Si après une période de plusieurs mois (3 à 6 mois), une diminution des concentrations de lipides ou de glucose (sucre) dans le sang n'est pas obtenue, votre médecin pourra envisager d'autres moyens thérapeutiques adaptés à votre cas.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase *(maladies métaboliques rares)*.

Grossesse/Allaitement:
Il est préférable de ne pas utiliser ce médicament pendant la grossesse ou au cours de l'allaitement.
Si vous découvrez que vous êtes enceinte pendant le traitement, consultez votre médecin car lui seul peut juger de la nécessité de le poursuivre.

Conduite de véhicules et utilisation de machines:
L'attention est attirée sur le risque de somnolence pouvant survenir avec ce médicament.

Sportifs:
Attention, cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

Liste des excipients à effet notoire:
Saccharose.

Prise ou utilisation d'autres médicaments:
Sans objet.

3. COMMENT PRENDRE MEDIATOR 150 mg, comprimé enrobé ?

Posologie:
RESERVE A L'ADULTE

Voie orale.
La posologie est habituellement de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:
- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

La posologie peut-être ramenée à 2 comprimés par jour, voire 1 comprimé par jour, en fonction des résultats biologiques.

DANS TOUS LES CAS, SE CONFORMER STRICTEMENT A L'ORDONNANCE DE VOTRE MEDECIN.

Si vous avez pris plus de MEDIATOR 150 mg, comprimé enrobé que vous n'auriez dû:
Les signes de surdosage peuvent être des troubles digestifs (nausées, vomissements, diarrhée), une sensation vertigineuse voire une somnolence. En cas d'apparition de ces troubles, consultez votre médecin ou votre pharmacien.

Si vous oubliez de prendre MEDIATOR 150 mg, comprimé enrobé:
Ne prenez pas de double dose pour compenser la dose simple que vous avez oubliée de prendre.

Effets pouvant apparaître lorsque le traitement par MEDIATOR 150 mg, comprimé enrobé est arrêté :
Sans objet.

4. QUELS SONT LES EFFETS INDESIRABLES EVENTUELS avec MEDIATOR 150 mg, comprimé enrobé ?

Comme tous les médicaments, MEDIATOR 150 mg, comprimé enrobé est susceptible d'avoir des effets indésirables :

- troubles digestifs: nausées, vomissements, diarrhée, maux d'estomac ;
- sensation de fatigue, voire somnolence;
- sensations vertigineuses.

Ces effets ont été observés à des posologies élevées.

Si vous remarquez des effets indésirables non mentionnés dans cette notice, veuillez en informer votre médecin ou votre pharmacien.

5. COMMENT CONSERVER MEDIATOR 150 mg, comprimé enrobé ?

Pas de précautions particulières de conservation.

Ne laisser ni à la portée ni à la vue des enfants.

Ne pas utiliser après la date de péremption figurant sur la boîte.

La dernière date à laquelle cette notice a été approuvée est le (date).

ANNEXE I

RESUME DES CARACTERISTIQUES DU PRODUIT

1. DENOMINATION

MEDIATOR 150 mg, comprimé enrobé

2. COMPOSITION QUALITATIVE ET QUANTITATIVE

Chlorydrate de benfluorex ..... 150,00 mg
pour un comprimé enrobé de 700 mg

Pour les excipients, voir rubrique 6.1..

3. FORME PHARMACEUTIQUE

Comprimé enrobé

4. DONNEES CLINIQUES

4.1 Indications thérapeutiques

- Adjuvant du régime adapté dans les hypertriglycéridémies;
- Adjuvant du régime adapté chez les diabétiques avec surcharge pondérale.

Remarque : L'efficacité pour la prévention primaire et secondaire des complications de l'athérosclérose n'est pas prouvée.

4.2 Posologie et mode d'administration

Voie orale.

habituellement (Cohérence avec la description du schéma posologique ci-dessous).

La posologie est ~~en moyenne~~ de 3 comprimés par jour. Cette posologie peut être prescrite d'emblée ou atteinte progressivement de la manière suivante:
- 1ère semaine: 1 comprimé par jour, au cours du dîner;
- 2ème semaine: 2 comprimés par jour, 1 au cours du déjeuner, 1 au cours du dîner;
- à partir de la 3ème semaine: 3 comprimés par jour, soit 1 au petit déjeuner, 1 au déjeuner, 1 au dîner.

En fonction des résultats biologiques, la posologie peut être diminuée à 2 comprimés par jour, voire 1 comprimé par jour.

(Conformité au libellé d'indications thérapeutiques)

En association à un régime adapté, Médiator ~~ne~~ constitue ~~qu'~~un traitement *adjuvant*; une surveillance régulière clinique et biologique de chaque patient sera instaurée.

4.3 Contre-indications

- Hypersensibilité au chlorydrate de benfluorex ou à l'un des constituants ;
- Pancréatites chroniques avérées.

Annexe 2-46

× Cohérence avec le libellé de la rubrique "Indications thérapeutiques" et celui de la rubrique "Posologie et mode d'administration".

C REY-QUINIO

× Grossesse :
- Cohérence avec la première phrase introductive :
"Ce médicament <u>ne doit pas être utilisé</u> pendant la grossesse et l'allaitement"
- l'allusion à des propriétés amphétaminiques ne se justifie pas :
  - propriétés non retrouvées avec Benfluorex,
  - classification ATC différente de Benfluorex,
  - ne correspond pas à la réalité clinique,
  - pourrait, en outre, susciter des déviations d'usage.

4.4 Mises en garde et précautions particulières d'emploi

Les troubles métaboliques relevant d'un traitement par Médiator sont essentiellement observés chez l'adulte. La prescription de Médiator n'est donc pas justifiée chez l'enfant.

Si, après une période d'administration de quelques mois (3 à 6 mois), une diminution satisfaisante de concentrations sériques de lipides n'est pas obtenue, des moyens thérapeutiques complémentaires ou différents doivent être envisagés.

ou de glucose OK

L'attention des sportifs sera attirée sur le fait que cette spécialité contient un principe actif pouvant induire une réaction positive des tests pratiqués lors des contrôles antidopage.

En raison de la présence de saccharose, ce médicament ne doit pas être utilisé en cas d'intolérance au fructose, de syndrome de malabsorption du glucose et du galactose ou de déficit en sucrase-isomaltase.

4.5 Interactions avec d'autres médicaments et autres formes d'interactions

4.6 Grossesse et allaitement

~~Ce médicament ne doit pas être utilisé pendant la grossesse et l'allaitement.~~

Grossesse:
Les études chez l'animal n'ont pas mis en évidence d'effet tératogène. En l'absence d'effet tératogène chez l'animal, un effet malformatif dans l'espèce humaine n'est pas attendu. En effet, à ce jour, les substances responsables de malformations dans l'espèce humaine se sont révélées tératogènes chez l'animal au cours d'études bien conduites sur deux espèces.
En clinique, il n'existe pas actuellement de données suffisamment pertinentes pour évaluer un éventuel effet malformatif ou foetotoxique du benfluorex lorsqu'il est administré pendant la grossesse.

PROJET

En cas d'exposition fortuite, il conviendra d'interrompre ce traitement ~~dont la prescription du fait des propriétés amphétaminiques est déconseillée au cours de la grossesse~~.

ajout ↓
(1) En conseq, par mesure de prudence, il est préf de ne pas utiliser ce medic pdt la grossesse OK

Allaitement
En l'absence de données sur le passage du benfluorex dans le lait maternel, ce médicament est déconseillé au cours de l'allaitement.

4.7 Effets sur l'aptitude à conduire des véhicules et à utiliser des machines

L'attention des conducteurs est attirée sur la somnolence pouvant survenir lors de l'utilisation de ce médicament.

4.8 Effets indésirables

Les effets secondaires suivants ont été observés :
- troubles digestifs (nausées, vomissements, gastralgies, diarrhée) ;
- asthénie ;
- somnolence ;

Annexe 2-46

Non
Le résumé d'avis ne mentionne
pas cela en conclusion
L'étude ne permet pas de conclure

non

x Chez le diabétique avec surcharge pondérale, en association à un régime adapté, on observe une baisse de l'hémoglobine glyquée supérieure à celle que l'on obtient avec un régime identique associé à un placebo.

(cf: décision de l'AFSSAPS du 25 avril 2000)

- état vertigineux.

X Toutefois, ces effets s'observent plus particulièrement à ~~la posologie de 3 comprimés par jour~~ des posologies élevées. Une susceptibilité individuelle a également été observée. OK

4.9 Surdosage

En cas d'absorption massive, le traitement sera uniquement symptomatique: lavage d'estomac, diurèse osmotique, correction des troubles électrolytiques éventuels, surveillance de la pression artérielle, de l'état de conscience ainsi que des fonctions respiratoire et cardiaque.

5. PROPRIETES PHARMACOLOGIQUES

5.1 Propriétés pharmacodynamiques

Actions de Médiator sur le métabolisme lipidique:
Chez l'animal (rat), Médiator diminue l'absorption intestinale des triglycérides.
Cet effet a été également observé chez l'homme en pharmacologie clinique et serait dû à une diminution de l'activité de la lipase pancréatique.

Les effets suivants ont été également observés chez l'animal:
- diminution de la synthèse hépatique des triglycérides et du cholestérol, *in vitro* et *in vivo* (rat);
- diminution de la stéatose hépatique induite par des régimes riches en lipides, riches en glucides (rat obèse) ainsi qu'au cours du diabète expérimental (rat);
- limitation de l'incorporation du cholestérol dans la paroi artérielle (lapin).
Ces différents mécanismes pourraient expliquer en partie la diminution du cholestérol et des triglycérides observée chez l'homme.

Actions de Médiator sur le métabolisme glucidique:
Chez l'animal, les effets suivants ont été observés:
- facilitation de la pénétration et de l'utilisation cellulaire du glucose (rat);
- diminution de l'hyperglycémie chez le rat diabétique (insulinoprive ou non), diminution de l'hyperglycémie (mesurée par l'aire d'HPO) chez le lapin.

X ← Médiator n'a pas d'action sur l'insulino-sécrétion; la survenue d'hypoglycémie est peu probable.

Effet complémentaire de Médiator:
Une baisse de l'uricémie d'environ 14 % a été observée chez des patients obèses hyperuricémiques traités par Médiator en association à un régime adapté.

5.2 Propriétés pharmacocinétiques

L'absorption gastro-intestinale est rapide et totale.
Après administration orale, le pic de concentration plasmatique est maximal entre 1 et 2 heures.

L'élimination est rapide et totale par voie urinaire. Huit heures après l'absorption, 74 % de la dose administrée est éliminée dans les urines.

L'élimination se fait en 2 phases :
- une première phase rapide (60 % en 3 ou 4 heures);
- une seconde phase lente, de 36 heures environ.

5.3 Données de sécurité précliniques

Sans objet.

6. DONNEES PHARMACEUTIQUES

6.1. Liste des excipients

Amidon de maïs, bicarbonate de sodium, carmellose sodique, cire d'abeille blanche, dioxyde de titane, éthylcellulose, monooléate de glycérol, polysorbate 80, povidone, saccharose, silice colloïdale anhydre, stéarate de magnésium, talc.

1. QU'EST-CE QUE MEDIATOR 150 mg, comprimé enrobé ET DANS QUEL CAS EST-IL UTILISÉ ?

MEDIATOR 150 mg, comprimé enrobé contient du chlorhydrate de benfluorex.
MEDIATOR 150 mg se présente sous la forme de comprimés enrobés.
Boîtes de 10, 20, 24, 30, 60 et 100 comprimés.

Code ATC: A (Appareil Digestif et métabolisme).

Ce traitement est en préconisé comme adjuvant à un régime adapté :
- dans les hypertriglycéridémies (pour diminuer le taux de lipides dans le sang),
- chez les diabétiques avec surcharge pondérale (pour diminuer le taux de sucre dans le sang).

ET DE L'INFORMATION SCIENTIFIQUE

DÉPARTEMENT PUBLICITÉ ET BON USAGE
DES PRODUITS DE SANTÉ
Unité Publicité des médicaments pour les professionnels

Saint-Denis, le 28 NOV. 2002

DÉCISION

Interdisant une publicité pour un médicament, mentionnée à l'article L.5122-1, premier alinéa du code de la santé publique, destinée aux personnes habilitées à prescrire ou délivrer ces médicaments ou à les utiliser dans l'exercice de leur art.

LE DIRECTEUR DE L'AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ

Vu le code de la santé publique et notamment les articles L.5122-1 à L.5122-3, L.5122-9, L.5422-1, R.5045, R.5047 à R.5047-2, R.5047-5, R.5054 à R.5054-4 ;

Vu l'avis de la Commission chargée du contrôle de la publicité et de la diffusion de recommandations sur le bon usage des médicaments réunie le 15 octobre 2002.

Considérant que les Laboratoires SERVIER, 22 rue Garnier, 92 200 Neuilly-sur-Seine, ont diffusé une publicité relative à la spécialité MEDIATOR – tiré-à-part.

Considérant que

Ce document présente les résultats d'un résumé de communication de congrès relatif à une étude évaluant l'efficacité et la tolérance de MEDIATOR versus metformine et placebo chez des patients diabétiques sur une durée de six mois, avec notamment les allégations " efficacité antidiabétique sur l'HbA1c après 6 mois de traitement ", " versus metformine : MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c " et la mise en exergue des conclusions des auteurs " 1) MEDIATOR réduit significativement l'HbA1c et la glycémie à jeun, en comparaison au placebo ; 2) MEDIATOR est bien toléré ; 3) MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c. Cette baisse apparaît néanmoins un peu plus importante, dans cette étude, sous metformine ".

Annexe 2-47

Cette étude a été examinée par la Commission d'Autorisation de Mise sur le Marché des médicaments dans le cadre d'une demande d'extension d'indication de MEDIATOR au traitement du diabète de type 2 après échec des mesures hygiéno-diététiques seules.

Or, cette étude présente des faiblesses méthodologiques, avec notamment :

- des patients inclus qui sont en moyenne peu sévèrement atteints ;
- un déséquilibre dans les taux d'HbA1c à l'inclusion, plus bas dans le groupe MEDIATOR que dans le groupe metformine ;
- une analyse statistique de la comparaison de l'efficacité de MEDIATOR versus metformine réalisée avec un intervalle de confiance à 90 % (soit un risque d'erreur de 10 %), alors que la comparaison de MEDIATOR versus placebo a été analysée avec un intervalle de confiance à 95 % (soit un risque d'erreur de 5 %). Ainsi, l'analyse réalisée avec un intervalle de confiance à 90 % présentée dans le document promotionnel montre une non infériorité de MEDIATOR par rapport à la metformine, tandis que celle réalisée avec un intervalle de confiance à 95 % en intention de traiter ne permet pas de conclure à la non infériorité du benfluorex comparé à la metformine ;
- une analyse en per protocole qui n'a inclus que 68 % des patients.

Ainsi, cette extension d'indication a été refusée par la Commission d'autorisation de mise sur le marché, considérant que la démonstration d'efficacité n'a pas été apportée, notamment dans la mesure où l'essai clinique fourni ne permet pas de conclure à la non infériorité du benfluorex par rapport à la metformine compte tenu des faiblesses méthodologiques de l'étude.

Par ailleurs, la mise en exergue d'une non infériorité de MEDIATOR sur la diminution de l'HbA1c est associée en dernière page du document à la mise en exergue de résultats de tolérance gastro-intestinale en faveur de MEDIATOR : 13 % dans le bras traité par MEDIATOR versus 25 % pour la metformine, sans précision d'un degré de significativité pour interpréter cette différence et sans que soient mentionnés les autres effets indésirables. Or, cette présentation tend à établir une comparaison du rapport bénéfice/risque de ces deux spécialités et à générer une prescription préférentielle de MEDIATOR chez certains diabétiques de type 2 sur la base d'un profil de tolérance plus favorable pour une efficacité non inférieure, ce qui ne favorise pas le bon usage de MEDIATOR dans la mesure où les indications validées par les autorisations de mise sur le marché de MEDIATOR et de la metformine ne sont pas superposables concernant leur place dans la prise en charge du diabète de type 2. En effet, MEDIATOR est indiqué comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » tandis que la metformine est indiquée dans le « traitement du diabète de type 2 de l'adulte, en particulier en cas de surcharge pondérale, lorsque le régime alimentaire et l'exercice physique ne sont pas suffisants pour rétablir l'équilibre glycémique ». Ainsi, cette présentation d'une efficacité antidiabétique non inférieure à la metformine associée à une meilleure tolérance gastro-intestinale tend à positionner MEDIATOR au même niveau de la stratégie thérapeutique du traitement du diabète de type 2, c'est-à-dire après échec des mesures hygiéno-diététiques, ce qui ne correspond pas à l'indication validée par l'autorisation de mise sur le marché de MEDIATOR.

Annexe 2-47

Considérant qu'

En conséquence, la présentation des résultats de l'étude précitée comparant l'efficacité et la tolérance de MEDIATOR versus metformine et la conclusion " efficacité antidiabétique sur l'HbA1c après 6 mois de traitement : versus metformine, MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c " sont contraires à l'article L.5122-2 du code de la santé publique, qui dispose que la publicité doit respecter les dispositions de l'autorisation de mise sur le marché, présenter le médicament de façon objective et favoriser son bon usage.

DÉCIDE

ARTICLE 1er.

Les publicités, sous quelque forme que ce soit, pour la spécialité pharmaceutique *MEDIATOR* reprenant les allégations mentionnées ci-dessus sont interdites.

ARTICLE 2.

Le Directeur des Etudes Médico-économiques et de l'Information Scientifique est chargé de l'exécution de la présente décision, qui sera publiée par extrait au Journal officiel de la République française.

Fait à Saint-Denis, le 28 NOV. 2002

Le Directeur Général de l'~~Agence~~ Française
de Sécurité Sanitaire des Produits de Santé

Annexe 2-47

RÉPUBLIQUE FRANÇAISE

AGENCE FRANÇAISE DE SÉCURITÉ SANITAIRE DES PRODUITS DE SANTÉ

DÉCISION

interdisant une publicité pour un médicament mentionnée à l'article L.5122-1, premier alinéa du code de la santé publique, destinée aux personnes habilitées à prescrire ou délivrer ces médicaments, ou à les utiliser dans l'exercice de leur art.

-:-:-:-:-:-:-:-:-:-:-:-:-

Par décision du Directeur Général de l'Agence Française de Sécurité Sanitaire des Produits de Santé en date du 28 NOV. 2002
Considérant que les Laboratoires SERVIER, 22 rue Garnier, 92 200 Neuilly-sur-Seine, ont diffusé une publicité relative à la spécialité MEDIATOR – tiré-à-part.
Considérant que ce document présente les résultats d'un résumé de communication de congrès relatif à une étude évaluant l'efficacité et la tolérance de MEDIATOR versus metformine et placebo chez des patients diabétiques sur une durée de six mois, avec notamment les allégations " efficacité antidiabétique sur l'HbA1c après 6 mois de traitement ", " versus metformine : MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c " et la mise en exergue des conclusions des auteurs " 1) MEDIATOR réduit significativement l'HbA1c et la glycémie à jeun, en comparaison au placebo ; 2) MEDIATOR est bien toléré ; 3) MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c. Cette baisse apparaît néanmoins un peu plus importante, dans cette étude, sous metformine ".

Cette étude a été examinée par la Commission d'Autorisation de Mise sur le Marché des médicaments dans le cadre d'une demande d'extension d'indication de MEDIATOR au traitement du diabète de type 2 après échec des mesures hygiéno-diététiques seules.

Or, cette étude présente des faiblesses méthodologiques, avec notamment :
- des patients inclus qui sont en moyenne peu sévèrement atteints ;
- un déséquilibre dans les taux d'HbA1c à l'inclusion, plus bas dans le groupe MEDIATOR que dans le groupe metformine ;
- une analyse statistique de la comparaison de l'efficacité de MEDIATOR versus metformine réalisée avec un intervalle de confiance à 90 % (soit un risque d'erreur de 10 %), alors que la comparaison de MEDIATOR versus placebo a été analysée avec un intervalle de confiance à 95 % (soit un risque d'erreur de 5 %). Ainsi, l'analyse réalisée avec un intervalle de confiance à 90 % présentée dans le document promotionnel montre une non infériorité de MEDIATOR par rapport à la metformine, tandis que celle réalisée avec un intervalle de confiance à 95 % en intention de traiter ne permet pas de conclure à la non infériorité du benfluorex comparé à la metformine ;
- une analyse en per protocole qui n'a inclus que 68 % des patients.

Ainsi, cette extension d'indication a été refusée par la Commission d'autorisation de mise sur le marché, considérant que la démonstration d'efficacité n'a pas été apportée, notamment dans la mesure où l'essai clinique fourni ne permet pas de conclure à la non

Annexe 2-47

infériorité du benfluorex par rapport à la metformine compte tenu des faiblesses méthodologiques de l'étude.

Par ailleurs, la mise en exergue d'une non infériorité de MEDIATOR sur la diminution de l'HbA1c est associée en dernière page du document à la mise en exergue de résultats de tolérance gastro-intestinale en faveur de MEDIATOR : 13 % dans le bras traité par MEDIATOR versus 25 % pour la metformine, sans précision d'un degré de significativité pour interpréter cette différence et sans que soient mentionnés les autres effets indésirables. Or, cette présentation tend à établir une comparaison du rapport bénéfice/ risque de ces deux spécialités et à générer une prescription préférentielle de MEDIATOR chez certains diabétiques de type 2 sur la base d'un profil de tolérance plus favorable pour une efficacité non inférieure, ce qui ne favorise pas le bon usage de MEDIATOR dans la mesure où les indications validées par les autorisations de mise sur le marché de MEDIATOR et de la metformine ne sont pas superposables concernant leur place dans la prise en charge du diabète de type 2. En effet, MEDIATOR est indiqué comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale » tandis que la metformine est indiquée dans le « traitement du diabète de type 2 de l'adulte, en particulier en cas de surcharge pondérale, lorsque le régime alimentaire et l'exercice physique ne sont pas suffisants pour rétablir l'équilibre glycémique ». Ainsi, cette présentation d'une efficacité antidiabétique non inférieure à la metformine associée à une meilleure tolérance gastro-intestinale tend à positionner MEDIATOR au même niveau de la stratégie thérapeutique du traitement du diabète de type 2, c'est-à-dire après échec des mesures hygiéno-diététiques, ce qui ne correspond pas à l'indication validée par l'autorisation de mise sur le marché de MEDIATOR.

Considérant qu'en conséquence, la présentation des résultats de l'étude précitée comparant l'efficacité et la tolérance de MEDIATOR versus metformine et la conclusion " efficacité antidiabétique sur l'HbA1c après 6 mois de traitement : versus metformine, MEDIATOR s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c " sont contraires à l'article L.5122-2 du code de la santé publique, qui dispose que la publicité doit respecter les dispositions de l'autorisation de mise sur le marché, présenter le médicament de façon objective et favoriser son bon usage.
Les publicités, sous quelque forme que ce soit, pour la spécialité pharmaceutique MEDIATOR reprenant les allégations mentionnées ci-dessus sont interdites.

siège social se situe à Paris (15e), 6, rue Vandrezanne, est agréée pour pratiquer les opérations relevant des branches ou sous-branches suivantes mentionnées à l'article R. 211-2 du code précité :

1 Accidents (y compris les accidents du travail et les maladies professionnelles) ;
2 Maladie ;
20 Vie-décès.

Art. 2. – Le directeur de la sécurité sociale est chargé de l'exécution du présent arrêté, qui sera publié au *Journal officiel* de la République française.

Fait à Paris, le 13 décembre 2002.

Le ministre de la santé, de la famille et des personnes handicapées,
Pour le ministre et par délégation :
Par empêchement du directeur de la sécurité sociale :
Le sous-directeur des retraites et des institutions de la protection sociale complémentaire,
F. LE MORVAN

Le ministre des affaires sociales, du travail et de la solidarité,
Pour le ministre et par délégation :

F. LE MORVAN

Arrêté du 16 décembre 2002 relatif au budget pour 2002 de l'agence régionale de l'hospitalisation de Languedoc-Roussillon

NOR : *SANG0224184A*

Par arrêté du ministre de la santé, de la famille et des personnes handicapées et du ministre délégué au budget et à la réforme budgétaire en date du 16 décembre 2002, le montant du budget primitif pour 2002 de l'agence régionale de l'hospitalisation de Languedoc-Roussillon est majoré de la somme nette de 22 904,43 € (décision modificative n° 1).

Arrêté du 18 décembre 2002 portant prorogation du mandat des membres des commissions administratives paritaires de l'Assistance publique-hôpitaux de Paris

NOR : *SANH0224208A*

Par arrêté du ministre de la santé, de la famille et des personnes handicapées en date du 18 décembre 2002, le mandat des membres des commissions administratives paritaires propres à l'Assistance publique-hôpitaux de Paris est prorogé d'un *an* à compter du 1er janvier 2003.

Décision du 28 novembre 2002 interdisant des publicités pour des médicaments mentionnées à l'article L. 5122-1, premier alinéa, du code de la santé publique, destinées aux personnes habilitées à prescrire ou à délivrer ces médicaments ou à les utiliser dans l'exercice de leur art

NOR : *SANM0239953S*

Par décision du directeur général de l'Agence française de sécurité sanitaire des produits de santé en date du 28 novembre 2002 :

Considérant que les laboratoires Servier, 22, rue Garnier, 92200 Neuilly-sur-Seine, ont diffusé une publicité relative à la spécialité Mediator (tiré à part) ;

Considérant que ce document présente les résultats d'un résumé de communication de congrès relatif à une étude évaluant l'efficacité et la tolérance de Mediator *versus* metformine et placebo chez des patients diabétiques sur une durée de six mois, avec notamment les allégations « efficacité antidiabétique sur l'HbA1c après six mois de traitement », « *versus* metformine : Mediator s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c » et la mise en exergue des conclusions des auteurs :

« 1. Mediator réduit significativement l'HbA1c et la glycémie à jeun, en comparaison au placebo ;

2. Mediator est bien toléré ;

3. Mediator s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c. Cette baisse apparaît néanmoins un peu plus importante, dans cette étude, sous metformine. »

Cette étude a été examinée par la commission d'autorisation de mise sur le marché des médicaments dans le cadre d'une demande d'extension d'indication de Mediator au traitement du diabète de type 2 après échec des mesures hygiéno-diététiques seules.

Or, cette étude présente des faiblesses méthodologiques, avec notamment :

- des patients inclus qui sont en moyenne peu sévèrement atteints ;
- un déséquilibre dans les taux d'HbA1c à l'inclusion, plus bas dans le groupe Mediator que dans le groupe metformine ;
- une analyse statistique de la comparaison de l'efficacité de Mediator *versus* metformine réalisée avec un intervalle de confiance à 90 % (soit un risque d'erreur de 10 %), alors que la comparaison de Mediator *versus* placebo a été analysée avec un intervalle de confiance à 95 % (soit un risque d'erreur de 5 %). Ainsi, l'analyse réalisée avec un intervalle de confiance à 90 % présentée dans le document promotionnel montre une non-infériorité de Mediator par rapport à la metformine, tandis que celle réalisée avec un intervalle de confiance à 95 % en intention de traiter ne permet pas de conclure à la non-infériorité du benfluorex comparé à la metformine ;
- une analyse en per protocole qui n'a inclus que 68 % des patients.

Ainsi, cette extension d'indication a été refusée par la commission d'autorisation de mise sur le marché, considérant que la démonstration d'efficacité n'a pas été apportée, notamment dans la mesure où l'essai clinique fourni ne permet pas de conclure à la non-infériorité du benfluorex par rapport à la metformine, compte tenu des faiblesses méthodologiques de l'étude.

Par ailleurs, la mise en exergue d'une non-infériorité de Mediator sur la diminution de l'HbA1c est associée en dernière page du document à la mise en exergue de résultats de tolérance gastro-intestinale en faveur de Mediator : 13 % dans le bras traité par Mediator *versus* 25 % pour la metformine, sans précision d'un degré de significativité pour interpréter cette différence et sans que soient mentionnés les autres effets indésirables. Or, cette présentation tend à établir une comparaison du rapport bénéfice/risque de ces deux spécialités et à générer une prescription préférentielle de Mediator chez certains diabétiques de type 2 sur la base d'un profil de tolérance plus favorable pour une efficacité non inférieure, ce qui ne favorise pas le bon usage de Mediator dans la mesure où les indications validées par les autorisations de mise sur le marché de Mediator et de la metformine ne sont pas superposables concernant leur place dans la prise en charge du diabète de type 2. En effet, Mediator est indiqué comme « adjuvant du régime adapté chez les diabétiques avec surcharge pondérale », tandis que la metformine est indiquée dans le « traitement du diabète de type 2 de l'adulte, en particulier en cas de surcharge pondérale, lorsque le régime alimentaire et l'exercice physique ne sont pas suffisants pour rétablir l'équilibre glycémique ». Ainsi, cette présentation d'une efficacité antidiabétique non inférieure à la metformine associée à une meilleure tolérance gastro-intestinale tend à positionner Mediator au même niveau de la stratégie thérapeutique du traitement du diabète de type 2, c'est-à-dire après l'échec des mesures hygiéno-diététiques, ce qui ne correspond pas à l'indication validée par l'autorisation de mise sur le marché de Mediator ;

Considérant qu'en conséquence la présentation des résultats de l'étude précitée comparant l'efficacité et la tolérance de Mediator *versus* metformine et la conclusion efficacité antidiabétique sur l'HbA1c après six mois de traitement, *versus* metformine Mediator s'est montré statistiquement non inférieur à la metformine sur la baisse de l'HbA1c sont contraires à l'article L. 5122-2 du code de la santé publique, qui dispose que la publicité doit respecter les dispositions de l'autorisation de mise sur le marché, présenter le médicament de façon objective et favoriser son bon usage,

les publicités, sous quelque forme que ce soit, pour la spécialité pharmaceutique Mediator reprenant les allégations mentionnées ci-dessus sont interdites.

Liste des postes à recrutement prioritaire vacants de praticien hospitalier à temps partiel pour l'année 2002 pour la région Bourgogne

NOR : *SANH0224102K*

En application de l'article 3-1 du décret n° 85-384 du 29 mars 1985 modifié portant statut des praticiens exerçant leur activité à temps partiel dans les établissements d'hospitalisation publics, la liste des postes à recrutement prioritaire vacants est établie pour l'année 2002 ainsi qu'il est mentionné dans les tableaux ci-dessous.

Les conditions et les modalités de dépôt des candidatures sur ces postes vacants à recrutement prioritaire sont identiques à celles définies dans l'avis précédent de vacance de postes de praticien des hôpitaux à temps partiel (postes vacants ou susceptibles de l'être).

* * *

Les tableaux suivants dressent la liste de ces postes à recrutement prioritaire vacants dans les établissements publics de santé hors centres hospitaliers universitaires et dans les hôpitaux locaux ou dans les centres hospitaliers universitaires, dans les services placés hors de l'application de l'ordonnance du 30 décembre 1958 :

Laboratoires **SERVIER**
A l'attention de
Monsieur Pierre MONTES
Pharmacien Responsable
22, rue Garnier
92 200 NEUILLY-sur-SEINE

Lettre avec Accusé de Réception

Monsieur,

Je vous informe qu'en application des dispositions des articles L.5122-9 et R.5047-5-II du code de la santé publique, et après avis de la Commission chargée du contrôle de la publicité et de la diffusion de recommandations sur le bon usage des médicaments réunie le 15 octobre 2002, la poursuite de la diffusion de votre publicité concernant la spécialité MEDIATOR – tiré-à-part, est interdite par décision du 28 NOV. 2002 dont vous trouverez ci-joint une copie.

Cette interdiction, qui sera publiée au Journal Officiel de la République Française, prend effet à compter de la date de réception de ce courrier par vos services.

Toute diffusion qui se poursuivrait après cette date constituerait une infraction aux articles précités, passible des peines énumérées à l'article L.5422-1 du code de la santé publique.

Dans le cas où vous désireriez contester cette décision, un recours contentieux pourra être engagé devant le Tribunal administratif compétent dans un délai de deux mois à compter de la présente notification.

Veuillez agréer, Monsieur, l'expression de ma considération distinguée.

Le Directeur Général

Annexe 3-1

Pharmacovigilance AFSSAPS

Organisation de la pharmacovigilance

La pharmacovigilance est la surveillance et la prévention du risque d'effet indésirable, que ce risque soit potentiel ou avéré, des médicaments lorsqu'ils sont consommés largement dans le cadre de leur commercialisation.

Elle comprend :

- Le recueil basé sur la notification spontanée des effets indésirables par les professionnels de santé et les industriels avec l'appui du réseau des 31 centres régionaux de pharmacovigilance
- L'enregistrement et l'évaluation de ces informations
- La mise en place d'enquêtes ou d'études pour analyser les risques, la participation à la mise en place et au suivi des plans de gestion des risques
- L'appréciation du profil de sécurité d'emploi du médicament en fonction des données recueillies
- La prise de mesures correctives (précautions ou restriction d'emploi, contre-indications, voire retrait du produit) et la communication vers les professionnels de santé et le public
- La communication et la diffusion de toute information relative à la sécurité d'emploi du médicament
- La participation à la politique de santé publique de lutte contre la iatrogénie médicamenteuse

La pharmacovigilance s'appuie sur une base réglementaire nationale et européenne : lois, décrets, directives, bonnes pratiques de pharmacovigilance publiées par arrêté.

Le système national de pharmacovigilance comprend :

Un échelon national

- L'Afssaps (département de pharmacovigilance)
- La Commission nationale de pharmacovigilance et de son comité technique

Un échelon régional

- Les centres régionaux de pharmacovigilance (CRPV)

Autres acteurs

- Les professionnels de santé
- Les patients et/ou les associations de patients
- Les entreprises du médicament

Ce système s'intègre dans une organisation européenne de la pharmacovigilance (groupe de travail européen de pharmacovigilance/eudravigilance) et de l'évaluation du médicament (agence européenne du médicament : EMEA) dans le respect du contexte réglementaire européen

Le département de pharmacovigilance échange avec des institutions internationales telles que l'OMS qui dispose d'un centre collaborateur de référence en pharmacovigilance (Uppsala Monitoring Center) ou avec d'autres autorités de santé (aux USA, au Japon) ...

- Rapport d'activité Pharmacovigilance 2008 (29/07/2008) (135 ko)

Pharmacovigilance européenne

Il existe une **organisation européenne** pour l'autorisation et la surveillance des médicaments. La création le 1er janvier 1995 de l'Agence européenne des médicaments : EMEA (European Médicines Evaluation Agency) implantée à Londres a permis d'organiser et de structurer un système de pharmacovigilance au niveau communautaire. Cette structure reproduit l'organisation française : recueil et validation décentralisés au niveau de chaque état membre, évaluation et avis et/ou décision centralisés au niveau européen à l'EMEA par l'intermédiaire du comité des médicaments à usage humain (CHMP) et de son **groupe de travail** européen de pharmacovigilance.

Ce groupe de travail (dit « **pharmacovigilance working party** ») réunit les responsables des départements de pharmacovigilance de chacun des 27 états membres ainsi qu'un représentant de la commission européenne et du secrétariat de l'EMEA. Il s'agit d'un véritable forum européen de discussion et d'échanges en pharmacovigilance qui peut être saisi à la demande du CHMP ou des états membres. Il peut aussi bien aborder les problèmes de sécurité d'emploi rencontrés après l'AMM qu'en cours d'évaluation des dossiers d'AMM si besoin. Il permet aussi des échanges réguliers avec la FDA.

Ce système européen permet :

- Une identification/communication rapide et efficace sur les problèmes de pharmacovigilance
- Une coopération dans l'évaluation des risques liés à l'utilisation des médicaments
- La prise de mesures pour répondre à un problème de pharmacovigilance
- Et une information commune sur les médicaments

Il existe une base de données européenne de Pharmacovigilance EudraVigilance dont l'objectif est de :

- Développer les outils permettant le traitement et la transmission électronique d'observations individuelles de pharmacovigilance

- Et d'améliorer la communication et faciliter la collaboration en pharmacovigilance entre les autorités compétentes

Champ d'application

La pharmacovigilance repose avant tout sur le signalement, par les professionnels de santé, des effets indésirables susceptibles d'être dus aux médicaments ou produits. Ces déclarations sont ensuite validées, évaluées et enregistrées par les centres régionaux de pharmacovigilance (CRPV) dans une base informatique située à l'Afssaps qui coordonne l'ensemble du système.

Ces trois activités : signalement, évaluation, et transmission des effets indésirables, permettent d'identifier les risques médicamenteux.

Si nécessaire, des études complémentaires sont réalisées et le cas échéant des mesures correctives sont mises en place afin de réduire ces risques.

Dans quelle cadre d'utilisation du médicament le dispositif de pharmacovigilance s'applique t-il ?

La pharmacovigilance s'exerce sur les médicaments et produits à finalité sanitaire à usage humain lors d'une utilisation « conforme » mais aussi lors d'une utilisation non conforme. Cependant en cas d'abus de médicament contenant des substances psychoactives, la surveillance est effectuée par le système national de pharmacodépendance (addictovigilance).

Il est important de préciser que ce dispositif permet aussi de recueillir les effets indésirables résultant :

- D'une utilisation au cours de la grossesse ou de l'allaitement
- D'une interaction médicamenteuse
- D'une perte d'efficacité
- D'un défaut de qualité
- **Une fiche** permettant de signaler un défaut de qualité en dehors de la survenue d'un effet indésirable .

A quels produits?

La pharmacovigilance s'exerce sur les médicaments et produits à usage humain mentionnés à l'article L.2121-1.

Ces médicaments sont distribué par une pharmacie (avec ou sans ordonnance).

De façon explicite, il s'agit des produits suivants :

> Spécialité pharmaceutique ayant fait l'objet d'une AMM (autorisation de mise sur le marché)

La règlementation ayant évolué au fil du temps, il est important de préciser que cela comprend bien :

- Le médicament immunologique : allergène, vaccin, toxine, ou sérum
- Le produit de thérapie cellulaire lorsqu'il est soumis à une AMM
- Le produit de thérapie génique
- Le médicament radiopharmaceutique
- Le produit présenté comme supprimant l'envie de fumer ou réduisant l'accoutumance au tabac
- Le médicament dérivé du sang (produit stable préparé à partir du sang ou de ses composants)
  (Remarque : c'est le dispositif d'hémovigilance qui surveille le produit sanguin labile)
- Les insecticides et acaricides destinés à être appliqués sur l'homme
- Les produits contraceptifs

> Spécialité pharmaceutique faisant l'objet d'une ATU

Lire aussi :

Pharmacovigilance des médicaments en ATU :

- Avis aux demandeurs d'Autorisation Temporaire d'Utilisation (ATU) (15/11/2007) (345 ko) chapitre VIII

- Notice to applicants for Temporary Authorisation for Use (ATU) (15/11/2007) (735 ko) chapter VIII

> Le médicament homéopathique,

Remarques

- La pharmacovigilance des médicaments utilisés dans le cadre des essais cliniques est soumise à un autre dispositif décrit dans des textes réglementaires nationaux et européens distincts
- Les aliments diététiques destinés à des fins médicales spéciales ne sont pas des médicaments

Rôle de l'Afssaps

L'Afssaps est l'autorité compétente en matière de pharmacovigilance. En vertu des missions qui lui sont dévolues, elle veille à la sécurité de l'emploi des médicaments et contribue à leur bon usage. L'Afssaps assure la mise en œuvre et coordonne le système national de pharmacovigilance. Ce système national s'intègre dans une organisation européenne pour l'autorisation et la surveillance des médicaments (lien avec la pharmacovigilance européenne).

Cette veille sanitaire repose sur :

- Le signalement des effets indésirables par les professionnels de santé et les industriels
- Le recueil, l'exploitation et l'évaluation de toute information concernant le risque d'effets indésirables
- La réalisation d'études ou de travaux concernant la sécurité d'emploi des médicaments
- La mise en place d'actions nécessaires à l'exercice de la pharmacovigilance.
- La prise de mesures correctives ou préventives

En pratique, ces missions sont assurées, au sein de l'Afssaps, par l'Unité de pharmacovigilance qui est rattachée au Département de l'évaluation thérapeutique de la Direction de l'évaluation des médicaments et des produits biologiques (DEMEB).

Mise en place pour animer le système national de pharmacovigilance, son rôle consiste notamment à :

- Évaluer toutes les déclarations d'effets indésirables qui lui parviennent
- Informer les professionnels de santé des procédures et des recommandations établies
- Coordonner l'activité des centres régionaux de pharmacovigilance
- Mettre en place des groupes de réflexion scientifique et méthodologique
- Assurer le secrétariat du Comité technique et de la Commission nationale de pharmacovigilance
- Etre en liaison permanente avec les autres directions de l'Afssaps et, en particulier, le Comité de coordination des vigilances, les autres Unités de vigilance (matériovigilance, hémovigilance, réactovigilance, biovigilance...).

Rôle de la Commission nationale de pharmacovigilance et son comité technique

La Commission nationale de pharmacovigilance est une commission composée de 6 membres de droit (présidents de la DGS, DHOS, Afssaps, INSERM, Commission nationale de pharmacovigilance vétérinaire et Commission nationale des stupéfiants et psychotropes) et de 33 membres nommés. Ces derniers sont des médecins ou des pharmaciens choisis en fonction de leurs compétences dans les différents domaines d'activité ayant trait à la pharmacovigilance (médecins cliniciens, pharmaciens, pharmacologues ou toxicologues, pharmaco-épidémiologistes) mais aussi des personnes représentant différentes instances (le comité technique de toxicovigilance, les associations de personnes malades et d'usagers du système de santé, associations de consommateurs, les entreprises exploitant des médicaments). Cette commission est nommée après un appel à candidature par le ministre chargé de la santé pour 3 ans. Elle se réunit tous les 2 mois.

Elle a pour missions :

- D'évaluer les informations sur les médicaments et produits à usage humain ;
- De proposer les enquêtes et travaux utiles à l'exercice de la pharmacovigilance ;
- De donner un avis au directeur général de l'Afssaps sur les mesures à prendre pour faire cesser les incidents et accidents liés à l'emploi des médicaments et produits.

Le Ministre chargé de la santé a la possibilité de saisir la Commission nationale de pharmacovigilance sur toute question ayant trait à son domaine de compétence pour recueillir son avis.
Un règlement intérieur permet de préciser toutes les modalités de fonctionnement de la dite commission.
Les comptes rendus des réunions sont mis en ligne.

Le **Comité technique de pharmacovigilance**, composé des membres de droit de la Commission nationale de pharmacovigilance et d'un représentant de chaque centre régional de pharmacovigilance est chargé de préparer les travaux de la Commission nationale de pharmacovigilance.

Il a pour missions :

- De coordonner et évaluer les informations relatives aux effets indésirables des médicaments et produits ;
- De proposer, mettre en place et évaluer les enquêtes demandées aux centres régionaux de pharmacovigilance et aux industriels.

Rôle des centres régionaux de pharmacovigilance

La mission générale des **centres régionaux de pharmacovigilance**(CRPV) est de surveiller, d'évaluer et de prévenir les risques médicamenteux potentiels ou avérés et de promouvoir le bon usage du médicament.

Il existe 31 CRPV répartis sur toute la France.

Les CRPV sont au cœur du système de déclaration puisque qu'ils assurent le recueil et la transmission des effets indésirables à l'Afssaps. Ils sont chargés de remplir une mission d'expertise au sein du système national de pharmacovigilance en conduisant les enquêtes de pharmacovigilance et/ou en assurant une évaluation de dossiers (demande d'AMM, demande de modification de l'information…).

Ils assurent également une mission d'information en matière de pharmacovigilance, notamment en renseignant les professionnels de santé et en participant à leur formation et en faisant remonter les informations portées à leur connaissance au niveau de l'Afssaps (usage abusif, mésusage, produit défectueux…).

Rôle des professionnels de santé

Comme pour les autres systèmes de vigilances déjà opérationnels et coordonnés par l'Afssaps, les professionnels de santé jouent un rôle fondamental dans le système national de pharmacovigilance. En effet, ce sont eux qui sont habilités, d'une part à prescrire les

médicaments, à les administrer ou à les délivrer et, d'autre part, à assurer le suivi médical des patients.

La pharmacovigilance repose sur le signalement, sans délai, par les professionnels de santé, des effets indésirables graves susceptibles d'être dus à un médicament. Dès qu'ils soupçonnent un lien, même s'il n'est pas certain, une déclaration peut être effectuée auprès du centre régional de pharmacovigilance.

Rôle des entreprises du médicament

Toute entreprise ou organisme exploitant un médicament ou produit à usage humain doit mettre en place un service de pharmacovigilance dans le but d'assurer le recueil, l'enregistrement et l'évaluation des informations relatives aux effets indésirables susceptibles d'être dus à des médicaments. Ce service est placé sous la responsabilité d'un médecin ou pharmacien justifiant d'une expérience en matière de pharmacovigilance.. Le responsable de pharmacovigilance doit veiller au respect des obligations de déclaration de pharmacovigilance auprès de l'Afssaps :

> Déclaration immédiate des effets indésirables graves

- Information destinée aux entreprises pharmaceutiques concernant la transmission électronique des observations individuelles de pharmacovigilance (18/06/2009) (91 ko)
- Electronic exchanges of individual case safety reports (ICSRs) with Afssaps (30/06/2009) (72 ko)

> Envoi de rapports périodiques actualisés de pharmacovigilance appelés PSUR (Periodic Safety Update Report) contenant l'ensemble des données de pharmacovigilance recueillies sur le plan national et international par le laboratoire pendant la période considérée.

- Avis aux demandeurs d'autorisation de mise sur le marché des médicaments à usage humain (20/10/2009) (551 ko) (voir partie concernée pour les PSURs)
- Avis aux demandeurs d'autorisation de mise sur le marché des médicaments à usage humain (02/11/2010) (1041 ko) (voir partie concernée pour les PSURs)

> Réponse aux demandes du directeur général de l'Afssaps

> Transmission de toute autre information présentant un intérêt pour l'évaluation du rapport bénéfice/risque d'un médicament

> Demande de modification de l'information

- Avis aux demandeurs d'autorisation de mise sur le marché des médicaments à usage humain (20/10/2009) (551 ko) (voir partie concernée pour les DMI et variations)
- Avis aux demandeurs d'autorisation de mise sur le marché des médicaments à usage humain (02/11/2010) (1041 ko) (voir partie concernée pour les DMI et variations)

> Proposition de plan de gestion des risques

Les entreprises du médicament travaillent avec l'Afssaps et les centres régionaux de pharmacovigilance dans le cadre des enquêtes de pharmacovigilance relatives aux médicaments ou produits qu'ils exploitent.

Rôle des patients et des associations de patients

La loi du 4 mars 2002 relative au droit des malades et à la qualité du système de santé confère aux malades un rôle actif en les associant au fonctionnement du système de santé.

Actuellement, les dispositions de pharmacovigilance ne prévoient pas de déclaration directe d'un effet indésirable par un patient ou ses proches. Cependant, il arrive de plus en plus fréquemment qu'un patient ou une association de patients contacte directement un CRPV ou un laboratoire pharmaceutique pour les informer d'un problème lié à la survenue d'un effet indésirable médicamenteux. Ils sont alors invités à se diriger vers un professionnel de santé afin de procéder à la déclaration de l'effet indésirable conformément aux bonnes pratiques de pharmacovigilance.

L'Afssaps s'est engagée, depuis 2002, dans une réflexion sur leur éventuelle participation au système de pharmacovigilance. Plusieurs expériences pilotes de signalement direct des effets indésirables par les patients ont été réalisées, en collaboration avec des associations de patients, ou sont en cours.

Partenariat Afssaps /Associations de patients

- Partenariat Afssaps/Associations de patients et de consommateurs : lancement d'une étude sur les déclarations des événements indésirables par les patients - 07/06/2006 - communiqué

Déclaration des effets indésirables

Que déclarer?

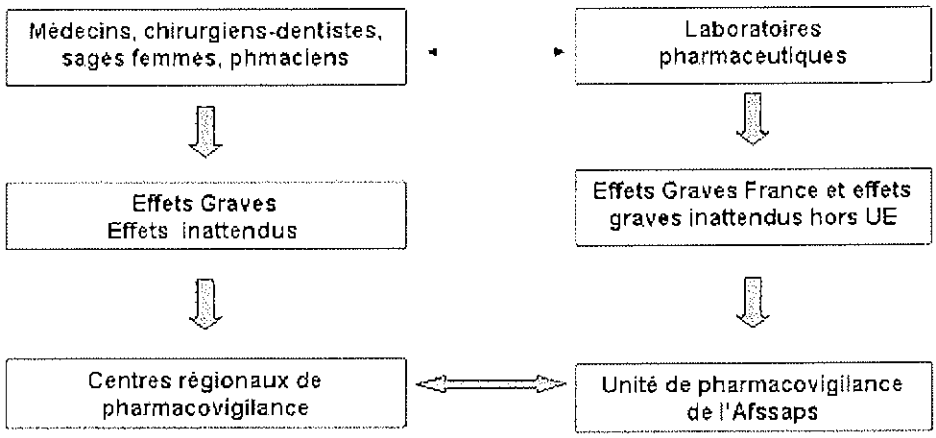
- **Tout effet indésirable grave** (létal, ou susceptible de mettre la vie en danger, ou entraînant une invalidité ou une incapacité importantes ou durables, ou provoquant ou prolongeant une hospitalisation ou se manifestant par une anomalie ou une malformation congénitale).
- **Tout effet inattendu** (dont la nature, la sévérité ou l'évolution ne correspondent pas aux informations contenues dans le RCP).
- Mais aussi tout effet que vous jugez pertinent de déclarer en dehors de ces définitions

Qui doit déclarer?

Les professionnels de santé

Les patients doivent s'adresser à leur médecin ou à leur pharmacien qui a délivré les médicaments ou produits.

Cependant tout autre professionnel de santé ayant observé un effet indésirable susceptible d'être dû à un médicament ou produit peut également en faire la déclaration auprès du centre régional de pharmacovigilance dont il dépend



A qui déclarer?

A un centre régional de pharmacovigilance

Quand déclarer?

Immédiatement pour les effets graves ou inattendus ; pas de délai défini pour les autres.

Comment déclarer

A l'aide de la **fiche de pharmacovigilance** par courrier postal ou électronique.

Une déclaration doit comporter au minimum les informations suivantes :

- Une source identifiable (le notificateur)
- Un patient identifiable
- Le nom du produit suspecté et le numéro de lot (indispensable pour la traçabilité du médicament dérivé du sang)
- La nature de l'effet indésirable.

Il est recommandé de transmettre ces informations par écrit ou au moyen du après contact téléphonique préalable le cas échéant.

En pratique, pour être évalué correctement, le dossier comprendra des informations sur le patient (sexe, âge, poids, taille, département de résidence, antécédents, profession, etc.), les médicaments pris (dénomination, numéro de lot, posologie, voies d'administration, date de début et de fin de traitement, indication etc.), l'effet indésirable (description, date d'apparition, évolution etc.).

Il peut comprendre des copies de compte-rendus d'hospitalisation, de courriers médicaux et d'examens complémentaires.

Le notificateur pourra être recontacté si un suivi est nécessaire ou pour obtenir des informations complémentaires. A tout moment, après obtention de nouvelles informations, la déclaration initiale pourra être complétée.

Il s'agit d'un dossier évolutif dans le temps.

- Signalement de pharmacovigilance - Cerfa N°10011*02

Centres régionaux de pharmacovigilance

Coordonnées et territoire géographique d'intervention

Le réseau est constitué de 31 centres répartis de façon à favoriser les échanges de proximité avec les professionnels de santé.

Parmi leurs missions, ils sont notamment chargés de :

- Recueillir les déclarations d'effet indésirable que doivent leur adresser les médecins, chirurgiens-dentistes, les sages-femmes et les pharmaciens,
- Renseigner les professionnels de santé sur leur territoire d'intervention.

Les professionnels de santé sont incités à contacter les centres régionaux de leur lieu d'exercice dont ils trouveront les coordonnées et les zones d'intervention dans la liste suivante

CENTRE REGIONAL DE PHARMACOVIGILANCE
BESANCON
CHU Jean Minjoz 25030 BESANCON Cedex

MEDIATOR (benfluorex)

ENQUETE OFFICIELLE

(Mise à jour du rapport de décembre 1998)

Comité Technique du 20 Juillet 1999

Confidentiel

M.DAVID-LAROCHE
P.BECHTEL

Annexe 3-2

Le MEDIATOR (chlorhydrate de benfluorex) est commercialisé en France depuis 1976, par le laboratoire BIOPHARMA, sous forme de comprimés, dosés à 150 mgL
La posologie recommandée est de 3 comprimés par jour.

Ses indications sont :

- adjuvant du régime adapté dans les hypertriglycéridémies
- adjuvant du régime dans le diabète asymptomatique avec surcharge pondérale.

Le benfluorex n'est pas classé dans les anorexigènes, mais lors de l'enquête sur les effets indésirables et les restrictions de délivrance de ces produits, le Comité technique de Pharmacovigilance a craint une déviation de l'utilisation du benfluorex comme anorexigène.
(Le benfluorex a d'ailleurs été inscrit dans la liste des substances interdites dans l'exécution et la délivrance des préparations magistrales en même temps que les anorexigènes, 10 mai 1995).

Une enquête officieuse a été ouverte, suite à la première mise au point des effets indésirables du benfluorex, présentée lors du Comité Technique du 11 juillet 1995.
Deux mises au point ont été faites :
-le 30 Avril 1998 sur les effets indésiirables du benfluorex, rapportés aux CRPV
-le 10 Septembre 1998 sur le métabolisme et les chiffres de vente du benfluorex.

Le rapport a été présenté au Comité Technique du 17 décembre 1998.

Ce présent rapport est une mise à jour du rapport précédent (du 17 décembre 1998) avec les nouvelles notifications des CRPV jusqu'au 30 juin 1999.
(Tous les changements par rapport à décembre 1998 sont inscrits en italique)

Les effets indésirables rapportés dans les RCP sont :

- effets digestifs : nausées, vomissements, gastralgies, diarrhée
- asthénie
- somnolence
- état vertigineux

Annexe 3-2

A. BILAN GLOBAL :

279 notifications validées ont été rapportées :

177 aux Centres Régionaux de Pharmacovigilance, 105 au laboratoire.(dont 3 doublons)

Elles concernent *100* hommes et *178* femmes (1 sexe non précisé), dont l'age moyen est de :

Répartition par classe-organe des effets indésirables notifiés :

APPAREIL	Nombre de Notifications CRPV	Nombre de Notifications Laboratoire	TOTAL	Nombre de doublons
FOIE	***20***	9	***28***	1
APP. DIGESTIF (sauf foie)	***17***	5	***23***	-
HEMATOLOGIE	8	6	14	-
APPAREIL RESPIRATOIRE	***11***	11	***21***	1
CARDIO-VASCULAIRE	***14***	6	***20***	-
APPAREIL URINAIRE	9	4	13	-
PEAU - ALLERGIE	***43***	23	***66***	-
NEURO-PSYCHIATRIE	***31***	18	***49***	-
VERTIGES	***20***	5	***24***	1
METABOLISME	3	18	21	-
APPAREIL SENSORIEL	1	-	-	-
TOTAL	***177***	105	***279***	3

N.B : les nouvelles notifications par rapport à la mise au point de Juillet 1995, sont imprimées **«en gras »** dans les tableaux suivants.
Dans la colonne, « traitement associé », le médicament est souligné, lorsque l'imputabilité bibliographique est supérieure au MEDIATOR.

Annexe 3-2

I. ATTEINTES HEPATIQUES :

26 cas d'hépatites ou de perturbations de la biologie hépatique ont été notifiés : (le benfluorex est le seul suspect ou d'imputabilité égale ou supérieure aux médicaments associés)

-*18* aux CRPV, 9 au laboratoire (dont 1 doublon) .

Elles concernent *16* femmes (âge moyen : *55,2* ans) et *10* hommes (âge moyen: 59.9 ans)

Dans *8* cas le benfluorex a une imputation plausible:

DJ9300271 : Femme de 50 ans , traitée pendant 2 semaines par MEDIATOR, une préparation d'aubépine, 200mg, et amfépramone 35 mg ,citrarginine, Veinobiase et depuis 1 mois et demi par AXONYL.
ALAT = 625 UI/L, ASAT : 303 UI/L, γGT: 656 UI/L, Ph.Alc. : 198 UI/L.
Evolution favorable 2 semaines après l'arrêt du traitement ,sauf les γGT qui sont encore à 171 UI/L

NY8804047=060K94 (doublon) : homme de 47 ans, traité par MEDIATOR, pendant 6 mois, puis 3 mois (après un arrêt de 3 mois)
ALAT : 375 UI/L , ASAT : 105 UI/L, γGT : 182 UI/L
L'évolution est lentement favorable dans un délai de 2 mois.

DJ9100164 : homme de 61 ans, éthylique chronique, traité depuis 4 ans par RENITEC, DOGMATIL, LASILIX, depuis 1 an par RYHMODAN et depuis 3 ans par MEDIATOR.
ALAT : 1350 UI/L, ASAT : 410 UI/L, γGT : 280 UI/L
La régression de l'hépatite est partielle à l'arrêt de toutes les thérapeutiques, chez ce patient éthylique.

NC9600020 :Femme de 39 ans, traitée par MEDIATOR depuis 8 mois.
ALAT: 205 UI/L (4N), ASAT : 89 UI/L (2N), γGT: 134 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

NY9608618 : Femme de 36 ans, traité par MEDIATOR, pour cure d'amaigrissement pendant 4 mois.
ALAT : 126 UI/L, ASAT : 41UI/L, γGT : 110 UI/L
L'évolution est favorable à l'arrêt du MEDIATOR.

BX9700024 : Femme de 59 ans, apparition d'un ictère avec prurit, après 4 semaines de traitement par MEDIATOR. (LOXEN et ACUILIX sont pris au long cours)
ALAT: 1017 UI/L (30N), ASAT : 391 UI/L (10N), γGT : 1042 UI/L, Ph. alc. : 907 UI/L (4N)

10010325 : Homme de 42 ans présentant une cytolyse modére et une cholestase discrète 3 semaines après le début d'un traitement par MEDIATOR, pour hypertriglycéridémie et diabète modéré.
L'évolution est favorable à l'arrêt du MEDIATOR.

LY9900193 : *Femme de 57 ans, hospitalisée pour décompensation respiratoire et cytolyse hépatique,qui prenait MEDIATOR, XANAX, depuis 6 mois, AVLOCARDYL, DEROXAT, depuis 1 an et TOPALGIC depuis 2 mois et SOLUPRED, 1 mois*

Dans 1 cas, l'imputation est vraisemblable :

Observation 120O39 : observation très succinte du laboratoire, concernant une augmentation des γGT (169 UI/L) , chez une femme de 70 ans, qui était traitée par ailleurs par Diamicron, Icaz et Hypérium. La réintroduction a été positive.

Dans *17* cas, l'imputation est douteuse : dont 10 C2,S1, *7* C1,S1

Conclusion : Plusieurs cas d' augmentations de transaminases et/ou de γGT ont été rapportés.
La plupart du temps, le MEDIATOR est en association avec d'autres médicaments qui ont la même imputabilité.
Dans quelques cas, le MEDIATOR est le seul médicament pris par le ou la patiente.
Dans la majorité des dossiers, le délai de survenue est de ≅ 3 mois.

Cet effet indésirable n'est pas mentionné dans les RCP

- **AUTRES ATTEINTES HEPATIQUES**

2 observations d'imputabilité douteuse ont été rapportées:

- BX88003099, patient de 53 ans, éthylique, traité depuis 13 ans par MEDIATOR, ZYLORIC et VISKEN . L'évolution n'est pas connue.

-LY9500598 , femme de 59 ans, hospitalisée pour tentative d'autolyse, traitée par de nombreux médicaments: évolution inconnue, dossier très succinct.

II. AUTRES ATTEINTES DIGESTIVES :

Elles concernent *15* femmes (âge moyen : *60,1* ans) et 7 hommes (âge moyen : 61,7 ans)

- Dans les 14 cas de diarrhée rapportés, (10 femmes et 4 hommes), le MEDIATOR est utilisé en monothérapie, ou son imputabilité est supérieure aux médicaments associés.

Cet effet indésirable est mentionné dans les RCP.

- *4* cas d'ulcères ont été rapportés (3 par le laboratoire, *1* par le CRPV) :

- 10060052 : homme de 74 ans, reçoit MEDIATOR, depuis 6 à 8 mois, LIPANTHYL depuis 10 ans , TANAKAN et des AINS. Une fibroscopie montre des ulcères multiples qui nécessitent non seulement l'arrêt des AINS mais de toute thérapeutique.
L'évolution est favorable après prescription d'antiulcéreux. (C1,S1)

- 10540930 : Femme de 64 ans, hospitalisée pour ulcère gastrique, après 3 mois de traitement par MEDIATOR et après 1 an de GLUCOPHAGE RETARD, EUGLUCAN, ZESTRIL, LIPUR.
Le MEDIATOR est arrêté.
L'évolution est favorable après traitement par anti-acide, pansement gastrique et perfusion. (C1,S1)

--10060587 : Femme de 72 ans, avec diabète, HTA, traitée par MODURETIC et ALDOMET depuis plusieurs années et MEDIATOR depuis 3 jours. Apparition de gastralgies intenses après prise de MEDIATOR, avec réadministration positive. (C3,S1)
L'évolution est favorable à l'arrêt du MEDIATOR.
Une fibroscopie ultérieure met en évidence un ulcère duodénal.

Annexe 3-2

- TO990455 : *Femme de 53 ans, traitée depuis 2 semaines par MEDIATOR et XENICAL , d écouverte d'un ulcère gastrique, traité par MOPRAL. (C1,S1)*

- 1 cas de rectocolite hémorragique : (1054P69) chez une femme de 46 ans traitée au long cours par DAONIL, GLUCOPHAGE RETARD, INSULINE, LEVOTHYROX et ELISOR, apparition d'une diarrhée aigue, sanglante et colite inflammatoire ressemblant à une colite hémorragique après 1 cp de MEDIATOR.

L'évolution est favorable après administration de PENTASA. (C2,S1)

III. ATTEINTES HEMATOLOGIQUES

14 observations (8 CRPV, 6 laboratoire) ont été rapportées.

Elles concernent 5 hommes (âge moyen : 62,2 ans) et 9 femmes (âge moyen : 57 ans) .

- Aucun nouveau cas n'a été rapporté depuis la mise au point de Juillet 1995

- L'imputabilité est douteuse dans tous les cas : 11 C1,S1
3 C2,S1

Dans la plupart des observations, il existe un traitement associé, qui peut être responsable de l'effet indésirable

-Dans l'observation 10050F09 : (C2,S1) il s'agit d'1 femme de 70 ans, avec HTA, hyperlipémie, angor et antécédents d'ulcère gastrique, traitée par MEDIATOR depuis 3 semaines:
apparition de purpura et d'hémorragie digestive : plaquettes<5000/mm3 et hémoglobine à 9g/l
La recherche d'anticorps antiplaquettes est positive.
L'évolution est favorable après arrêt du MEDIATOR

21 notifications (*11* CRPV et 11 laboratoire) dont 1 doublon ont été rapportées, concernant

- *12* hypertensions pulmonaires:.9 dossiers ont été expertisés par le Professeur WEITZENBLUM , 6 ont été classés en HTA P d'allure primitive lors de l'enquête « anorexigènes et HTAPP», 3 en hypertensions pulmonaires post-embolique(1) et post-capillaire(2).
Elles concernent ***10*** femmes (âge moyen : *544* ans) et 2 hommes (âge moyen : 48 ans)

Le MEDIATOR n'est jamais prescrit seul : il est présent en association à un ou plusieurs anorexigènes (ISOMERIDE : 10 fois, PONDERAL : 2 fois)
Ces cas font partie de l'enquête concernant les anorexigènes

Dans 1 cas, ***(PS9900385),*** *chez une femme de 50 ans, ayant une HTA et une hypercholestérolémie, traitée par LOGIRENE, TRIATEC, Fenofibrate et MEDIATOR, découverte en décembre 1998 d'une HTAP.*

La durée de traitement par MEDIATOR est imprécise dans 5 cas sur 12.
Dans les 6 autres cas, la durée de traitement va de plusieurs mois à 4 ans.

La prise de MEDIATOR et d'anorexigènes est concommitante dans 5 cas, antérieure dans 2 cas, postérieure dans 3 cas, imprécise dans 1 cas.

-- 5 cas de toux, après des traitements allant de 8 à 34 mois. L'évolution est inconnue dans 2 cas.

Dans 1 observation (541078), dont l'imputabilité est vraisemblable, chez une femme de 70 ans, traitée par MEDIATOR pour un diabète et AMLOR pour HTA depuis 2 mois, apparition d'une toux sèche qui disparait à l'arrêt du MEDIATOR.
Les dates de prise de MEDIATOR ne sont pas précisées: seul un rechallenge positif est noté. (C3,S1),

- des cas de syndrome hémorragique intra-alvéolaire (MP9500482), tuberculome (SE9400175), pneumopathies interstitielles (LM9800297 et NT9800036) ont tous une imputabilité douteuse: soit une autre étiologie est fortement évoquée, soit l'évolution est inconnue.

V. ATTEINTES CARDIOVASCULAIRES :

20 notifications ont été rapportées : *14* par les CRPV, 6 par le laboratoire

Elles concernent *5* hommes (âge moyen : *50.8* ans) et 15 femmes (âge moyen : 48,3 ans)

Annexe 3-2

- 3 cas d'hypertension artérielle : dont une observation plausible :

NC9100093 : chez une femme de 51 ans, hypertendue traitée par LOPRESSOR depuis 5 ans, la tension est montée progressivement de 150/90 à 180/110 après introduction de MEDIATOR, malgré l'ajout de RENITEC. La tension a diminué lorsque le MEDIATOR a été arrêté.

- 2 cas de tachycardie : dont 1 plausible

NC8900097 : chez une patiente de 60 ans, qui a pris 3 comprimés de MEDIATOR, le soir. Apparition 3 heures plus tard de vertiges, puis d'angoisse, tachycardie et prurit généralisé. L'évolution est favorable.

- une fibrillation auriculaire (C2,S2) chez une femme de 25 ans après 9 mois de MEDIATOR, CANOL et TEALINE et 6 mois de MODERATAN. Evolution favorable à l'arrêt de tout le traitement.

- 3 syndromes de Raynaud dont un plausible C2,S2 et 2 douteux (C2,S1 et C1,S1)

- une insuffisance aortique *découverte chez un homme de 43 ans, ayant des antécédents d'infarctus du myocarde, d'insuffisance mitrale, d'hypercholestérolémie, de tabagisme, et qui était traité par MEDIATOR, VASTEN, TENORMINE depuis 6 ans*

- les autres notifications sont isolées et d'imputabilité douteuse

VI. ATTEINTES RENALES :

13 notifications ont été rapportées , 9 par les CRPV et 4 par le laboratoire

Elles concernent 5 hommes (âge moyen : 66,6 ans) et 8 femmes (âge moyen : 55,2 ans)

-3 cas de dysurie, d'imputation :
C3,S1 : réadministration positive mais durée de traitement inconnu
C2,S2 : apparition après 5 mois de MEDIATOR, évolution favorable à l'arrêt de celui-ci
C2,S1 : apparition après 48 h de traitement par MEDIATOR (cystite concommitante)

- 4 cas de pollakurie :
- en début de traitement 1j,2j et 16j
- ou réadministration positive après 4 mois de traitement

-1 cas de cystalgie (C2,S1) chez une femme de 33 ans après 8 jours de traitement.
L'évolution est favorable à l'arrêt de MEDIATOR

- les autres dossiers ont tous une imputabilité douteuse:
- anurie (MA8900044)
- glomérulonéphrite (LY8700356),
- syndrome néphrotique (BX9700689),
- créatininémie augmentée(10060463)
- soit le dossier est succinct
- soit l'évolution est inconnue ou l'évolution n'est pas favorable à l'arrêt du traitement:
- soit une autre étiologie est possible

VII. ATTEINTES METABOLIQUES :

21 Notifications ont été rapportées , 18 par le laboratoire, 3 par les CRPV.

Elles concernent 11 hommes (âge moyen : 58,7 ans) et 10 femmes (âge moyen : 56,7 ans)

Dans 13 cas, c'est 1 effet lié à aux propriétés pharmacologiques du médicament lui-même:

- hypoglycémie : 6 cas
- malaise hypoglycémique : 1 cas
- hyperglycémie : 2 cas

- hyperlipémie : 2 cas
- augmentation des triglycérides : 2 cas

-3 cas de lactacidémie d'imputabilité douteuse

-dans 1 cas (10060F73), chez un homme de 68 ans, la lactacidémie est à 4.13mmol/l (normale 0.55-2.20) après un traitement de 37 jours par MEDIATOR. Un mois après de MEDIATOR, elle est de 2.27mmol/l.

Annexe 3-2

-2 dossiers succincts: pas de précision sur l'arrêt du MEDIATOR (10060683)
évolution inconnue (10060356)

- 2 cas de goutte chez 2 hommes de 61 et 71 ans (LASILIX est associé dans les 2 cas : C3,S2,B3 et C1,S1,B3)

- 2 cas d 'amaigrissement déclaré par un médecin au laboratoire (10060446 et 10060447) : perte de 5 Kg chez un homme de 36 ans après 1 mois de traitement, perte de 8 Kg chez une femme de 67 ans après 2 mois de traitement pour hypercholestérolémie.

VIII. DIVERS : Diminution de l'acuité visuelle

NY9810174	F,67	5 sem	C1,S1		F	

IX. ATTEINTES CUTANEES et REACTIONS ALLERGIQUES :

Elles concernent 20 hommes (Age moyen = 51,5 ans) et 46 femmes (Age moyen = *50,5* ans)

1 . Allergie, eczema :

Parmi les 29 réactions allergiques, on note:

- 14 cas d'urticaire dont 5 cas d'urticaires géantes ou généralisées
- 4 oedèmes de Quincke ou oedème laryngé
- 6 chocs anaphylactiques
- 5 allergies

Le délai de survenue est le plus souvent très rapide (1 jour), l'imputation sera donc souvent vraisemblable (15 fois) ou plausible (3 fois).
Elle est douteuse dans les cas où il y a eu un traitement correcteur : 9 fois

Parmi les 6 cas d'eczéma, d'imputabilité douteuse, l'évolution est favorable dans 4 cas.
L'eczéma n'est pas guéri dans 2 cas. (NC9300394 etNY9809751)
Dans l'observation 540W61, le délai d'apparition est long (2 ans) et la crème cosmétique semble être en cause.

2. Eruption, vascularite, purpura

30 notifications ont été rapportées : 20 par les CRPV, 10 par le laboratoire

Elles concernent 18 femmes agées de 47,7 ans et 12 hommes agés de 52,6 ans

Les éruptions cutanées sont variées:

- 16 cas de prurit, d' éruptions érythèmateuse, maculeuse, papuleuse ou maculopapuleuse dont 6 cas d'imputabilité vraisemblable (réadministration positive)

Annexe 3-2

- 3 cas d'érythème polymorphe, avec une évolution favorable à l'arrêt du MEDIATOR, chez 2 hommes agés de 60 et 68 ans. Le délai d'apparition est respectivement de 15 jours et de 6 mois (!).
Dans le 3° cas, (MA9700614) l'évolution est inconnue et le TANAKAN a une imputabilité bibliographique supérieure au MEDIATOR.

- 3 notifications de vascularite aigue leucocytoclasique:
- dans 1 cas, l'évolution est favorable à l'arrêt du MEDIATOR (RE9420042)
- dans 1 cas, l'évolution est favorable sans arrêt du MEDIATOR , mais avec un traitement corticoïde (lorsque la corticothérapie est arrêtée, 4 mois plus tard, survient un érythème polymorphe :MA9700957)
- dans le troisième cas (MP9700134), l'évolution n'est pas complète malgré l'arrêt du MEDIATOR et une corticothérapie.

- 3 cas de purpura:
- purpura des membres inférieurs avec un oedème apparu une semaine après le début du traitement par MEDIATOR (PP8990384)
- purpura des membres inférieurs, s'étendant aux membres supérieurs, disparaissant 1 semaine après l'arrêt du traitement (CF9200106)
- purpura rhumatoïde survenant après 2 semaines de traitement, l' évolution est inconnue (PO9700410)

Les effets indésirables cutanés et/ou allergiques ne sont pas mentionnés dans les RCP

X. ATTEINTES NEURO-PSYCHIATRIQUES :

49 notifications ont été rapportées, *31* par les CRPV, 18 par le laboratoire :

Elles concernent *24* hommes (Age moyen : *52,9* ans) , 25 femmes (Age moyen : 58,8 ans)

1. Asthénie, Somnolence, Impuissance :

Dans certaines observations:

- soit le délai de survenue semble long : 2ans (LM8600219) ou inconnu (DJ8800131)
- soit le traitement associé peut être responsable de tels effets: PROZAC, GLUCOPHAGE...

Asthénie et somnolence sont mentionnés dans les RCP.

2. Troubles psychiatriques :

Elles concernent 13 hommes (âge moyen :53,2 ans) et 14 femmes (âge moyen : 60,4 ans)

Les troubles psychiatriques sont divers : agressivité, nervosité, confusion, délire

La responsabilité de la pathologie et des nombreux traitements associés ne peut être exclue

3 cas sont imputés « vraisemblable » :

- NC9500171 : nervosité et nausées chez une femme de 50 ans, 1 à 2 h après la prise d'1 cp de MEDIATOR

- 10010345 : désorientation et obnubilation, chez une femme de 80 ans. Le traitement a été arrêté après 13 j. Une réadministration ultérieure a été positive. (traitement associé : KERLONE et MOGADON)

- PA97355052 : syndrome de sevrage avec excitation, chez un homme de 27 ans, sportif, qui avait pris 9 cp/j de MEDIATOR, comme « dopant ».

5 cas sont imputés « plausible » :

- NC9700094 : accès d'agitation et agressivité, chez une femme de 74 ans, pendant la prise de MEDIATOR, pendant 6 j. Disparition des symptômes 12 h après l'arrêt du MEDIATOR.

Annexe 3-2

- NC9300347 : irritabilité chez un homme de 39 ans, traité pendant 11 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- NC9300349 : dépression, chez un homme de 50 ans, traité pendant 9 mois par MEDIATOR. L'évolution est favorable à l'arrêt du médicament.

- MA9100069 : angoisse et palpitation, chez un homme de 40 ans, 2h après avoir ingéré 4 cp de MEDIATOR.

- CF9000137 : désorientation chez une femme de 79 ans, traitée par MEDIATOR, HALDOL, SERESTA, ZESTRIL, CATAPRESSAN, PRAXILENE, SERMION. L'évolution est favorable à l'arrêt de tous les médicaments.

19 ont été imputés « douteux » : (8 C1,S1, 10 C2,S1, 1 C1,S2)

XI. TROUBLES DE L'EQUILIBRE, VERTIGES :

Ils concernent *7* hommes (Age moyen: *66.4* ans) et *17* femmes (Age moyen : *63,9* ans)

Il s 'agit de patients agés, en général, avec une pathologie lourde : diabète, HTA, insuffisance cardiaque, pontage coronarien, cirrhose ...

6 cas rapportés par le CRPV de BORDEAUX ont été à l'origine d'une nouvelle mise au point des effets indésirables du MEDIATOR lors du Comité Technique du 30 avril 1998.

- BX9701040 : chez un homme de 74 ans, apparition d'une difficulté à la marche pendant un traitement de 4 semaines par MEDIATOR, les troubles sont apparus au bout de 3 semaines.
ATCD et terrain :HTA, DNID, double pontage coronarien
Traitement associé : PREVISCAN, DAONIL, CAPTOLANE, GLUCOPHAGE
Evolution favorable à l'arrêt de MEDIATOR

- BX9701041 : chez un homme de 78 ans, apparition d'un trouble de l'équilibre pendant un traitement de 10 j par MEDIATOR.
ATCD et terrain : DNID, Infarctus du myocarde,3 pontages coronariens, gastrectomie, anévrisme de l'aorte abdominale, ACFA
Traitement associé : DAONIL, CORDARONE, ASPEGIC, GLUCOR
Evolution favorable à l'arrêt de MEDIATOR

- BX9701023 : chez une femme de 63 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 9 semaines par MEDIATOR, les symptômes sont apparus au bout de 8 semaines
ATCD et terrain : DNID, cirrhose hépatique alcoolique, HTA, exérèse basocellulaire, neuropathie diabétique
Traitement associé : AVLOCARDYL, DAFLON, DAONIL, LASILIX, GLUCOR, TRANXENE, IMOVANE
Evolution favorable à l'arrêt de MEDIATOR

- BX 9700381 : chez un homme de 63 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 4 semaines par MEDIATOR,
ATCD et terrain : DNID, cirrhose, HTA, neuropathie périphérique avec paresthésie des extrémités
Traitement associé : DAONIL
Evolution favorable à l'arrêt de MEDIATOR

- BX9700301 : chez un homme de 71 ans, apparition de trouble de la marche et perte de l'équilibre, pendant un traitement de 6 semaines par MEDIATOR,
ATCD et terrain : DNID, infarctus du myocarde, pontage coronarien,artérite des membres inférieurs, OAP,
Traitement associé :LOPRIL, CORDARONE, VASTAREL, PRAXILENE, EUGLUCAN
Franche amélioration à l'arrêt de MEDIATOR

- BX9701022 : chez une femme de 74 ans, apparition de trouble de la marche pendant un traitement de 7 mois par MEDIATOR, les symptômes sont apparus au bout de 4 semaines
Traitement associé : DIAMICRON, MOPRAL, TILDIEM, ALDACTAZINE, LYSANXIA
ATCD et terrain : DNID, angor
Evolution favorable à l'arrêt de MEDIATOR

Cet effet indésirable est mentionné dans les RCP

Résumé des paramètres métaboliques de benfluorex

In vivo

Chez l'animal comme chez l'homme, benfluorex est hydrolysé très rapidement au niveau plasmatique et hépatique par des estérases. Benfluorex n'a été retrouvé dans aucun fluide corporel sauf chez le rat où il est présent à des taux faibles (Cmax 2.6 ng/ml à1heure) au niveau plasmatique après administration orale (40 mg/kg). Neuf métabolites majeurs ont été identifiés. Il n'existe pas de différence qualitative entre les espèces animales étudiées et l'homme, les métabolites étant produits en proportion différente.

Après administration orale de benfluorex, S 422 (dérivé alcool) est formé très rapidement puis transformé par oxydation (S 1475, dérivé acide) ou déalkylation (S 585, norfenfluramine) (figure1).

Chez l'homme, les composés présents sont identiques. L'administration orale d'une dose de benfluorex pendant 14 jours (steady state) chez 6 volontaires sains révèle que le métabolite majoritaire est le dérivé carboxylique S 1475 (1361±233 ng/ml). Le métabolite primaire S 422 et la norfenfluramine sont retrouvés à des taux très inférieurs (22 ± 7 et 59 ± 15 ng/ml, respectivement).

Après administration de benfluorex radioactif, l'élimination complète de la radioactivité dans les urines (87 à 99 % de la radioactivité après 72 heures) couplée à l'absence de quantité significative dans les fèces montre que le produit est bien absorbée et qu'aucun phénomène d'accumulation n'est observé.

In vitro

Les 3 principaux métabolites de benfluorex, S 422, S 1475 et norfenfluramine, sont retrouvés dans des proportions équivalentes après incubation d'hépatocytes frais humains (figure2).

Cependant, aucun métabolite de benfluorex ou de S 422 n'est produit à partir de cellules hôtes exprimant de manière spécifique l'un des principaux cytochromes P450 (1A2, 2C9, 2C19, 2D6, 2E1 et 3A4). A partir de microsomes humains, S 1475 et S 585 n'exercent aucun effet inhibiteur sur les cytochrome P450 1A1, 2C19, 2C9, 2D6, 2E1, 3A4 à des concentrations correspondant à 10 et 100 fois le C_{max}. Seul, S 422 à 100 fois le C_{max} réduit d'environ 50 % l'activité de CYP2D6. Les faibles taux circulants de ce métabolite par rapport à S 1475 sont néanmoins en faveur d'une vitesse de métabolisation rapide de S 422 par des enzymes de type alcool déshydrogénase ou aldéhyde oxydase.

Sur des préparations d'hépatocytes humains les inhibiteurs sélectifs ou non sélectifs des principaux cytochromes sont sans effet sur le métabolisme de benfluorex.

Ces résultats suggèrent qu'in vitro les principaux cytochromes P 450 jouent un rôle très minoritaire dans le métabolisme de benfluorex.

Enfin, l'inhibition du clivage de benfluorex en S 422 et acide benzoïque par le paroxon confirme que cette réaction est sous la dépendance de carboxylestérase.

Résumé

Benfluorex chez l'animal comme chez l'homme est rapidement métabolisé par des estérases en S 422 puis en au moins 8 autres composés dont S 1475 (majoritaire chez l'homme) et la norfenfluramine. Ces trois métabolites sont produits in vitro à partir de préparations d'hépatocytes frais humains. Les travaux menés sur microsomes et les études d'inhibition révèlent que S 422 emprunte une voie métabolique indépendante des principaux cytochromes P450 (voir Schéma).

Annexe 3-3

I - ADOPTION DES PROCES-VERBAUX DES COMITES TECHNIQUES DU 20 AVRIL ET DU 26 AVRIL 1995

Les procès-verbaux des Comités Techniques du 20/04/95 et du 26/04/95 ont été adoptés sous réserve des modifications suivantes :

Page 25 : POLARAMINE® : remplacer "demande d'exonération" par "demande d'automédication".

Page 32 : Remplacer à l'avant dernier paragraphe "800 mg/m^2" par "700 mg/m^2" et "700 mg/m^2" par "800 mg/m^2".

Page 33 : Remplacer demande d'exonération de liste II en liste II par demande d'exonération de liste I en liste II.
Remplacer "Arylcarboxyliques" par "Aryl-carboxyliques".

Page 36 : Remplacer le troisième paragraphe par "un groupe de travail est mis en place afin d'instaurer une réflexion sur les éventuels échanges d'information concernant les effets indésirables graves et inattendus venant des CRPV vers les Industriels".

II - APROTININE ET THROMBOSE

Une actualisation du bilan de 1993 sur les thromboses survenant lors de traitement par l'aprotinine a été présentée par le C.R.P.V. de Créteil. L'aprotinine, inhibiteur de la plasmine et de la kallicréine, est commercialisée sous forme de trois spécialités : ANTAGOSAN®, INIPROL®, TRASYLOL®.

• Fin 1993, 9 dossiers d'imputabilité faible (C2S1) avaient été retenus. Les résultats des essais cliniques et des études *in vitro* étaient attendus pour clarifier les données de la littérature.

• Depuis :

- Le système national n'a recueilli qu'une seule observation de thrombose, d'évolution fatale, survenue chez une femme de 42 ans lors d'une greffe de foie pour cirrhose hépatique. Etant donné des antécédents notables d'hémorragie importante en post-partum, la greffe avait eu lieu sans héparine, ce qui représente un facteur favorisant la formation de thrombose.

- Les trois essais cliniques menés sur de petits effectifs avec l'INIPROL®, n'ont pas mis le risque de thrombose en évidence.

- Les quelques cas rapportés dans la littérature ont été observés lors d'association de protamine et d'aprotinine.

- Les données épidémiologiques ne montrent pas de différence entre placebo et traitement du point de vue de la sécurité sur des critères de mortalité ou de complications.

Des facteurs favorisant la formation d'une thrombose semblent donc apparaître : un hématocrite élevé, une réintervention chirurgicale (tissus remaniés, thromboses anciennes), une héparinisation incorrecte du patient ou de cathéter, ou une mise en place traumatique de cathéter. La recherche de protocoles d'emplois de l'aprotinine adaptés aux facteurs de risque des patients apparaît nécessaire.

Annexe 3-3

III - AMLOR® (amlodipine) ET EFFETS INDESIRABLES

Le CRPV de Dijon a fait le point des effets indésirables de l'amlodipine en dehors des effets indésirables cardiaques qui ont été examinés par le CRPV de Lille.
A cette enquête officielle s'est ajoutée l'analyse d'une demande de modification de l'ensemble du RCP déposée par la firme et concernant en particulier les effets indésirables. Il est important de mentionner dans ce cadre la demande d'extension d'indication à l'angor spontané.

L' AMLOR® (amlodipine) a obtenu son AMM en 1990 et est commercialisé depuis 1992 par les laboratoires Pfizer.
309 observations d'effets indésirables ont été retenues.
Parmi ceux-ci, **les effets cardiaques** sont en plus grand nombre :

Sur les 137 dossiers examinés, 69 restent exploitables (les autres dossiers sont soit inexploitables soit relèvent d'une inefficacité thérapeutique).

Il s'agit de 16 cas d'insuffisance coronarienne :

	Ins. coronarienne connue et/ou coronarographie anormale	I1	I2	I3
douleur angineuse	12/16	13	2	1 (rech+ mais arrêt β^- aussi : syndrome de sevrage aux β^- possible)
angor instable	2/2	2	0	0
infarctus du myocarde	4/5	5	0	0
précordialgies atypiques	4/10	7	1	2

Il faut remarquer une observation de douleurs angineuses précoces, avec infarctus du myocarde au 3ème jour après introduction du traitement, posant le problème d'une déstabilisation d'une angine de poitrine entraînant un IDM.

2) de décompensation cardiaque : 4 cas contemporains :

- d'un passage en fibrillation auriculaire,

- d'une insuffisance ventriculaire gauche sur cardiopathie hypertensive,

- d'un oedème aigu du poumon compliquant un choc cardiogénique d'un infarctus du myocarde aigu,

- d'un oedème aigu du poumon sur cardiopathie ischémique.

Annexe 3-3

3) de mort subite chez 4 patients

- aux antécédents d'hypertension artérielle et d'insuffisance coronarienne dans 2 cas,
- ayant fait un effort physique la veille dans 2 cas,

4) d'hypotension et d'hypertension : 11 cas

Parmi ces observations, 5 sont d'imputabilité plausible (I2) mais en association à un facteur favorisant dans 3 cas (hémodialyse, IDM semi-récent, interaction avec un autre médicament) ; il faut préciser pour l'observation d'hypertension qu'elle est survenue immédiatement au moment du relais nifédipine/amlodipine.

5) de tachycardie : 6 cas d'imputabilité douteuse

6) de 3 cas douteux de bradycardie,

7) et de 3 observations diverses (syncope post prandiale, troubles de la repolarisation atypiques, allongement du QT).

De plus le rapport interne de la firme fait état de 14 cas de fibrillation auriculaire et de 10 cas de troubles du rythme ventriculaire sur la période allant du 24.04.92 au 31.12.93.

Dans son ensemble, ce dossier ne paraît pas alarmant.

* La demande de modification de la firme d'introduire la notion d'infarctus du myocarde selon le libellé proposé (qui précise que la relation de cause à effet n'est pas prouvé) est recevable. Il faut noter que cette mention est déjà incluse dans le Vidal®1995.

Il s'agit de la modification suivante (phrase soulignée) :

" chez les coronariens, comme avec les autres inhibiteurs calciques, ont été rarement observés des douleurs thoraciques, éventuellement des douleurs angineuses, voire un infarctus du myocarde, sans que ces événements puissent être distingués de l'histoire naturelle de la maladie. Ces manifestations demeurent extrêmement rares mais imposent l'arrêt du traitement."

* il n'y a pas lieu d'apporter d'autres modifications (les autres mentions existantes sont :"..tachycardie, palpitations..."

* il est souhaitable de compléter la liste des médicaments pouvant donner lieu à une interaction médicamenteuse (baclofène, AINS, anti dépresseurs imipraminiques, corticoïdes et neuroleptiques) ; ces modifications figurent déjà au Vidal®1995.

Annexe 3-3

En ce qui concerne la revue des autres effets (dont l'analyse plus précise fera l'objet d'une présentation à un prochain comité technique à l'automne prochain), il s'agit pour la plupart d'effets déjà bien connus tels que :

- des troubles vaso moteurs périphériques,

- des manifestations dermatologiques (le libellé actuel est succinct : "on observe plus rarement...des réactions cutanées (prurit)..." ; la firme propose actuellement de rajouter "rash",

- des troubles neurologiques et neuro psychiatriques (une attention particulière sera portée sur la possibilité de syndrome parkinsonien) ; le libellé actuel comporte la notion d'étourdissements et la firme souhaite ajouter la notion de somnolence,

- des troubles digestifs à type de nausées, vomissements, douleurs abdominales, dyspepsie ; la notion de nausées existe déjà et la firme souhaite rajouter douleurs abdominales, dyspepsie,

- 10 cas d'effets bronchopulmonaires dont 5 avec toux, d'un cas d'aggravation d'un asthme, de 2 observations de dyspnée d'effort (non cardiogénique) et de 2 pneumopathies interstitielles :**ces manifestations respiratoires nécessitent une analyse plus précise** avant de pouvoir se prononcer sur la proposition de la firme d'un ajout isolé de la mention :"dyspnée".

- des atteintes hépatiques : 10 cas dont 5 d'imputabilité plausible et 3 avec médicaments associés,

- des troubles à type d'élargissement et d'hypertrophie gingivale (effet non nouveau),

- 7 cas de polyurie et pollakiurie (effet décrit avec la nifédipine : à inclure aussi pour l'amlodipine ?),

- des atteintes hématologiques (3 sur la lignée blanche et 3 concernant la lignée plaquettaire),

- des troubles de la coagulation avec hypocoagulabilité sans interaction retrouvée : un effet antiagrégant plaquettaire a déjà été évoqué dans la littérature ;

- et enfin 5 modifications du taux de prothrombine lors d'association avec un anticoagulant oral ; une étude préAMM a conclu l'absence de modification de la liaison protéique de la warfarine en présence de l'amlodipine ; cependant un autre mécanisme d'interaction pourrait être évoqué du fait du métabolisme hépatique oxydatif de cette molécule : **ce point sera donc à revoir ultérieurement**.

Dans un premier temps une réunion de concertation avec la firme est à prévoir en ce qui concerne les effets indésirables cardiaques et la rédaction actuelle du Vidal® 1995.

Annexe 3-3

IV - SPECIALITES CONTENANT DU NAFTIDROFURYL UTILISEES PAR VOIE ORALE ET EFFETS INDESIRABLES HEPATIQUES.

Commercialisées par trois laboratoires, les spécialités de naftidrofuryl sous forme orale sont : PRAXILENE® 200 (comprimés), PRAXILENE® 100 (gélules), GEVATRAN® 200 (gélules LP), DI-ACTANE® 200 (gélules LP) et NAFTILUX® 200 (gélules LP).

Le C.R.P.V. de Lyon a réalisé l'enquête sur les effets indésirables hépatiques lors de l'administration par voie orale de ce principe actif.

De 1985 à fin 1994, 79 cas d'atteinte hépatique ont été collectés par le système national de pharmacovigilance (73 cas) et par les industriels (10 cas, dont 4 doublons).

Après exclusion de 35 observations (autre diagnostic étiologique possible, médicament associé d'imputabilité supérieure, critère chronologique incompatible), les 44 observations retenues impliquent en majorité le PRAXILENE® 200. Le sexe ratio est proche de 1. La moyenne d'âge est d'environ 70 ans et correspond aux données DOREMA de prescription. L'indication est précisée seulement dans 41% des observations (essentiellement traitement de l'artérite).

A l'exception de 3 cas de surdosage, la posologie utilisée est conforme aux recommandations dans 92% des cas. Le délai moyen de survenue est de 11 mois après le début de traitement pour l'ensemble des observations et de 5,1 mois pour les observations plausibles. Les atteintes hépatiques observées sont le plus souvent de type cytolytique. Des signes de gravité sont présents dans 8 cas plausibles (un cas d'hépatite fulminant avec décès, un décès brutal, trois cas avec ictère et/ou baisse du TP<50% et trois cas avec ictère seul) mais aussi dans 9 cas douteux. Un médicament associé de même imputabilité et potentiellement hépatotoxique est retrouvé dans 13 de ces 17 cas présentant un critère de gravité.

A l'exception de 4 décès, l'évolution a été favorable dans les autres cas. Un cas avec réintroduction positive est noté chez une patiente souffrant de la maladie de Gilbert. Les cas douteux comportent toujours un traitement associé.
L'incidence des observations plausibles est très faible : 1 cas pour 1 180 000 mois de traitement.

Au niveau international, 9 cas ont été signalés dont 6 en faveur de la responsabilité du PRAXILENE®.

Les arguments suggérant une hépatotoxicité du naftidrofuryl sont représentés par un cas avec réintroduction positive, et l'homogénéité des types d'atteinte (cytolytique aiguë dans 70% des cas). Cependant, l'incidence demeure très faible et la majorité des observations comporte un traitement concomitant potentiellement hépatotoxique.

Le dossier sera présenté lors d'une prochaine Commission nationale de Pharmacovigilance.

Annexe 3-3

V - ZAGAM® (sparfloxacine) ET PHOTOSENSIBILISATION

Le Comité technique de pharmacovigilance, réuni le 18 mai 1995, a pris connaissance des données de pharmacovigilance concernant la spécialité ZAGAM® et plus particulièrement des **accidents cutanés de phototoxicité.**

Cette étude porte sur les **7 premiers mois de commercialisation** (jusqu'au 24 avril 1995) et regroupe 208 observations en provenance de la firme et des centres régionaux de pharmacovigilance.

Ces réactions de photosensibilisation représentent 30% de l'ensemble des effets et 80% des effets indésirables cutanés signalés avec cette spécialité.

Il s'agit de manifestations cliniques de type phototoxique (érythème de type solaire des parties découvertes) survenant après 3 à 4 jours de traitement en moyenne mais avec des signes de gravité clinique dans **15,6% des observations** : il s'agit alors de **brûlures du 2° degré.**
Ces signes peuvent également survenir après l'arrêt du traitement (jusqu'à 4 jours après l'arrêt).

La gravité de la réaction semble dose dépendante mais pour 26 cas (graves ou non), les lésions sont apparues **sans exposition évidence au soleil.** Ainsi dans les cas graves, l'exposition solaire a été franche pour la moitié des cas, mais inapparente ou modérée dans 27% des cas.
Dans l'ensemble, l'évolution est favorable (65,8%) mais il faut noter que le **délai de guérison** peut dépasser 1 mois.

Il est difficile de préciser si le produit a été pris dans le cadre strict des indications de l'AMM :

- les pneumopathies communautaires présumées bactériennes, pneumococciques et non pneumococciques,

- les exacerbations des bronchopneumopathies chroniques obstructives,

- et les sinusites aiguës purulentes.

Les observations de pharmacovigilance rapportées lors de cette enquête concernaient le traitement de pneumopathies, de bronchites et de sinusites, mais sans plus de précision.

Pendant cette période, 1.034.073 boites de 6 comprimés ont été vendues. Les ventes mensuelles vont de 202.277 boites en octobre 1995 (maximum) à 77.205 boites en avril 1995 (minimum).

La fréquence de notification de ces accidents de photosensibilité est de :

- **1 cas pour 29755 jours de traitement, soit 1 cas pour 4020 patients traités.**

Annexe 3-3

Par comparaison, il s'agit d'une effet de classe bien connu avec les autres fluoroquinolones étudiées jusqu'à maintenant en France (prévu dans l'AMM : mention dans la mise en garde et effet cité dans la rubrique effet indésirable), mais sa fréquence de notification est 4,5 fois plus élevée par rapport à celle de la pefloxacine, 96 fois pour la ciprofloxacine, 100 fois pour la norfloxacine et 410 fois pour l'ofloxacine.

De plus, les premiers résultats de l'enquête concernant les 21 notifications d' **effets indésirables cardiaques** ont été analysés. Il existait déjà une mise en garde prévenant du risque d'une légère augmentation de l'intervalle QT (allongement inférieur à 3% en moyenne) et une précaution d'emploi lors de l'association aux médicaments connus pour allonger le QT.

Cette analyse rapporte **6 cas d'allongement du QT** de découverte fortuite dans un cas mais symptomatiques dans les 5 autres cas dont 3 cas de **torsades de pointe** avec **2 arrêts cardiaques** initiaux récupérés et une syncope dans le dernier cas.

Dans les 3 observations avec torsades de pointe, on retrouve dans 2 cas un traitement associé par cordarone et un QT long congénital dans le 3°cas (associé à des taux plasmatiques de sparfloxacine élevés de façon inexpliquée).

D'autres observations peuvent évoquer un trouble du rythme aigu mais ne sont pas documentées sur le plan électrocardiographique : il s'agit de 2 cas de mort subite, 2 pertes de connaissance avec hypotension dans un cas et bradycardie dans l'autre.

Ainsi l'estimation de la fréquence est de 1 cas d'effet indésirable cardiaque pour 294.717 jours de traitement, soit 1 notification pour 39.800 patients traités.
Malgré cette fréquence faible, il est inquiétant de voir dès les premiers mois de commercialisation apparaître des observations de torsade de pointes alors que les données pré AMM ne laissaient supposer qu'une augmentation faible et asymptomatique du QT.

En conclusion, le Comité technique est alerté par ces données, concernant en particulier la photosensibilité de ce médicament, et estime qu'elles posent un problème de santé publique urgent (à l'approche de l'été) du fait de la **gravité**, de la **fréquence**, de la difficulté **d'appliquer des mesures préventives.**

Le Comité technique souhaite que des mesures soient prises d'urgence. L'administration propose de convoquer rapidement une Commission nationale extraordinaire.

Annexe 3-3

VI - EXAMEN DE LA DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE DU TRIATEC® (ramipril)

Le ramipril est un inhibiteur de l'enzyme de conversion indiqué dans le traitement de l'hypertension artérielle.

Une demande de modification du résumé des caractéristiques du produit pour les trois formes commercialisées TRIATEC® FAIBLE 1,25 mg, TRIATEC® 2,5mg et TRIATEC® 5mg a été déposée par le laboratoire Hoechst en mars 1994, transmise à l'unité de pharmacovigilance en mars 1995 et confiée au centre régional de pharmacovigilance de **Paris-Broussais.**

Au vu des notifications de la banque nationale de pharmacovigilance, des déclarations obligatoires de la firme et de la littérature, le Comité Technique s'est montré favorable pour rajouter :

- à la rubrique "Mise en Garde" : à la fin du paragraphe hémodialyse concernant les réactions anaphylactoïdes : "des réactions similaires ont été observées au cours de LDL aphérèses sur sulfate de dextran".

- à la rubrique "Effets Indésirables" :

  - au paragraphe "effets digestifs , "une augmentation des enzymes hépatiques a été notée dans des cas isolés, associée exceptionnellement à une hépatite cholestatique ou mixte nécessitant l'arrêt du traitement".

  - un paragraphe "effets respiratoires" : " Toux, et plus rarement rhinite ou bronchospasme"

  - un paragraphe "effets allergiques et cutanés" : "Prurit , éruption cutanée maculopapuleuse ou urticarienne, flush, et exceptionnellement : dermatose lichénoïde ou psoriasiforme. Fièvre, myalgies arthralgies ont aussi été observées".

En revanche, il n'a pas été jugé nécessaire de signaler la notion d'érythème polymorphe et de purpura vasculaire , les notifications de ces effets étant très rares.

Le dossier sera présenté à une prochaine Commission Nationale de Pharmacovigilance.

Annexe 3-3

VII - EXAMEN DE LA DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE DU PRESTOLE® (triamtérène et hydrochlorothiazide)

L'analyse de la demande de modification de l'information médicale des laboratoires SmithKline Beecham, concernant leur spécialité PRESTOLE® (association de triamtérène et d'hydrochlorothiazide indiquée dans le traitement de l'hypertension artérielle) a été présentée par le C.R.P.V. d'Amiens.

1/ Interactions médicamenteuses :

La proposition du laboratoire d'introduire à propos des "associations nécessitant une précaution d'emploi" les inhibiteurs de l'enzyme de conversion en raison d'un risque d'hyperkaliémie parait justifiée. Cependant, afin de respecter le schéma commun de rédaction des RCP des diurétiques thiazidiques, cette mention sera libellée en élargissant au risque d'insuffisance rénale aiguë.

En revanche l'interaction médicamenteuse avec le chlorpropamide et son risque de majoration d'une hyponatrémie, mentionnée dans la 29ème édition du Martindale, n'a pas été confirmée lors d'une étude cas/témoin, et semble avoir peu d'intérêt pratique pour le prescripteur.

2/ Effets indésirables :

D'après les données de la littérature, il n'est pas établi qu'une association type PRESTOLE® présente un risque de troubles du rythme. L'hypokaliémie peut favoriser la survenue de troubles du rythme induits par un médicament antiarythmique ou proarythmique (digitaliques, anti-arythmiques et substances non anti-arythmiques susceptibles de donner des torsades de pointe). Cette notion ne sera pas insérée dans la rubrique "Effets indésirables" mais devrait apparaître dans les "Précautions d'emploi" ou les associations déconseillées.

La possibilité d'un pouvoir lithogène du triamtérène est avancée depuis 1979. Si sa responsabilité est discutée et non réellement prouvée, l'analyse des sédiments a montré la présence de triamtérène. Cette proposition parait donc justifiée.

La survenue d'effets indésirables à type de modification de la formule sanguine et thrombopénie est rapportée dans la littérature, pancytopénie, thrombopénies périphériques immunes, anémie hémolytique immuno-allergique. Le libellé proposé par le laboratoire sera reformulé ("exceptionnellement accidents hématologiques avec pancytopénie par déficit en folates").
Des élévations modérées des taux plasmatiques de créatinine, urée, acide urique et glucose, peuvent être observées, et seront donc mentionnées dans le RCP, comme le souhaite le laboratoire.

3/ Précautions d'emploi :

Aucune étude n'étant disponible chez l'enfant, la sécurité d'emploi n'a donc pas été établie. Cette notion peut donc apparaître dans ce chapitre.
Le relevé d'avis du Comité technique relatif à ce dossier sera présenté lors d'une prochaine Commission nationale de pharmacovigilance.

Annexe 3-3

VIII - EXAMEN DE LA DEMANDE DE MODIFICATION DE L'INFORMATION MEDICALE DU SPORANOX® (itraconazole)

Le Centre de pharmacovigilance de Lille a examiné la demande de modification de l'information médicale de SPORANOX®(itraconazole), antifongique azolé commercialisé par les laboratoires Janssen-Cilag.
L'intérêt de cette spécialité réside dans son efficacité dans les mycoses systémiques, notamment l'aspergillose, et sa possibilité d'administration par la voie orale.

Données de pharmacovigilance :

Entre avril 1993, lors de la commercialisation, et fin 1994, 25 observations ont été enregistrées par les CRPV, dont 3 cas d'interactions médicamenteuses imputées I_2 ou I_3 impliquant l'itraconazole.
Il s'agit d' un cas d'augmentation des concentrations plasmatiques de la terbinafine ayant entraîné un allongement de QT avec arrêt cardiaque (imputé I_3), d'un cas d'hémorragie digestive et baisse du taux de prothrombine, lors d'une association à l'acénocoumarol (imputé I_2) et d'un cas de diminution des concentrations plasmatiques d'itraconazole lors d'une association avec le phénobarbital et la carbamazépine (I_3).
Parmi les observations imputées I_1, on note 3 anomalies ou atteintes hépatiques et 3 atteintes nerveuses périphériques.

Les effets indésirables recensés sont :

- des oedèmes de localisation variée (des chevilles, des jambes, des extrêmités ou périphériques, généralisés ou sans précision : 40 cas internationaux, 2 angio-oedèmes dans la déclaration obligatoire française) correspondant pour certains à des interactions médicamenteuses avec les dihydropyridines ou des réactions de type allergiques.

- des neuropathies périphériques (6 neuropathies ou névrites et 6 paresthésies au niveau international, 1 cas publié de potentialisation de la neurotoxicité de la vincristine, 9 dossiers de la banque nationale et 2 cas du laboratoire). Ces deux derniers se caractérisent par une réintroduction positive (certaine dans un cas).

- des anomalies du bilan hépatique ou atteintes hépatiques (37 observations succinctes au niveau international, 31 cas possibles ou probables notifiés en 1992 au niveau international sur une période de 10 mois, pour lesquels on observe que l'incidence augmente lorsque le traitement dure plus d'un mois, 40 cas dans la banque française, 4 cas rapportés dans la littérature et 2 cas d'hépatites fulminantes rapportés par le laboratoire).

- des effets indésirables cutanés, dont 2 cas de syndrome de Stevens-Johnson dans le bilan international, qui méritent d'être inclus dans le RCP.

- des effets auditifs à type d'acouphènes ou diminution de l'acuité auditive (16 observations internationales ou publiées, dont 9 lors d'association avec des quinidiniques, évoquant des manifestations de cinchonisme).

Annexe 3-3

Pour la grande majorité, les demandes de modification du laboratoire paraissent justifiées :

1/ Contre-indications :

Il s'agit notamment des contre-indications avec l'astémizole ou le cisapride. Des études expérimentales sur microsomes hépatiques humains ont mis en évidence une inhibition de leur métabolisme par l'itraconazole.
L'association avec le triazolam sera aussi mentionnée, en raison d'une étude pharmacocinétique chez des volontaires sains montrant une élévation significative de l'aire sous la courbe, du Cmax et de la demi-vie d'élimination de ce médicament, en présence d'itraconazole. De plus, au niveau international, 5 cas de somnolence ont été notifiés lors d'un traitement concomitant.

2 /Mises en garde :

Les données de pharmacovigilance sur les atteintes hépatiques plaident en faveur de l'introduction d'une surveillance du bilan hépatique lors de traitement de plus d'un mois.

3/ Interactions médicamenteuses :

Avec :

- les dihydropyridines : 16 cas d'oedèmes des membres recensés au niveau international lors d'une prise concomitante d'antagonistes du calcium, le plus souvent des dihydropyridines. Une interaction de type pharmacocinétique semble être possible , certaines dihydropyridines étant métabolisées par le cytochrome P 450 3A4.
- la didanosine : l'anti-ancide présent dans les comprimés de didanosine est susceptible d'interagir dans la solubilisation de l'itraconazole et donc de diminuer son absorption. Un intervalle de 2 heures entre les prises de ces deux médicaments est donc conseillé. Il apparait nécessaire d'étendre cette interaction aux antiacides. En revanche, en l'absence d'arguments, les inhibiteurs de la pompe à protons et les antihistaminiques H2 ne paraissent pas devoir être mentionnés.
- les quinidiniques : 9 notifications de manifestations auditives sont recensées lors d'une association avec un quinidinique (concentrations plasmatiques non déterminées), qui peuvent évoquer un cinchonisme. D'autre part un dossier de la firme fait état d'une surdité avec réintroduction positive. Il apparait prudent, compte tenu de ces constations d'introduire une précaution d'emploi dans le RCP.
- les antivitamines K : les cas observés avec l'acénocoumarol et la warfarine rendent nécessaires un contrôle du taux de prothrombine et une adaptation posologique.
- le tacrolimus : une étude expérimentale sur microsomes hépatiques de rat montre un caractère inhibiteur de l'itraconazole sur le métabolisme de ce produit, non encore commercialisé en France (s'il obtient l'autorisation de mise sur le marché, l'association devra être déconseillée).

Annexe 3-3

4/ Effets indésirables :

Au vu des données de pharmacovigilance, il apparait nécessaire d'inclure les effets indésirables de type oedème de Quincke, syndrome de Stevens-Johnson et d'élévation des enzymes hépatiques lors de traitements de courte durée, ainsi que la possibilité de survenue d'oedème, hépatites et neuropathies périphériques lors de traitements de longue durée.

L'association avec le midazolam, disponible uniquement par voie IV en France, pourrait être déconseillée. De plus, le Comité technique suggère un réexamen des cas de neuropathies avec une analyse du rapport de toxicologie animale.

Le relevé d'avis relatif à cette demande de modification d'information sera présenté lors de la prochaine Commission nationale de pharmacovigilance.

Annexe 3-3

IX - POINT SUR LES EFFETS INDESIRABLES DES INTERFERONS ALFA 2 RECOMBINANT (INTRONA® ET ROFERON®)

Le C.R.P.V. de Paris-Créteil a fait le point des effets indésirables survenant lors de traitement par interféron.
Pour l'INTRONA® (laboratoires Schering-Plough), 226 dossiers ont été collectés par la firme et le système national de pharmacovigilance entre 1992 et 1995. Il s'agit essentiellement de réactions indésirables cutanées, neuropsychiatriques, cardiovasculaires, mais aussi de dysthyroïdies.
148 dossiers ont été dénombrés pour le ROFERON® (laboratoires Roche).

Au vu de ces premiers résultats, le comité technique souhaite ouvrir une enquête officielle de pharmacovigilance sur les effets indésirables de l'interféron alfa-2 recombinant et la pondération du risque en fonction des indications en hépatologie et en oncologie.

Après validation de l'ensemble des observations par le centre régional de Paris-Créteil :

- l'examen des effets neurologiques et psychiatriques sera confié, respectivement, aux C.R.P.V. de Toulouse et Montpellier.

- l'analyse des effets indésirables de type dysimmunitaires et dysthyroïdiens sera réalisée par le C.R.P.V. de Lyon.

- et les effets indésirables touchant les organes génitaux seront évalués par le C.R.P.V. de Paris-Pitié Salpétrière.

Le C.R.P.V. de Paris-Créteil, coordonnateur de l'enquête, est chargé de l'évaluation le rapport bénéfice/risque en fonction des indications.

Annexe 3-3

X - EXAMEN DE LA DEMANDE D'EXONERATION A L'INSCRIPTION SUR LA LISTE II DES SUBSTANCES VENENEUSES DU DOMPERIDONE

La demande d'exonération déposée par les laboratoires JANSSEN concerne :

- une présentation de 20 sachets de dompéridone granulés effervescents par voie orale dosée à 10 mg ;
- une quantité maximale de 200mg par conditionnement
- dans l'indication : "manifestations dyspeptiques de l'adulte et de l'enfant de plus de 15 ans ",
- pour une posologie recommandée de 3 sachets par jour pour une durée d'utilisation limitée à 7 jours.

L'examen de cette demande a été présenté par le CRPV de Toulouse.

La dompéridone est un antagoniste dopaminergique bloquant préférentiellement les récepteurs D2. Son action est donc essentiellement antidopaminergique périphérique.

L'analyse des données de pharmacovigilance a reposé sur deux types d'enquête :

- d'une part, sur une enquête officieuse de pharmacovigilance concernant les syndromes extrapyramidaux réalisée par le CRPV de Tours.

- d'autre part, sur l'analyse des effets indésirables recueillis sur SOS V6 de janvier 1990 à 1994.

L'analyse du dossier ne concerne que les patients âgés de plus de quinze ans.

Deux types de problèmes ont été soulevés :

- le premier concerne la vigilance des conducteurs de véhicules et des utilisateurs de machine (les CRPV ont recensés 8 observations de somnolence sous dompéridone). Le laboratoire ne dispose pas d'études de pharmacologie clinique. Ce principe actif semble, cependant, franchir difficilement la barrière hémato-encéphalique)
- le deuxième a trait à l'utilisation du médicament durant la grossesse (aucune étude clinique permette d'évaluer le risque; cependant un effet tératogène a été observé à forte dose chez l'animal).

Le Comité technique a émis un avis défavorable à cette demande d'exonération, en raison de l'absence de données de vigilance et de données concernant la femme enceinte. Cet avis sera présenté lors d'une prochaine Commission Nationale de Pharmacovigilance.

Annexe 3-3

XI - CEREDASE®

Dans le cadre d'une procédure européenne concernant la spécialité CEREDASE®, l'Agence Française devait donner un avis sur le rapport hollandais (pays rapporteur) concernant les dernières données disponibles sur l'efficacité et la tolérance de ce traitement de la maladie de Gaucher (déficit en glucocérébrosidase) de type I par une enzyme extraite du placenta en attendant la production d'une enzyme recombinante.
Hormis cette enzymothérapie, les thérapeutiques ne peuvent être que palliatives (splénectomie, prothèses articulaires, greffe de moelle osseuse...).

Les point soulevés en ce qui concerne la tolérance sont :

- 2 cas de diminution de l'efficacité thérapeutique à la suite d'apparition d'anticorps ; ces deux cas restent isolés : d'après les données du registre ICGG (International Collaborative Gaucher Group), 360 malades n'ont pas développé d'anticorps alors que 106 ont eu une séroconversion mais sans effet cliniquement mesurable.
La proposition d'inclure le texte suivant est donc acceptable :"une baisse d'activité a été notée chez moins de 0,5% des patients traités à cause de la présence d'anticorps IgG anti-alglucérase. Il n'y a pas d'autres mesures envisagées pour l'instant."

- l'observation d'une puberté précoce avec accélération de l'âge osseux chez un enfant de 11 ans ayant reçu de fortes doses de CEREDASE®, repose le problème du risque de la contamination par de l'hCG liée à l'origine placentaire du produit. Ainsi, l'information devient :" L'hCG, une hormone se trouvant naturellement dans le placenta humain a été détectée dans la CEREDASE®. Il est probable que cette hCG soit partiellement déglycosylée. Les études initiales suggèrent que cette hCG déglycosylée est éliminée rapidement, à une vitesse environ 40 fois plus importante que l'hCG initiale . Chez les hommes, l'administration de CEREDASE® résulte en une augmentation de production de testostérone, *mais il n'a pas été mis en évidence d'effets cliniques à des doses en dessous de 120U/kg/4semaines. Cependant il faut surveiller la survenue de signes de virilisation précoce chez les jeunes garçons, particulièrement quand la posologie dépasse 120/U/kg/ 4 semaines."*

Annexe 3-3

XII - CAS MARQUANTS ET NOUVELLES ENQUETES

• Le CRPV de Lyon signale un cas marquant avec **DEROXAT®** : il s'agit d'une hépatite fulminante grave, avec diminution du TP, chez un homme traité par neuroleptique depuis plusieurs années et par paroxétine depuis un mois.

• **AULIN®** (nimésulide) : spécialité italienne anti-inflammatoire non stéroïdien : une hépatite chronique active chez un homme de 66 ans est signalée par le CRPV de Paris-Saint Vincent de Paul.

• **MEDIATOR®** (benfluorex) : à la suite d'interrogation sur les potentialités anorexigènes du MEDIATOR® et de la possibilité de l'utiliser dans des préparations magistrales à la place des anorexigènes interdits, une enquête officielle sur l'ensemble des effets indésirables est confiée au CRPV de Besançon.

Annexe 3-3

XIII - QUESTIONS DIVERSES

A - Dossier de toxicologie animale de l'itraconazole pour le CRPV de Lille.

B - Suivi National des Hémophiles

Le CRPV de Saint-Antoine a souligné que le Suivi national des Hémophiles, pendant 5 ans, avait débuté depuis 2 ans et que les premiers patients avaient été inclus récemment. Le promoteur est l'Agence du Médicament. Deux types d'effets indésirables sont plus particulièrement étudiés : l'apparition d'anticorps anti facteur VIII ou anti facteur IX, ainsi que le risque de contamination virale.
(Liste des Centres de Traitement de l'Hémophilie en annexe)

C - Fichier des établissements de santé

L'Unité de Pharmacovigilance a pris contact avec les services compétents de la Direction des Hôpitaux (SESI) et transmettra dès leur réception les informations requises.

D - Procédure d'agrément des CRPV

1°) Le décret n°95-278 relatif à l'organisation générale de la pharmacovigilance ayant été promulgué le 13 Mars 1995, les établissements de santé hébergeant un centre régional de pharmacovigilance ont jusqu'au 13 Septembre 1995 seulement pour déposer une demande d'agrément et conformément à la note remise en Avril.
L'attention des centres est attirée sur le fait que seulement 4 dossiers ont été reçus à ce jour.

2°) Concernant la nature de l'unité fonctionnelle, il est rappelé que l'esprit du texte veut que cette unité fonctionnelle soit une unité médicale plutôt qu'une unité de gestion. La nécessité de voir un médecin à sa tête le confirme.
Il apparaît donc indispensable aux centres qui n'auraient pas encore entamé la procédure nécessaire auprès de leur CME de le faire rapidement.

3°) Il est rappelé que cette procédure a pour objectif une meilleure intégration hospitalière des centres et un fléchage facilité des postes (internes, vacations hospitalières, praticiens hospitaliers).
Les centres attirent l'attention de l'Administration sur la vigilance qui doit s'exercer en terme budgétaire, car la création de postes de praticiens hospitaliers pourrait entraîner la disparition d'un nombre de vacations supérieur à celui entraîné par la création du poste, ce qui est préjudiciable à l'activité du centre.
En ce qui concerne les hôpitaux parisiens, les centres rappellent également que les vacations allouées au titre de la subvention doivent être absolument prises en considération lors des modifications statutaires, ce qui n'est pas le cas actuellement.

Annexe 3-3

4°) Dans cette optique, les centres doivent faire parvenir à l'Agence leur besoin précis et les candidats possibles à de tels postes.

5°) Un arrêté définissant les territoires géographiques d'intervention doit être pris prochainement.
En accord avec les centres de Nantes et de Poitiers, le département des Deux-Sèvres fera partie du territoire d'intervention de Poitiers.
En ce qui concerne les centres d'Ile de France, il leur est demandé que, lors d'une réunion, ils définissent ensemble d'éventuelles modifications devant notamment tenir compte de leur activité, mais aussi de la superposition de la répartition géographique par arrondissement et par C.H.U., leur proposition devant parvenir courant Juin à l'Agence, pour pouvoir être pris en compte dans l'arrêté.
Les éventuelles propositions des autres centres sont également attendues.

E - Autorisation Temporaire d'Utilisation (A.T.U.)

1°) La liste des médicaments bénéficiant d'une A.T.U. ainsi que leurs indications vont parvenir prochainement aux centres.

2°) Il est précisé que ces médicaments dont la pharmacovigilance a la charge ne peuvent être saisis sur le système national de pharmacovigilance.

F - Fiche de déclaration des effets indésirables

Les centres ont tous reçu la version faisant la synthèse de tous les commentaires sur la version de travail précédent.
Cette fiche ayant reçu l'accord des ordres professionnels, la procédure d'agrément au CERFA va débuter, le modèle de formulaire étant dorénavant considéré comme définitif.

G - Médicaments dérivés du sang

- Le décret relatif aux règles particulières applicables à la pharmacovigilance des médicaments dérivés du sang a été promulgué le 7 Mai 1995. Il est applicable à compter du 1er Décembre 1995.

- Le Laboratoire du Fractionnement et des Biotechnologies a édité une documentation sur l'ensemble de ses produits qui doit être prochainement adressée à tous les centres.

H - Le PALFIUM® injectable ne serait plus utilisable par les anesthésistes, car il serait contre-indiqué par voie intra-veineuse. Ce point a été soulevé par le C.R.PV de Lille et est à vérifier auprès de la Commission des Stupéfiants.

DIRECTION DE L'EVALUATION
Unité de Pharmacovigilance

Saint-Denis, le

COMITE TECHNIQUE DE PHARMACOVIGILANCE
(Procès-verbal de la réunion du Mardi 11 Juillet 1995)

Etaient présents

M. IMBS : Président, M. HUGUES : Vice-Président,
Mme ALBENGRES, Mme BENETON (suppléante de M. ALLAIN H.), M. ALLAIN P., M. CHETAILLE (suppléant de M. ANDREJAK), Mme AUTRET, Mme DAVID (suppléante de M. BECHTEL), Mme HARAMBURU (suppléante de M. BEGAUD), Mme HILLAIRE-BUYS (suppléante de M. BLAYAC), M. CARON, M. BIOUR (suppléant de M. CHEYMOL), Mme CHICHMANIAN, M. CHOISY, Mme PIERRON et Mme JULLIAN (suppléantes de Mme EFTHYMIOU), M. ESCOUSSE, M. VIAL (suppléant de M. EVREUX), Mme JOUGLARD, Mme KREFT-JAIS, M. LAROUSSE, Mme LAVARENNE, M. MALLARET, M. MERLE, Mme BAGHERI (suppléante de M. MONTASTRUC), M. MOORE, M. MOULIN, Mme BAVOUX (suppléante de M. OLIVE), M. OLLAGNIER, M. RICHE, Mme PIERFITTE (suppléante de M. ROYER), Mme SOUBRIE, M. VANDEL, Mme GOUJARD (représentant M. le Directeur Général de l'INSERM), Mme BARON (représentant M. le Directeur Général de la Santé), M. LAMOUREUX (représentant de M. le Directeur Général de l'Agence du Médicament).

Conseiller scientifique

M. LAGIER

Unité de pharmacovigilance

Mme MANCEL

Annexe 3-4

I INTRODUCTION de M. P. LAMOUREUX (sous-directeur de l'Agence du Médicament)

M. LAMOUREUX annonce que le conseil d'administration, après avis du conseil scientifique, a approuvé le projet de subvention. Pour l'année 1995, son montant sera de 10 M francs (pour 5,9 M de francs en 1994).
Cette subvention sera versée en deux fois. Les procédures de versement de la première partie seront mises en place au mois de juillet. La somme versée à chaque centre sera du même montant que celle de la subvention de l'année précédente. Le complément de la subvention 1995 ne sera versé que lorsque toutes les demandes d'agrément seront transmises au directeur de l'Agence du Médicament, au cours du dernier trimestre de l'année civile.

M. LAMOUREUX rappelle aux centres la nécessité de transmettre à l'Agence du Médicament la demande d'agrément prévue par le décret n°95-278 du 13 mars 1995 qui, n'étant qu'une démarche de régularisation, ne remet pas en cause l'existence des 31 centres. Cette demande doit être adressée obligatoirement au directeur de l'Agence du Médicament avant le 13 septembre. Il est préférable qu'elle soit signée par le directeur du centre hospitalier.

Tous les centres ayant transmis leur demande d'agrément à leur directeur d'hôpital et n'ayant pas eu de réponses doivent le signaler à l'unité de pharmacovigilance.

II ADOPTION DU PROCES-VERBAL DES COMITES TECHNIQUES DU 26/04/95 et du 18/05/95

Les procès-verbaux ont été adoptés avec les modifications suivantes :

Proçès-verbal du 26/04/95 :
- M. OLLAGNIER, M. MONTASTRUC et M. RICHE étaient bien présents et non excusés .
- ajouter, p 2 : l'enquête sur les vaccins PENTACOQ® et PENTHIBEST® reste ouverte.

Proçès-verbal de la réunion du 18/05/95 :
- M. OLLAGNIER était remplacé par Mme le Docteur BEYENS
- p 4 remplacer "Il s'agit de 16 cas d'insuffisance coronarienne" par
" Il s'agit :
1) de 16 cas d'insuffisance coronarienne".

Annexe 3-4

III TOUR DE TABLE DES CAS MARQUANTS RELEVES PAR LES CENTRES

La répartition des effets tient compte des définitions européennes en matière de gravité et de nouveauté.

A - LES EFFETS GRAVES

1) Les effets graves et nouveaux

- **ACUITEL®** (quinapril) : Pancréatite aiguë oedémateuse chez une femme de 68 ans, (ROUEN)

- **AGRAM®** (amoxicilline) + ORACILLINE® (phénoxyméthylpénicilline) + COQUELUSEDAL® (niaouli, grindélia, gelsémium, phénobarbital) + PANOTILE® (polymyrine, néomycine, fludrocortisone, lidocaïne) + MUCICLAR® (carbocistéine) : Syndrome de Lyell chez un enfant de 30 mois, (NANTES)

- **AMLOR®** (amlodipine) + **BACTRIM®** (sulfaméthoxazole, triméthoprime) : Vascularite aiguë nécrosante chez une femme de 73 ans, (MONTPELLIER)

- **ANSATIPINE®** (rifabutine) : Uvéite chez 3 hommes de 34, 37 et 49 ans, (PARIS-SAINT ANTOINE)

- **ART 50®** (diacerhéine) : Ulcère gastrique hémorragique avec présence d'helicobacter pylori chez une femme de 87 ans, (LIMOGES)

- **ASPEGIC®** (acétylsalicylate de lysine) : Hépatite, obnubilation chez un enfant de 3 ans et demi, (NANTES)

- ATRIUM®
(fébarbamate, difébarbamate, phénobarbital)
+
LEXOMIL®
(bromazépam) : Syndrome de Stevens-Johnson chez une femme de 34 ans, (RENNES)

- AUGMENTIN®
(amoxicilline, acide clavulanique)
+
AMIKLIN®
(amikacine)
+
PEFLACINE®
(pefloxacine) : Eruption cutanée, purpura non thrombopénique chez une femme de 22 ans,
(RENNES)

- COGNEX®
(tacrine) : Décompensation circulatoire cérébrale, décès chez une femme de 73 ans,
Décompensation cardio-respiratoire sur bronchopneumopathie chez un homme de 88 ans,
(LIMOGES)
Troubles du rythme chez une femme de 80 ans,
Infarctus du myocarde chez une femme de 73 ans,
(BESANCON)

- CYTOTEC®
(misoprostol) : Hyperthermie, oedème cérébral, ischémie myocardique, insuffisance hépatique, (tentative d'autolyse) chez un homme de 34 ans,
(AMIENS)

- DEPAKINE®
(acide valproïque sel de sodium) :

- Malaise, cyanose chez un nouveau-né de 24 heures, après prise par la mère.

- Petite dysmorphie faciale, hyperthrophie clitoridienne, CIA haute, reflux gastro-oesophagien à la naissance, allongement TCK, baisse fibrinogène, facteur II à 24 heures, mort subite, chez un nourrisson de 3 mois après prise de la mère pendant toute la grossesse,

- Allongement TCK, baisse fibrinogène, facteur II à la naissance, puis mort subite chez un nourrisson de 4 mois, après prise de la mère pendant toute la grossesse,
(PARIS-SAINT VINCENT DE PAUL)

- **DEPAMIDE®** (valpromide) + **PEPDINE®** (famotidine) :	Syndrome de Lyell chez une femme d'age non précisé (PARIS-CRETEIL)
- **DEROXAT®** (paroxétine) :	Eruption cutanée, hépatite chez une femme de 67 ans, (RENNES)
- **DEROXAT®** (paroxétine) + MODITEN® (fluphénazine) + DROLEPTAN® (dropéridol) + SOLIAN® (amisulpride)	Hépatite fulminante chez un homme de 35 ans, (LYON)
- **FELDENE®** (piroxicam) : + **COLTRAMYL®** (thiocolchicoside) + **CLAMOXYL®** (amoxicilline) + **MOPRAL®** (oméprazole) + **TOPLEXIL®** (oxomémazine, guaïfénésine, paracétamol) :	Erythème annulaire centrifuge chez un homme de 51 ans, (MONTPELLIER)
- **FLOXYFRAL®** (fluvoxamine):	Fibrose rétropéritonéale chez une femme de 40 ans (BREST)

- FONZYLANE®
(buflomédil)
+
DI-ANTALVIC®
(dextropropoxyphène,
paracétamol) : Choc anaphylactique chez une femme de 45 ans,
(ST ETIENNE)

- FLUVERMAL®
(flubendazole) : Malformation foetale, résidus branchiaux sous une oreille chez un nouveau né,
(CAEN)

- FRAZOLINE SPRAY®
(framycétine, naphazoline,
amyléine) : Bradycardie, hypertension artérielle, coma chez un nouveau-né 1 mois (sexe féminin),
(TOULOUSE)

- HYDROSOL POLYVITAMINE BON®
(vitamines A, D2, D3, E, B1, B2,
B6, C, nicotinamide,
dexpanthénol) : Irritabilité, urticaire géante, poussée hypertensive chez un nourrisson de 7 jours,
(DIJON)

- IMIGRANE®
(sumatriptan): Choc chez une femme de 33 ans,
(MARSEILLE)

- IMODIUM®
(lopéramide): Occlusion chez un nouveau-né après prise du médicament par la mère en fin de grossesse,
(ST VINCENT DE PAUL)

- Interferon alfa
+
HYDREA®
(hydroxycarbamide): Ostéonécrose multifocale chez un homme de 49 ans,
(ST ETIENNE)

- IVADAL®
(zopidem) : Diplopie transitoire chez une femme de 39 ans,
(ST ETIENNE)

-LAMISIL®
(terbinafine) : Gynécomastie unilatérale chez une homme 45 ans,
(FERNAND WIDAL)

- LOPRIL®
(captopril) — Pancréatite aiguë oedemateuse chez un homme de 52 ans,
(ROUEN)

- MEDIATOR®
(benfluorex)
+
LIPANTHYL®
(fénofibrate)
+
Amfépramone
+
CANOL®
(cynara, lawsonia, chimaphylla, aphloïa)
+
PILOSURYL®
(piloselle, phyllantus)
+
OLIVIASE®
(olivier)
+
STRESAM®
(étifoxine)
+
CRAETEGUS®
(aubépine)
+
RELVENE®
(hydroxyéthylrutosides) : Bouffée délirante, épisode confusionnel chez une femme de 59 ans,
(ROUEN)

- Méthotrexate
+
ZOPHREN®
(ondansétron)
+
LEDERFOLINE®
(folinate de calcium)
+
NUBAIN®
(nalbuphine) : Erythème anal chez une adolescente de 13 ans,
(MONTPELLIER)

- MIGWELL®
(ergotamine, caféine, cyclizine)
+
Sumatriptan : Délire aigu, agitation, confusion chez une femme de 40 ans,
(ST ETIENNE)

- **NEURIPLEGE®**
(chlorproéthazine)
+
SURGAM®
(acide tiaprofénique) : Syndrome extra-pyramidal chez un enfant de 10 ans,
(ST VINCENT DE PAUL)

- **NIFLURIL®**
(acide niflumique)
+
CLAMOXYL®
(amoxicilline)
+
DOLIPRANE®
(paracétamol) : Syndrome de Stevens-Johnson chez une fillette de 22 mois,
(MONTPELLIER)

- **OXEOL®**
(bambutérol) : Décès chez un homme de 71 ans,
(MARSEILLE)

- **PARA-PLUS®**
(perméthrine, malathion,
butoxyde de pipéronyle) : Brûlure au visage, suite à une explosion dans les cheveux chez une fillette de 4 ans,
(ST ETIENNE)

- **PEFLACINE®**
(péfloxacine)
+
DI-ANTALVIC®
(dextropropoxyphène,
paracétamol) : Aggravation d'une myasthénie chez une femme de 82 ans,
(LYON)

- **PENTASA®**
(mésalazine) : Lupus érythémateux disséminé chez une femme de 32 ans,
(CAEN)

- **PLACENTAFIL®**
(extrait placentaire
humain): Hépatite C chez une femme 37 ans,
(LYON)

- **PRAGMAREL®**
(trazodone)
+
MODIODAL®
(modiodal) : Psychose aiguë chez une femme de 66 ans
(LYON)

- PROFENID® gel (kétoprofène) :	Choc anaphylactique chez une femme de 74 ans, (RENNES)
- PYOSTACINE® (pristinamycine) :	Erythrodermie, ischémie des extrêmités des membres chez une femme de 58 ans, (BESANCON)
-PYOSTACINE® (pristinamycine) + FLAGYL® (métronidazole) :	Erythème morbilliforme, oedème de la face chez un homme de 35 ans, (BESANCON)
- ROACCUTANE® (isotrétinoïne) :	Névrite optique chez une femme de 36 ans, (RENNES)
- ROFERON® (interféron alfa-2a recombinant) :	Décès brutal probablement par arrêt cardio-respiratoire d'un homme de 32 ans, (TOULOUSE)
- RULID® (roxithromycine) + INDOCID® (indométacine) + XANAX® (alprazolam) :	Hépatite fulminante chez une femme de 81 ans, (PARIS-SAINT ANTOINE)
- SERC® (bétahistine) + **LEXOMIL®** (bromazépam) :	Eruption discoïde fixe non pigmentée chez une femme de 61 ans, (MONTPELLIER)
- SOLUMEDROL® (méthylprednisolone) :	Mort subite (infarctus septal) chez un homme 48 ans, (ST ETIENNE)

- **SPASFON®**
(phloroglucinol)
+
DIPRIVAN®
(propofol)
+
PRODAFALGAN®
(propacétamol)
+
SOPROL®
(bisoprolol) : Choc anaphylactique chez une femme de 57 ans, (BORDEAUX)

- **TENORMINE® IV**
(aténolol)
+
-ACTILYSE®
(altéplase) Choc anaphylactique chez un homme 65 ans, (NICE)

- **UTROGESTAN®**
(progestérone) : Cytolyse hépatique chez une femme de 30 ans, (POITIERS)

- **VASTEN®**
(pravastatine)
+
- TENORMINE®
(aténolol) : Myasthénie chez une femme de 82 ans, (LYON)

- **XENETIC®**
(iobitridol) : Ischémie myocardique chez un homme de 67 ans, (TOURS)

- **ZECLAR®**
(clarithromycine)
+
ICAZ®
(isradipine) : Hépatite aiguë mixte chez un homme de 78 ans, (CAEN)

INTERACTION MEDICAMENTEUSE

- **DI-HYDAN®**
(phénytoïne)
+
FLOXYFRAL®
(fluvoxamine) : Troubles de l'équilibre, nygstamus, taux de phénytoïne 4xN chez un homme de 73 ans, (PARIS-FERNAND WIDAL)

- **NIZORAL®**
(Kétoconazole)
+
TINSET®
(oxatomide)
+
ADALATE®
(nifédipine)
+
PIPRAM®
(acide pipémidique)
+
DAONIL®
(glibenclamide) : Allongement QT, pas d'hypokaliémie chez une femme de 69 ans,
(FERNAND WIDAL)

- **ZECLAR®**
(clarithromycine)
+
GYNERGENE® CAFEINE
(ergotamine, caféine) : Paresthésies, froideur des extrêmités chez une femme de 36 ans,
(ANGERS)

2) Les effets graves "connus"

- **ALINAM®**
(chlormézanone)
+
MINALFENE®
(alminoprofène) : Syndrome de Lyell chez une femme de 47 ans,
(LILLE)

- **APRANAX®**
(naproxène) : Oedème de Quincke chez une femme de 50 ans,
(BESANCON)

- **AROLAC®**
(lisuride) : Chute de la pression artérielle chez trois patientes âgées de 25 ans, de 34 ans et de 36 ans,
(ST ETIENNE)

- **AUGMENTIN®**
(amoxicilline, acide clavulanique)
+
CLAVENTIN®
(ticarcilline,
acide clavulanique) : Ictère cholestatique, syndrome de Stevens-Johnson grave chez un homme de 69 ans,
(NICE)

- **AZANTAC®**
(ranitidine) : Dyskinésie, confusion, puis encéphalopathie myoclonique chez un homme de 78 ans,
(NANTES)

- **CALCIPARINE®**
(héparine calcique) : Thrombopénie, thromboses multiples chez une femme de 67 ans,
(NANTES)

- **CIBLOR®**
(amoxicilline) : Hépatite aiguë mixte chez un homme de 60 ans,
(CAEN)

- **CLAMOXYL®**
(amoxicilline)
+
OROKEN®
(céfixime)
+
ROCEPHINE®
(ceftriaxone) : Colite pseudomembraneuse chez une femme de 45 ans,
(CLERMONT-FERRAND)

- **COLCHICINE®**
(colchicine)
+
SANDIMMUM®
(ciclosporine) : Rhabdomyolyse chez un homme de 42 ans,
(CLERMONT-FERRAND)

- **DEPAKINE® 500**
(acide valproïque, sel de sodium)
+
XATRAL®
(alfuzosine) : Agranulocytose chez un homme de 82 ans,
(CLERMONT-FERRAND)

- **DEROXAT®** (paroxétine) + **PROTHIADEN®** (dosulépine) :	Hyponatrémie chez une femme de 72 ans, (ST ETIENNE)
- **DIANE®** (cyprotérone acétate, éthinylestradiol) :	Thrombose veineuse fémoro-iliaque gauche chez une jeune femme de 19 ans, (DIJON)
- **DISTILBENE®** (diéthylstilbestrol) :	Adénose cervico-vaginale chez la fille découverte à l'âge de 18 ans, après prise par la mère âgée de 28 ans, (STRASBOURG)
- **EFFERALGAN VIT C®** (paracétamol, acide ascorbique) :	Choc anaphylactique chez une femme de 30 ans, (REIMS)
- **FELDENE®** (piroxicam) + **TAGAMET ®** (cimétidine) + **EFFERALGAN®** (paracétamol) + **PRIMALAN®** (méquitazine) :	Syndrome de Stevens-Johnson sévère chez une femme de 49 ans, (RENNES)
- **FLAGYL®** (métronidazole) :	Encéphalo-neuropathie chez un homme de 34 ans, (ANGERS)
- **Fludarabine :**	Encéphalopathie chez un homme de 64 ans, (TOULOUSE)
- **FLUORESCEINE®** (fluorescéine sodique) :	Choc anaphylactoïde chez un homme de 59 ans, (STRASBOURG)

- FLUOTHANE®
(halothane)
+
Rifampicine : Hépatite avec insuffisance hépato-cellulaire chez un enfant de 9 mois,
(TOURS)

-GLIFANAN®
(glafénine)
+
VOLTARENE® 100 LP
(diclofénac)
+
TEMESTA®
(lorazépam) : Insuffisance rénale aiguë (tentative d'autolyse ?) chez un homme de 44 ans,
(AMIENS)

- GYNERGENE® CAFEINE
(ergotamine, caféine): Ischémie iléale chez un homme de 51 ans,
(STRASBOURG)

- Hormone de croissance extractive®
+
LEVOTHYROX®
(lévothyroxine sodique)
+
TRINORDIOL®
(lévonorgestrel,
éthinylestradiol) : Maladie de Creutzfeldt-Jakob chez une femme de 24 ans (traitement entre Janvier 1981 et Décembre 1987),
(PARIS PITIE SALPETRIERE)

- ISOMERIDE®
(dexfenfluramine) : Hypertension pulmonaire chez une femme de 49 ans,
(POITIERS)

- LAMISIL®
(terbinafine) : Erythème polymorphe buccal chez un homme de 52 ans,
(FERNAND WIDAL)

- LEPONEX®
(clozapine) : Agranulocytose chez un homme de 39 ans,
(TOURS)

- **LEPONEX®**
(clozapine)
+
NOZINAN®
(lévomépromazine)
+
SURMONTIL®
(trimipramine) : Agranulocytose fatale chez un homme de 53 ans, (LIMOGES)

- **LIPANOR®**
(ciprofibrate)
+
PRACTAZIN®
(spironolactone, altizide)
+
PIPRAM®
(acide pipénridique)
+
CERVOXAN®
(vinburnine) : Rhabdomyolyse chez une femme de 66 ans, (CAEN)

- **LYMPHOGLOBULINE®**
(immunoglobulines de cheval antilymphocytes humains) : Réaction allergique chez une femme de 45 ans, (REIMS)

- **MOPRAL®**
(oméprazole)
+
PREPULSID®
(cisapride) : Cholestase chez une femme de 49 ans, (RENNES)

- **NALGESIC®**
(fénoprofène) : Néphrite interstitielle chez un homme de 66 ans, (DIJON)

- **NOCERTONE®**
(oxétorone)
+
PARLODEL®
(bromocriptine)
+
LAROXYL®
(amitriphyline) : Diarrhée chez une femme de 57 ans, (MONTPELLIER)

- **NOROXINE®**
(nofloxacine) : Syndrome de Lyell chez une femme de 36 ans,
(NICE)

- **PEDIAZOLE®**
(érythromycine
sulfafurazole) : Agranulocytose chez une enfant de 4 ans,
(TOURS)

- **PEDIAZOLE®**
(érythromycine sulfafurazole)
+
ORELOX®
(cefpodoxine)
+
EXOMUC®
(acétylcystéine)
+
CELESTENE®
(bétaméthasone)
+
FLUIMUCIL®
(acétylcystéine)
+
IRS 19®

INTERACTION MEDICAMENTEUSE

- SERECOR® (hydroquinidine) + CORDARONE® (amiodarone) + DIGOXINE® (digoxine) :	Tachycardie ventriculaire, fibrillation ventriculaire chez une femme de 38 ans, décès, (LILLE)
- TICLID® (ticlopidine) + FRAGMINE® (daltéparine sodique) :	Rectorragies abondantes chez un homme de 75 ans, (CLERMONT-FERRAND)

B - LES EFFETS NON GRAVES

1) Les effets nouveaux

- COGNEX® (tacrine) :	Pancréatite biologique chez une femme, (PARIS-CRETEIL)
- DEBRIDAT® (trimébutine) + NEO-CODION® (camphosulfonate de codéine, sulfogaïacol, grindélia) :	Pharmacodépendance, toxicomanie chez un homme de 30 ans, (ROUEN)
- DEDROGYL® (calciférol) + OSTRAM® (phosphate tricalcique) + DIDRONEL® (acide étidronique) :	Crise de "pseudo-goutte" chez une femme de 68 ans, (CAEN)

Annexe 3-4

- **DI-ANTALVIC®** (dextropropoxyphène, paracétamol) :	Surdité de perception unilatérale chez une adolescente de 15 ans, (LIMOGES)
- **KARAYAL®** (oxyde de magnésium, sulfate de magnésium, kaolin, gomme de sterculia) :	Ulcère de l'oesophage chez une femme de 60 ans, (ROUEN)
- **LAMISIL®** (terbinafine) :	Hallucinations auditives et troubles de l'humeur chez un homme de 24 ans, (PARIS-FERNAND WIDAL
- **LOVENOX®** (énoxaparine) :	Hyperplaquettose chez un homme de 50 ans, (BREST)
- **MOCLAMINE®** (moclobémide) :	Urticaire chez une femme de 40 ans, (RENNES)
- **MOCLAMINE®** (moclobémide) + STILNOX® (zolpidem) + XANAX® (alprazolam) :	Convulsion chez un homme de 73 ans, (MARSEILLE)
- **MOPRAL®** (oméprazole) + **DOGMATIL®** (sulpiride) :	Gynécomastie, impuissance chez un homme de 37 ans, (SAINT-ETIENNE)
- **ODRIK®** (trandolapril) :	Erythème pigmenté fixe muqueux invalidant chez un homme, (MARSEILLE)

- **ORELOX®** (cefpodoxime) + **SPIRAMYCINE COQUELUSEDAL®** (spiramycine) :	Maladie pseudo-sérique chez un homme de 24 ans, (REIMS)
- **ROACCUTANE®** (isotrétinoïne) :	Sensations vertigineuses, irritabilité, nervosité, idées suicidaires chez une femme de 30 ans, (ROUEN)
- **TEMGESIC®** (buprénorphine) :	Chute brutale du taux de prothrombine à 56 % chez un homme de 82 ans, (CLERMONT-FERRAND)
- **UTROGESTAN®** (progestérone) :	Cytolyse hépatique chez trois femmes de 28, 30 et 33 ans, (POITIERS)
- **UTROGESTAN®** (progestérone) + **ERYTHROTON®** (cyanocobalamine) + SPECIAFOLDINE® (acide folique) :	Cytolyse hépatique chez une femme de 33 ans, (POITIERS)
- **UTROGESTAN®** (progestérone) + **SPASFON®** (phloroglucinol) :	Cytolyse hépatique chez une femme de 32 ans, (POITIERS)
- **ZOLTUM®** (oméprazole) :	Gynécomastie chez un homme de 24 ans, (SAINT-ETIENNE)

Annexe 3-4

2) Les effets non graves et connus

- ANAFRANIL® (clomipramine) :	Diarrhée, veinite au point d'injection chez un homme de 74 ans, Diarrhée chez un homme de 43 ans, Prurit au niveau du point de ponction chez une femme de 68 ans, Oedème au niveau du point de ponction chez un homme de 61 ans, (NANCY)
- AROLAC® (lisuride) :	Nausées, vomissements (dose-dépendant) chez une femme de 28 ans, (NANTES)
- CORTANCYL® (prednisone) :	Ulcère gastrique chez un homme de 62 ans, (CAEN)
- CYCLADOL® (piroxicam, bêta-cyclodextrine) + EFFERALGAN CODEINE® (paracétamol, codéine) :	Epidermolyse toxique nécrotique (extrêmités des membres) chez un homme de 32 ans, (CLERMONT-FERRAND)
- ENURETINE® (isopropamide, thiamine, phénobarbital, vitamine E, éphédrine) + NEO-CODION® (camphosulfonate de codéine, sulfagaïacol, grindélia) :	Usage abusif chez un homme de 34 ans, (CAEN)
- FACTEUR IX Hp LFB :	Toux, fièvre, bronchospasme, chez un enfant de 10 mois, (NANTES)
- IMIJECT® (sumatriptan) :	Malaise, asthénie, oppression thoracique et de la gorge, vertige et fourmillements cutanés chez un homme de 41 ans, (CLERMONT-FERRAND)

- **IMMUNOGLOBULINES HUMAINES DE L'HEPATITE B I.V.** : (immunoglobulines spécifiques)	Urticaire chez un homme de 54 ans (MARSEILLE)
- **IMMUNOGLOBULINES HUMAINES NORMALE LFB I.V.** : (immunoglobulines polyvalentes)	Frissons, fièvre chez une femme de 80 ans, (MARSEILLE)
- **KETUM®** (kétoprofène) :	Réaction cutanée (bulles + vésicules) chez un homme de 68 ans, Eczéma de contact chez un homme de 28 ans, (MONTPELLIER)
- **KETUM®** (kétoprofène) + TRIACANA® (tiratricol) :	Eczéma de contact chez un homme de 43 ans, (MONTPELLIER)
- **LYMPHOGLOBULINE®** (immunoglobuline de cheval antilymphocytes humains) :	Maladie sérique chez une femme de 29 ans, (REIMS)
- **NORCURON®** (vécuronium) :	Syndrome myogène chez une femme de 24 ans, (CLERMONT-FERRAND)
- **PLAQUENIL®** (hydroxychloroquine) :	Oedème de la face, des genoux, des chevilles chez une femme de 43 ans, (RENNES)
- **PRANTAL®** (diphémanil) :	Excitation, anorexie, troubles du sommeil chez une femme, (PARIS-SAINT VINCENT DE PAUL)
- **PREVISCAN®** (fluindione) :	Augmentation isolée ALAT chez une femme de 58 ans, (RENNES)

- **RYTHMOL®** (propafénone) :	Dysgueusie chez un homme de 71 ans, (TOULOUSE)
- **UMATROPE 16®** (somatropine) :	Céphalées violentes avec oedèmes palpébraux et picotement de la face chez un garçon de 9 ans, (STRASBOURG)
- **VIBRAMYCINE®** (doxycycline monohydrate) :	Photosensibilisation (dos des mains) chez un homme de 73 ans, (CLERMONT-FERRAND)
- **ZAGAM®** (sparfloxacine) :	Réaction de phototoxicité chez une femme de 64 ans, (MONTPELLIER) Photosensibilité chez un homme de 30 ans, (RENNES) Réaction de photosensibilité, uvéite antérieure bilatérale chez une femme de 66 ans, (BREST) Eruption des zones exposées chez un homme de 43 ans, Erythème des zones exposées chez une femme de 53 ans, (DIJON) Phototoxicité chez un homme de 38 ans, (BESANCON)
- **ZAGAM®** (sparfloxacine) + **AUGMENTIN®** (amoxicilline, acide clavulanique) :	Eruption bulleuse et purpurique chez un homme de 62 ans, (CAEN)
- **ZAGAM®** (sparfloxacine) + CELESTAMINE® (bétaméthasone, dexchlorphéniramine) + NETUX® (codéine, phényltoloxamine) :	Réaction de phototoxicité chez une femme de 32 ans, (MONTPELLIER)

- ZAGAM® (sparfloxacine) + SOLUPRED® (prednisolone) :	Réaction de phototoxicité chez une femme de 41 ans, (MONTPELLIER)
- **ZAGAM®** (sparfloxacine) + SOLUPRED® (prednisolone) + ZYRTEC® (cétirizine) :	Photosensibilisation chez une femme de 53 ans, (MONTPELLIER)
- **ZAGAM®** (sparfloxacine) + TENORMINE® (aténolol) :	Réaction de phototoxicité chez un homme de 65 ans, (MONTPELLIER)
- **ZAGAM®** (sparfloxacine) + **ZYRTEC®** (cétirizine) :	Tendinopathie bilatérale (tendon d'Achille) chez une femme de 70 ans, (CLERMONT-FERRAND)

INTERACTIONS MEDICAMENTEUSES

- **ZOCOR®** (simvastatine) + **BEFIZAL®** (bézafibrate) :	Elévation des CPK chez un homme de 37 ans, (CLERMONT-FERRAND)

Annexe 3-4

C - NOUVELLES ENQUETES ET NOUVEAUX DOSSIERS

Enquêtes officieuses :

- SINEMET® : Les C.R.P.V. de Nice et de Marseille sont chargés de faire le point sur la possibilité de survenue de mélanome malin lors de traitement avec ce médicament.

- UTROGESTAN® : Le C.R.P.V. de Poitiers est chargé d'effectuer un bilan des mésusages, risques et bénéfices de l'utilisation de la progestérone sous forme micronisée.

- EUPHYTOSE® : Un point sur l'hépatotoxicité de cette spécialité de phytothérapie est confiée au C.R.P.V. de Toulouse.

- ROACCUTANE® : Les C.R.P.V. de Tours et de Paris Saint-Vincent de Paul sont chargés de rassembler des informations sur les cas d'initialisation du traitement alors qu'une grossesse est en cours.

Enquêtes officielles :

- PRANTAL® : Une enquête officielle a été confiée au C.R.P.V. de Paris Saint-Vincent de Paul, à la suite de la présentation du point sur les effets indésirables du diphémanil méthylsulfate chez l'enfant.

- Une enquête officielle de pharmacovigilance sur la sécurité d'emploi des LYMPHOGLOBULINE® Merieux est confiée aux C.R.P.V. de Dijon et Lyon.

Nouveaux dossiers :

- L'analyse des Déclarations obligatoires 1994 des effets indésirables des spécialités PENTASA® et ALTIM® a été confiée au C.R.P.V. de Marseille.

- La demande de modification de l'information médicale de la spécialité INDOCID® a été confiée au C.R.P.V. de Nancy.

- ELOHES® et HESTERIL® : La demande de modification de l'information médicale concernant l'utilisation des dihydroxyéthylamidons chez la femme enceinte a été confiée au C.R.P.V. de Paris Saint-Vincent de Paul.

- La demande de modification de l'information médicale de la spécialité DOBUTREX® a été confiée au C.R.P.V. de Saint-Etienne.

Annexe 3-4

IV -CANTOR® (minaprine) ET SURDOSAGE

Les résultats d'une enquête des centres anti-poison français concernant les intoxications aiguës par la minaprine ont été présentés aux membres du comité technique par Mr le Pr Lambert du Centre Anti-poison de Nancy.

Il s'agit d'un psychotrope indiqué dans "les états d'inhibition pouvant s'exprimer par : ralentissement psychomoteur, baisse de la libido, baisse d'activité ou manque d'initiative, difficultés mnésiques et de concentration".

La minaprine présente une affinité pour les récepteurs à la glycine, neuromédiateur inhibiteur, prouvée par la potentialisation des convulsions à la strychnine, antagoniste glycinergique.
Le pic plasmatique est atteint en 1 heure et la demi-vie du produit inchangé est de 2,5 heures. La parahydroxylation hépatique, variable selon les individus, est la voie prépondérante de métabolisation de la minaprine.

Cette molécule a obtenu une AMM en 1979 avec un conditionnement de 30 comprimés à 50mg, soit 1,5 g par boîte.
En 1990, l'AMM a été modifiée avec un conditionnement de 20 comprimés dosés à 100mg, soit 2g par boîte.

En 1993, la Commission Nationale de Pharmacovigilance a souhaité que le conditionnement soit de nouveau restreint à 1,4 g par boîte (2 blisters de 7 cps de 100mg). Il était prévu d'apprécier le retentissement de ces mesures au bout d'un an, mais elles n'ont été effectives qu'en 1995. Ceci reviendrait à réévaluer le dossier début 1996.

Toxicité aiguë expérimentale : la mort survient rapidement après des signes d'hyperexcitabilité et des convulsions de type clonique antagonisées dans toutes les espèces par les barbituriques et non antagonisées par les benzodiazépines ; la minaprine potentialise les effets de la strychnine. La DL 50 représente deux fois la dose pharmacologiquement active.

Intoxications aiguës chez l'homme :
L'analyse des données issues de la banque nationale des Centres anti-poisons depuis 1978 permet de dénombrer 1346 dossiers d'intoxication aiguë par la minaprine. Sur les 1093 cas notifiés de 1978 à 1990, 6% des patients ont présenté des convulsions et 1,5% ont une évolution fatale.
253 autres cas ont été collectés de 1990 à 1995, dont 14,6% avec des convulsions et 3,6% d'évolution mortelle.

Plus particulièrement à partir des 322 cas recensés par la dernière étude multicentrique 1990-1994, on peut conclure que :

* la symptomatologie est constituée de troubles neurologiques précoces (convulsions, état de mal convulsif, coma) qui font la gravité de l'intoxication (évolution rapide vers un décès et coma végétatif), de symptômes cardio-vasculaires (hypotension, tachycardie, arrêt cardio-circulatoire, troubles du rythme, de la conduction) et de troubles digestifs.

* des signes cliniques sont observés pour une dose annoncée (DA) supérieure ou égale à 200 mg,

* il existe dans 26% des cas des convulsions pour une DA de 200 à 10.000 mg,

* l'évolution dans 9,8% des cas s'est faite vers un décès ou un état végétatif.

Ainsi, il existe une très grande variabilité clinique en fonction des doses supposées ingérées qui peuvent aller de 1/2 cp à 100 cps. Il apparaît que le décès survient en général à partir de 1 gramme ingéré. Il existe cependant 2 décès pour des doses allant de 500 mg à 1 g. La gravité provient aussi de la rapidité de survenue des troubles, avant même l'arrivée des secours.
L'attention est attirée par les cas d'intoxications survenant chez des patients jeunes (20,6 ans en moyenne).
La preuve de l'intoxication n'est pas toujours apportée dans ces observations (7 cas documentés).
La réduction du conditionnement n'apparait pas comme une solution suffisante.

Les membres du Comité Technique souhaitent :

1) disposer d'informations complémentaires sur la nouvelle présentation orale (gouttes) qui a obtenu une AMM mais qui n'est pas encore commercialisée. Le Comité est alarmé par le risque d'intoxication accidentelle grave chez l'enfant et la possibilité d'une survenue encore plus précoce des convulsions en cas d'intoxication aiguë, favorisée par la biodisponibilité de cette forme galénique,

2) une réévaluation de l'efficacité de la molécule, afin de pouvoir en apprécier le rapport bénéfice/risque,

3) la mise à disposition par la firme des données de toxicologie précliniques sur le système nerveux central aux centres de pharmacovigilance de Marseille et de Lyon qui ont en charge l'enquête officielle,

4) la réévaluation par la Commission Nationale de Pharmacovigilance du risque de ces intoxications, avant un délai de 1 an, du fait de leur gravité potentielle.

Annexe 3-4

V - ANTHRACYCLINES ET SURVENUE DE LEUCEMIES

Le laboratoire PHARMACIA a fait une demande de modifications de l'information médicale de la rubrique "effets indésirables" des monographies des produits ADRIAMYCINE®, ADRIBLASTINE® et FARMORUBICINE®.

Cette demande a été examinée par Mme le Docteur E. BAUMELOU, du C.M.C. FOCH de Suresnes.

L'analyse des diverses publications (1990 à 1995) a permis de montrer qu'il existe des arguments cliniques, pharmacologiques et moléculaires pour considérer qu'il existe un risque particulier de leucémies secondaires aux inhibiteurs de Topo-Isomérase II et/ou agents intercalants.

Plusieurs questions restent cependant sans réponse :

- tous les agents de la classe ont-ils le même effet leucémogène ?
- se potentialisent-ils les uns les autres ?
- y-a-t-il des cofacteurs ?
- le risque est-il augmenté avec les doses ?

Le comité technique a donc considéré :

- qu'il n'était pas possible d'accepter les propositions de modifications de l'information médicale du laboratoire. Le risque de leucémies induites par les anthracyclines semble confirmé mais il est difficile d'en apprécier le niveau qui pourrait être différent entre les anthracyclines. Les patients atteints de leucémie secondaire ayant très généralement reçu de multiples agents cancéreux, il est très difficile de faire la part du rôle de l'un par rapport à l'autre.
En conséquence, la modification des monographies, si elle est décidée, devrait concerner tous les agents anticancéreux interagissant directement avec l'ADN.

- qu'il est nécessaire d'organiser un groupe de travail en EUROPE comparable à celui des USA, pour établir un registre des leucémies et myélodysplasies secondaires à ces traitements en association avec des oncologues et des hématologues. En France une enquête type cohorte pourrait être menée par une équipe constituée de : Mme le Dr RM. CHICHMANIAN, Mme le Dr GOUJARD, M. le Pr G. LAGIER, Mme le Dr C. SOUBRIE et d'experts.

Annexe 3-4

VI -IDARAC® (floctafénine) ET EFFETS INDESIRABLES

Le Centre Régional de Pharmacovigilance de Paris Saint-Antoine a présenté les résultats de l'enquête nationale de pharmacovigilance sur les effets indésirables de la floctafénine, suivi d'un premier bilan entre 1983 et 1988.

Cette étude a porté sur tous les effets indésirables notifiés entre le 1er janvier 1988 et 31 décembre 1994 et plus particulièrement, sur les effets graves à type de choc ou de malaise.

Parmi les 249 notifications colligées (dont 83,1% proviennent du système national de pharmacovigilance), 165 ont été analysées après exclusion des doublons et des dossiers inexploitables. Les observations de choc (22), malaise grave (16), malaise modéré (12) et malaise léger (14) sont en augmentation par rapport à la période 1982-1987. Aucun décès imputable à la floctafénine et secondaire à un état de choc n'a été recensé. Les chocs sont survenus essentiellement lors d'utilisation de la floctafénine en automédication. Un préchallenge positif à la glafénine ou la floctafénine pourrait constituer un facteur de risque dans la survenue des effets indésirables allergiques.

D'autre part, l'imputabilité de la floctafénine est douteuse pour les 7 observations d'atteintes hématologiques et les 13 atteintes hépatiques recueillies.

Au total, cette enquête montre que les incidences relatives de décès et d' hospitalisations sont en nette progression. L'augmentation des notifications (x 3,3) apparaît paradoxale face à la chute des chiffres de vente (-50%).

Le Comité technique propose de compléter l'enquête par l'analyse des données internationales et la comparaison des taux de notification au cours des deux périodes couvertes par les enquêtes successives de 1983 à 1988 puis de 1988 à 1994. Un groupe de travail constitué des C.R.P.V. de Tours, Nice, Paris Saint-Antoine, Bordeaux, ainsi que Mme le Dr J. Goujard et M. le Pr G. Lagier est chargé d'évaluer la faisabilité de cette étude de sous-notification.

Annexe 3-4

VII - BUFEXAMAC ET EFFETS INDESIRABLES CUTANES

Un point sur l'enquête officielle relative aux spécialités contenant du bufexamac a été réalisé par le Centre Régional de Pharmacovigilance de Rennes. Trois spécialités sont concernées : le PARFENAC®, le CALMADERM® et le BUFAL® qui sont des produits conseils vendus dans les pharmacies.

Cette enquête est menée en association avec le centre de Saint-Etienne et en collaboration avec le service de dermatologie du Pr J. CHEVANT-BRETON. Les centres GERDA ont été contactés.

Deux enquêtes ont été réalisées :

- de 1974 à 1990, 69 cas ont été notifiés dont 46 hospitalisations.
- de 1990 à 1995, 127 cas ont été notifiés (91 par les CRPV, 9 par les laboratoires et 27 par les GERDA) dont 53 hospitalisations.

L'analyse des notifications de la deuxième enquête montre que 42 % des cas sont graves. Il s'agit de 29 eczéma, de 6 aggravations d'eczéma ; parmi les 18 autres cas, on trouve 1 érythrodermie, 1 éruption généralisée, 1 pustulose exanthématique et 3 éruptions à type d'érythème polymorphe. L'évolution est favorable dans 88,6% des cas. La durée moyenne d'hospitalisation est de 8,6 j. Dans 37 cas, une hospitalisation a été nécessaire. Dans 75,5 % des cas, l'imputabilité est I2 et dans 68% I3.

L'incidence totale des notifications est de 6 cas pour 1 million de tubes vendus. Une seule de ces spécialités est remboursée par la sécurité sociale.

Le coût en journées d'hospitalisation d'une dermatose liée au bufexamac est de 26 178,40 F.

En conclusion :

L'incidence est faible mais il existe une forte sous notification.

42% des effets sont graves entraînant un coût élevé des effets indésirables. Il a été évoqué la possibilité d'inscription de ces spécialités sur la liste I des substances vénéneuses, en contre-indiquant l'emploi en cas d'eczéma, de peau lésée, d'antécédents allergiques.

Le Comité Technique a souhaité que cette enquête soit prolongée sur un plan prospectif avec la collaboration des GERDA, en ciblant sur une incidence plus précise et en évaluant la possibilité d'une sensibilité croisée.
Il a été également suggéré qu'une enquête auprès des pharmaciens soient menée quant à l'utilisation dans l'érythème fessier du nourrisson.

Annexe 3-4

VIII - GAMMAGARD®

A la suite du rappel mondial des lots de GAMMAGARD® par la firme Baxter motivé par la survenue de cas de séroconversion HVC en Suède et en Espagne, une enquête de pharmacovigilance a été initiée en France afin de dépister d'éventuels cas. Le C.R.P.V. de Paris Fernand Widal a présenté les résultats de cette enquête.

Ces immunoglobulines sont importées et utilisées comme traitement substitutif d'un déficit humoral ou comme traitement immunomodulateur.

Une fois la traçabilité effectuée, les patients susceptibles d'avoir reçu certains lots à partir du 01.01.1993 ont été convoqués pour dépistage, selon un protocole défini par une lettre circulaire émanant de la DGS, de l'Agence Française du Sang et de l'Agence du Médicament.

Au total, le dernier bilan mondial recensait 223 cas ; en France, 19 cas ont été identifiés dont 10 patients qui avaient reçu ce traitement dans le cadre d'une allogreffe de moelle, 4 pour un déficit immunitaire et 5 pour d'autres pathologies diverses.
Plus particulièrement pour les patients qui avaient subi une greffe de moelle dans le même service, il y a eu aussi transfusion de produits sanguins labiles.

Toutes les PCR sont positives pour le virus C ; 13 patients avaient une PCR négatives, avant d'avoir reçu des GAMMAGARD® ou avant le 01.01.93 ; pour les 6 autres cas, les sérologies étaient négatives.
Le génotype viral est le 2b pour 11 patients, le 1a pour 6 et le 3 pour 1 patient. Ce génotype 2b est exceptionnel pour la population générale.

Les hypothèses formulées initialement étaient basées sur :

- le changement de test de dépistage du virus HCV sur les pools de plasma : les tests de deuxième génération éliminant une plus grande quantité d'anticorps VHC empêchant la formation de complexes VHC-Ac, la neutralisation du virus ou son exclusion de la fraction d'immunoglobulines,

- l'absence d'étape d'inactivation virale par un procédé solvant-détergent : cette dernière étape existe pour le GAMMAGARD® S/D disponible actuellement avec une ATU.

Actuellement, l'enquête continue au niveau international. Le suivi des patients se poursuit ; certains d'entre eux demandent des informations sur la relation causale et sur les conclusions pratiques de cette enquête pour laquelle leur participation a été vivement sollicitée.

Annexe 3-4

IX - POINT SUR LES EFFETS INDESIRABLES DU PRANTAL EN PEDIATRIE (Diphémanil méthylsulfate)

Suite à des accidents cardiaques chez les prématurés rapportés au système national de pharmacovigilance en 1993 et 1994, un point sur les effets indésirables du diphémanil méthylsulfate a été réalisé par les Centres Régionaux de Pharmacovigilance de Paris Saint-Vincent de Paul et de Rennes.

Commercialisé jusqu'en 1991 par les laboratoires Schering Plough, le diphémanil méthylsulfate est distribué par la Pharmacie Centrale des Hôpitaux depuis 1992, sous forme de comprimés sécables dosés à 2 et 10 mg et disponible sous forme de matière première pour les pharmacies hospitalières et officinales, au niveau de la Coopération Pharmaceutique Française. Le diphémanil méthylsulfate est utilisé dans la prévention de la mort subite du nourrisson.

Vingt-cinq observations, émanant de la banque nationale de pharmacovigilance et concernant 12 prématurés et 13 nourrissons, ont été retenues.
Dans 13 cas (10 prématurés et 3 nourrissons), il s'agit d'effets indésirables de nature cardiaque. Les dossiers des prématurés sont les plus préoccupants. De plus, 7 cas récents dont 6 chez le prématuré ont été recensés dans la littérature.

Les indications sont la bradycardie, l'apnée, l'hypertonie vagale chez des grands prématurés de 27 SA à 32 SA. Un décès a été constaté par arrêt cardiaque chez un prématuré né à 29 SA avec des taux thérapeutiques d'environ 30 fois supérieurs à ceux signalés dans la littérature. Trois erreurs d'usage sont à noter : 2 intoxications aiguës et une erreur d'administration. Les autres effets rapportés sont essentiellement des effets digestifs, dont un sévère et atropinique.

Au vu de ces premiers résultats, le Comité technique a décidé l'ouverture d'une enquête officielle.

X -SPASFON® INJECTABLE (phloroglucinol) ET TROUBLES ATROPINIQUES

Le phloroglucinol est un antispasmodique musculotrope présenté comme non atropinique.
Un point effectué par le Centre Régional de Pharmacovigilance de Limoges sur ses éventuels effets atropiniques avait révélé l'existence d'accidents sévères, notamment allergiques, avec la forme injectable et a conduit à la mise en place d'une enquête officielle de pharmacovigilance.

Soixante quatre observations d'effets indésirables ont été retenues et analysées. Elles concernent en majorité des femmes, dans le cadre d'indications urinaires, digestives, hépato-biliaires et obstétricales. L'âge moyen est de 40 ans. Les effets indésirables recueillis sont essentiellement de nature allergique : cutanés, respiratoires, malaises généraux à traduction cardio-vasculaire et/ou neurologique. L'évolution est en général favorable. Quatre décès sont survenus : par choc septique, SIDA, embolie amniotique et arrêt cardio-respiratoire.

Au total, la fréquence des effets indésirables apparaît faible mais un tiers d'entre eux sont sévères et essentiellement de type allergique. Le résumé des caractéristiques du produit mérite donc d'être modifié par la mention dans la rubrique "Effets indésirables" de la possibilité de survenue de "réactions allergiques rares mais parfois graves", et la contre-indication en cas d'allergie connue au phloroglucinol. Il semble excessif de maintenir à la rubrique pharmacodynamie que ce produit ne présente pas d'inconvénients atropiniques. La compatibilité physico-chimique du phloroglucinol avec certains AINS et certains antiémétique doit être évaluée, car il s'agit d'associations fréquemment employées.

Au vu de l'ensemble de ces données, le SPASFON® sous sa forme injectable mériterait de figurer sur la liste II.

Le Comité technique est favorable aux modifications du RCP proposées par le rapporteur et à l'étude des incompatibilités physico-chimiques. Cependant si l'inscription en liste II est proposée, elle s'appliquera au principe actif quelque soit sa voie d'administration.

Annexe 3-4

XI - POINT SUR LES MICROANGIOPATHIES THROMBOTIQUES ET LE FLUCONAZOLE (TRIFLUCAN®)

Un point sur la possibilité de survenue de microangiopathie thrombotique (M.A.T.) en relation avec la prise de TRIFLUCAN® (fluconazole) a été présenté par le Centre Régional de Pharmacovigilance de Paris Saint-Antoine.

La M.A.T. est une pathologie grave d'évolution spontanée fatale en quelques semaines à quelques mois, regroupant les purpuras thrombotiques et thrombocytopéniques, associés à des syndromes hémolytiques et urémiques.
De nombreux facteurs étiologiques ont été avancés : viraux, bactériens ou médicamenteux, mais aussi la grossesse et la greffe de moelle ou de rein. Le diagnostic est porté avec certitude, après histologie du cerveau ou du rein montrant des microthromboses vasculaires.

Entre 1993 et fin 1994, 16 observations colligées par l'équipe du Pr. W. Rosenbaum (Hôpital Rothschild AP-HP, Paris) ont permis la réalisation d'une étude cas-témoins par le réseau national de santé publique.
